***Consumers Council of Canada and the Vulnerable Energy Consumers Coalition (CCC) and (VECC) INTERROGATORY #23 List 1***

***Interrogatory***

Ref: B1/T3/S1 p. 51

Issue 4.0
Issue: Cost of Capital/Capital Structure

Topic: Risk premium regression

Request:

a) Please provide all the underlying data necessary to replicate the risk premium estimates reported in footnotes 53 and 57.

b) How are we to interpret the regression estimate on page 51 when the long term interest rate appears as both a dependent variable (through the risk premium) as well as the independent variable?

***Response***

a) The requested data is attached as Attachment A.

b) It is equivalent to estimating the relationship between the bond yield and the cost of equity. In that case, the coefficient is .31, that is, the cost of equity increases by 31 basis points for every one percentage point increase (decrease) in the long Canada bond yield. That is the relationship is the mirror of the regression on p. 51. There the equity risk premium increases (decreases) by 69 basis points for every one percentage point decrease (increase) in long Canada yields. There are a number of published studies that have estimated the relationship in the manner set out on p. 51. The most recent, to Ms. McShane's knowledge, is Robert S. Harris and Felicia C. Marston, "The Market Risk Premium: Expectational Estimates Using Analysts' Forecasts", Journal of Applied Finance, 2001.
