- Subsequent to August 31, 2015, Hydro One continues to provide certain management, administrative and smart meter network services to Hydro One Brampton pursuant to certain service level agreements, which are provided at market rates. These agreements will continue until the end of 2016 (except in the case of smart meter network services, which will continue until the end of 2017). Hydro One Brampton has the right to renew these agreements (other than smart meter network services) for additional one-year terms to end no later than December 31, 2019. Additionally, on August 31, 2015, Hydro One Inc. and Hydro One Brampton entered into a license agreement which permits Hydro One Brampton to use the "Hydro One" name and related licensed marks. These agreements will terminate if the Province disposes of its interest in Hydro One Brampton, except in the case of the smart meter network services agreement, which is anticipated to continue for a transition period after the Province disposes of its interest in Hydro One Brampton. During 2015, revenues related to the provision of services with respect to these service level agreements were $1 million.

Sales to and purchases from related parties occur at normal market prices or at a proxy for fair value based on the requirements of the OEB's Affiliate Relationships Code. Outstanding balances at period end are interest free and settled in cash.

The amounts due to and from related parties as a result of the transactions referred to above are as follows:

| *(millions of Canadian dollars)* | December 31, 2015 | December 31, 2014 |
|---|---|---|
| Due from related parties | 191 | 224 |
| Due to related parties[1] | (138) | (227) |

[1] Included in due to related parties at December 31, 2015 are amounts owing to the IESO in respect of power purchases of $134 million (2014 – $214 million).

## 24. Consolidated Statements of Cash Flows

The changes in non-cash balances related to operations consist of the following:

| *Year ended December 31* *(millions of Canadian dollars)* | 2015 | 2014 |
|---|---|---|
| Accounts receivable | 240 | (93) |
| Due from related parties | 33 | (27) |
| Materials and supplies | 2 | – |
| Prepaid expenses and other assets | 4 | (13) |
| Accounts payable | (23) | 39 |
| Accrued liabilities | (15) | (35) |
| Due to related parties | (89) | (3) |
| Accrued interest | (4) | – |
| Long-term accounts payable and other liabilities | – | (3) |
| Post-retirement and post-employment benefit liability | 60 | 80 |
| | 208 | (55) |

## Capital Expenditures

The following table illustrates the reconciliation between investments in property, plant and equipment and the amount presented in the Consolidated Statements of Cash Flows after accounting for capitalized depreciation and the net change in related accruals:

| *Year ended December 31*<br>*(millions of Canadian dollars)* | 2015 | 2014 |
|---|---|---|
| Capital investments in property, plant and equipment | (1,623) | (1,511) |
| Capitalized depreciation and net change in accruals included in capital investments in property, plant and equipment | 28 | 30 |
| Capital expenditures – property, plant and equipment | (1,595) | (1,481) |

The following table illustrates the reconciliation between investments in intangible assets and the amount presented in the Consolidated Statements of Cash Flows after accounting for the net change in related accruals:

| *Year ended December 31*<br>*(millions of Canadian dollars)* | 2015 | 2014 |
|---|---|---|
| Capital investments in intangible assets | (40) | (19) |
| Net change in accruals included in capital investments in intangible assets | 3 | (4) |
| Capital expenditures – intangible assets | (37) | (23) |

## Capital Contributions

Hydro One enters into contracts governed by the OEB Transmission System Code when a transmission customer requests a new or upgraded transmission connection. The customer is required to make a capital contribution to Hydro One based on the shortfall between the present value of the costs of the connection facility and the present value of revenues. The present value of revenues is based on an estimate of load forecast for the period of the contract with Hydro One. Once the connection facility is commissioned, in accordance with the OEB Transmission System Code, Hydro One will periodically reassess the estimated of load forecast which will lead to a decrease, or an increase in the capital contributions from the customer. The increase or decrease in capital contributions is recorded directly to fixed assets in service. In 2015, capital contributions from these reassessments totalled $62 million, which represents the difference between the revised load forecast of electricity transmitted compared to the load forecast in the original contract, subject to certain adjustments. No reassessments occurred in 2014.

## Supplementary Information

| *Year ended December 31*<br>*(millions of Canadian dollars)* | 2015 | 2014 |
|---|---|---|
| Net interest paid | 416 | 412 |
| Income taxes / PILs paid | 2,933 | 86 |

# 25. Contingencies

## Legal Proceedings

Hydro One is involved in various lawsuits, claims and regulatory proceedings in the normal course of business. In the opinion of management, the outcome of such matters will not have a material adverse effect on the Company's consolidated financial position, results of operations or cash flows.

In September 2015, Hydro One and three of its subsidiaries were served with a class action suit in which the representative plaintiff is seeking up to $125 million in damages related to allegations of improper billing practices. Hydro One intends to defend the action. Due to the preliminary stage of legal proceedings, an estimate of a possible loss related to this claim cannot be made.

## Transfer of Assets

The transfer orders by which the Company acquired certain of Ontario Hydro's businesses as of April 1, 1999 did not transfer title to some assets located on Reserves (as defined in the *Indian Act* (Canada)). Currently, the OEFC holds these assets. Under the terms of the transfer orders, the Company is required to manage these assets until it has obtained all consents necessary to complete the transfer of title of these assets to itself. The Company cannot predict the aggregate amount that it may have to pay, either on an annual or one-time basis, to obtain the required consents. In 2015, the Company paid approximately $1 million (2014 – $1 million) in respect of consents obtained. If the Company cannot obtain the required consents, the OEFC will continue to hold these assets for an indefinite period of time. If the Company cannot reach a satisfactory settlement, it may have to relocate these assets to other locations at a cost that could be substantial or, in a limited number of cases, to abandon a line and replace it with diesel-generation facilities. The costs relating to these assets could have a material adverse effect on the Company's results of operations if the Company is not able to recover them in future rate orders.

# 26. Commitments

## Outsourcing Agreements

Inergi LP (Inergi), an affiliate of Capgemini Canada Inc., provides services to Hydro One, including settlements, source to pay services, pay operations services, information technology, finance and accounting services. The agreement with Inergi for these services expires in December 2019. In addition, Inergi provides customer service operations outsourcing services to Hydro One. The agreement for these services expires in February 2018.

Brookfield Global Integrated Solutions (formerly Brookfield Johnson Controls Canada LP) (Brookfield) provides services to Hydro One, including facilities management and execution of certain capital projects as deemed required by the Company. The current agreement with Brookfield expires in December 2024.

At December 31, 2015, the annual commitments under the outsourcing agreements were as follows: 2016 – $167 million; 2017 – $138 million; 2018 – $106 million; 2019 – $99 million; 2020 – $2 million; and thereafter – $11 million.

## Trilliant Agreement

In December 2015, Hydro One entered into an agreement with Trilliant Holdings Inc. and Trilliant Networks (Canada) Inc. (Trilliant) for the supply, maintenance and support services for smart meters and related hardware and software, including additional software licenses, as well as certain professional services. This agreement is for a term of ten years, from December 31, 2015 to December 31, 2025, with the option to renew for an additional term of five years at Hydro One's sole discretion. At December 31, 2015, the annual commitments under the agreement were as follows: 2016 – $17 million; 2017 – $17 million; 2018 – $17 million; 2019 – $17 million; 2020 – $16 million; and thereafter – $6 million.

## Prudential Support

Purchasers of electricity in Ontario, through the IESO, are required to provide security to mitigate the risk of their default based on their expected activity in the market. As at December 31, 2015, Hydro One Inc. provided prudential support to the IESO on behalf of its subsidiaries using parental guarantees of $329 million (2014 – $330 million), and on behalf of a distributor using guarantees of $1 million (2014 – $1 million). In addition, as at December 31, 2015, Hydro One Inc. has provided letters of credit in the amount of $15 million (2014 – $8 million) to the IESO. The IESO could draw on these guarantees and/or letters of credit if these subsidiaries or distributor fail to make a payment required by a default notice issued by the IESO. The maximum potential payment is the face value of any letters of credit plus the amount of the parental guarantees.

## Retirement Compensation Arrangements

Bank letters of credit have been issued to provide security for Hydro One Inc.'s liability under the terms of a trust fund established pursuant to the supplementary pension plan for eligible employees of Hydro One Inc. The supplementary pension plan trustee is required to draw upon these letters of credit if Hydro One Inc. is in default of its obligations under the terms of this plan. Such obligations include the requirement to provide the trustee with an annual actuarial report as well as letters of credit sufficient to secure Hydro One Inc.'s liability under the plan, to pay benefits payable under the plan and to pay the letter of credit fee. The maximum potential payment is the face value of the letters of credit. At December 31, 2015, Hydro One Inc. had letters of credit of $139 million (2014 – $126 million) outstanding relating to retirement compensation arrangements.

## Operating Leases

Hydro One is committed as lessee to irrevocable operating lease contracts for buildings used in administrative and service-related functions and storing telecommunications equipment. These leases have typical terms of between three and five years, but several leases have lesser or greater terms to address special circumstances and/or opportunities. Renewal options, which are generally prevalent in most leases, have similar terms of three to five years. All leases include a clause to enable upward revision of the rental charge on an annual basis or on renewal according to prevailing market conditions or pre-established rents. There are no restrictions placed upon Hydro One by entering into these leases.

During the year ended December 31, 2015, the Company made lease payments totaling $7 million (2014 – $11 million). At December 31, 2015, the future minimum lease payments under non-cancellable operating leases were as follows; 2016 –$11 million; 2017 – $10 million; 2018 – $9 million; 2019 – $4 million; 2020 – $8 million; and thereafter – $3 million.

## 27. Segmented Reporting

### Hydro One has three reportable segments:

- The Transmission Business, which comprises the core business of transmitting high voltage electricity across the province, interconnecting more than 70 local distribution companies and certain large directly connected industrial customers throughout the Ontario electricity grid;
- The Distribution Business, which comprises the core business of delivering electricity to end customers and certain other municipal electricity distributors; and
- Other Business, which includes certain corporate activities and the operations of the Company's telecommunications business.

The designation of segments has been based on a combination of regulatory status and the nature of the products and services provided. Operating segments of the Company are determined based on information used by the chief operating decision maker in deciding how to allocate resources and evaluate the performance of each of the segments. The Company evaluates segment performance based on income before financing charges and income taxes from continuing operations (excluding certain allocated corporate governance costs).

The accounting policies followed by the segments are the same as those described in the summary of significant accounting policies (see Note 2 – Significant Accounting Policies). Segment information on the above basis is as follows:

| *Year ended December 31, 2015*<br>*(millions of Canadian dollars)* | Transmission | Distribution | Other | Consolidated |
|---|---|---|---|---|
| Revenues | 1,536 | 4,949 | 53 | 6,538 |
| Purchased power | – | 3,450 | – | 3,450 |
| Operation, maintenance and administration | 426 | 633 | 76 | 1,135 |
| Depreciation and amortization | 374 | 380 | 5 | 759 |
| Income (loss) before financing charges and income taxes | 736 | 486 | (28) | 1,194 |
| Capital investments | 943 | 711 | 9 | 1,663 |

| *Year ended December 31, 2014*<br>*(millions of Canadian dollars)* | Transmission | Distribution | Other | Consolidated |
|---|---|---|---|---|
| Revenues | 1,588 | 4,903 | 57 | 6,548 |
| Purchased power | – | 3,419 | – | 3,419 |
| Operation, maintenance and administration | 394 | 742 | 56 | 1,192 |
| Depreciation and amortization | 346 | 367 | 9 | 722 |
| Income (loss) before financing charges and income taxes | 848 | 375 | (8) | 1,215 |
| Capital investments | 845 | 680 | 5 | 1,530 |

### Total Assets by Segment:

| *December 31*<br>*(millions of Canadian dollars)* | 2015 | 2014 |
|---|---|---|
| Transmission | 12,066 | 12,540 |
| Distribution | 9,213 | 9,805 |
| Other | 3,049 | 205 |
| Total assets | 24,328 | 22,550 |

All revenues, costs and assets, as the case may be, are earned, incurred or held in Canada.

## 28. Subsequent Events

### Dividends

On February 11, 2016, preferred share dividends in the amount of $6 million and common share dividends in the amount of $202 million were declared.

### Dividend Reinvestment Plan

On February 11, 2016, Hydro One's Board of Directors approved the creation of a Dividend Reinvestment Plan which the Company currently intends to put in place in March 2016. The Dividend Reinvestment Plan will enable eligible shareholders to have their regular quarterly cash dividends automatically reinvested in additional Hydro One common shares acquired on the open market.

### Great Lakes Power Transmission Purchase Agreement

On January 28, 2016, Hydro One reached an agreement to acquire from Brookfield Infrastructure various entities that own and control Great Lakes Power Transmission LP, an Ontario regulated electricity transmission business operating along the eastern shore of Lake Superior, north and east of Sault Ste. Marie, Ontario, for $222 million in cash, subject to customary adjustments, plus the assumption of approximately $151 million in outstanding indebtedness. The acquisition is pending a *Competition Act* approval as well as regulatory approval from the OEB.

# POWERING FORWARD

## 2016 ANNUAL REPORT

ONE OF NORTH AMERICA'S LARGEST ELECTRIC UTILITIES (TSX: H)

**Hydro One Limited is Canada's largest pure-play electric transmission and distribution utility with $25 billion in assets and annual revenues of over $6.5 billion. It transmits and distributes electricity safely and reliably across the Province of Ontario, home to 38 percent of the country's population.**

Hydro One owns and operates a 30,000 circuit km high-voltage transmission network transmitting 98 percent of Ontario s electric capacity, and a 123,000 circuit km lower voltage distribution network serving 75 percent of the geography of the province and more than 1.3 million residential and business customers. Hydro One Limited became a public company coincident with its initial public offering in November 2015, and its common shares are listed on the Toronto Stock Exchange (TSX: H).

## CONTENTS

> **"Hydro One has achieved much over this past year while making significant progress in laying the foundation and building the organizational momentum to deliver increasing value for its customers and shareholders in the years to come."**

# A MESSAGE FROM **THE CHAIR OF THE BOARD**

Dear fellow shareholders,

2016 was Hydro One's first full year as a public company, and its evolution to a more broadly owned and customer-focused organization is well underway. The company has achieved much over this past year, including executing its 2016 financial and operating plans and generating total shareholder return of 19.7% since the November 2015 initial public offering. It has also made significant progress in laying the foundation to deliver increasing value for its customers and shareholders in the years to come.

One of President and Chief Executive Officer Mayo Schmidt's key objectives over the past year was to significantly strengthen the company's senior leadership team, and in that regard we now have new executives heading Hydro One's operations, customer service, legal, and strategy functions. Each of these individuals has brought significant experience and capabilities to Hydro One, and the Board of Directors is very confident that we now have in place the depth and breadth of leadership expertise that will further accelerate the company's evolution.

In April 2016, the Province of Ontario sold an additional 15% of its stake in Hydro One to the public in a very successful secondary offering. This followed the November 2015 initial public offering of the shares of Hydro One, and served to double the public float of the company to 30% of shares outstanding while at the same time measurably increasing the trading volume and liquidity of the shares. This transaction was not dilutive to our existing public shareholders, and was another step by the Province towards its stated goal of reducing its ownership of Hydro One to 40%.

While the Province of Ontario remains a significant shareholder of Hydro One, the autonomy of the company and independence of our Board of Directors is enshrined in a governance agreement between Hydro One and the Province. This governance agreement was executed in advance of last year's initial public offering and has operated as designed to ensure that the company is governed as an independent commercial entity with the Province's role limited to that of a shareholder.

I would like to recognize my fellow Board members for their service over this busy period of change. Our Board is comprised of a diverse and accomplished group of proven leaders, each of whom is very committed to the success of Hydro One and the highest standards of corporate governance. The Board has been highly engaged with Mayo Schmidt and his leadership team in defining the strategy for the organization and charting the path forward over the course of the next few years.

I would also like to acknowledge the hard work and commitment of the more than 5,500 regular employees of Hydro One. This team of dedicated professionals works tirelessly -- often around the clock and in potentially hazardous weather and conditions -- to ensure that electric power is transmitted and distributed safely, reliably and cost-effectively to the millions of citizens of Ontario and the communities in which they live and work.

Thank you for your investment and continued support,

**DAVID F. DENISON, O.C.**
*Chair of the Board*
Hydro One Limited

"We have assembled a team of talented and deeply experienced leaders who are dedicated to transforming Hydro One into a more disciplined, customer-focused and commercially oriented electric transmission and distribution service provider."

# A MESSAGE FROM **THE PRESIDENT AND CEO**

Dear fellow shareholders,

This is a new era at Hydro One. 2016 was a transformative year as we embarked on our journey from good to great. In this first full year as a public company, we undertook a company-wide systematic review of our business. Through this intensive process, we identified a number of initiatives, metrics and targets that will enable us to drive greater efficiency and effectiveness across customer service, operations, procurement, network planning, capital deployment and administration.

Accordingly, we have assembled a team of talented and deeply experienced leaders who are dedicated to transforming Hydro One into a more disciplined, customer-focused and commercially oriented electric transmission and distribution service provider. We are becoming significantly more customer and performance driven by focusing on company-wide accountability, productivity, and efficiency while also engaging more proactively with our communities and First Nations and Métis partners.

Many Ontarians feel the pressure of increases to their electricity bills, so we are doing our part to keep Hydro One's portion of the bill as low as possible. We are also providing customers with meaningful conservation programs so they can take greater control of their consumption and manage their bills. Part of this move involves information technology investments that enable the shift from paper-based systems to increasingly mobile, online and paperless technologies.

Hydro One's employees have embraced our transformational journey to becoming a commercial enterprise, one focused on delivering value for customers and shareholders. This transformation is central to our actions and strategies, and is enshrined in all that we endeavour to achieve. As we move the organization forward and modernize Ontario's electrical grid, I believe that we have multiple opportunities to create increasing value for our customers and shareholders alike.

While we are fortunate to have a strong foundation for growth upon which to build, we are also aware that there are opportunities for us to enhance customer service and improve our execution capabilities across the business. We also appreciate the criticality of accelerating the pace of upgrading Ontario's aging electric power system and the significant infrastructure investment that is needed to build and maintain a strong, modern and reliable grid.

We made important progress this year on the regulatory front, where we now have a plan with a clear line of sight to the imminent transition from a cost of service-based regulatory model to a more dynamic performance-based, customer-focused regulatory model. We are fully engaged and gaining traction on this front in both segments of our regulated business. We expect to complete the transition to a performance-based regulatory framework in our distribution segment in early 2018 and in our transmission segment in early 2019.

In addition to the significant value we intend to create in improving the performance of our substantial existing operations, there is also value to be created in continuing to lead the consolidation of what is still a fragmented system of electric utility assets in Ontario. As such, during 2016 we significantly stepped up the rigour and capabilities around how we acquire and integrate other electric utilities. Our successful integration of the Haldimand and Woodstock municipal utilities is a good indicator of things to come. During the year, we also completed the acquisition of Great Lakes Power Transmission and announced the acquisition of Orillia Power Distribution, two regulated electric utilities in Ontario which further add to our leadership position.

My thanks go out to the thousands of Hydro One employees across Ontario for embracing this transformational journey and their unwavering commitment to our customers. I also extend my appreciation to our Board of Directors for its support and confidence in management.

The future is bright and we will continue to power forward,

Mayo Schmidt

**MAYO SCHMIDT**
*President and Chief Executive Officer*
Hydro One Limited

**IN 2016, HYDRO ONE COMPLETED THE PURCHASE OF GREAT LAKES POWER TRANSMISSION, THE SECOND LARGEST ELECTRICITY TRANSMITTER IN ONTARIO. THIS ACQUISITION INCREASED HYDRO ONE'S TRANSMISSION CAPACITY IN ONTARIO TO 98%, WHILE IMPROVING THE COMPANY'S ABILITY TO CONNECT GENERATORS IN NORTHERN ONTARIO TO ELECTRICITY DEMAND IN SOUTHERN ONTARIO.**

# ELECTRIC TRANSMISSION SEGMENT

The scale of Hydro One's transmission operations increased during 2016 to approximately 30,000 circuit-kilometres of high-voltage lines. Hydro One transmits high-voltage electricity from nuclear, hydroelectric, natural gas, wind and solar generation sources to local distribution companies and to directly connected industrial customers across Ontario.

**Hydro One's transmission assets can be divided into three main categories:**

**Transmission stations**
Used for the delivery of power, voltage transformation and switching, the stations serve as connection points for both customers and generators.

**Transmission lines**
Bulk transmission lines deliver power from generating stations or connections to receiving terminal stations. Area supply lines take power from the network and transmit it to customer supply transmission stations at customer load centres.

**Network operations**
The Ontario Grid Control Centre manages all of Hydro One's transmission and sub-transmission operations.

**During 2016, capital investments in Hydro One's transmission segment totaled $988 million, including expenditures on the following projects:**

### TORONTO MIDTOWN TRANSMISSION REINFORCEMENT PROJECT

In 2016, Hydro One substantially completed work on the $118 million Toronto Midtown Transmission Reinforcement Project which refurbished the existing transmission infrastructure that serves midtown Toronto and areas to the west. This five-year project replaced 14,500 metres of transmission cables and provides 100 megawatts of additional capacity to serve the local distribution company and its customers.

### GUELPH AREA TRANSMISSION REFURBISHMENT PROJECT

Hydro One substantially completed the $87 million Guelph Area Transmission Refurbishment Project that will help meet the electricity needs of the growing southwestern Ontario region. The project included upgrading a five-kilometre section of existing transmission lines, and installing new transformer and switching equipment at the transformer station. More than 340 construction professionals were involved in the construction phase of the project.

### COLLABORATION WITH LONDON HYDRO

Hydro One entered into a collaborative investment with London Hydro to modernize the equipment in Hydro One's Nelson Transformer Station. Hydro One identified a need to replace aging equipment and London Hydro contributed financially for a voltage conversion of the station to be consistent with the other six local transformer stations, allowing the entire London Hydro system to be interconnected. The project will also increase the reliability of supply to an important station that serves much of downtown London.

These projects together with many others underway ensure that Ontarians continue to receive a safe, reliable supply of electricity now, and for years to come.

**HYDRO ONE'S 5,500 SKILLED AND DEDICATED EMPLOYEES SERVE 1.3 MILLION VALUED RESIDENTIAL AND BUSINESS CUSTOMERS ACROSS ONTARIO. HYDRO ONE IS THE PROVINCE'S LARGEST LOCAL ELECTRIC POWER DISTRIBUTION COMPANY WITH APPROXIMATELY 123,000 CIRCUIT KILOMETRES OF POWER LINES.**

# ELECTRIC DISTRIBUTION SEGMENT

Operating in rural, suburban and urban communities spread across the province of Ontario, home to 38 percent of the population of Canada, Hydro One possesses significant economies of scale and brings to bear a strong commitment to ensuring a modern and reliable local electricity system for its 1.3 million customers. This commitment also includes serving customers in 21 remote communities spread across the far reaches of northern Ontario that are not connected to the electricity transmission grid.

### CUSTOMER CONSULTATION

In mid-2016, Hydro One announced a province-wide consultation process to seek input from its customers on the development of a five-year rate plan that will help shape future investments in Hydro One's electric distribution system. The goal of the consultation was to better understand how Hydro One's customers' needs are being met by the current system, and the types of reliability and service improvements customers would value most. This included addressing aging electricity infrastructure, system repairs and responding to power outages, power quality and costs, as well as new products, services and web-enabled tools to make it easier for customers to do business with Hydro One.

The feedback influenced detailed plans that the company will submit to the Ontario Energy Board, who will ultimately determine the investments and rate plans for Hydro One's local distribution segment for the 2018 through 2022 period.

### ACQUISITION OF ORILLIA POWER

In August 2016, Hydro One announced that it reached a definitive agreement to acquire Orillia Power Distribution Corporation in a transaction valued at over $41 million. Hydro One will integrate into its operations approximately 14,000 customers located in Simcoe County, home to a population of more than 30,000 and part of the Huronia region of Central Ontario.

Hydro One's current service territory includes the areas surrounding the City of Orillia and this acquisition enables Hydro One to realize operational synergies over time. After closing, Hydro One also intends to construct several grid control and operating facilities in Orillia. The acquisition is conditional upon the satisfaction of customary closing conditions and approval of the Ontario Energy Board.

### SERVING MANITOULIN ISLAND

In October 2016, Hydro One announced that a new distribution station will be built to serve customers on Manitoulin Island, located in northern Ontario on Lake Huron. The new distribution station will replace the Little Current Distribution Station, which was originally built in 1950, and will help improve reliability and increase capacity for the approximately 10,000 customers who live on Manitoulin Island.

# SERVING
# CUSTOMERS & COMMUNITIES

| | | |
|---|---|---|
| CUSTOMER SERVICE | RELIABILITY | SAFETY |
| FIRST NATIONS PARTNERSHIPS | SUSTAINABILITY | DIVERSITY |

Throughout 2016, Hydro One's skilled and dedicated employees responded 24 hours a day, seven days a week to quickly and safely restore power for customers through often extremely challenging weather, terrain and circumstances. Hydro One also continued to provide new and enhanced programs and services to further define the company's commitment to customer service and energy conservation.

## PROACTIVE OUTAGE ALERTS

In early 2016, Hydro One was the first utility in Canada to offer customers proactive outage alerts. Customers who register for this service receive personalized email or text alerts about outages that may affect their homes, cottages, farms or small businesses, as well as information on estimated times of restoration. Since launching the program, Hydro One has sent hundreds of thousands of proactive alerts to customers. This service is an extension of Hydro One's existing suite of outage communication tools, which includes online outage maps and smartphone apps.

## GET LOCAL IN FIRST NATIONS COMMUNITIES

Hydro One began to offer a new service model in First Nations and Métis communities which focuses on local, face-to-face interactions to ensure customers are informed of and have access to all of the conservation and assistance programs the company offers. Meeting with Chiefs and Councils, representatives from Hydro One's Customer Service team visit communities throughout the province and conduct information-sharing sessions with customers.

*For further information on Hydro One's commitments to customers go to*
▶ HydroOne.com/Commitments

## FARM RAPID RESPONSE TEAM

Hydro One announced the launch of its Farm Rapid Response Team that assists the company's 13,000 farming customers to identify, assess and mitigate on-farm electrical issues. This new approach better serves the needs of Hydro One's farming customers and was developed in partnership with the Ontario Federation of Agriculture. This streamlined process also provides Hydro One's farming customers a single, specialized point of contact to better assist with their specific on-farm concerns.

## PAPERLESS BILLING AND HIGH USAGE ALERTS

In late 2016, Hydro One launched paperless billing notifications and high usage alerts to provide customers with more visibility and control over their accounts and energy use. With billing notifications, customers sign up to receive paperless billing together with personalized insights and program promotions, which also provide a new online self-service channel for customers as an alternative to contacting the call centre. With high usage alerts, customers receive emails or text messages if their usage during a billing period is trending higher than a predefined threshold. Customers also receive guidance on how they can adjust their energy use before the end of the billing period. Through the enhanced web portal, customers can also easily find more information about their energy use, as well as explore a wide range of energy tips and conservation programs provided by Hydro One.

## COMMUNITY INVESTMENT

Throughout 2016, Hydro One committed millions of dollars in donations and sponsorships to communities it serves across Ontario. The contributions supported community projects such as the Markstay outdoor ice rink roof-building project for the local municipality, benefiting the community's local youth. Other community initiatives include the company's partnership with Right to Play's Promoting Life-Skills in Aboriginal Youth program, a non-profit organization that aims to deliver safe, fun and educational programming to Aboriginal youth.

# TRANSMITTING AND DELIVERING SOME OF THE CLEANEST ELECTRIC POWER IN NORTH AMERICA

**AS A STEWARD OF THE GRID, HYDRO ONE IS FOCUSED ON TRANSMITTING AND DELIVERING SAFE, CLEAN AND SUSTAINABLE ENERGY. THIS YEAR THE COMPANY PRODUCED ITS FIRST CORPORATE SOCIAL RESPONSIBILITY REPORT, ONE WHICH ADHERES TO THE GUIDELINES FOR THE G4 GLOBAL REPORTING INITIATIVE AND IS PART OF A CONTINUED EFFORT BY THE COMPANY TO ENHANCE THE TRANSPARENCY, ACCOUNTABILITY AND LINE OF SIGHT TO ITS SUSTAINABLE OPERATIONS.**

## ENVIRONMENTAL SUSTAINABILITY

### HEBER DOWN CONSERVATION AREA

Hydro One's Forestry team partnered with the Central Lake Ontario Conservation Authority and neighbouring utilities to mitigate the spread of Phragmites, an invasive species, on 3,500 square metres of a right-of-way corridor in the Heber Down Conservation Area. Challenging and costly to remove, such invasive species threaten lakes, rivers and forests. Together with a local contractor and using a variety of control methods based on location, density and surrounding vegetation of each area, the company began work on eliminating the invasive species from its right-of-way. With thousands of kilometres of transmission line corridors crossing the province, the company has taken a leadership role in engaging with local stakeholders, taking a proactive approach to land management and pooling community resources to manage the spread of invasive species.

### VEGETATION MANAGEMENT

To ensure the continued safe operation of Hydro One's transmission and distribution lines, the company conducts province-wide vegetation management operations to maintain reliability across the system. As part of the company's ongoing commitment to local communities, Hydro One has consulted with conservation authorities and is working with local seed distributors to develop and test pollinator-friendly seed mixes. Pollinators include various forms of bees, wasps, ants, flies, moths, beetles, bats and birds. These species feed on nectar and pollen from plants and their populations in Ontario are generally in decline due to habitat loss, disease, pesticide use and climate change. To mitigate this, Hydro One is working to incorporate pollinator-friendly seed as part of its vegetation management work in appropriate areas as an alternative to grass seed. Locally, this work supports provincial initiatives like the Pollinator Health Action Plan developed by the Ontario Ministry of Agriculture, Food and Rural Affairs.

### CORPORATE KNIGHT'S BEST 50 CORPORATE CITIZENS

Hydro One was ranked as the top utility in the 15th annual ranking of the 2015 Corporate Knights Canada's Best 50 Corporate Citizens. The Best 50 Corporate Citizens in Canada ranking assesses a broad range of Canadian enterprises on a set of 12 sustainability metrics, including carbon, water and waste productivity, percent of taxes paid, leadership gender diversity, innovation, health and safety performance, and pension fund quality. Being recognized as one of Canada's Best 50 Corporate Citizens is a testament to Hydro One's core values and demonstrates that the company continues to develop a strong culture of sustainability and corporate responsibility. Customers, investors and citizens of Ontario should expect that Hydro One will power forward in its responsible leadership on Corporate Citizenship in Canada.

Hydro One and its independent Board of Directors recognize the importance of corporate governance to the effective management of the company. Independence, integrity and accountability are the foundation of the company's approach to corporate governance. It is in the long-term best interests of shareholders as well as customers and promotes and strengthens relationships with employees, the communities in which the company operates and other stakeholders of the company. The Board of Directors is firmly supported in these commitments by a governance agreement between Hydro One and the Province of Ontario, which was executed in advance of the November 2015 initial public offering of the company and assures that the Province's role is limited to that of a shareholder and not a manager of the business.

Hydro One's Board of Directors is composed of a diverse and accomplished group of independent, proven business leaders with deep corporate governance experience. The Board's primary role is overseeing corporate performance and the quality, depth and continuity of management required to meet the company's strategic objectives. Hydro One is committed to best practices of corporate governance, and regularly reviews the company's governance practices in response to changing governance expectations and regulations. The Company's practices are fully aligned with the rules and regulations issued by Canadian Securities Administrators and the Toronto Stock Exchange, including national corporate governance guidelines and related disclosure requirements.

# TEN REASONS TO INVEST IN HYDRO ONE

1

One of the largest pure play electric utilities in North America, with significant scale and a leadership position in Canada's most populated province

2

Unique combination of electric transmission and local distribution, with no material exposure to commodity prices

3

Business is 99 percent regulated and operates in a stable, transparent and collaborative rate-regulated environment

4

Consistent rate base growth expected under multi-year capital investment program to upgrade aging electric power system infrastructure

5

Strong governance structure and a fully independent Board allow company to operate autonomously, transform its culture and drive shareholder value creation on multiple fronts

6

Timing of operational transformation coincident with transition to Ontario's incentive based regulatory framework expected to create value for both customers and shareholders

7

Proven management team with demonstrated experience in transforming organizations, accelerating performance and creating significant shareholder value

8

Attractive dividend yield with 70 – 80 percent target payout ratio and opportunity for growth with rate base expansion, efficiency realization and continued consolidation

9

Strong 'A'-rated investment grade balance sheet with one of the highest-quality credit profiles in the North American utility sector

10

**A unique opportunity to participate in the transformation of a premium, large-scale utility**

hydro One

# 2016 FINANCIAL REPORT

# Management's Discussion and Analysis

*For the years ended December 31, 2016 and 2015*

The following Management's Discussion and Analysis (MD&A) of the financial condition and results of operations should be read together with the consolidated financial statements and accompanying notes (the Consolidated Financial Statements) of Hydro One Limited (Hydro One or the Company) for the year ended December 31, 2016. The Consolidated Financial Statements are presented in Canadian dollars and have been prepared in accordance with United States (US) Generally Accepted Accounting Principles (GAAP). All financial information in this MD&A is presented in Canadian dollars, unless otherwise indicated.

The Company has prepared this MD&A in accordance with National Instrument 51-102 – Continuous Disclosure Obligations of the Canadian Securities Administrators. This MD&A provides information for the year ended December 31, 2016, based on information available to management as of February 9, 2017.

The comparative information consists of the results of Hydro One Inc. up to October 31, 2015, and the consolidated results of Hydro One and Hydro One Inc. from November 1, 2015 to December 31, 2015. See further details in section "Other Developments – Change in Hydro One Ownership Structure".

## Consolidated Financial Highlights And Statistics

| *Year ended December 31*<br>*(millions of dollars, except as otherwise noted)* | 2016 | 2015 | Change |
|---|---|---|---|
| Revenues | 6,552 | 6,538 | 0.2% |
| Purchased power | 3,427 | 3,450 | (0.7%) |
| Revenues, net of purchased power | 3,125 | 3,088 | 1.2% |

| Assets placed in-service | 1,605 | 1,476 | 8.7% |
| Transmission: Average monthly Ontario 60-minute peak demand *(MW)* | 20,690 | 20,344 | 1.7% |
| Distribution: Electricity distributed to Hydro One customers *(GWh)* | 26,289 | 28,764 | (8.6%) |

| *December 31* | 2016 | 2015 |
|---|---|---|
| Debt to capitalization ratio[2] | 52.6% | 50.7% |

[1] See section "Non-GAAP Measures" for description and reconciliation of Adjusted EPS, adjusted net cash from operating activities, FFO and Adjusted FFO.

[2] Debt to capitalization ratio has been calculated as total debt (includes total long-term debt and short-term borrowings, net of cash and cash equivalents) divided by total debt plus total shareholders' equity, including preferred shares but excluding any amounts related to noncontrolling interest.

## Overview

Hydro One is the largest electricity transmission and distribution company in Ontario. Through its wholly owned subsidiary, Hydro One Inc., Hydro One owns and operates substantially all of Ontario's electricity transmission network, and an approximately 123,000 circuit km low-voltage distribution network. Hydro One has three business segments: (i) transmission; (ii) distribution; and (iii) other business.

### Transmission Segment

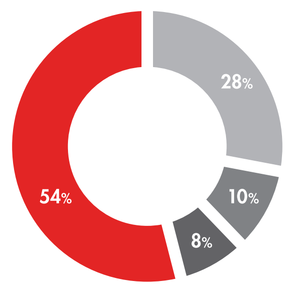
Hydro One's transmission business owns, operates and maintains Hydro One's transmission system, which accounts for approximately 98% of Ontario's transmission capacity based on revenue approved by the Ontario Energy Board (OEB). The Transmission Business consists of the transmission system operated by Hydro One Inc.'s subsidiaries, Hydro One Networks Inc. (Hydro One Networks) and Hydro One Sault Ste. Marie LP (formerly Great Lakes Power Transmission LP (Great Lakes Power)), as well as a 66% interest in B2M Limited Partnership (B2M LP), a limited partnership between Hydro One and the Saugeen Ojibway Nation in respect of the Bruce-to-Milton transmission line. The Company's transmission business is a rate-regulated business that earns revenues mainly from charging transmission rates that are approved by the OEB. The transmission business represented approximately 51% of the Company's total assets as at December 31, 2016, and approximately 51% of its 2016 revenues, net of purchased power.

| | 2016 | 2015 |
|---|---|---|
| Electricity transmitted[1] *(MWh)* | 136,989,747 | 137,011,780 |
| Transmission lines spanning the province *(circuit-kilometres)* | 30,259 | 29,355 |
| Rate base *(millions of dollars)* | 10,775 | 10,175 |
| Capital investments *(millions of dollars)* | 988 | 943 |
| Assets placed in-service *(millions of dollars)* | 937 | 696 |

[1] Electricity transmitted represents total electricity transmission in Ontario by all transmitters.

### Distribution Segment

Hydro One's distribution business is the largest in Ontario and consists of the distribution system operated by Hydro One Inc.'s subsidiaries Hydro One Networks and Hydro One Remote Communities Inc. The Company's distribution business is a rate-regulated business that earns revenues mainly by charging distribution rates that are approved by the OEB. The distribution business represented approximately 37% of the Company's total assets as at December 31, 2016, and approximately 47% of its 2016 revenues, net of purchased power.



| | 2016 | 2015 |
|---|---|---|
| Electricity distributed to Hydro One customers *(GWh)* | 26,289 | 28,764 |
| Electricity distributed through Hydro One lines *(GWh)*[1] | 37,394 | 40,721 |
| Distribution lines spanning the province *(circuit-kilometres)* | 122,599 | 123,425 |
| Distribution customers *(number of customers)* | 1,355,302 | 1,347,231 |
| Rate base *(millions of dollars)* | 7,056 | 6,739 |
| Capital investments *(millions of dollars)* | 703 | 711 |
| Assets placed in-service *(millions of dollars)* | 662 | 775 |

[1] Units distributed through Hydro One lines represent total distribution system requirements and include electricity distributed to consumers who purchased power directly from the Independent Electricity System Operator (IESO).

### Other Business Segment

Hydro One's other business segment consists of the Company's telecommunications business and certain corporate activities. The telecommunications business provides telecommunications support for the Company's transmission and distribution businesses, and also offers communications and IT solutions to organizations with broadband network requirements utilizing Hydro One Telecom Inc.'s (Hydro One Telecom) fibre optic network to provide diverse, secure and highly reliable broadband connectivity. Hydro One's other business segment is not rate-regulated. This segment represented approximately 12% of Hydro One's total assets as at December 31, 2016, and approximately 2% of its 2016 revenues, net of purchased power.

# Primary Factors Affecting Results Of Operations

## Transmission Revenues

Transmission revenues primarily consist of the Company's transmission rates approved by the OEB which are charged based on the monthly peak electricity demand across Hydro One's high-voltage network. Transmission rates are designed to generate revenues necessary to construct, upgrade, extend and support a transmission system with sufficient capacity to accommodate maximum forecasted demand and a regulated return on the Company's investment. Peak electricity demand is primarily influenced by weather and economic conditions. Transmission revenues also include export revenues associated with transmitting electricity to markets outside of Ontario. Ancillary revenues include revenues from providing maintenance services to power generators and from third-party land use.

## Distribution Revenues

Distribution revenues include the distribution rates approved by the OEB and amounts to recover the cost of purchased power used by the customers of the distribution business. Distribution rates are designed to generate revenues necessary to construct and support the local distribution system with sufficient capacity to accommodate existing and new customer demand and a regulated return on the Company's investment. Accordingly, distribution revenues are influenced by distribution rates, the cost of purchased power, and the amount of electricity the Company distributes. Distribution revenues also include ancillary distribution service revenues, such as fees related to the joint use of Hydro One's distribution poles by the telecommunications and cable television industries, as well as miscellaneous revenues such as charges for late payments.

## Purchased Power Costs

Purchased power costs are incurred by the distribution business and represent the cost of the electricity purchased by the Company for delivery to customers within Hydro One's distribution service territory. These costs comprise the wholesale commodity cost of energy, in addition to wholesale market service and transmission charges levied by the IESO. Hydro One passes the cost of electricity that it delivers to its customers, and is therefore not exposed to wholesale electricity commodity price risk.

## Operation, Maintenance and Administration Costs

Operation, maintenance and administration (OM&A) costs are incurred to support the operation and maintenance of the transmission and distribution systems, and other costs such as property taxes related to transmission and distribution lines, stations and buildings. Transmission OM&A costs are incurred to sustain the Company's high-voltage transmission stations, lines and rights-of-way, and include preventive and corrective maintenance costs related to power equipment, overhead transmission lines, transmission station sites, and forestry control to maintain safe distance between line spans and trees. Distribution OM&A costs are required to maintain the Company's low-voltage distribution system, and include costs related to distribution line clearing and forestry control to reduce power outages caused by trees, line maintenance and repair, as well as land assessment and remediation. Hydro One manages its costs through ongoing efficiency and productivity initiatives, while continuing to complete planned work programs associated with the development and maintenance of its transmission and distribution networks.

## Depreciation and Amortization

Depreciation and amortization costs relate primarily to depreciation of the Company's property, plant and equipment, and amortization of certain intangible assets and regulatory assets. Depreciation and amortization also includes the costs incurred to remove property, plant and equipment where no asset retirement obligations have been recorded on the balance sheet.

## Financing Charges

Financing charges relate to the Company's financing activities, and include interest expense on the Company's long-term debt and short-term borrowings, gains and losses on interest rate swap agreements, net of interest earned on short-term investments. A portion of financing charges incurred by the Company is capitalized to the cost of property, plant and equipment associated with the periods during which such assets are under construction before being placed in-service.

## Income Taxes

Hydro One and its subsidiaries were exempt from regular Canadian federal and Ontario income tax (Federal Tax Regime) and instead paid an equivalent amount referred to as payments in lieu of corporate income taxes (PILs) to the Ontario Electricity Financial Corporation (OEFC) under the *Electricity Act* (PILs Regime) until October 2015. Since then, Hydro One and its subsidiaries have been subject to the Federal Tax Regime.

# Results of Operations

## Net Income

Net income attributable to common shareholders for the year ended December 31, 2016 was $721 million, an increase of 4.5% from the prior year. Earnings were positively affected by lower OM&A and higher revenues net of purchased power. These positive effects were partly offset by non-recurring items related to the Company's IPO in 2015, namely an increase in the effective tax rate primarily driven by IPO-related tax benefit of $19 million recorded in 2015 and divestiture of Hydro One Brampton Inc. (Hydro One Brampton) in 2015. Excluding these IPO-related effects, net income increased by 10.9%.

## Basic EPS and Adjusted Basic EPS

Basic EPS was $1.21 in 2016 (2015 – $1.39). Basic EPS is significantly affected by the weighted average number of shares in issue being different from last year due to the effects of the IPO, and is the most significant reason for the lower EPS compared to last year.

Adjusted Basic EPS, which adjusts for the inconsistent number of shares in issue, was $1.21 in 2016 (2015 – $1.16), driven by increased net income compared to last year. See section "Non-GAAP Measures" for description of Adjusted EPS.

## Revenues

| *Year ended December 31*<br>*(millions of dollars, except as otherwise noted)* | 2016 | 2015 | Change |
|---|---|---|---|
| Transmission | **1,584** | 1,536 | 3.1% |
| Distribution | **4,915** | 4,949 | (0.7%) |
| Other | **53** | 53 | – |
| | **6,552** | 6,538 | 0.2% |
| Transmission volumes: Average monthly Ontario 60-minute peak demand *(MW)* | **20,690** | 20,344 | 1.7% |
| Distribution volumes: Electricity distributed to Hydro One customers *(GWh)* | **26,289** | 28,764 | (8.6%) |

### Transmission Revenues

Transmission revenues increased by 3.1% in 2016 primarily due to the following:

- prior year revenues were affected by a regulatory driven reduction of $28 million related to differences between actual and forecast province-wide conservation and demand management savings during 2014, which did not recur in 2016;
- higher average monthly Ontario 60-minute peak demand mainly due to warmer weather in the second and third quarters of 2016, as well as the impact of several extremely cold days that more than offset the overall milder weather in the fourth quarter of 2016; and
- increased OEB-approved transmission rates for 2016.

### Distribution Revenues

Distribution revenues decreased by 0.7% in 2016 primarily due to the following:

- the divestiture of Hydro One Brampton in August 2015, which also caused the majority of the decrease in distribution volumes; and
- lower overall energy consumption resulting from milder weather in the first and fourth quarters of 2016; partially offset by
- higher power costs from generators that are passed on to customers, excluding the impact of divestiture of Hydro One Brampton;
- increased OEB-approved distribution rates for 2016; and
- increased revenues due to a rate order related to shared-use revenue.

## Operation, Maintenance and Administration Costs

| *Year ended December 31*<br>*(millions of dollars)* | 2016 | 2015 | Change |
|---|---|---|---|
| Transmission | **382** | 414 | (7.7%) |
| Distribution | **608** | 633 | (3.9%) |
| Other | **79** | 88 | (10.2%) |
| | **1,069** | 1,135 | (5.8%) |

## Transmission OM&A Costs

Transmission OM&A decreased by 7.7% in 2016 primarily due to lower project cost and inventory write-downs coupled with lower activity related to transformer equipment refurbishments and stations maintenance.

## Distribution OM&A Costs

Distribution OM&A decreased by 3.9% in 2016 primarily due to the following:

- decrease in bad debt expense including the impact of revised estimates of uncollectible accounts;
- the divestiture of Hydro One Brampton in August 2015;
- lower support services costs; and
- lower costs associated with underground distribution cable locates; partially offset by
- higher volume of vegetation management activities.

## Other OM&A Costs

Other OM&A decreased by 10.2% in 2016 primarily due to lower costs relating to the integration of acquired local distribution companies and lower consulting costs.

## Depreciation and Amortization

The increase of $19 million or 2.5% in depreciation and amortization costs for 2016 was mainly due to the growth in capital assets as the Company continues to place new assets in-service, consistent with its ongoing capital investment program.

## Financing Charges

The increase of $17 million or 4.5% in financing charges for 2016 was mainly due to the following:

- an increase in interest expense on long-term debt mainly due to the increase in weighted average long-term debt balance outstanding during the year, partially offset by a decrease in the weighted average interest rate for long-term debt; and
- an increase in interest expense on short-term notes mainly due to the increase in weighted average short-term notes balance outstanding during the year, as well as an increase in the weighted average interest rate for short-term notes.

## Income Tax Expense

Income tax expense in 2016 increased by $34 million compared to 2015, and the Company realized an effective tax rate of approximately 15.7% in 2016, compared to approximately 12.8% realized in 2015. The increase in the tax expense is primarily due to the effect of an IPO-related positive tax adjustment of $19 million in 2015, coupled with higher income before taxes in 2016.

# Common Share Dividends

In 2016, the Company declared and paid cash dividends to common shareholders as follows:

| Date Declared | Record Date | Payment Date | Amount per Share | Total Amount *(millions of dollars)* |
|---|---|---|---|---|
| February 11, 2016 | March 17, 2016 | March 31, 2016 | $0.34[1] | 202 |
| May 5, 2016 | June 14, 2016 | June 30, 2016 | $0.21 | 125 |
| August 11, 2016 | September 14, 2016 | September 30, 2016 | $0.21 | 125 |
| November 10, 2016 | December 14, 2016 | December 30, 2016 | $0.21 | 125 |
| | | | | *577* |

[1] This was the first common share dividend declared by the Company following the completion of its initial public offering in November 2015. The $0.34 per share dividend included $0.13 for the post-IPO period from November 5 to December 31, 2015, and $0.21 for the quarter ended March 31, 2016.

Following the conclusion of the fourth quarter of 2016, the Company declared a cash dividend to common shareholders as follows:

| Date Declared | Record Date | Payment Date | Amount per Share | Total Amount *(millions of dollars)* |
|---|---|---|---|---|
| February 9, 2017 | March 14, 2016 | March 31, 2017 | $0.21 | 125 |

## Divestiture of Hydro One Brampton

On August 31, 2015, a dividend was paid to the Province of Ontario (Province) by transferring to a company wholly owned by the Province all of the issued and outstanding shares of Hydro One Brampton and inter-company indebtedness owed to Hydro One Inc. by Hydro One Brampton. Hydro One's 2015 consolidated results of operations include the results of Hydro One Brampton up to August 31, 2015. The following tables present quarterly results of Hydro One Brampton that were included in consolidated results of Hydro One for the year ended December 31, 2015.

| *Quarter ended (millions of dollars)* | Mar. 31, 2015 | Jun. 30, 2015 | Sept. 30, 2015 | Dec. 31, 2015 | 2015 Total |
|---|---|---|---|---|---|
| Revenues | 125 | 129 | 100 | – | 354 |
| Purchased power | 107 | 111 | 88 | – | 306 |
| OM&A | 6 | 6 | 4 | – | 16 |
| Depreciation and amortization | 5 | 4 | 2 | – | 11 |
| Income tax expense | – | 1 | (1) | – | – |
| Net income | 7 | 7 | 7 | – | 21 |
| Capital investments | 9 | 11 | 8 | – | 28 |

## Selected Annual Financial Statistics

| *Year ended December 31 (millions of dollars, except per share amounts)* | **2016** | 2015 | 2014 |
|---|---|---|---|
| Total revenue | **6,552** | 6,538 | 6,548 |
| Net income attributable to common shareholders | **721** | 690 | 731 |
| Basic and diluted EPS | **$ 1.21** | $ 1.39 | $ 1.53 |
| Basic and diluted Adjusted EPS | **$ 1.21** | $ 1.16 | $ 1.23 |
| Dividends per common share declared | **$ 0.97**[1] | $ 1.83 | $ 0.56 |
| Dividends per preferred share declared | **$ 1.12** | $ 1.03 | $ 1.38 |

[1] The $0.97 per share dividends declared in 2016 included $0.13 for the post-IPO period from November 5 to December 31, 2015, and $0.84 for the year ended December 31, 2016.

| *December 31 (millions of dollars)* | **2016** | 2015 | 2014 |
|---|---|---|---|
| Total assets | **25,351** | 24,294 | 22,550 |
| Total non-current financial liabilities | **10,078** | 8,207 | 8,373 |

## Quarterly Results of Operations

| *Quarter ended (millions of dollars, except EPS)* | **Dec. 31, 2016** | **Sep. 30, 2016** | **Jun. 30, 2016** | **Mar. 31, 2016** | Dec. 31, 2015 | Sep. 30, 2015 | Jun. 30, 2015 | Mar. 31, 2015 |
|---|---|---|---|---|---|---|---|---|
| Revenues | **1,614** | **1,706** | **1,546** | **1,686** | 1,522 | 1,645 | 1,563 | 1,808 |
| Purchased power | **858** | **870** | **803** | **896** | 786 | 856 | 838 | 970 |
| Revenues, net of purchased power | **756** | **836** | **743** | **790** | 736 | 789 | 725 | 838 |
| Net income to common shareholders | **128** | **233** | **152** | **208** | 143 | 188 | 131 | 228 |
| Basic EPS | **$ 0.22** | **$ 0.39** | **$ 0.26** | **$ 0.35** | $ 0.26 | $ 0.39 | $ 0.27 | $ 0.47 |
| Diluted EPS | **$ 0.21** | **$ 0.39** | **$ 0.25** | **$ 0.35** | $ 0.26 | $ 0.39 | $ 0.27 | $ 0.47 |
| Basic Adjusted EPS | **$ 0.22** | **$ 0.39** | **$ 0.26** | **$ 0.35** | $ 0.24 | $ 0.32 | $ 0.22 | $ 0.38 |
| Diluted Adjusted EPS | **$ 0.21** | **$ 0.39** | **$ 0.25** | **$ 0.35** | $ 0.24 | $ 0.32 | $ 0.22 | $ 0.38 |

Variations in revenues and net income over the quarters are primarily due to the impact of seasonal weather conditions on customer demand and market pricing.

## Capital Investments

The Company makes capital investments to maintain the safety, reliability and integrity of its transmission and distribution assets and to provide for the ongoing growth and modernization required to meet the expanding and evolving needs of its customers and the electricity market. This is achieved through a combination of sustaining capital investments, which are required to support the continued operation of Hydro One's existing assets, and development capital investments, which involve both additions to existing assets and large scale projects such as new transmission lines and transmission stations.

The following table presents Hydro One's 2016 and 2015 capital investments:

| *Year ended December 31*<br>*(millions of dollars)* | 2016 | 2015 | Change |
|---|---|---|---|
| Transmission | | | |
| Sustaining | **750** | 706 | 6.2% |
| Development | **156** | 166 | (6.0%) |
| Other | **82** | 71 | 15.5% |
| | **988** | 943 | 4.8% |
| Distribution | | | |
| Sustaining | **384** | 398 | (3.5%) |
| Development | **217** | 220 | (1.4%) |
| Other | **102** | 93 | 9.7% |
| | **703** | 711 | (1.1%) |
| Other | **6** | 9 | (33.3%) |
| Total capital investments | **1,697** | 1,663 | 2.0% |

### Transmission Capital Investments

Transmission capital investments increased by $45 million or 4.8% in 2016. Principal impacts on the levels of capital investments included:

- an increased volume of work on overhead line refurbishments and insulator replacements;
- an increased volume of integrated station component replacements to sustain certain aging assets at transmission stations;
- continued work on major local area supply network development projects, such as the Holland Transmission Station, the Hawthorne Transmission Station, and the Toronto Midtown Transmission Reinforcement; and
- increased investments relating to information technology infrastructure and customer programs, enhancement projects, including investments to integrate mobile technology with the Company's existing work management tools; partially offset by
- decreased investments in system enhancement projects, primarily due to completion of certain projects and a difference in timing of work on other projects; and
- completion of the Guelph Area Transmission Refurbishment project.

### Distribution Capital Investments

Distribution capital investments decreased by $8 million or 1.1% in 2016. Principal impacts on the levels of capital investments included:

- reduced capital expenditures due to the divestiture of Hydro One Brampton in 2015; and
- a lower volume of work within station refurbishment programs and lower volume of spare transformer purchases; partially offset by
- increased investments related to information technology infrastructure and customer programs together with upgrade and enhancement projects, including investments to integrate mobile technology with the Company's existing work management tools; and
- investments in smart grid technology to mitigate power quality impacts of distributed generation and to improve outage response times.

## Major Transmission Capital Investment Projects

The following table summarizes the status of significant transmission projects as at December 31, 2016:

| Project Name | Location | Type | Anticipated In-Service Date | Estimated Cost | Capital Cost To-Date |
|---|---|---|---|---|---|
| **Development Projects:** | | | | | |
| Guelph Area Transmission Refurbishment | Guelph area Southwestern Ontario | Transmission line upgrade | September 2016[1] | $87 million | $86 million |
| Toronto Midtown Transmission Reinforcement | Toronto Southwestern Ontario | New transmission line | December 2016[2] | $118 million | $113 million |
| Supply to Essex County Transmission Reinforcement | Windsor-Essex area Southwestern Ontario | New transmission line and station | 2018 | $73 million | $13 million |
| Clarington Transmission Station | Oshawa area Southwestern Ontario | New transmission station | 2018 | $267 million | $192 million |
| Northwest Bulk Transmission Line | Thunder Bay Northwestern Ontario | New transmission line | To be determined | To be determined | – |
| East-West Tie Station Expansion | Northern Ontario | Station expansion | 2020 | $166 million | – |
| **Sustainment Projects:** | | | | | |
| Bruce A Transmission Station | Tiverton Southwestern Ontario | Station sustainment | 2019 | $109 million | $83 million |
| Richview Transmission Station Circuit Breaker Replacement | Toronto Southwestern Ontario | Station sustainment | 2019 | $102 million | $68 million |
| Lennox Transmission Station Circuit Breaker Replacement | Napanee Southeastern Ontario | Station sustainment | 2020 | $95 million | $15 million |
| Beck #2 Transmission Station Circuit Breaker Replacement | Niagara area Southwestern Ontario | Station sustainment | 2021 | $93 million | $28 million |

[1] Major portions of the project were completed and placed in-service in September 2016. Work on certain minor portions of the project continues in the first quarter of 2017.

[2] Major portions of the project were completed and placed in-service in December 2016. Work on certain minor portions of the project continues in the first quarter of 2017.

## Future Capital Investments

Following is a summary of estimated capital investments by Hydro One over the next five years. The Company's estimates are based on management's expectations of the amount of capital expenditures that will be required to provide transmission and distribution services that are efficient, reliable, and provide value for customers, consistent with the OEB's Renewed Regulatory Framework. These estimates differ from the prior year disclosures, reflecting annual increases of $126 million for 2017, $113 million for 2018, $239 million for 2019, and $360 million for 2020. These future capital investments reflect management's best estimates and, as applicable, projections included in rate filings currently in process. These projections and the timing of expenditures are in large part subject to approval by the OEB, and will be adjusted going forward as appropriate to reflect rate decisions by the OEB.

The following table summarizes Hydro One's annual projected capital investments for 2017 to 2021, by business segment:

| *(millions of dollars)* | 2017 | 2018 | 2019 | 2020 | 2021 |
|---|---|---|---|---|---|
| Transmission | 1,086 | 1,132 | 1,217 | 1,278 | 1,486 |
| Distribution | 648 | 647 | 771 | 735 | 749 |
| Other | 12 | 9 | 8 | 6 | 8 |
| **Total capital investments** | **1,746** | **1,788** | **1,996** | **2,019** | **2,243** |

The following table summarizes Hydro One's annual projected capital investments for 2017 to 2021, by category:

| *(millions of dollars)* | 2017 | 2018 | 2019 | 2020 | 2021 |
|---|---|---|---|---|---|
| Sustaining | 1,107 | 1,165 | 1,219 | 1,327 | 1,546 |
| Development | 414 | 400 | 484 | 487 | 490 |
| Other[1] | 225 | 223 | 293 | 205 | 207 |
| **Total capital investments** | **1,746** | **1,788** | **1,996** | **2,019** | **2,243** |

[1] "Other" capital expenditures consist of special projects, such as those relating to information technology.

## Summary Of Sources And Uses Of Cash

Hydro One's primary sources of cash flows are funds generated from operations, capital market debt issuances and bank credit facilities that are used to satisfy Hydro One's capital resource requirements, including the Company's capital expenditures, servicing and repayment of debt, and dividend payments.

| *Year ended December 31*<br>*(millions of dollars)* | **2016** | 2015 |
|---|---|---|
| Cash provided by (used in) operating activities | **1,656** | (1,248) |
| Cash provided by financing activities | **161** | 2,954 |
| Cash used in investing activities | **(1,861)** | (1,712) |
| **Decrease in cash and cash equivalents** | **(44)** | (6) |

### Primary factors behind the increase in cash provided by operating activities

The increase in cash provided by operating activities is primarily due to a deferred tax recovery of $2.8 billion recorded in 2015 that resulted as a consequence of leaving the PILs Regime and entering the Federal Tax Regime.

### Primary factors behind the decrease in cash provided by financing activities

Sources of cash

- The Company received $2.3 billion proceeds from issuance of long-term debt in 2016, compared to $350 million received last year.
- The Company received $3,031 million proceeds from issuance of short-term notes in 2016, compared to $2,891 million received last year.
- In 2015, the Company received $2.6 billion proceeds from common shares issued to the Province prior to the completion of the initial public offering (IPO).

Uses of cash

- Dividends paid in 2016 were $596 million, consisting of $577 million common share dividends and $19 million preferred share dividends, compared to $888 million paid in 2015. 2015 dividends consisted of $75 million common share dividends, $13 million preferred share dividends, as well as an $800 million special dividend paid to the Province prior to the completion of the IPO.
- The Company repaid $4,053 million of short-term notes, compared to $1,400 million repaid last year.
- The Company repaid $502 million of long-term debt in 2016 compared to $585 million repaid last year.

### Primary factors behind the increase in cash used in investing activities

Uses of cash

- Capital expenditures were $29 million higher in 2016, primarily due to increased transmission capital investments consistent with the Company's ongoing capital investment program.
- In 2016, the Company paid $226 million to acquire Great Lakes Power, compared to a total of $90 million paid in 2015 to acquire Haldimand County Utilities Inc. (Haldimand Hydro) and Woodstock Hydro Holdings Inc. (Woodstock Hydro).
- In August 2015, an investment of $53 million was made in Hydro One Brampton prior to its divestiture to the Province.

## Liquidity and Financing Strategy

Short-term liquidity is provided through funds from operations, Hydro One Inc.'s commercial paper program, and the Company's consolidated bank credit facilities. Under the commercial paper program, Hydro One Inc. is authorized to issue up to $1.5 billion in short-term notes with a term to maturity of up to 365 days. At December 31, 2016, Hydro One Inc. had $469 million in commercial paper borrowings outstanding, compared to $1,491 million outstanding at December 31, 2015. In addition, the Company and Hydro One Inc. have revolving bank credit facilities totalling $2,550 million maturing in 2021. The Company may use the credit facilities for working capital and general corporate purposes. The short-term liquidity under the commercial paper program, the credit facilities and anticipated levels of funds from operations are expected to be sufficient to fund the Company's normal operating requirements.

At December 31, 2016, the Company's long-term debt in the principal amount of $10,671 million included $10,523 million long-term debt issued under Hydro One Inc.'s Medium Term Note (MTN) Program and long-term debt in the principal amount of $148 million held by Great Lakes Power. At December 31, 2016, the maximum authorized principal amount of notes issuable under the current MTN Program prospectus filed in December 2015 was $3.5 billion, with $1.2 billion remaining available for issuance until January 2018. The long-term debt consists of notes and debentures that mature between 2017 and 2064, and at December 31, 2016, had an average term to maturity of approximately 15.9 years and a weighted average coupon of 4.3%.

On March 30, 2016, Hydro One filed a final universal short form base shelf prospectus (Universal Base Shelf Prospectus) with securities regulatory authorities in Canada. The Universal Base Shelf Prospectus allows Hydro One to offer, from time to time in one or more public offerings, up to $8.0 billion of debt, equity or other securities, or any combination thereof, during the 25-month period ending on April 30, 2018. Hydro One filed the Universal Base Shelf Prospectus in part to facilitate the secondary offerings of outstanding shares of the Company by the Province, and to provide the Company with increased financing flexibility going forward. In 2016, Hydro One completed a secondary offering of a portion of its common shares previously owned by the Province. See section "Other Developments – Change in Hydro One Ownership Structure" for details of this transaction. Upon closing of the transaction, $6,030 million remained available under the Universal Base Shelf Prospectus.

At December 31, 2016, the Company and Hydro One Inc. were in compliance with all financial covenants and limitations associated with the outstanding borrowings and credit facilities.

### Credit Ratings

At December 31, 2016, Hydro One's corporate credit ratings were as follows:

| Rating Agency | Corporate Credit Rating |
|---|---|
| Standard & Poor's Rating Services (S&P) | A |

Hydro One has not obtained a credit rating in respect of any of its securities. An issuer rating from S&P is a forward-looking opinion about an obligor's overall creditworthiness. This opinion focuses on the obligor's capacity and willingness to meet its financial commitments as they come due but it does not apply to any specific financial obligation. An obligor with a long-term credit rating of 'A' has strong capacity to meet its financial commitments but is somewhat more susceptible to the adverse effects of changes in circumstances and economic conditions than obligors in higher-rated categories.

The rating above is not a recommendation to purchase, sell or hold any of Hydro One's securities and does not comment on the market price or suitability of any of the securities for a particular investor. There can be no assurance that the rating will remain in effect for any given period of time or that the rating will not be revised or withdrawn entirely by S&P at any time in the future. Hydro One has made, and anticipates making, payments to S&P pursuant to agreements entered into with S&P in respect of the rating assigned to Hydro One and expects to make payments to S&P in the future to the extent it obtains a rating specific to any of its securities.

At December 31, 2016, Hydro One Inc.'s long-term and short-term debt ratings were as follows:

| Rating Agency | Short-term Debt Rating | Long-term Debt Rating |
|---|---|---|
| DBRS Limited | R-1 (low) | A (high) |
| Moody's Investors Service | Prime-2 | A3 |
| S&P | A-1 | A |

### Effect of Interest Rates

The Company is exposed to fluctuations of interest rates as its regulated return on equity (ROE) is derived using a formulaic approach that takes into account changes in benchmark interest rates for Government of Canada debt and the A-rated utility corporate bond yield spread. See section "Risk Management and Risk Factors – Risks Relating to Hydro One's Business – Market, Financial Instrument and Credit Risk" for more details.

### Pension Plan

In 2016, Hydro One contributed approximately $108 million to its pension plan, compared to contributions of approximately $177 million in 2015, and incurred $116 million in net periodic pension benefit costs, compared to $163 million incurred in 2015.

In June 2016, Hydro One Inc. filed an actuarial valuation of its Pension Plan as at December 31, 2015. Based on this valuation and 2016 levels of pensionable earnings, the 2016 annual employer contributions have decreased by approximately $72 million from $180 million as estimated at December 31, 2015, primarily due to improvements in the funded status of the plan and future actuarial assumptions. The decrease also reflects the impact of changes implemented by management to improve the balance between employee and Company contributions to the Pension Plan. The updated actuarial valuation resulted in a $25 million decrease in 2016 revenue with a corresponding decrease in OM&A costs, as the lower pension contributions will be returned to customers through the pension cost variance deferral account in future rate applications. The Company estimates that total pension contributions for 2017 and 2018 will be approximately $105 million and $102 million, respectively.

The Company's pension benefits obligation is impacted by various assumptions and estimates, such as discount rate, rate of return on plan assets, rate of cost of living increase and mortality assumptions. A full discussion of the significant assumptions and estimates can be found in the section "Critical Accounting Estimates – Employee Future Benefits".

## Other Obligations

### Off-Balance Sheet Arrangements

There are no off-balance sheet arrangements that have, or are reasonably likely to have, a material current or future effect on the Company's financial condition, changes in financial condition, revenues or expenses, results of operations, liquidity, capital expenditures or capital resources.

### Summary of Contractual Obligations and Other Commercial Commitments

The following table presents a summary of Hydro One's debt and other major contractual obligations and commercial commitments:

| *December 31, 2016* *(millions of dollars)* | Total | Less than 1 year | 1-3 years | 3-5 years | More than 5 years |
|---|---|---|---|---|---|
| Contractual obligations *(due by year)* | | | | | |
| Long-term debt – principal repayments | 10,671 | 602 | 1,484 | 1,156 | 7,429 |
| Long-term debt – interest payments | 8,145 | 456 | 827 | 754 | 6,108 |
| Short-term notes payable | 469 | 469 | – | – | – |
| Pension contributions[1] | 207 | 105 | 102 | – | – |
| Environmental and asset retirement obligations | 243 | 27 | 51 | 65 | 100 |
| Outsourcing agreements | 374 | 165 | 196 | 4 | 9 |
| Operating lease commitments | 42 | 11 | 16 | 13 | 2 |
| Long-term software/meter agreement | 73 | 17 | 33 | 18 | 5 |
| Total contractual obligations | 20,224 | 1,852 | 2,709 | 2,010 | 13,653 |
| Other commercial commitments *(by year of expiry)* | | | | | |
| Credit facilities[2] | 2,550 | – | – | 2,550 | – |
| Letters of credit[3] | 174 | 174 | – | – | – |
| Guarantees[4] | 330 | 330 | – | – | – |
| Total other commercial commitments | 3,054 | 504 | – | 2,550 | – |

[1] Contributions to the Hydro One Pension Fund are generally made one month in arrears. The 2017 and 2018 minimum pension contributions are based on an actuarial valuation as at December 31, 2015 and projected levels of pensionable earnings.

[2] On August 15, 2016, Hydro One Inc. terminated its credit facilities totalling $2.3 billion maturing in June 2020 and October 2018, and entered into a new $2.3 billion credit facility maturing in June 2021. On November 7, 2016, the maturity date of Hydro One's $250 million credit facility was extended from November 2020 to November 2021.

[3] Letters of credit consist of a $150 million letter of credit related to retirement compensation arrangements, and letters of credit totalling $24 million provided as prudential support.

[4] Guarantees consist of prudential support provided to the IESO by Hydro One Inc. on behalf of its subsidiaries.

## Regulation

The OEB approves both the revenue requirements of and the rates charged by Hydro One's regulated transmission and distribution businesses. The rates are designed to permit the Company's transmission and distribution businesses to recover the allowed costs and to earn a formula-based annual rate of return on its equity invested in the regulated businesses. This is done by applying a specified equity risk premium to forecasted interest rates on long-term bonds. In addition, the OEB approves rate riders to allow for the recovery or disposition of specific regulatory deferral accounts over specified time frames.

The following table summarizes the status of Hydro One's major regulatory proceedings:

| Application | Year(s) | Type | Status |
|---|---|---|---|
| Electricity Rates | | | |
| Hydro One Networks | 2015-2016 | Transmission – Cost-of-service | OEB decision received |
| Hydro One Networks | 2017-2018 | Transmission – Cost-of-service | OEB decision pending |
| Hydro One Networks | 2015-2017 | Distribution – Custom | OEB decision received |
| B2M LP | 2015-2019 | Transmission – Cost-of-service | OEB decision received |
| Great Lakes Power | 2017 | Transmission – Cost-of-service | OEB decision pending |
| Mergers Acquisitions Amalgamations and Divestitures | | | |
| Great Lakes Power | n/a | Acquisition | OEB decision received |
| Orillia Power | n/a | Acquisition | OEB decision pending |
| Leave to Construct | | | |
| Supply to Essex County Transmission Reinforcement Project | n/a | Section 92 | OEB decision received |

Hydro One has obtained revenue requirement approvals from the OEB, subject to certain annual adjustments, for Hydro One Networks' transmission business through 2016, for B2M LP through 2019, and for Hydro One Networks' distribution business to the end of 2017. The following table summarizes the key elements and status of Hydro One's electricity rate applications:

| Application | Year | ROE Allowed (A) or Forecast (F) | Rate Base | Rate Application Status | Rate Order Status |
|---|---|---|---|---|---|
| **Transmission** | | | | | |
| Hydro One Networks | 2016 | 9.19% (A) | $10,040 million | Approved in January 2015 | Approved in January 2016 |
| | 2017 | 8.78% (A) | $10,554 million | Filed in May 2016 | To be filed in 2017 Q1 |
| | 2018 | 8.78% (F) | $11,226 million | Filed in May 2016 | To be filed in 2017 Q4 |
| B2M LP | 2016 | 9.19% (A) | $516 million | Approved in December 2015 | Approved in January 2016 |
| | 2017 | 8.78% (A) | $509 million | Approved in December 2015 | Filed in December 2016 |
| | 2018 | 8.78% (F) | $502 million | Approved in December 2015 | To be filed in 2017 Q4 |
| | 2019 | 8.78% (F) | $496 million | Approved in December 2015 | To be filed in 2018 Q4 |
| Great Lakes Power | 2017 | 9.19% (F) | $218 million | Filed in December 2016 | Filed in December 2016 |
| **Distribution** | | | | | |
| Hydro One Networks | 2016 | 9.19% (A) | $6,863 million | Approved in March 2015 | Approved in April 2015 |
| | 2017 | 8.78% (A) | $7,190 million | Approved in March 2015 | Approved in December 2016 |

### Hydro One Networks

On May 31, 2016, Hydro One Networks filed a cost-of-service application with the OEB for 2017 and 2018 transmission rates. The application seeks approval of rate base of $10,554 million for 2017 and $11,226 million for 2018. In October 2016, the OEB issued updated cost of capital parameters for rates effective in 2017, including an updated 2017 allowed ROE of 8.78%. The application also lays out a planned transmission capital investment program for the five-year period ending on December 31, 2021, with investments in capital spending primarily to address reliability, safety and customer needs, in a cost-effective manner. Management expects that a decision will be received in the first half of 2017, and that new rates will be retroactive to January 1, 2017. Future transmission rate applications are anticipated to be filed under the OEB's incentive-based regulatory framework.

Hydro One Networks plans to submit an application for 2018-2022 distribution rates under the OEB's incentive-based regulatory framework in the first quarter of 2017.

### B2M LP

On January 14, 2016, the OEB issued its Decision and Rate Order approving the B2M LP revenue requirement recovery through the 2016 Uniform Transmission Rates. On December 1, 2016, B2M LP filed a Draft Rate Order with a revised 2017 revenue requirement of $34 million, reflecting updated 2017 cost of capital parameters issued by the OEB in October 2016.

### Other Regulatory Developments

#### OEB Pension and Other Post-Employment Benefits (OPEB) Generic Hearing

In 2015, the OEB began a consultation process to examine pensions and OPEBs in rate-regulated utilities, with the objectives of developing standard principles to guide its review of pension and OPEB related costs in the future, and to establish specific requirements for applications and appropriate and consistent regulatory mechanisms for cost recovery. Hydro One and other stakeholders filed written submissions with respect to initial OEB questions intended to solicit views on the key issues of interest to the OEB. Following a stakeholder forum in July 2016, updated written submissions were filed with the OEB in September 2016. It is anticipated that subsequent to the OEB's review of the updated written submissions, the OEB will outline principles to guide its review of pension and OPEB related costs in the future, and provide further guidance on application requirements and regulatory mechanisms for cost recovery.

## Other Developments

### Change in Hydro One Ownership Structure

In November 2015, Hydro One and the Province completed an IPO on the Toronto Stock Exchange of approximately 89.3 million common shares of Hydro One, representing 15% of the Province's ownership position. Prior to the completion of the IPO, Hydro One and its subsidiary, Hydro One Inc., completed a series of transactions (Pre-IPO Transactions) that resulted in, among other things, the acquisition by Hydro One of all of the issued and outstanding shares of Hydro One Inc. from the Province and the issuance of new common shares and preferred shares of Hydro One to the Province. Both Hydro One and Hydro One Inc. are reporting issuers. In April 2016, the Province completed a secondary offering of 83.3 million common shares of Hydro One on the Toronto Stock Exchange. Hydro One did not receive any of the proceeds from either of the sales of common shares by the Province. At December 31, 2016, the Province directly holds approximately 70.1% of Hydro One's total issued and outstanding common shares.

### Class Action Lawsuit

Hydro One Inc., Hydro One Networks, Hydro One Remote Communities Inc., and Norfolk Power Distribution Inc. are defendants in a class action suit in which the representative plaintiff is seeking up to $125 million in damages related to allegations of improper billing practices. A certification motion in the class action is pending. Due to the preliminary stage of legal proceedings, an estimate of a possible loss related to this claim cannot be made.

### Acquisitions

#### Integration of Haldimand Hydro and Woodstock Hydro

In 2015, the Company acquired Haldimand Hydro and Woodstock Hydro, two Ontario-based local distribution companies. In September 2016, the Company successfully completed the integration of both entities, including the integration of employees, customer and billing information, business processes, and operations.

#### Acquisition of Great Lakes Power

On October 31, 2016, following receipt of regulatory approval of the transaction by the OEB, Hydro One completed the acquisition of Great Lakes Power, an Ontario regulated electricity transmission business operating along the eastern shore of Lake Superior, north and east of Sault Ste. Marie, Ontario. The total purchase price for Great Lakes Power was approximately $376 million, including the assumption of approximately $150 million in outstanding indebtedness. On January 16, 2017, Great Lakes Power's name was changed to Hydro One Sault Ste. Marie LP.

On December 23, 2016, Great Lakes Power filed an application for 2017 rates, requesting an increase to the approved 2016 revenue requirement of 1.9%, resulting in an updated revenue requirement of $41 million.

#### Acquisition of Orillia Power

In August 2016, the Company reached an agreement to acquire Orillia Power Distribution Corporation (Orillia Power), an electricity distribution company located in Simcoe County, Ontario, for approximately $41 million, including the assumption of approximately $15 million in outstanding indebtedness and regulatory liabilities, subject to closing adjustments. The acquisition is subject to regulatory approval by the OEB.

## Hydro One Work Force

Hydro One has a skilled and flexible work force of approximately 5,500 regular employees and over 2,000 non-regular employees province-wide, comprising a mix of skilled trades, engineering, professional, managerial and executive personnel. Hydro One's regular employees are supplemented primarily by accessing a large external labour force available through arrangements with the Company's trade unions for variable workers, sometimes referred to as "hiring halls", and also by access to contract personnel. The hiring halls offer Hydro One the ability to flexibly utilize highly trained and appropriately skilled workers on a project-by-project and seasonal basis.

The following table sets out the number of Hydro One employees as at December 31, 2016.

| | Regular Employees | Non-Regular Employees | Total |
|---|---|---|---|
| Power Workers' Union (PWU) | 3,470 | 698[1] | 4,168 |
| The Society of Energy Professionals (Society) | 1,365 | 44 | 1,409 |
| Canadian Union of Skilled Workers (CUSW) and construction building trade unions[2] | – | 1,275 | 1,275 |
| Total employees represented by unions | 4,835 | 2,017 | 6,852 |
| Management and non-represented employees | 659 | 28 | 687 |
| Total employees | 5,494 | 2,045 | 7,539 |

1 Includes 528 non-regular "hiring hall" employees covered by the PWU agreement.

2 Employees are jointly represented by both unions. The construction building trade unions have collective agreements with the Electrical Power Systems Construction Association (EPSCA).

### Share-based Compensation

During 2016, the Company granted awards under its Long-term Incentive Plan, consisting of Performance Stock Units (PSUs) and Restricted Stock Units (RSUs), all of which are equity settled. At December 31, 2016, 230,600 PSUs and 254,150 RSUs were outstanding. No long-term incentive awards were granted during 2015.

## Non-Gaap Measures

### Funds from Operations (FFO) and Adjusted FFO

FFO is defined as net cash from operating activities, adjusted for (i) changes in non-cash balances related to operations, (ii) dividends paid on preferred shares, and (iii) distributions to noncontrolling interest. Adjusted FFO is defined as FFO, adjusted for the impact of the deferred income tax asset that resulted as a consequence of leaving the PILs Regime and entering the Federal Tax Regime. Management believes that FFO and Adjusted FFO are helpful as supplemental measures of the Company's operating cash flows as they exclude timing-related fluctuations in non-cash operating working capital and cash flows not attributable to common shareholders, and, in the case of Adjusted FFO, the impact of the IPO-related deferred income tax asset. As such, these measures provide consistent measures of the cash generating performance of the Company's assets.

The following table presents the reconciliation of net cash from operating activities to FFO and Adjusted FFO:

| *Year ended December 31*<br>*(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| Net cash from (used in) operating activities | 1,656 | (1,248) |
| Changes in non-cash balances related to operations | (134) | (213) |
| Preferred share dividends | (19) | (13) |
| Distributions to noncontrolling interest | (9) | (5) |
| FFO | 1,494 | (1,479) |
| Less: Deferred income tax asset[1] | – | (2,810) |
| Adjusted FFO | 1,494 | 1,331 |

[1] Impact of deferred income tax asset that resulted as a consequence of leaving the PILs Regime and entering the Federal Tax Regime.

### Adjusted EPS

The following basic and diluted Adjusted EPS has been prepared by management on a supplementary basis which assumes that the total number of common shares outstanding was 595,000,000 in each of the years ended December 31, 2016 and 2015. The supplementary pro forma disclosure is used internally by management subsequent to the IPO of the Company's common shares in November 2015 to assess the Company's performance and is considered useful because it eliminates the impact of a different and non-comparable number of shares outstanding and held by the Province prior to the IPO. Adjusted EPS is considered an important measure and management believes that presenting it consistently for all periods based on the number of outstanding shares on, and subsequent to, the IPO provides users with a comparative basis to evaluate the operations of the Company.

| *Year ended December 31* | 2016 | 2015 |
|---|---|---|
| Net income attributable to common shareholders *(millions of dollars)* | 721 | 690 |
| Pro forma weighted average number of common shares | | |
| Basic | 595,000,000 | 595,000,000 |
| Effect of dilutive stock-based compensation plans | 1,700,823 | 94,691 |
| Diluted | 596,700,823 | 595,094,691 |
| Adjusted EPS | | |
| Basic | $ 1.21 | $ 1.16 |
| Diluted | $ 1.21 | $ 1.16 |

## Adjusted Net Cash from Operating Activities

Adjusted net cash from operating activities is defined as net cash from operating activities, adjusted for the impact of the deferred income tax asset that resulted as a consequence of leaving the PILs Regime and entering the Federal Tax Regime. Management believes that this measure is helpful as a supplemental measure of the Company's net cash from operating activities as it excludes the impact of the IPO-related deferred income tax asset. As such, adjusted net cash from operating activities provides a consistent measure of the Company's cash from operating activities compared to prior periods.

The following table presents the reconciliation of net cash from operating activities to adjusted net cash from operating activities:

| *Year ended December 31*<br>*(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| Net cash from (used in) operating activities | 1,656 | (1,248) |
| Less: Deferred income tax asset[1] | – | (2,810) |
| Adjusted net cash from operating activities | 1,656 | 1,562 |

[1] Impact of deferred income tax asset that resulted as a consequence of leaving the PILs Regime and entering the Federal Tax Regime.

To the extent that adjusted net income is used in future continuous disclosure documents of Hydro One, it will be defined as net income, adjusted for certain items, including non-recurring items and other one-time items that management does not consider to be reflective of the operating performance of the Company. No such adjustments to net income are presented in this MD&A. Management believes that this measure will be helpful in assessing the Company's financial and operating performance in the future.

FFO, adjusted FFO, adjusted basic and diluted EPS, adjusted net cash from operating activities, and adjusted net income are not recognized measures under US GAAP and do not have a standardized meaning prescribed by US GAAP. They are therefore unlikely to be directly comparable to similar measures presented by other companies. They should not be considered in isolation nor as a substitute for analysis of the Company's financial information reported under US GAAP.

## Related Party Transactions

The Province is the majority shareholder of Hydro One. The IESO, Ontario Power Generation Inc. (OPG), OEFC, OEB, and Hydro One Brampton are related parties to Hydro One because they are controlled or significantly influenced by the Province. The following is a summary of the Company's related party transactions during the year ended December 31, 2016:

| | | Year ended December 31 | |
|---|---|---|---|
| | | 2016 | 2015 |
| Related Party | Transaction | *(millions of dollars)* | |
| Province[1] | Dividends paid | 451 | 888 |
| | Common shares issued[2] | – | 2,600 |
| | IPO costs subsequently reimbursed by the Province[3] | – | 7 |
| IESO | Power purchased | 2,096 | 2,318 |
| | Revenues for transmission services | 1,549 | 1,548 |
| | Distribution revenues related to rural rate protection | 125 | 127 |
| | Distribution revenues related to the supply of electricity to remote northern communities | 32 | 32 |
| | Funding received related to Conservation and Demand Management programs | 63 | 70 |
| OPG | Power purchased | 6 | 11 |
| | Revenues related to provision of construction and equipment maintenance services | 5 | 7 |
| | Costs expensed related to the purchase of services | 1 | 1 |
| OEFC | Payments in lieu of corporate income taxes[4] | – | 2,933 |
| | Power purchased from power contracts administered by the OEFC | 1 | 6 |
| | Indemnification fee paid (terminated effective October 31, 2015) | – | 8 |
| OEB | OEB fees | 11 | 12 |
| Hydro One Brampton[1] | Revenues from management, administrative and smart meter network services | 3 | 1 |

[1] On August 31, 2015, Hydro One Inc. completed the spin-off of its subsidiary, Hydro One Brampton, to the Province.
[2] On November 4, 2015, Hydro One issued common shares to the Province for proceeds of $2.6 billion.
[3] In 2015, Hydro One incurred certain IPO related expenses totalling $7 million, which were subsequently reimbursed to the Company by the Province.
[4] In 2015, Hydro One made PILs to the OEFC totalling $2.9 billion, including departure tax of $2.6 billion.

At December 31, 2016, the amounts due from and due to related parties as a result of the transactions described above were $158 million and $147 million, compared to $191 million and $138 million at December 31, 2015, respectively. At December 31, 2016, included in amounts due to related parties were amounts owing to the IESO in respect of power purchases of $143 million, compared to $134 million at December 31, 2015.

# Risk Management and Risk Factors

## Risks Relating to Hydro One's Business

### Regulatory Risks and Risks Relating to Hydro One's Revenues

#### *Risks Relating to Obtaining Rate Orders*

The Company is subject to the risk that the OEB will not approve the Company's transmission and distribution revenue requirements requested in outstanding or future applications for rates. Rate applications for revenue requirements are subject to the OEB's review process, usually involving participation from intervenors and a public hearing process. There can be no assurance that resulting decisions or rate orders issued by the OEB will permit Hydro One to recover all costs actually incurred, costs of debt and income taxes, or to earn a particular ROE. A failure to obtain acceptable rate orders, or approvals of appropriate returns on equity and costs actually incurred, may materially adversely affect: Hydro One's transmission or distribution businesses, the undertaking or timing of capital expenditures, ratings assigned by credit rating agencies, the cost and issuance of long-term debt, and other matters, any of which may in turn have a material adverse effect on the Company. In addition, there is no assurance that the Company will receive regulatory decisions in a timely manner and, therefore, costs may be incurred prior to having an approved revenue requirement.

#### *Risks Relating to Actual Performance Against Forecasts*

The Company's ability to recover the actual costs of providing service and earn the allowed ROE depends on the Company achieving its forecasts established and approved in the rate-setting process. Actual costs could exceed the approved forecasts if, for example, the Company incurs operations, maintenance, administration, capital and financing costs above those included in the Company's approved revenue requirement. The inability to obtain acceptable rate decisions or to recover any significant difference between forecast and actual expenses could materially adversely affect the Company's financial condition and results of operations.

Further, the OEB approves the Company's transmission and distribution rates based on projected electricity load and consumption levels, among other factors. If actual load or consumption materially falls below projected levels, the Company's revenue and net income for either, or both, of these businesses could be materially adversely affected. Also, the Company's current revenue requirements for these businesses are based on cost and other assumptions that may not materialize. There is no assurance that the OEB would allow rate increases sufficient to offset unfavourable financial impacts from unanticipated changes in electricity demand or in the Company's costs.

The Company is subject to risk of revenue loss from other factors, such as economic trends and weather conditions that influence the demand for electricity. The Company's overall operating results may fluctuate substantially on a seasonal and year-to-year basis based on these trends and weather conditions. For instance, a cooler than normal summer or warmer than normal winter may reduce demand for electricity below that forecast by the Company, causing a decrease in the Company's revenues from the same period of the previous year. The Company's load could also be negatively affected by successful Conservation and Demand Management programs whose results exceed forecasted expectations.

#### *Risks Relating to Rate-Setting Models for Transmission and Distribution*

The OEB approves and periodically changes the ROE for transmission and distribution businesses. The OEB may in the future decide to reduce the allowed ROE for either of these businesses, modify the formula or methodology it uses to determine the ROE, or reduce the weighting of the equity component of the deemed capital structure. Any such reduction could reduce the net income of the Company.

The OEB's recent Custom Incentive Rate-setting model requires that the term of a custom rate application be a minimum five-year period. There are risks associated with forecasting key inputs such as revenues, operating expenses and capital, over such a long period. For instance, if unanticipated capital expenditures arise that were not contemplated in the Company's most recent rate decision, the Company may be required to incur costs that may not be recoverable until a future period or not recoverable at all in future rates. This could have a material adverse effect on the Company.

After rates are set as part of a part of a Custom Incentive Rate application, the OEB expects there to be no further rate applications for annual updates within the five-year term, unless there are exceptional circumstances, with the exception of the clearance of established deferral and variance accounts. For example, the OEB does not expect to address annual rate applications for updates for cost of capital (including ROE), working capital allowance or sales volumes. If there were an increase in interest rates over the period of a rate decision and no corresponding changes were permitted to the

Company's allowed cost of capital (including ROE), then the result could be a decrease in the Company's financial performance.

To the extent that the OEB approves an In-Service Variance Account for the transmission and/or distribution businesses, and should the Company fail to meet the threshold levels of in-service capital, the OEB may reclaim a corresponding portion of the Company's revenues.

### *Risks Relating to Capital Expenditures*

In order to be recoverable, capital expenditures require the approval of the OEB, either through the approval of capital expenditure plans, rate base or revenue requirements for the purposes of setting transmission and distribution rates, which include the impact of capital expenditures on rate base or cost of service. There can be no assurance that all capital expenditures incurred by Hydro One will be approved by the OEB. Capital cost overruns may not be recoverable in transmission or distribution rates. The Company could incur unexpected capital expenditures in maintaining or improving its assets, particularly given that new technology may be required to support renewable generation and unforeseen technical issues may be identified through implementation of projects. There is risk that the OEB may not allow full recovery of such expenditures in the future. To the extent possible, Hydro One aims to mitigate this risk by ensuring prudent expenditures, seeking from the regulator clear policy direction on cost responsibility, and pre-approval of the need for capital expenditures.

Any future regulatory decision by the OEB to disallow or limit the recovery of any capital expenditures would lead to a lower than expected approved revenue requirement or rate base, potential asset impairment or charges to the Company's results of operations, any of which could have a material adverse effect on the Company.

### *Risks Relating to Deferred Tax Asset*

As a result of leaving the PILs Regime and entering the Federal Tax Regime in connection with the IPO of the Company, Hydro One recorded a deferred tax asset due to the revaluation of the tax basis of Hydro One's fixed assets at their fair market value and recognition of eligible capital expenditures. Management believes this will result in annual net cash savings over at least the next five years due to the reduction of cash income taxes payable by Hydro One associated primarily with a higher capital cost allowance. There is a risk that, in current or future rate applications, the OEB will reduce the Company's revenue requirement by all or a portion of those net cash savings. If the OEB were to reduce the Company's revenue requirement in this manner, it could have a material adverse effect on the Company.

### *Risks Relating to Other Applications to the OEB*

The Company is also subject to the risk that it will not obtain required regulatory approvals for other matters, such as leave to construct applications, applications for mergers, acquisitions, amalgamations and divestitures, and environmental approvals. Decisions to acquire or divest other regulated businesses licensed by the OEB are subject to OEB approval. Accordingly, there is the risk that such matters may not be approved or that unfavourable conditions will be imposed by the OEB.

## First Nations and Métis Claims Risk

Some of the Company's current and proposed transmission and distribution assets are or may be located on reserve (as defined in the *Indian Act* (Canada); Reserve) lands, and lands over which First Nations and Métis have Aboriginal, treaty, or other legal claims. Some First Nations and Métis leaders, communities, and their members have made assertions related to sovereignty and jurisdiction over Reserve lands and traditional territories and are increasingly willing to assert their claims through the courts, tribunals, or by direct action. These claims and/or settlement of these claims could have a material adverse effect on the Company or otherwise materially adversely impact the Company's operations, including the development of current and future projects.

The Company's operations and activities may give rise to the Crown's duty to consult and potentially accommodate First Nations and Métis communities. Procedural aspects of the duty to consult may be delegated to the Company by the Province or the federal government. A perceived failure by the Crown to sufficiently consult a First Nations or Métis community, or a perceived failure by the Company in relation to delegated consultation obligations, could result in legal challenges against the Crown or the Company, including judicial review or injunction proceedings, or could potentially result in direct action against the Company by a community or its citizens. If this occurs, it could disrupt or delay the Company's operations and activities, including current and future projects, and have a material adverse effect on the Company.

## Risk from Transfer of Assets Located on Reserves

The transfer orders by which the Company acquired certain of Ontario Hydro's businesses as of April 1, 1999 did not transfer title to assets located on Reserves. The transfer of title to these assets did not occur because authorizations originally granted by the federal government for the construction and operation of these assets on Reserves could not be transferred without required consent. In several cases, the authorizations had either expired or had never been issued.

Currently, the Ontario Electricity Financial Corporation holds legal title to these assets and it is expected that the Company will manage them until it has obtained permits to complete the title transfer. To occupy Reserves, the Company must have valid permits issued by Her Majesty the Queen in the Right of Canada. For each permit, the Company must negotiate an agreement (in the form of a memorandum of understanding) with the First Nation, the Ontario Electricity Financial Corporation and any members of the First Nation who have occupancy rights. The agreement includes provisions whereby the First Nation consents to the federal government (presently Indigenous Affairs and Northern Development Canada) issuing a permit. For transmission assets, the Company must negotiate terms of payment. It is difficult to predict the aggregate amount that the Company may have to pay, either on an annual or one-time basis, to obtain the required agreements from First Nations. If the Company cannot reach satisfactory agreements with the relevant First Nation to obtain federal permits, it may have to relocate these assets to other locations and restore the lands at a cost that could be substantial. In a limited number of cases, it may be necessary to abandon a line and replace it with diesel generation facilities. In either case, the costs relating to these assets could have a material adverse effect on the Company if the costs are not recoverable in future rate orders.

## Compliance with Laws and Regulations

Hydro One must comply with numerous laws and regulations affecting its business, including requirements relating to transmission and distribution companies, environmental laws, employment laws and health and safety laws. The failure of the Company to comply with these laws could have a material adverse effect on the Company's business. See also "– Health, Safety and Environmental Risk".

For example, Hydro One's licensed transmission and distribution businesses are required to comply with the terms of their licences, with codes and rules issued by the OEB, and with other regulatory requirements, including regulations of the National Energy Board. In Ontario, the Market Rules issued by the IESO require the Company to, among other things, comply with the reliability standards established by the North American Electric Reliability Corporation (NERC) and Northeast Power Coordinating Council, Inc. (NPCC). The incremental costs associated with compliance with these reliability standards are expected to be recovered through rates, but there can be no assurance that the OEB will approve the recovery of all of such incremental costs. Failure to obtain such approvals could have a material adverse effect on the Company.

There is the risk that new legislation, regulations, requirements or policies will be introduced in the future. These may require Hydro One to incur additional costs, which may or may not be recovered in future transmission and distribution rates.

## Risk of Natural and Other Unexpected Occurrences

The Company's facilities are exposed to the effects of severe weather conditions, natural disasters, man-made events including but not limited to cyber and physical terrorist type attacks, events which originate from third-party connected systems, or any other potentially catastrophic events. The Company's facilities may not withstand occurrences of this type in all circumstances. The Company does not have insurance for damage to its transmission and distribution wires, poles and towers located outside its transmission and distribution stations resulting from these or other events. Where insurance is available for other assets, such insurance coverage may have deductibles, limits and/or exclusions. Losses from lost revenues and repair costs could be substantial, especially for many of the Company's facilities that are located in remote areas. The Company could also be subject to claims for damages caused by its failure to transmit or distribute electricity.

## Risk Associated with Information Technology Infrastructure and Data Security

The Company's ability to operate effectively in the Ontario electricity market is, in part, dependent upon it developing, maintaining and managing complex information technology systems which are employed to operate and monitor its transmission and distribution facilities, financial and billing systems and other business systems. The Company's increasing reliance on information systems and expanding data networks increases its exposure to information security threats. The Company's transmission business is required to comply with various rules and standards for transmission reliability, including mandatory standards established by the NERC and the NPCC. These include standards relating to cyber-security and information technology, which only apply to certain of the Company's assets (generally being those whose failure could impact the functioning of the bulk electricity system). The Company may maintain different or lower levels of information technology security for its assets that are not subject to these mandatory standards. The Company must also comply with legislative and licence requirements relating to the collection, use and disclosure of personal information and information regarding consumers, wholesalers, generators and retailers.

Cyber-attacks or unauthorized access to corporate and information technology systems could result in service disruptions and system failures, which could have a material adverse effect on the Company, including as a result of a failure to provide electricity to customers. Due to operating critical infrastructure, Hydro One may be at greater risk of cyber-attacks from third parties (including state run or controlled parties) that could impair or incapacitate its assets. In addition, in the normal course of its operations, the Company collects, uses, processes and stores information, which could be exposed in the event of a cyber-security incident or other unauthorized access, such as information about customers, suppliers, counterparties and employees.

Security and system disaster recovery controls are in place; however, there can be no assurance that there will not be system failures or security breaches or that such threats would be detected or mitigated on a timely basis. Upon occurrence and detection, the focus would shift from prevention to isolation, remediation and recovery until the incident has been fully addressed. Any such system failures or security breaches could have a material adverse effect on the Company.

## Work Force Demographic Risk

By the end of 2016, approximately 22% of the Company's employees who are members of the Company's defined benefit pension plan were eligible for retirement under that plan, and by the end of 2017, up to approximately 23% could be eligible. These percentages are not evenly spread across the Company's work force, but tend to be most significant in the most senior levels of the Company's staff and especially among management staff. During each of 2016 and 2015, approximately 3% of the Company's work force elected to retire. Accordingly, the Company's continued success will be tied to its ability to continue to attract and retain sufficient qualified staff to replace the capability lost through retirements and to meet the demands of the Company's work programs.

In addition, the Company expects the skilled labour market for its industry to be highly competitive in the future. Many of the Company's current employees and many of the potential employees it would seek in the future possess skills and experience that would also be highly sought after by other organizations inside and outside the electricity sector. The failure to attract and retain qualified personnel for Hydro One's business could have a material adverse effect on the Company.

## Labour Relations Risk

The substantial majority of the Company's employees are represented by either the PWU or the Society. Over the past several years, significant effort has been expended to increase Hydro One's flexibility to conduct operations in a more cost-efficient manner. Although the Company has achieved improved flexibility in its collective agreements, the Company may not be able to achieve further improvements. The Company reached an agreement with the PWU for a renewal collective agreement with a three-year term, covering the period from April 1, 2015 to March 31, 2018 and an early renewal collective agreement with the Society with a three-year term, covering the period from April 1, 2016 to March 31, 2019. The Company also reached a renewal collective agreement with the Canadian Union of Skilled Workers for a three-year term, covering the period from May 1, 2014 to April 30, 2017. Additionally, the EPSCA and a number of construction unions have reached renewal agreements, to which Hydro One is bound, for a five-year term, covering the period from May 1, 2015 to April 30, 2020. Future negotiations with unions present the risk of a labour disruption and the ability to sustain the continued supply of energy to customers. The Company also faces financial risks related to its ability to negotiate collective agreements consistent with its rate orders. In addition, in the event of a labour dispute, the Company could face operational risk related to continued compliance with its requirements of providing service to customers. Any of these could have a material adverse effect on the Company.

## Risk Associated with Arranging Debt Financing

The Company expects to borrow to repay its existing indebtedness and to fund a portion of capital expenditures. Hydro One Inc. has substantial debt principal repayments, including $602 million in 2017, $753 million in 2018, and $731 million in 2019. In addition, from time to time, the Company may draw on its syndicated bank lines and or issue short-term debt under Hydro One Inc.'s $1.5 billion commercial paper program which would mature within approximately one year of issuance. The Company also plans to incur continued material capital expenditures for each of 2017 and 2018. Cash generated from operations, after the payment of expected dividends, will not be sufficient to fund the repayment of the Company's existing indebtedness and capital expenditures. The Company's ability to arrange sufficient and cost-effective debt financing could be materially adversely affected by numerous factors, including the regulatory environment in Ontario, the Company's results of operations and financial position, market conditions, the ratings assigned to its debt securities by credit rating agencies, an inability of the Corporation to comply with its debt covenants, and general economic conditions. A downgrade in the Company's credit ratings could restrict the Company's ability to access debt capital markets and increase the Company's cost of debt. Any failure or inability on the Company's part to borrow the required amounts of debt on satisfactory terms could impair its ability to repay maturing debt, fund capital expenditures and meet other obligations and requirements and, as a result, could have a material adverse effect on the Company.

## Market, Financial Instrument and Credit Risk

Market risk refers primarily to the risk of loss that results from changes in costs, foreign exchange rates and interest rates. The Company is exposed to fluctuations in interest rates as its regulated ROE is derived using a formulaic approach that takes into account anticipated interest rates, but is not currently exposed to material commodity price risk or material foreign exchange risk.

The OEB-approved adjustment formula for calculating ROE in a deemed regulatory capital structure of 60% debt and 40% equity provides for increases and decreases depending on changes in benchmark interest rates for Government of Canada debt and the A-rated utility corporate bond yield spread. The Company estimates that a decrease of 100 basis points in the combination of the forecasted long-term Government of Canada bond yield and the A-rated utility corporate bond yield spread used in determining its rate of return would reduce the Company's transmission business' 2018 net income by approximately $23 million and its distribution business' 2018 net income by approximately $15 million. The Company periodically utilizes interest rate swap agreements to mitigate elements of interest rate risk.

Financial assets create a risk that a counterparty will fail to discharge an obligation, causing a financial loss. Derivative financial instruments result in exposure to credit risk, since there is a risk of counterparty default. Hydro One monitors and minimizes credit risk through various techniques, including dealing with highly rated counterparties, limiting total exposure levels with individual counterparties, entering into agreements which enable net settlement, and by monitoring the financial condition of counterparties. The Company does not trade in any energy derivatives. The Company is required to procure electricity on behalf of competitive retailers and certain local distribution companies for resale to their customers. The resulting concentrations of credit risk are mitigated through the use of various security arrangements, including letters of credit, which are incorporated into the Company's service agreements with these retailers in accordance with the OEB's Retail Settlement Code.

The failure to properly manage these risks could have a material adverse effect on the Company.

## Risks Relating to Asset Condition and Capital Projects

The Company continually incurs sustainment and development capital expenditures and monitors the condition of its transmission assets to manage the risk of equipment failures and to determine the need for and timing of major refurbishments and replacements of its transmission and distribution infrastructure. However the lack of real time monitoring of distribution assets increases the risk of distribution equipment failure. The connection of large numbers of generation facilities to the distribution network has resulted in greater than expected usage of some of the Company's equipment. This increases maintenance requirements and may accelerate the aging of the Company's assets.

Execution of the Company's capital expenditure programs, particularly for development capital expenditures, is partially dependent on external factors, such as environmental approvals, municipal permits, equipment outage schedules that accommodate the IESO, generators and transmission-connected customers, and supply chain availability for equipment suppliers and consulting services. There may also be a need for, among other things, *Environmental Assessment Act* (Ontario) approvals, approvals which require public meetings, appropriate engagement with First Nations and Métis communities, OEB approvals of expropriation or early access to property, and other activities. Obtaining approvals and carrying out these processes may also be impacted by opposition to the proposed site of the capital investments. Delays in obtaining required approvals or failure to complete capital projects on a timely basis could materially adversely affect transmission reliability or customers' service quality or increase maintenance costs which could have a material adverse effect on the Company. External factors are considered in the Company's planning process. If the Company is unable to carry out capital expenditure plans in a timely manner, equipment performance may degrade, which may reduce network capacity, result in customer interruptions, compromise the reliability of the Company's networks or increase the costs of operating and maintaining these assets. Any of these consequences could have a material adverse effect on the Company.

Increased competition for the development of large transmission projects and legislative changes relating to the selection of transmitters could impact the Company's ability to expand its existing transmission system, which may have an adverse effect on the Company. To the extent that other parties are selected to construct, own and operate new transmission assets, the Company's share of Ontario's transmission network would be reduced.

## Health, Safety and Environmental Risk

The Company is subject to provincial health and safety legislation. Findings of a failure to comply with this legislation could result in penalties and reputational risk, which could negatively impact the Company.

The Company is subject to extensive Canadian federal, provincial and municipal environmental regulation. Failure to comply could subject the Company to fines or other penalties. In addition, the presence or release of hazardous or other harmful substances could lead to claims by third parties or governmental orders requiring the Company to take specific actions such as investigating, controlling and remediating the effects of these substances. Contamination of the Company's properties could limit its ability to sell or lease these assets in the future.

In addition, actual future environmental expenditures may vary materially from the estimates used in the calculation of the environmental liabilities on the Company's balance sheet. The Company does not have insurance coverage for these environmental expenditures.

There is also risk associated with obtaining governmental approvals, permits, or renewals of existing approvals and permits related to constructing or operating facilities. This may require environmental assessment or result in the imposition of conditions, or both, which could result in delays and cost increases.

Hydro One emits certain greenhouse gases, including sulphur hexafluoride or "SF6". There are increasing regulatory requirements and costs, along with attendant risks, associated with the release of such greenhouse gases, all of which could impose additional material costs on Hydro One.

Any future regulatory decision to disallow or limit the recovery of such costs could have a material adverse effect on the Company.

## Pension Plan Risk

Hydro One has the Hydro One Defined Benefit Pension Plan in place for the majority of its employees. Contributions to the pension plan are established by actuarial valuations which are required to be filed with the Financial Services Commission of Ontario on a triennial basis. The most recently filed valuation was prepared as at December 31, 2015, and was filed in June 2016, covering a three year period from 2016 to 2018. Hydro One's contributions to its pension plan satisfy, and are expected to satisfy, minimum funding requirements. Contributions beyond 2018 will depend on the funded position of the plan, which is determined by investment returns, interest rates and changes in benefits and actuarial assumptions at that time. A determination by the OEB that some of the Company's pension expenditures are not recoverable through rates could have a material adverse effect on the Company, and this risk may be exacerbated if the amount of required pension contributions increases.

The OEB has begun a consultation process that will examine pensions and other post-employment benefits in regulated utilities. See "– Other Post-Employment and Post-Retirement Benefits Risks". The outcome of this consultation process is uncertain and the Company is unable to assess the impact of the potential changes stemming from the review at this time.

## Risk of Recoverability of Total Compensation Costs

The Company manages all of its total compensation costs, including pension and other post-employment and post-retirement benefits, subject to restrictions and requirements imposed by the collective bargaining process. Should any element of total compensation costs be disallowed in whole or part by the OEB and not be recoverable from customers in rates, the costs could be material and could decrease net income, which could have a material adverse effect on the Company.

## Other Post-Employment and Post-Retirement Benefits Risks

The Company provides other post-employment and post-retirement benefits, including workers compensation benefits and long-term disability benefits to qualifying employees. The OEB has begun a consultation process that will examine pensions and other post-employment benefits in regulated utilities. The objectives of the consultation are to develop standard principles to guide the OEB's review of pension and other post-employment and post-retirement benefits costs in the future, to establish specific information requirements for application and to establish appropriate regulatory mechanisms for cost recovery which can be applied consistently across the gas and electricity sectors for rate-regulated utilities. The outcome of this consultation process is uncertain and the Company is unable to assess the impact of the potential changes stemming from the review at this time. A determination that some of the Company's post-employment and post-retirement benefit costs are not recoverable could have a material adverse effect on the Company.

## Risk Associated with Outsourcing Arrangements

Consistent with Hydro One's strategy of reducing operating costs, it has entered into an outsourcing arrangement with a third party for the provision of back office services and call centre services. If the outsourcing arrangement or statements of work thereunder are terminated for any reason or expire before a new supplier is selected and fully transitioned, the Company could be required to incur significant expenses to transfer to another service provider or insource, which could have a material adverse effect on the Company's business, operating results, financial condition or prospects.

## Risk from Provincial Ownership of Transmission Corridors

The Province owns some of the corridor lands underlying the Company's transmission system. Although the Company has the statutory right to use these transmission corridors, the Company may be limited in its options to expand or operate its systems. Also, other uses of the transmission corridors by third parties in conjunction with the operation of the Company's systems may increase safety or environmental risks, which could have a material adverse effect on the Company.

## Litigation Risks

In the normal course of the Company's operations, it becomes involved in, is named as a party to and is the subject of, various legal proceedings, including regulatory proceedings, tax proceedings and legal actions, relating to actual or alleged violations of law, common law damages claims, personal injuries, property damage, property taxes, land rights, the environment and contract disputes. The outcome of outstanding, pending or future proceedings cannot be predicted with certainty and may be determined adversely to the Company, which could have a material adverse effect on the Company. Even if the Company prevails in any such legal proceeding, the proceedings could be costly and time-consuming and would divert the attention of management and key personnel from the Company's business operations, which could adversely affect the Company. See also "Other Developments – Class Action Lawsuit".

### Transmission Assets on Third-Party Lands Risk

Some of the lands on which the Company's transmission assets are located are owned by third parties, including the Province and federal Crown, and are or may become subject to land claims by First Nations. The Company requires valid occupation rights to occupy such lands (which may take the form of land use permits, easements or otherwise). If the Company does not have valid occupational rights on third-party owned lands or has occupational rights that are subject to expiry, it may incur material costs to obtain or renew such occupational rights, or if such occupational rights cannot be renewed or obtained it may incur material costs to remove and relocate its assets and restore the subject land. If the Company does not have valid occupational rights and must incur costs as a result, this could have a material adverse effect on the Company or otherwise materially adversely impact the Company's operations.

### Reputational and Public Opinion Risk

Reputation risk is the risk of a negative impact to the Company's business, operations or financial condition that could result from a deterioration of Hydro One's reputation. The Company's reputation could be negatively impacted by changes in public opinion, attitudes towards the Company's privatization, failure to deliver on its customer promises and other external forces. Adverse reputational events could have negative impacts on the Company's business and prospects including, but not limited to, delays or denials of requisite approvals and accommodations for the Company's planned projects, escalated costs, legal or regulatory action, and damage to stakeholder relationships.

## Risks Relating to the Company's Relationship with the Province

### Ownership and Continued Influence by the Province and Voting Power; Share Ownership Restrictions

The Province currently owns approximately 70.1% of the outstanding common shares of Hydro One. The *Electricity Act* restricts the Province from selling voting securities of Hydro One (including common shares) of any class or series if it would own less than 40% of the outstanding number of voting securities of that class or series after the sale and in certain circumstances also requires the Province to take steps to maintain that level of ownership. Accordingly, the Province is expected to continue to maintain a significant ownership interest in voting securities of Hydro One for an indefinite period.

As a result of its significant ownership of the common shares of Hydro One, the Province has, and is expected indefinitely to have, the ability to determine or significantly influence the outcome of shareholder votes, subject to the restrictions in the governance agreement entered into between Hydro One and the Province dated November 5, 2015 (Governance Agreement; available on SEDAR at www.sedar.com). Despite the terms of the Governance Agreement in which the Province has agreed to engage in the business and affairs of the Company as an investor and not as a manager, there is a risk that the Province's engagement in the business and affairs of the Company as an investor will be informed by its policy objectives and may influence the conduct of the business and affairs of the Company in ways that may not be aligned with the interests of other shareholders.

The share ownership restrictions in the *Electricity Act* (Share Ownership Restrictions) and the Province's significant ownership of common shares of Hydro One together effectively prohibit one or more persons acting together from acquiring control of Hydro One. They also may limit or discourage transactions involving other fundamental changes to Hydro One and the ability of other shareholders to successfully contest the election of the directors proposed for election pursuant to the Governance Agreement. The Share Ownership Restrictions may also discourage trading in, and may limit the market for, the common shares and other voting securities.

### Nomination of Directors and Confirmation of Chief Executive Officer and Chair

Although director nominees are required to be independent of both the Company and the Province pursuant to the Governance Agreement, there is a risk that the Province will nominate or confirm individuals who satisfy the independence requirements but who it considers are disposed to support and advance its policy objectives and give disproportionate weight to the Province's interests in exercising their business judgment and balancing the interests of the stakeholders of Hydro One. This, combined with the fact certain matters require a two-thirds vote of the Board of Directors, could allow the Province to unduly influence certain Board actions such as confirmation of the Chair and confirmation of the Chief Executive Officer.

## Board Removal Rights

Under the Governance Agreement, the Province has the right to withhold from voting in favour of all director nominees and has the right to seek to remove and replace the entire Board of Directors, including in each case its own director nominees but excluding the Chief Executive Officer and, at the Province's discretion, the Chair. In exercising these rights in any particular circumstance, the Province is entitled to vote in its sole interest, which may not be aligned with the interests of other shareholders.

## More Extensive Regulation

Although under the Governance Agreement, the Province has agreed to engage in the business and affairs of Hydro One as an investor and not as a manager and has stated that its intention is to achieve its policy objectives through legislation and regulation as it would with respect to any other utility operating in Ontario, there is a risk that the Province will exercise its legislative and regulatory power to achieve policy objectives in a manner that has a material adverse effect on the Company.

## Prohibitions on Selling the Company's Transmission or Distribution Business

The *Electricity Act* prohibits the Company from selling all or substantially all of the business, property or assets related to its transmission system or distribution system that is regulated by the OEB. There is a risk that these prohibitions may limit the ability of the Company to engage in sale transactions involving a substantial portion of either system, even where such a transaction may otherwise be considered to provide substantial benefits to the Company and the holders of the common shares.

## Future Sales of Common Shares by the Province

The Province has indicated that it currently intends to sell further common shares of Hydro One over time, until it holds approximately 40% of the common shares, subject to the selling restrictions agreed with the Underwriters. The registration rights agreement between Hydro One and the Province dated November 5, 2015 (available on SEDAR at www.sedar.com) also grants the Province the right to request that Hydro One file one or more prospectuses and take other procedural steps to facilitate secondary offerings by the Province of the common shares of Hydro One. Future sales of common shares of Hydro One by the Province, or the perception that such sales could occur, may materially adversely affect market prices for these common shares and impede Hydro One's ability to raise capital through the issuance of additional common shares, including the number of common shares that Hydro One may be able to sell at a particular time or the total proceeds that may be realized.

## Limitations on Enforcing the Governance Agreement

The Governance Agreement includes commitments by the Province restricting the exercise of its rights as a holder of voting securities, including with respect to the maximum number of directors that the Province may nominate and on how the Province will vote with respect to other director nominees. Hydro One's ability to obtain an effective remedy against the Province, if the Province were not to comply with these commitments, is limited as a result of the *Proceedings Against the Crown Act* (Ontario). This legislation provides that the remedies of injunction and specific performance are not available against the Province, although a court may make an order declaratory of the rights of the parties, which may influence the Province's actions. A remedy of damages would be available to Hydro One, but damages may not be an effective remedy, depending on the nature of the Province's non-compliance with the Governance Agreement.

# Critical Accounting Estimates and Judgments

The preparation of Hydro One Consolidated Financial Statements requires the Company to make key estimates and critical judgments that affect the reported amounts of assets, liabilities, revenues and costs, and related disclosures of contingencies. Hydro One bases its estimates and judgments on historical experience, current conditions and various other assumptions that are believed to be reasonable under the circumstances, the results of which form the basis for making judgments about the carrying values of assets and liabilities, as well as identifying and assessing the Company's accounting treatment with respect to commitments and contingencies. Actual results may differ from these estimates and judgments. Hydro One has identified the following critical accounting estimates used in the preparation of its Consolidated Financial Statements:

### Revenues

Distribution revenues attributable to the delivery of electricity are based on OEB-approved distribution rates and are recognized on an accrual basis and include billed and unbilled revenues. Billed revenues are based on electricity delivered as measured from customer meters. At the end of each month, electricity delivered to customers since the date of the last billed meter reading is estimated, and the corresponding unbilled revenue is recorded. The unbilled revenue estimate is affected by energy consumption, weather, and changes in the composition of customer classes.

## Accounts Receivable and Allowance for Doubtful Accounts

The allowance for doubtful accounts reflects the Company's best estimate of losses on billed accounts receivable balances. The Company estimates the allowance for doubtful accounts on customer receivables by applying internally developed loss rates to the outstanding receivable balances by aging category. Loss rates applied to the accounts receivable balances are based on historical overdue balances, customer payments and write-offs.

## Regulatory Assets and Liabilities

Hydro One's regulatory assets represent certain amounts receivable from future electricity customers and costs that have been deferred for accounting purposes because it is probable that they will be recovered in future rates. The regulatory assets mainly include costs related to the pension benefit liability, deferred income tax liabilities, post-retirement and post-employment benefit liability, share-based compensation costs, and environmental liabilities. The Company's regulatory liabilities represent certain amounts that are refundable to future electricity customers, and pertain primarily to OEB deferral and variance accounts. The regulatory assets and liabilities can be recognized for rate-setting and financial reporting purposes only if the amounts have been approved for inclusion in the electricity rates by the OEB, or if such approval is judged to be probable by management. If management judges that it is no longer probable that the OEB will allow the inclusion of a regulatory asset or liability in future electricity rates, the applicable carrying amount of the regulatory asset or liability will be reflected in results of operations in the period that the judgment is made by management.

## Environmental Liabilities

Hydro One records a liability for the estimated future expenditures associated with the removal and destruction of PCB-contaminated insulating oils and related electrical equipment, and for the assessment and remediation of chemically contaminated lands. There are uncertainties in estimating future environmental costs due to potential external events such as changes in legislation or regulations and advances in remediation technologies. In determining the amounts to be recorded as environmental liabilities, the Company estimates the current cost of completing required work and makes assumptions as to when the future expenditures will actually be incurred, in order to generate future cash flow information. All factors used in estimating the Company's environmental liabilities represent management's best estimates of the present value of costs required to meet existing legislation or regulations. However, it is reasonably possible that numbers or volumes of contaminated assets, cost estimates to perform work, inflation assumptions and the assumed pattern of annual cash flows may differ significantly from the Company's current assumptions. Environmental liabilities are reviewed annually or more frequently if significant changes in regulations or other relevant factors occur. Estimate changes are accounted for prospectively.

## Employee Future Benefits

Hydro One's employee future benefits consist of pension and post-retirement and post-employment plans, and include pension, group life insurance, health care, and long-term disability benefits provided to the Company's current and retired employees. Employee future benefits costs are included in Hydro One's labour costs that are either charged to results of operations or capitalized as part of the cost of property, plant and equipment and intangible assets. Changes in assumptions affect the benefit obligation of the employee future benefits and the amounts that will be charged to results of operations or capitalized in future years. The following significant assumptions and estimates are used to determine employee future benefit costs and obligations:

### Weighted Average Discount Rate

The weighted average discount rate used to calculate the employee future benefits obligation is determined at each year end by referring to the most recently available market interest rates based on "AA"-rated corporate bond yields reflecting the duration of the applicable employee future benefit plan. The discount rate at December 31, 2016 decreased to 3.90% (from 4.00% at December 31, 2015) for pension benefits and decreased to 3.90% (from 4.10% used at December 31, 2015) for the post-retirement and post-employment plans. The decrease in the discount rate has resulted in a corresponding increase in employee future benefits liabilities for the pension, post-retirement and post-employment plans for accounting purposes. The liabilities are determined by independent actuaries using the projected benefit method prorated on service and based on assumptions that reflect management's best estimates.

### Expected Rate of Return on Plan Assets

The expected rate of return on pension plan assets is based on expectations of long-term rates of return at the beginning of the year and reflects a pension asset mix consistent with the pension plan's current investment policy.

Rates of return on the respective portfolios are determined with reference to respective published market indices. The expected rate of return on pension plan assets reflects the Company's long-term expectations. The Company believes that this assumption is reasonable because, with the pension plan's balanced investment approach, the higher volatility of equity investment returns is intended to be offset by the greater stability of fixed-income and short-term investment returns. The net result, on a long-term basis, is a lower return than might be expected by investing in equities alone. In the short term, the pension plan can experience fluctuations in actual rates of return.

## Rate of Cost of Living Increase

The rate of cost of living increase is determined by considering differences between long-term Government of Canada nominal bonds and real return bonds, which increased from 1.50% per annum as at December 31, 2015 to approximately 1.80% per annum as at December 31, 2016. Given the Bank of Canada's commitment to keep long-term inflation between 1.00% and 3.00%, management believes that the current rate is reasonable to use as a long-term assumption and as such, has used a 2.0% per annum inflation rate for employee future benefits liability valuation purposes as at December 31, 2016.

## Mortality Assumptions

The Company's employee future benefits liability is also impacted by changes in life expectancies used in mortality assumptions. Increases in life expectancies of plan members result in increases in the employee future benefits liability. The mortality assumption used at December 31, 2016 is 95% of 2014 Canadian Pensioners Mortality Private Sector table projected generationally using improvement Scale B (compared to 100% of 2014 Canadian Pensioners Mortality Public Sector table projected generationally using improvement Scale B used at December 31, 2015). The mortality table was updated based on a review of the historical mortality experience of the pension plan members.

## Rate of Increase in Health Care Cost Trends

The costs of post-retirement and post-employment benefits are determined at the beginning of the year and are based on assumptions for expected claims experience and future health care cost inflation. A 1% increase in the health care cost trends would result in a $23 million increase in 2016 interest cost plus service cost, and a $289 million increase in the benefit liability at December 31, 2016.

### Business Combinations

Management's judgment is required to estimate the purchase price, to identify and to determine fair value of all assets and liabilities acquired. The determination of the fair value of assets and liabilities acquired is based upon management's estimates and certain assumptions.

### Taxes

Hydro One assesses the likelihood that deferred tax assets will be recovered from future taxable income. To the extent management considers it is more likely than not that some portion or all of the deferred tax assets will not be realized, a valuation allowance is recognized.

### Asset Impairment

Within Hydro One's regulated businesses, the carrying costs of most of the long-lived assets are included in the rate base where they earn an OEB-approved rate of return. Asset carrying values and the related return are recovered through OEB-approved rates. As a result, such assets are only tested for impairment in the event that the OEB disallows recovery, in whole or in part, or if such a disallowance is judged to be probable. The Company regularly monitors the assets of its unregulated Hydro One Telecom subsidiary for indications of impairment. As at December 31, 2016, no asset impairment had been recorded for assets within Hydro One's regulated or unregulated businesses.

Goodwill is evaluated for impairment on an annual basis, or more frequently if circumstances require. Hydro One has concluded that goodwill was not impaired at December 31, 2016. Goodwill represents the cost of acquired distribution and transmission companies that is in excess of the fair value of the net identifiable assets acquired at the acquisition date.

# Disclosure Controls And Internal Controls Over Financial Reporting

Internal controls have been documented and tested for adequacy and effectiveness, and continue to be refined over all business processes.

In compliance with the requirements of National Instrument 52-109, the Company's Certifying Officers have reviewed and certified the Consolidated Financial Statements for the year ended December 31, 2016, together with other financial information included in the Company's securities filings. The Certifying Officers have also certified that disclosure controls and procedures (DC&P) have been designed to provide reasonable assurance that material information relating to the Company is made known within the Company. Further, the Certifying Officers have certified that internal controls over financial reporting (ICFR) have been designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of the Consolidated Financial Statements. Based on the evaluation of the design and operating effectiveness of the Company's DC&P and ICFR, the Certifying Officers concluded that the Company's DC&P and ICFR were effective as at December 31, 2016.

# New Accounting Pronouncements

The following tables present Accounting Standards Updates (ASUs) issued by the Financial Accounting Standards Board that are applicable to Hydro One.

## Recently Adopted Accounting Guidance

| ASU | Date issued | Description | Effective date | Impact on Hydro One |
|---|---|---|---|---|
| 2014-16 | November 2014 | This update clarifies that all relevant terms and features should be considered in evaluating the nature of a host contract for hybrid financial instruments issued in the form of a share. The nature of the host contract depends upon the economic characteristics and risks of the entire hybrid financial instrument. | January 1, 2016 | No material impact upon adoption |
| 2015-01 | January 2015 | Extraordinary items are no longer required to be presented separately in the income statement. | January 1, 2016 | No material impact upon adoption |
| 2015-02 | February 2015 | Guidance on analysis to be performed to determine whether certain types of legal entities should be consolidated. | January 1, 2016 | No material impact upon adoption |
| 2015-03 | April 2015 | Debt issuance costs are required to be presented on the balance sheet as a direct deduction from the carrying amount of the related debt liability consistent with debt discounts or premiums. | January 1, 2016 | Reclassification of deferred debt issuance costs and net unamortized debt premiums as an offset to long-term debt. Applied retrospectively. |
| 2015-05 | April 2015 | Cloud computing arrangements that have been assessed to contain a software licence should be accounted for as internal-use software. | January 1, 2016 | No material impact upon adoption |
| 2015-16 | September 2015 | Adjustments to provisional amounts that are identified during the measurement period of a business combination in the reporting period in which the adjustment amount is determined are required to be recognized. The amount recorded in current period earnings are required to be presented separately on the face of the income statement or disclosed in the notes by line item. | January 1, 2016 | No material impact upon adoption |
| 2015-17 | November 2015 | All deferred tax assets and liabilities are required to be classified as noncurrent on the balance sheet. | January 1, 2017 | This ASU was early adopted as of April 1, 2016 and was applied prospectively. As a result, the current portions of the Company's deferred income tax assets are reclassified as noncurrent assets on the consolidated Balance Sheet. Prior periods were not retrospectively adjusted. |
| 2016-09 | March 2016 | Several aspects of the accounting for share-based payment transactions were simplified, including the income tax consequences, classification of awards as either equity or liabilities, and classification on the statement of cash flows. | January 1, 2017 | This ASU was early adopted as of October 1, 2016 and was applied retrospectively. As a result, the Company accounts for forfeitures as they occur. There were no other material impacts upon adoption. |

## Recently Issued Accounting Guidance Not Yet Adopted

| ASU | Date issued | Description | Effective date | Anticipated impact on Hydro One |
|---|---|---|---|---|
| 2014-09<br>2015-14<br>2016-08<br>2016-10<br>2016-12<br>2016-20 | May 2014 – December 2016 | ASU 2014-09 was issued in May 2014 and provides guidance on revenue recognition relating to the transfer of promised goods or services to customers in an amount that reflects the consideration to which the entity expects to be entitled in exchange for those goods and services. ASU 2015-14 deferred the effective date of ASU 2014-09 by one year. Additional ASUs were issued in 2016 that simplify transition and provide clarity on certain aspects of the new standard. | January 1, 2018 | Hydro One has completed its initial assessment and has identified relevant revenue streams. No quantitative determination has been made as a detailed assessment is now underway and will continue through to the third quarter of 2017, with the end result being a determination of the financial impact of this standard. The Company is on track for implementation of this standard by the effective date. |
| 2016-01 | January 2016 | This update requires equity investments to be measured at fair value with changes in fair value recognized in net income, and requires enhanced disclosures and presentation of financial assets and liabilities in the financial statements. This ASU also simplifies the impairment assessment of equity investments without readily determinable fair values by requiring a qualitative assessment to identify impairment. | January 1, 2018 | Under assessment |
| 2016-02 | February 2016 | Lessees are required to recognize the rights and obligations resulting from operating leases as assets (right to use the underlying asset for the term of the lease) and liabilities (obligation to make future lease payments) on the balance sheet. | January 1, 2019 | An initial assessment is currently underway encompassing a review of all existing leases, which will be followed by a detailed review of relevant contracts. No quantitative determination has been made at this time. The Company is on track for implementation of this standard by the effective date. |
| 2016-05 | March 2016 | The amendments clarify that a change in the counterparty to a derivative instrument that has been designated as the hedging instrument under Topic 815 does not, in and of itself, require de-designation of that hedging relationship provided that all other hedge accounting criteria continue to be met. | January 1, 2018 | Under assessment |
| 2016-06 | March 2016 | Contingent call (put) options that are assessed to accelerate the payment of principal on debt instruments need to meet the criteria of being "clearly and closely related" to their debt hosts. | January 1, 2017 | No material impact |
| 2016-07 | March 2016 | The requirement to retroactively adopt the equity method of accounting if an investment qualifies for use of the equity method as a result of an increase in the level of ownership or degree of influence has been eliminated. | January 1, 2017 | No material impact |
| 2016-11 | May 2016 | This amendment covers the SEC Staff's rescinding of certain SEC Staff observer comments that are codified in Topic 605 and Topic 932, effective upon the adoption of Topic 606 and Topic 815, effective to coincide with the effective date of Update 2014-16. | January 1, 2019 | No material impact |

| ASU | Date issued | Description | Effective date | Anticipated impact on Hydro One |
|---|---|---|---|---|
| 2016-13 | June 2016 | The amendment provides users with more decision-useful information about the expected credit losses on financial instruments and other commitments to extend credit held by a reporting entity at each reporting date. | January 1, 2019 | Under assessment |
| 2016-15 | August 2016 | The amendments provide guidance for eight specific cash flow issues with the objective of reducing the existing diversity in practice. | January 1, 2018 | Under assessment |
| 2016-16 | October 2016 | The amendment eliminates the prohibition of recognizing current and deferred income taxes for an intra-entity asset transfer, other than inventory, until the asset has been sold to an outside party. The amendment will permit income tax consequences of such transfers to be recognized when the transfer occurs. | January 1, 2018 | Under assessment |
| 2016-18 | November 2016 | The amendment requires that restricted cash or restricted cash equivalents be included with cash and cash equivalents when reconciling the beginning and end-of-period balances in the statement of cash flows. | January 1, 2018 | Under assessment |
| 2017-01 | January 2017 | The amendment clarifies the definition of a business and provides additional guidance on evaluating whether transactions should be accounted for as acquisitions (or disposals) of assets or businesses. | January 1, 2018 | Under assessment |

## Summary of Fourth Quarter Results of Operations

| *Three months ended December 31*<br>*(millions of dollars, except EPS)* | 2016 | 2015 | Change |
|---|---|---|---|
| Revenues | | | |
| Distribution | 1,228 | 1,148 | 7.0% |
| Transmission | 373 | 361 | 3.3% |
| Other | 13 | 13 | – |
| | 1,614 | 1,522 | 6.0% |
| Costs | | | |
| Purchased power | 858 | 786 | 9.2% |
| OM&A | | | |
| Distribution | 163 | 146 | 11.6% |
| Transmission | 98 | 126 | (22.2%) |
| Other | 26 | 29 | (10.3%) |
| | 287 | 301 | (4.7%) |
| Depreciation and amortization | 204 | 193 | 5.7% |
| | 1,349 | 1,280 | 5.4% |
| Income before financing charges and income taxes | 265 | 242 | 9.5% |
| Financing charges | 101 | 94 | 7.4% |
| Income before income taxes | 164 | 148 | 10.8% |
| Income tax expense | 29 | 1 | 100.0% |
| Net income | 135 | 147 | (8.2%) |
| Net income attributable to common shareholders of Hydro One | 128 | 143 | (10.5%) |
| Basic EPS | $ 0.22 | $ 0.26 | (15.4%) |
| Diluted EPS | $ 0.21 | $ 0.26 | (19.2%) |
| Capital investments | | | |
| Distribution | 201 | 198 | 1.5% |
| Transmission | 274 | 251 | 9.2% |
| Other | 2 | 2 | – |
| | 477 | 451 | 5.8% |

### Net Income

Net income attributable to common shareholders for the quarter ended December 31, 2016 of $128 million is a decrease of $15 million or 10.5% from the prior year. Excluding the effect of an IPO-related positive tax adjustment of $19 million in the fourth quarter of 2015, net income for the quarter increased by 3.2%.

### Revenues

The quarterly increase of $12 million or 3.3% in transmission revenues was primarily due to higher average monthly Ontario 60-minute peak demand as several extremely cold days during the quarter increased peak transmission demand and OEB-approved transmission rate increases.

The quarterly increase of $80 million or 7.0% in distribution revenues was primarily due to higher power costs from generators that are passed on to customers and increased OEB-approved distribution rates for 2016, partially offset by lower energy consumption resulting from milder weather.

### OM&A Costs

The quarterly decrease of $28 million or 22.2% in transmission OM&A costs was primarily due to lower project cost and inventory write-downs and lower expenditures related to forestry control and line clearing on the Company's transmission rights-of-way.

The quarterly increase of $17 million or 11.6% in distribution OM&A costs was primarily due to higher volume of vegetation management activities, partially offset by lower costs related to restoring power services and storm response.

### Depreciation and Amortization

The increase of $11 million or 5.7% in depreciation and amortization costs for the fourth quarter of 2016 was mainly due to the growth in capital assets as the Company continues to place new assets in-service, consistent with its ongoing capital investment program.

### Financing Charges

The quarterly increase of $7 million or 7.4% in financing charges was primarily due to an increase in interest expense on long-term debt resulting from the increase in weighted average long-term debt outstanding during the quarter.

### Income Tax Expense

Income tax expense for the fourth quarter of 2016 increased by $28 million compared to 2015, and the Company realized an effective tax rate of approximately 17.7% in the fourth quarter of 2016 compared to approximately 0.7% in 2015. The increase in tax expense is primarily due to the following:

- the effect of an IPO-related positive tax adjustment of $19 million in the fourth quarter of 2015;
- higher income before taxes in the fourth quarter of 2016; and
- a decrease in deductible temporary differences such as capitalized pension deducted for tax purposes.

### Capital Investments

The increase in transmission capital investments during the fourth quarter was primarily due to

- an increased volume of work on insulator replacements;
- an increased volume of integrated station component replacements to replace deteriorated assets at transmission stations; and
- higher volume of demand work associated with equipment failures and spare transformer equipment purchases; partially offset by
- reduced work on the Clarington Transmission Station as the project nears completion.

The increase in distribution capital investments during the fourth quarter was primarily due to

- increased investments related to information technology infrastructure and customer programs together with upgrade and enhancement projects, including investments to integrate mobile technology with the Company's existing work management tools;
- higher volume of facility upgrades and construction of new operation centres; and
- higher volumes of work associated with further enabling certain of Hydro One's assets to be jointly used by the telecommunications and cable television industries, as well as relocation of poles, conductors and other equipment as required by municipal and provincial road authorities; partially offset by
- higher storm restoration work in the prior year primarily as a result of two significant wind storms during the fourth quarter of 2015.

## Forward-looking Statements And Information

The Company's oral and written public communications, including this document, often contain forward-looking statements that are based on current expectations, estimates, forecasts and projections about the Company's business and the industry, regulatory and economic environments in which it operates, and include beliefs and assumptions made by the management of the Company. Such statements include, but are not limited to: statements regarding the Company's transmission and distribution rates resulting from rate applications; statements regarding the Company's liquidity and capital resources and operational requirements; statements about the standby credit facilities; expectations regarding the Company's financing activities; statements regarding the Company's maturing debt; statements related to credit ratings; statements regarding ongoing and planned projects and/or initiatives, including expected results and completion dates; statements regarding expected future capital and development investments, the timing of these expenditures and the Company's investment plans; statements regarding contractual obligations and other commercial commitments; statements related to the OEB; statements regarding future pension contributions, the pension plan and valuations; expectations related to work force demographics; statements about collective agreements; statements related to dividends; statements related to claims; expectations regarding taxes; statements related to occupational rights; statements about non-GAAP measures; statements related to critical accounting estimates, including expectations regarding employee future benefits, environmental liabilities, and regulatory assets and liabilities; expectations related to the effect of interest rates; statements about the Company's reputation; statements regarding cyber and data security; statements related to future sales of shares of Hydro One; statements related to the Company's relationship with the Province; statements regarding recent accounting-related guidance; expectations related to tax impacts; statements related to the Universal Base Shelf Prospectus; and statements related to the Company's acquisitions, including statements about Great Lakes Power and Orillia Power. Words such as "expect", "anticipate", "intend", "attempt", "may", "plan", "will", "believe", "seek", "estimate", "goal", "aim", "target", and variations of such words and similar expressions are intended to identify such forward-looking statements. These statements are not guarantees of future performance and involve assumptions and risks and uncertainties that are difficult to predict. Therefore, actual outcomes and results may differ materially from what is expressed, implied or forecasted in such forward-looking statements. Hydro One does not intend, and it disclaims any obligation, to update any forward-looking statements, except as required by law.

These forward-looking statements are based on a variety of factors and assumptions including, but not limited to, the following: no unforeseen changes in the legislative and operating framework for Ontario's electricity market; favourable decisions from the OEB and other regulatory bodies concerning outstanding and future rate and other applications; no unexpected delays in obtaining the required approvals; no unforeseen changes in rate orders or rate setting methodologies for the Company's distribution and transmission businesses; continued use of US GAAP; a stable regulatory environment; no unfavourable changes in environmental regulation; and no significant event occurring outside the ordinary course of business. These assumptions are based on information currently available to the Company, including information obtained from third-party sources. Actual results may differ materially from those predicted by such forward-looking statements. While Hydro One does not know what impact any of these differences may have, the Company's business, results of operations, financial condition and credit stability may be materially adversely affected. Factors that could cause actual results or outcomes to differ materially from the results expressed or implied by forward-looking statements include, among other things:

- risks associated with the Province's share ownership of Hydro One and other relationships with the Province, including potential conflicts of interest that may arise between Hydro One, the Province and related parties;
- regulatory risks and risks relating to Hydro One's revenues, including risks relating to rate orders, actual performance against forecasts and capital expenditures;
- the risk that the Company may be unable to comply with regulatory and legislative requirements or that the Company may incur additional costs for compliance that are not recoverable through rates;
- the risk of exposure of the Company's facilities to the effects of severe weather conditions, natural disasters or other unexpected occurrences for which the Company is uninsured or for which the Company could be subject to claims for damage;
- public opposition to and delays or denials of the requisite approvals and accommodations for the Company's planned projects;
- the risk that Hydro One may incur significant costs associated with transferring assets located on Reserves (as defined in the *Indian Act* (Canada));
- the risks associated with information system security and maintaining a complex information technology system infrastructure;
- the risks related to the Company's work force demographic and its potential inability to attract and retain qualified personnel;
- the risk of labour disputes and inability to negotiate appropriate collective agreements on acceptable terms consistent with the Company's rate decisions;
- risk that the Company is not able to arrange sufficient cost-effective financing to repay maturing debt and to fund capital expenditures;
- risks associated with fluctuations in interest rates and failure to manage exposure to credit risk;
- the risk that the Company may not be able to execute plans for capital projects necessary to maintain the performance of the Company's assets or to carry out projects in a timely manner;
- the risk of non-compliance with environmental regulations or failure to mitigate significant health and safety risks and inability to recover environmental expenditures in rate applications;
- the risk that assumptions that form the basis of the Company's recorded environmental liabilities and related regulatory assets may change;
- the risk of not being able to recover the Company's pension expenditures in future rates and uncertainty regarding the future regulatory treatment of pension, other post-employment benefits and post-retirement benefits costs;
- the potential that Hydro One may incur significant expenses to replace functions currently outsourced if agreements are terminated or expire before a new service provider is selected;
- the risks associated with economic uncertainty and financial market volatility;
- the inability to prepare financial statements using US GAAP; and
- the impact of the ownership by the Province of lands underlying the Company's transmission system.

Hydro One cautions the reader that the above list of factors is not exhaustive. Some of these and other factors are discussed in more detail in the section "Risk Management and Risk Factors" in this MD&A.

In addition, Hydro One cautions the reader that information provided in this MD&A regarding the Company's outlook on certain matters, including potential future investments, is provided in order to give context to the nature of some of the Company's future plans and may not be appropriate for other purposes.

Additional information about Hydro One, including the Company's Annual Information Form, is available on SEDAR at www.sedar.com and the Company's website at www.HydroOne.com/Investors.

# Management's Report

The Consolidated Financial Statements, Management's Discussion and Analysis (MD&A) and related financial information have been prepared by the management of Hydro One Limited (Hydro One or the Company). Management is responsible for the integrity, consistency and reliability of all such information presented. The Consolidated Financial Statements have been prepared in accordance with United States Generally Accepted Accounting Principles and applicable securities legislation. The MD&A has been prepared in accordance with National Instrument 51-102.

The preparation of the Consolidated Financial Statements and information in the MD&A involves the use of estimates and assumptions based on management's judgment, particularly when transactions affecting the current accounting period cannot be finalized with certainty until future periods. Estimates and assumptions are based on historical experience, current conditions and various other assumptions believed to be reasonable in the circumstances, with critical analysis of the significant accounting policies followed by the Company as described in Note 2 to the Consolidated Financial Statements. The preparation of the Consolidated Financial Statements and the MD&A includes information regarding the estimated impact of future events and transactions. The MD&A also includes information regarding sources of liquidity and capital resources, operating trends, risks and uncertainties. Actual results in the future may differ materially from the present assessment of this information because future events and circumstances may not occur as expected. The Consolidated Financial Statements and MD&A have been properly prepared within reasonable limits of materiality and in light of information up to February 9, 2017.

Management is responsible for establishing and maintaining adequate internal control over financial reporting for the Company. In meeting its responsibility for the reliability of financial information, management maintains and relies on a comprehensive system of internal control and internal audit. The system of internal control includes a written corporate conduct policy; implementation of a risk management framework; effective segregation of duties and delegation of authorities; and sound accounting policies that are regularly reviewed. This structure is designed to provide reasonable assurance that assets are safeguarded and that reliable information is available on a timely basis. In addition, management has assessed the design and operating effectiveness of the Company's internal control over financial reporting in accordance with the criteria set forth in Internal Control – Integrated Framework (2013), issued by the Committee of Sponsoring Organizations of the Treadway Commission. Based on this assessment, management concluded that the Company maintained effective internal control over financial reporting as of December 31, 2016. The effectiveness of these internal controls is reported to the Audit Committee of the Hydro One Board of Directors, as required.

The Consolidated Financial Statements have been audited by KPMG LLP, independent external auditors appointed by the shareholders of the Company. The external auditors' responsibility is to express their opinion on whether the Consolidated Financial Statements are fairly presented in accordance with United States Generally Accepted Accounting Principles. The Independent Auditors' Report outlines the scope of their examination and their opinion.

The Hydro One Board of Directors, through its Audit Committee, is responsible for ensuring that management fulfills its responsibilities for financial reporting and internal controls. The Audit Committee of Hydro One met periodically with management, the internal auditors and the external auditors to satisfy itself that each group had properly discharged its respective responsibility and to review the Consolidated Financial Statements before recommending approval by the Board of Directors. The external auditors had direct and full access to the Audit Committee, with and without the presence of management, to discuss their audit findings.

The President and Chief Executive Officer and the Chief Financial Officer have certified Hydro One's annual Consolidated Financial Statements and annual MD&A, related disclosure controls and procedures and the design and effectiveness of related internal controls over financial reporting.

On behalf of Hydro One's management:

# Independent Auditors' Report

*To the Shareholders of Hydro One Limited*

We have audited the accompanying Consolidated Financial Statements of Hydro One Limited, which comprise the consolidated balance sheets as at December 31, 2016 and December 31, 2015, the consolidated statements of operations and comprehensive income, changes in equity and cash flows for the years then ended, and notes, comprising a summary of significant accounting policies and other explanatory information.

## *Management's Responsibility for the Consolidated Financial Statements*

Management is responsible for the preparation and fair presentation of these Consolidated Financial Statements in accordance with United States Generally Accepted Accounting Principles, and for such internal control as management determines is necessary to enable the preparation of Consolidated Financial Statements that are free from material misstatement, whether due to fraud or error.

## *Auditors' Responsibility*

Our responsibility is to express an opinion on these Consolidated Financial Statements based on our audits. We conducted our audits in accordance with Canadian generally accepted auditing standards. Those standards require that we comply with ethical requirements and plan and perform the audit to obtain reasonable assurance about whether the Consolidated Financial Statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the Consolidated Financial Statements. The procedures selected depend on our judgment, including the assessment of the risks of material misstatement of the Consolidated Financial Statements, whether due to fraud or error. In making those risk assessments, we consider internal control relevant to the entity's preparation and fair presentation of the Consolidated Financial Statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of accounting estimates made by management, as well as evaluating the overall presentation of the Consolidated Financial Statements.

We believe that the audit evidence we have obtained in our audits is sufficient and appropriate to provide a basis for our audit opinion.

## *Opinion*

In our opinion, the Consolidated Financial Statements present fairly, in all material respects, the consolidated financial position of Hydro One Limited as at December 31, 2016 and December 31, 2015, and its consolidated results of operations and its consolidated cash flows for the years then ended in accordance with United States Generally Accepted Accounting Principles.

# Notes to Consolidated Financial Statements

*For the years ended December 31, 2016 and 2015*

## 1. Description of The Business

Hydro One Limited (Hydro One or the Company) was incorporated on August 31, 2015, under the *Business Corporations Act* (Ontario). On October 31, 2015, the Company acquired Hydro One Inc., a company previously wholly owned by the Province of Ontario (Province). The acquisition of Hydro One Inc. by Hydro One was accounted for as a common control transaction and Hydro One is a continuation of business operations of Hydro One Inc. At December 31, 2016, the Province holds approximately 70.1% (2015 – 84%) of the common shares of Hydro One. See note 21 for further details regarding the reorganization of Hydro One.

The principal businesses of Hydro One are the transmission and distribution of electricity to customers within Ontario.

## 2. Significant Accounting Policies

### Basis of Consolidation and Preparation

These Consolidated Financial Statements include the accounts of the Company and its subsidiaries. Intercompany transactions and balances have been eliminated.

The comparative information to these Consolidated Financial Statements has been presented in a manner similar to the pooling-of-interests method. The comparative information consists of the results of operations of Hydro One Inc. prior to October 31, 2015, and the consolidated results of operations of Hydro One from the date of incorporation on August 31, 2015 to December 31, 2015, which include the results of Hydro One Inc. subsequent to its acquisition on October 31, 2015. The comparative information has been combined using historical amounts. In addition, Hydro One's issued and outstanding common shares prior to October 31, 2015 have been retroactively adjusted for the purposes of presentation to reflect the effects of the acquisition of Hydro One Inc. using the exchange ratio established for the acquisition. The Consolidated Financial Statements are referred to as "consolidated" for all periods presented.

On August 31, 2015, Hydro One Inc. completed the spin-off of its subsidiary, Hydro One Brampton Networks Inc. (Hydro One Brampton) to the Province (see note 4). The comparative information to these Consolidated Financial Statements includes the results of Hydro One Brampton up to August 31, 2015.

### Basis of Accounting

These Consolidated Financial Statements are prepared and presented in accordance with United States (US) Generally Accepted Accounting Principles (GAAP) and in Canadian dollars.

### Use of Management Estimates

The preparation of financial statements requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities at the date of the financial statements and the reported amounts of revenues, expenses, gains and losses during the reporting periods. Management evaluates these estimates on an ongoing basis based upon historical experience, current conditions, and assumptions believed to be reasonable at the time the assumptions are made, with any adjustments being recognized in results of operations in the period they arise. Significant estimates relate to regulatory assets and regulatory liabilities, environmental liabilities, pension benefits, post-retirement and post-employment benefits, asset retirement obligations, goodwill and asset impairments, contingencies, unbilled revenues, allowance for doubtful accounts, derivative instruments, and deferred income tax assets and liabilities. Actual results may differ significantly from these estimates.

### Rate Setting

The Company's Transmission Business consists of the transmission business of Hydro One Inc., which includes the transmission business of Hydro One Networks Inc. (Hydro One Networks), Hydro One Sault Ste. Marie LP (previously Great Lakes Power Transmission LP (Great Lakes Power)), and its 66% interest in B2M Limited Partnership (B2M LP). The Company's Distribution Business consists of the distribution business of Hydro One Inc., which includes the distribution businesses of Hydro One Networks, as well as Hydro One Remote Communities Inc. (Hydro One Remote Communities).

#### Transmission

In November 2015, the OEB approved Hydro One Networks' 2016 transmission rates revenue requirement of $1,480 million.

In December 2015, the OEB approved B2M LP's 2015-2019 rates revenue requirements of $39 million, $36 million, $37 million, $38 million and $37 million for the respective years. On January 14, 2016, the OEB approved the B2M LP revenue requirement recovery through the 2016 Uniform Transmission Rates, and the establishment of a deferral account to capture costs of Tax Rate and Rule changes.

## Distribution

In March 2015, the OEB approved Hydro One Networks' distribution revenue requirements of $1,326 million for 2015, $1,430 million for 2016 and $1,486 million for 2017. The OEB has subsequently approved updated revenue requirements of $1,410 million for 2016 and $1,415 million for 2017.

On March 17, 2016, the OEB approved an increase of 2.10% to Hydro One Remote Communities' basic rates for the distribution and generation of electricity, with an effective date of May 1, 2016.

## Regulatory Accounting

The OEB has the general power to include or exclude revenues, costs, gains or losses in the rates of a specific period, resulting in a change in the timing of accounting recognition from that which would have been applied in an unregulated company. Such change in timing involves the application of rate-regulated accounting, giving rise to the recognition of regulatory assets and liabilities. The Company's regulatory assets represent certain amounts receivable from future customers and costs that have been deferred for accounting purposes because it is probable that they will be recovered in future rates. In addition, the Company has recorded regulatory liabilities that generally represent amounts that are refundable to future customers. The Company continually assesses the likelihood of recovery of each of its regulatory assets and continues to believe that it is probable that the OEB will include its regulatory assets and liabilities in setting of future rates. If, at some future date, the Company judges that it is no longer probable that the OEB will include a regulatory asset or liability in setting future rates, the appropriate carrying amount would be reflected in results of operations in the period that the assessment is made.

## Cash and Cash Equivalents

Cash and cash equivalents include cash and short-term investments with an original maturity of three months or less.

## Revenue Recognition

Transmission revenues are collected through OEB-approved rates, which are based on an approved revenue requirement that includes a rate of return. Such revenue is recognized as electricity is transmitted and delivered to customers.

Distribution revenues attributable to the delivery of electricity are based on OEB-approved distribution rates and are recognized on an accrual basis and include billed and unbilled revenues. Billed revenues are based on electricity delivered as measured from customer meters. At the end of each month, electricity delivered to customers since the date of the last billed meter reading is estimated, and the corresponding unbilled revenue is recorded. The unbilled revenue estimate is affected by energy consumption, weather, and changes in the composition of customer classes.

Distribution revenue also includes an amount relating to rate protection for rural, residential, and remote customers, which is received from the Independent Electricity System Operator (IESO) based on a standardized customer rate that is approved by the OEB.

Revenues also include amounts related to sales of other services and equipment. Such revenue is recognized as services are rendered or as equipment is delivered.

Revenues are recorded net of indirect taxes.

## Accounts Receivable and Allowance for Doubtful Accounts

Billed accounts receivable are recorded at the invoiced amount, net of allowance for doubtful accounts. Unbilled accounts receivable are recorded at their estimated value. Overdue amounts related to regulated billings bear interest at OEB-approved rates. The allowance for doubtful accounts reflects the Company's best estimate of losses on billed accounts receivable balances. The Company estimates the allowance for doubtful accounts on billed accounts receivable by applying internally developed loss rates to the outstanding receivable balances by aging category. Loss rates applied to the billed accounts receivable balances are based on historical overdue balances, customer payments and write-offs. Accounts receivable are written-off against the allowance when they are deemed uncollectible. The allowance for doubtful accounts is affected by changes in volume, prices and economic conditions.

## Noncontrolling interest

Noncontrolling interest represents the portion of equity ownership in subsidiaries that is not attributable to shareholders of Hydro One. Noncontrolling interest is initially recorded at fair value and subsequently the amount is adjusted for the proportionate share of net income and other comprehensive income attributable to the noncontrolling interest and any dividends or distributions paid to the noncontrolling interest.

If a transaction results in the acquisition of all, or part, of a noncontrolling interest in a subsidiary, the acquisition of the noncontrolling interest is accounted for as an equity transaction. No gain or loss is recognized in consolidated net income or comprehensive income as a result of changes in the noncontrolling interest, unless a change results in the loss of control by the Company.

## Income Taxes

Prior to the IPO, Hydro One was exempt from tax under the *Income Tax Act* (Canada) and the *Taxation Act, 2007* (Ontario) (Federal Tax Regime). However, under the *Electricity Act*, Hydro One was required to make payments in lieu of tax (PILs) to the Ontario Electricity Financing Corporation (OEFC) (PILs Regime). The PILs were, in general, based on the amount of tax that Hydro One would otherwise be liable to pay under the Federal Tax Regime if it was not exempt from taxes under those statutes. In connection with the IPO of Hydro One, Hydro One's exemption from tax under the Federal Tax Regime ceased to apply. Upon exiting the PILs Regime, Hydro One is required to make corporate income tax payments to the Canada Revenue Agency (CRA) under the Federal Tax Regime.

Current and deferred income taxes are computed based on the tax rates and tax laws enacted as at the balance sheet date. Tax benefits associated with income tax positions taken, or expected to be taken, in a tax return are recorded only when the "more-likely-than-not" recognition threshold is satisfied and are measured at the largest amount of benefit that has a greater than 50% likelihood of being realized upon settlement. Management evaluates each position based solely on the technical merits and facts and circumstances of the position, assuming the position will be examined by a taxing authority having full knowledge of all relevant information. Significant management judgment is required to determine recognition thresholds and the related amount of tax benefits to be recognized in the Consolidated Financial Statements. Management re-evaluates tax positions each period using new information about recognition or measurement as it becomes available.

## Deferred Income Taxes

Deferred income taxes are provided for using the liability method. Deferred income taxes are recognized based on the estimated future tax consequences attributable to temporary differences between the carrying amount of assets and liabilities in the Consolidated Financial Statements and their corresponding tax bases.

Deferred income tax liabilities are recognized on all taxable temporary differences. Deferred tax assets are recognized to the extent that it is more-likely-than-not that these assets will be realized from taxable income available against which deductible temporary differences can be utilized.

Deferred income taxes are calculated at the tax rates that are expected to apply in the period when the liability is settled or the asset is realized, based on the tax rates and tax laws that have been enacted as at the balance sheet date. Deferred income taxes that are not included in the rate-setting process are charged or credited to the Consolidated Statements of Operations and Comprehensive Income.

If management determines that it is more-likely-than-not that some or all of a deferred income tax asset will not be realized, a valuation allowance is recorded against the deferred income tax asset to report the net balance at the amount expected to be realized. Previously unrecognized deferred income tax assets are reassessed at each balance sheet date and are recognized to the extent that it has become more-likely-than-not that the tax benefit will be realized.

The Company records regulatory assets and liabilities associated with deferred income taxes that will be included in the rate-setting process.

The Company uses the flow-through method to account for investment tax credits (ITCs) earned on eligible scientific research and experimental development expenditures, and apprenticeship job creation. Under this method, only non-refundable ITCs are recognized as a reduction to income tax expense.

## Materials and Supplies

Materials and supplies represent consumables, small spare parts and construction materials held for internal construction and maintenance of property, plant and equipment. These assets are carried at average cost less any impairments recorded.

## Property, Plant and Equipment

Property, plant and equipment is recorded at original cost, net of customer contributions, and any accumulated impairment losses. The cost of additions, including betterments and replacement asset components, is included on the Consolidated Balance Sheets as property, plant and equipment.

The original cost of property, plant and equipment includes direct materials, direct labour (including employee benefits), contracted services, attributable capitalized financing costs, asset retirement costs, and direct and indirect overheads that are related to the capital project or program. Indirect overheads include a portion of corporate costs such as finance, treasury, human resources, information technology and executive costs. Overhead costs, including corporate functions and field services costs, are capitalized on a fully allocated basis, consistent with an OEB-approved methodology.

Property, plant and equipment in service consists of transmission, distribution, communication, administration and service assets and land easements. Property, plant and equipment also includes future use assets, such as land, major components and spare parts, and capitalized project development costs associated with deferred capital projects.

### Transmission

Transmission assets include assets used for the transmission of high-voltage electricity, such as transmission lines, support structures, foundations, insulators, connecting hardware and grounding systems, and assets used to step up the voltage of electricity from generating stations for transmission and to step down voltages for distribution, including transformers, circuit breakers and switches.

### Distribution

Distribution assets include assets related to the distribution of low-voltage electricity, including lines, poles, switches, transformers, protective devices and metering systems.

### Communication

Communication assets include fibre optic and microwave radio systems, optical ground wire, towers, telephone equipment and associated buildings.

### Administration and Service

Administration and service assets include administrative buildings, personal computers, transport and work equipment, tools and other minor assets.

### Easements

Easements include statutory rights of use for transmission corridors and abutting lands granted under the *Reliable Energy and Consumer Protection Act, 2002*, as well as other land access rights.

## Intangible Assets

Intangible assets separately acquired or internally developed are measured on initial recognition at cost, which comprises purchased software, direct labour (including employee benefits), consulting, engineering, overheads and attributable capitalized financing charges. Following initial recognition, intangible assets are carried at cost, net of any accumulated amortization and accumulated impairment losses. The Company's intangible assets primarily represent major computer applications.

## Capitalized Financing Costs

Capitalized financing costs represent interest costs attributable to the construction of property, plant and equipment or development of intangible assets. The financing cost of attributable borrowed funds is capitalized as part of the acquisition cost of such assets. The capitalized financing costs are a reduction of financing charges recognized in the Consolidated Statements of Operations and Comprehensive Income. Capitalized financing costs are calculated using the Company's weighted average effective cost of debt.

## Construction and Development in Progress

Construction and development in progress consists of the capitalized cost of constructed assets that are not yet complete and which have not yet been placed in service.

## Depreciation and Amortization

The cost of property, plant and equipment and intangible assets is depreciated or amortized on a straight-line basis based on the estimated remaining service life of each asset category, except for transport and work equipment, which is depreciated on a declining balance basis.

The Company periodically initiates an external independent review of its property, plant and equipment and intangible asset depreciation and amortization rates, as required by the OEB. Any changes arising from OEB approval of such a review are implemented on a remaining service life basis, consistent with their inclusion in electricity rates. The last review resulted in changes to rates effective January 1, 2015. A summary of average service lives and depreciation and amortization rates for the various classes of assets is included below:

| | Average Service Life | Rate Range | Rate Average |
|---|---|---|---|
| Property, plant and equipment: | | | |
| Transmission | 56 years | 1% – 3% | 2% |
| Distribution | 46 years | 1% – 7% | 2% |
| Communication | 16 years | 1% –15% | 6% |
| Administration and service | 18 years | 1% –20% | 7% |
| Intangible assets | 10 years | 10% | 10% |

In accordance with group depreciation practices, the original cost of property, plant and equipment, or major components thereof, and intangible assets that are normally retired, is charged to accumulated depreciation, with no gain or loss being reflected in results of operations. Where a disposition of property, plant and equipment occurs through sale, a gain or loss is calculated based on proceeds and such gain or loss is included in depreciation expense.

## Acquisitions and Goodwill

The Company accounts for business acquisitions using the acquisition method of accounting and, accordingly, the assets and liabilities of the acquired entities are primarily measured at their estimated fair value at the date of acquisition. Goodwill represents the cost of acquired companies that is in excess of the fair value of the net identifiable assets acquired at the acquisition date. Goodwill is not included in rate base.

Goodwill is evaluated for impairment on an annual basis, or more frequently if circumstances require. The Company performs a qualitative assessment to determine whether it is more-likely-than-not that the fair value of the applicable reporting unit is less than its carrying amount. If the Company determines, as a result of its qualitative assessment, that it is not more-likely-than-not that the fair value of the applicable reporting unit is less than its carrying amount, no further testing is required. If the Company determines, as a result of its qualitative assessment, that it is more-likely-than-not that the fair value of the applicable reporting unit is less than its carrying amount, a goodwill impairment assessment is performed using a two-step, fair value-based test. The first step compares the fair value of the applicable reporting unit to its carrying amount, including goodwill. If the carrying amount of the applicable reporting unit exceeds its fair value, a second step is performed. The second step requires an allocation of fair value to the individual assets and liabilities using purchase price allocation in order to determine the implied fair value of goodwill. If the implied fair value of goodwill is less than the carrying amount, an impairment loss is recorded as a reduction to goodwill and as a charge to results of operations.

For the year ended December 31, 2016, based on the qualitative assessment performed as at September 30, 2016, the Company has determined that it is not more-likely-than-not that the fair value of each applicable reporting unit assessed is less than its carrying amount. As a result, no further testing was performed, and the Company has concluded that goodwill was not impaired at December 31, 2016.

## Long-Lived Asset Impairment

When circumstances indicate the carrying value of long-lived assets may not be recoverable, the Company evaluates whether the carrying value of such assets, excluding goodwill, has been impaired. For such long-lived assets, the Company evaluates whether impairment may exist by estimating future estimated undiscounted cash flows expected to result from the use and eventual disposition of the asset. When alternative courses of action to recover the carrying amount of a long-lived asset are under consideration, a probability-weighted approach is used to develop estimates of future undiscounted cash flows. If the carrying value of the long-lived asset is not recoverable based on the estimated future undiscounted cash flows, an impairment loss is recorded, measured as the excess of the carrying value of the asset over its fair value. As a result, the asset's carrying value is adjusted to its estimated fair value.

Within its regulated business, the carrying costs of most of Hydro One's long-lived assets are included in rate base where they earn an OEB-approved rate of return. Asset carrying values and the related return are recovered through approved rates. As a result, such assets are only tested for impairment in the event that the OEB disallows recovery, in whole or in part, or if such a disallowance is judged to be probable.

Hydro One regularly monitors the assets of its unregulated Hydro One Telecom subsidiary for indications of impairment. Management assesses the fair value of such long-lived assets using commonly accepted techniques. Techniques used to determine fair value include, but are not limited to, the use of recent third-party comparable sales for reference and internally developed discounted cash flow analysis. Significant changes in market conditions, changes to the condition of an asset, or a change in management's intent to utilize the asset are generally viewed by management as triggering events to reassess the cash flows related to these long-lived assets. As at December 31, 2016 and 2015, no asset impairment had been recorded for assets within either the Company's regulated or unregulated businesses.

## Costs of Arranging Debt Financing

For financial liabilities classified as other than held-for-trading, the Company defers the external transaction costs related to obtaining debt financing and presents such amounts net of related debt on the Consolidated Balance Sheets. Deferred debt issuance costs are amortized over the contractual life of the related debt on an effective-interest basis and the amortization is included within financing charges in the Consolidated Statements of Operations and Comprehensive Income. Transaction costs for items classified as held-for-trading are expensed immediately.

## Comprehensive Income

Comprehensive income is comprised of net income and other comprehensive income (OCI). Hydro One presents net income and OCI in a single continuous Consolidated Statement of Operations and Comprehensive Income.

## Financial Assets and Liabilities

All financial assets and liabilities are classified into one of the following five categories: held-to-maturity; loans and receivables; held-for-trading; other liabilities; or available-for-sale. Financial assets and liabilities classified as held-for-trading are measured at fair value. All other financial assets and liabilities are measured at amortized cost, except accounts receivable and amounts due from related parties, which are measured at the lower of cost or fair value. Accounts receivable and amounts due from related parties are classified as loans and receivables. The Company considers the carrying amounts of accounts receivable and amounts due from related parties to be reasonable estimates of fair value because of the short time to maturity of these instruments. Provisions for impaired accounts receivable are recognized as adjustments to the allowance for doubtful accounts and are recognized when there is objective evidence that the Company will not be able to collect amounts according to the original terms. All financial instrument transactions are recorded at trade date.

Derivative instruments are measured at fair value. Gains and losses from fair valuation are included within financing charges in the period in which they arise. The Company determines the classification of its financial assets and liabilities at the date of initial recognition. The Company designates certain of its financial assets and liabilities to be held at fair value, when it is consistent with the Company's risk management policy disclosed in Note 16 – Fair Value of Financial Instruments and Risk Management.

## Derivative Instruments and Hedge Accounting

The Company closely monitors the risks associated with changes in interest rates on its operations and, where appropriate, uses various instruments to hedge these risks. Certain of these derivative instruments qualify for hedge accounting and are designated as accounting hedges, while others either do not qualify as hedges or have not been designated as hedges (hereinafter referred to as undesignated contracts) as they are part of economic hedging relationships.

The accounting guidance for derivative instruments requires the recognition of all derivative instruments not identified as meeting the normal purchase and sale exemption as either assets or liabilities recorded at fair value on the Consolidated Balance Sheets. For derivative instruments that qualify for hedge accounting, the Company may elect to designate such derivative instruments as either cash flow hedges or fair value hedges. The Company offsets fair value amounts recognized on its Consolidated Balance Sheets related to derivative instruments executed with the same counterparty under the same master netting agreement.

For derivative instruments that qualify for hedge accounting and which are designated as cash flow hedges, the effective portion of any gain or loss, net of tax, is reported as a component of accumulated OCI (AOCI) and is reclassified to results of operations in the same period or periods during which the hedged transaction affects results of operations. Any gains or losses on the derivative instrument that represent either hedge ineffectiveness or hedge components excluded from the assessment of effectiveness are recognized in results of operations. For fair value hedges, changes in fair value of both the derivative instrument and the underlying hedged exposure are recognized in the Consolidated Statements of Operations and Comprehensive Income in the current period. The gain or loss on the derivative instrument is included in the same line item as the offsetting gain or loss on the hedged item in the Consolidated Statements of Operations and Comprehensive Income. The changes in fair value of the undesignated derivative instruments are reflected in results of operations.

Embedded derivative instruments are separated from their host contracts and are carried at fair value on the Consolidated Balance Sheets when: (a) the economic characteristics and risks of the embedded derivative are not clearly and closely related to the economic characteristics and risks of the host contract; (b) the hybrid instrument is not measured at fair value, with changes in fair value recognized in results of operations each period; and (c) the embedded derivative itself meets the definition of a derivative. The Company does not engage in derivative trading or speculative activities and had no embedded derivatives at December 31, 2016 or 2015.

Hydro One periodically develops hedging strategies taking into account risk management objectives. At the inception of a hedging relationship where the Company has elected to apply hedge accounting, Hydro One formally documents the relationship between the hedged item and the hedging instrument, the related risk management objective, the nature of the specific risk exposure being hedged, and the method for assessing the effectiveness of the hedging relationship. The Company also assesses, both at the inception of the hedge and on a quarterly basis, whether the hedging instruments are effective in offsetting changes in fair values or cash flows of the hedged items.

## Employee Future Benefits

Employee future benefits provided by Hydro One include pension, post-retirement and post-employment benefits. The costs of the Company's pension, post-retirement and post-employment benefit plans are recorded over the periods during which employees render service.

The Company recognizes the funded status of its defined benefit pension, post-retirement and post-employment plans on its Consolidated Balance Sheets and subsequently recognizes the changes in funded status at the end of each reporting year. Defined benefit pension, post-retirement and post-employment plans are considered to be underfunded when the projected benefit obligation exceeds the fair value of the plan assets. Liabilities are recognized on the Consolidated Balance Sheets for any net underfunded projected benefit obligation. The net underfunded projected benefit obligation may be disclosed as a current liability, long-term liability, or both. The current portion is the amount by which the actuarial present value of benefits included in the benefit obligation payable in the next 12 months exceeds the fair value of plan assets. If the fair value of plan assets exceeds the projected benefit obligation of the plan, an asset is recognized equal to the net overfunded projected benefit obligation. The post-retirement and post-employment benefit plans are unfunded because there are no related plan assets.

Hydro One recognizes its contributions to the defined contribution pension plan as pension expense, with a portion being capitalized as part of labour costs included in capital expenditures. The expensed amount is included in operation, maintenance and administration costs in the Consolidated Statements of Operations and Comprehensive Income.

### Defined Benefit Pension

Defined benefit pension costs are recorded on an accrual basis for financial reporting purposes. Pension costs are actuarially determined using the projected benefit method prorated on service and are based on assumptions that reflect management's best estimate of the effect of future events, including future compensation increases. Past service costs from plan amendments and all actuarial gains and losses are amortized on a straight-line basis over the expected average remaining service period of active employees in the plan, and over the estimated remaining life expectancy of inactive employees in the plan. Pension plan assets, consisting primarily of listed equity securities as well as corporate and government debt securities, are fair valued at the end of each year. Hydro One records a regulatory asset equal to the net underfunded projected benefit obligation for its pension plan.

### Post-retirement and Post-employment Benefits

Post-retirement and post-employment benefits are recorded and included in rates on an accrual basis. Costs are determined by independent actuaries using the projected benefit method prorated on service and based on assumptions that reflect management's best estimates. Past service costs from plan amendments are amortized to results of operations based on the expected average remaining service period.

For post-retirement benefits, all actuarial gains or losses are deferred using the "corridor" approach. The amount calculated above the "corridor" is amortized to results of operations on a straight-line basis over the expected average remaining service life of active employees in the plan and over the remaining life expectancy of inactive employees in the plan. The post-retirement benefit obligation is remeasured to its fair value at each year end based on an annual actuarial report, with an offset to the associated regulatory asset, to the extent of the remeasurement adjustment.

For post-employment obligations, the associated regulatory liabilities representing actuarial gains on transition to US GAAP are amortized to results of operations based on the "corridor" approach. The actuarial gains and losses on post-employment obligations that are incurred during the year are recognized immediately to results of operations. The post-employment benefit obligation is remeasured to its fair value at each year end based on an annual actuarial report, with an offset to the associated regulatory asset, to the extent of the remeasurement adjustment.

All post-retirement and post-employment future benefit costs are attributed to labour and are either charged to results of operations or capitalized as part of the cost of property, plant and equipment and intangible assets.

## Stock-Based Compensation

### Share Grant Plans

Hydro One measures share grant plans based on fair value of share grants as estimated based on the grant date share price. The costs are recognized in the financial statements using the graded-vesting attribution method for share grant plans that have both a performance condition and a service condition. The Company records a regulatory asset equal to the accrued costs of share grant plans recognized in each period. Forfeitures are recognized as they occur (see note 3).

### Directors' Deferred Share Unit (DSU) Plan

The Company records the liabilities associated with its Directors' DSU Plan at fair value at each reporting date until settlement, recognizing compensation expense over the vesting period on a straight-line basis. The fair value of the DSU liability is based on the Company's common share closing price at the end of each reporting period.

### Long-term Incentive Plan (LTIP)

The Company measures its LTIP at fair value based on the grant date share price. The related compensation expense is recognized over the vesting period on a straight-line basis. Forfeitures are recognized as they occur.

## Loss Contingencies

Hydro One is involved in certain legal and environmental matters that arise in the normal course of business. In the preparation of its Consolidated Financial Statements, management makes judgments regarding the future outcome of contingent events and records a loss for a contingency based on its best estimate when it is determined that such loss is probable and the amount of the loss can be reasonably estimated. Where the loss amount is recoverable in future rates, a regulatory asset is also recorded. When a range estimate for the probable loss exists and no amount within the range is a better estimate than any other amount, the Company records a loss at the minimum amount within the range.

Management regularly reviews current information available to determine whether recorded provisions should be adjusted and whether new provisions are required. Estimating probable losses may require analysis of multiple forecasts and scenarios that often depend on judgments about potential actions by third parties, such as federal, provincial and local courts or regulators. Contingent liabilities are often resolved over long periods of time. Amounts recorded in the Consolidated Financial Statements may differ from the actual outcome once the contingency is resolved. Such differences could have a material impact on future results of operations, financial position and cash flows of the Company.

Provisions are based upon current estimates and are subject to greater uncertainty where the projection period is lengthy. A significant upward or downward trend in the number of claims filed, the nature of the alleged injuries, and the average cost of resolving each claim could change the estimated provision, as could any substantial adverse or favourable verdict at trial. A federal or provincial legislative outcome or structured settlement could also change the estimated liability. Legal fees are expensed as incurred.

## Environmental Liabilities

Environmental liabilities are recorded in respect of past contamination when it is determined that future environmental remediation expenditures are probable under existing statute or regulation and the amount of the future expenditures can be reasonably estimated. Hydro One records a liability for the estimated future expenditures associated with contaminated land assessment and remediation and for the phase-out and destruction of polychlorinated biphenyl (PCB)-contaminated mineral oil removed from electrical equipment, based on the present value of these estimated future expenditures. The Company determines the present value with a discount rate equal to its credit-adjusted risk-free interest rate on financial instruments with comparable maturities to the pattern of future environmental expenditures. As the Company anticipates that the future expenditures will continue to be recoverable in future rates, an offsetting regulatory asset has been recorded to reflect the future recovery of these environmental expenditures from customers. Hydro One reviews its estimates of future environmental expenditures annually, or more frequently if there are indications that circumstances have changed.

## Asset Retirement Obligations

Asset retirement obligations are recorded for legal obligations associated with the future removal and disposal of long-lived assets. Such obligations may result from the acquisition, construction, development and/or normal use of the asset. Conditional asset retirement obligations are recorded when there is a legal obligation to perform a future asset retirement activity but where the timing and/or method of settlement are conditional on a future event that may or may not be within the control of the Company. In such a case, the obligation to perform the asset retirement activity is unconditional even though uncertainty exists about the timing and/or method of settlement.

When recording an asset retirement obligation, the present value of the estimated future expenditures required to complete the asset retirement activity is recorded in the period in which the obligation is incurred, if a reasonable estimate can be made. In general, the present value of the estimated future expenditures is added to the carrying amount of the associated asset and the resulting asset retirement cost is depreciated over the estimated useful life of the asset. Where an asset is no longer in service when an asset retirement obligation is recorded, the asset retirement cost is recorded in results of operations.

Some of the Company's transmission and distribution assets, particularly those located on unowned easements and rights-of-way, may have asset retirement obligations, conditional or otherwise. The majority of the Company's easements and rights-of-way are either of perpetual duration or are automatically renewed annually. Land rights with finite terms are generally subject to extension or renewal. As the Company expects to use the majority of its facilities in perpetuity, no asset retirement obligations have been recorded for these assets. If, at some future date, a particular facility is shown not to meet the perpetuity assumption, it will be reviewed to determine whether an estimable asset retirement obligation exists. In such a case, an asset retirement obligation would be recorded at that time.

The Company's asset retirement obligations recorded to date relate to estimated future expenditures associated with the removal and disposal of asbestos-containing materials installed in some of its facilities and with the decommissioning of specific switching stations located on unowned sites.

## 3. New Accounting Pronouncements

The following tables present Accounting Standards Updates (ASUs) issued by the Financial Accounting Standards Board (FASB) that are applicable to Hydro One:

### Recently Adopted Accounting Guidance

| ASU | Date issued | Description | Effective date | Impact on Hydro One |
|---|---|---|---|---|
| 2014-16 | November 2014 | This update clarifies that all relevant terms and features should be considered in evaluating the nature of a host contract for hybrid financial instruments issued in the form of a share. The nature of the host contract depends upon the economic characteristics and risks of the entire hybrid financial instrument. | January 1, 2016 | No material impact upon adoption |
| 2015-01 | January 2015 | Extraordinary items are no longer required to be presented separately in the income statement. | January 1, 2016 | No material impact upon adoption |
| 2015-02 | February 2015 | Guidance on analysis to be performed to determine whether certain types of legal entities should be consolidated. | January 1, 2016 | No material impact upon adoption |
| 2015-03 | April 2015 | Debt issuance costs are required to be presented on the balance sheet as a direct deduction from the carrying amount of the related debt liability consistent with debt discounts or premiums. | January 1, 2016 | Reclassification of deferred debt issuance costs and net unamortized debt premiums as an offset to long-term debt. Applied retrospectively (see note 15). |
| 2015-05 | April 2015 | Cloud computing arrangements that have been assessed to contain a software licence should be accounted for as internal-use software. | January 1, 2016 | No material impact upon adoption |
| 2015-16 | September 2015 | Adjustments to provisional amounts that are identified during the measurement period of a business combination in the reporting period in which the adjustment amount is determined are required to be recognized. The amount recorded in current period earnings are required to be presented separately on the face of the income statement or disclosed in the notes by line item. | January 1, 2016 | No material impact upon adoption |
| 2015-17 | November 2015 | All deferred tax assets and liabilities are required to be classified as noncurrent on the balance sheet. | January 1, 2017 | This ASU was early adopted as of April 1, 2016 and was applied prospectively. As a result, the current portions of the Company's deferred income tax assets are reclassified as noncurrent assets on the consolidated Balance Sheet. Prior periods were not retrospectively adjusted (see note 7). |
| 2016-09 | March 2016 | Several aspects of the accounting for share-based payment transactions were simplified, including the income tax consequences, classification of awards as either equity or liabilities, and classification on the statement of cash flows. | January 1, 2017 | This ASU was early adopted as of October 1, 2016 and was applied retrospectively. As a result, the Company accounts for forfeitures as they occur. There were no other material impacts upon adoption. |

## Recently Issued Accounting Guidance Not Yet Adopted

| ASU | Date issued | Description | Effective date | Anticipated impact on Hydro One |
|---|---|---|---|---|
| 2014-09<br>2015-14<br>2016-08<br>2016-10<br>2016-12<br>2016-20 | May 2014 – December 2016 | ASU 2014-09 was issued in May 2014 and provides guidance on revenue recognition relating to the transfer of promised goods or services to customers in an amount that reflects the consideration to which the entity expects to be entitled in exchange for those goods and services. ASU 2015-14 deferred the effective date of ASU 2014-09 by one year. Additional ASUs were issued in 2016 that simplify transition and provide clarity on certain aspects of the new standard. | January 1, 2018 | Hydro One has completed its initial assessment and has identified relevant revenue streams. No quantitative determination has been made as a detailed assessment is now underway and will continue through to the third quarter of 2017, with the end result being a determination of the financial impact of this standard. The Company is on track for implementation of this standard by the effective date. |
| 2016-01 | January 2016 | This update requires equity investments to be measured at fair value with changes in fair value recognized in net income, and requires enhanced disclosures and presentation of financial assets and liabilities in the financial statements. This ASU also simplifies the impairment assessment of equity investments without readily determinable fair values by requiring a qualitative assessment to identify impairment. | January 1, 2018 | Under assessment |
| 2016-02 | February 2016 | Lessees are required to recognize the rights and obligations resulting from operating leases as assets (right to use the underlying asset for the term of the lease) and liabilities (obligation to make future lease payments) on the balance sheet. | January 1, 2019 | An initial assessment is currently underway encompassing a review of all existing leases, which will be followed by a detailed review of relevant contracts. No quantitative determination has been made at this time. The Company is on track for implementation of this standard by the effective date. |
| 2016-05 | March 2016 | The amendments clarify that a change in the counterparty to a derivative instrument that has been designated as the hedging instrument under Topic 815 does not, in and of itself, require de-designation of that hedging relationship provided that all other hedge accounting criteria continue to be met. | January 1, 2018 | Under assessment |
| 2016-06 | March 2016 | Contingent call (put) options that are assessed to accelerate the payment of principal on debt instruments need to meet the criteria of being "clearly and closely related" to their debt hosts. | January 1, 2017 | No material impact |
| 2016-07 | March 2016 | The requirement to retroactively adopt the equity method of accounting if an investment qualifies for use of the equity method as a result of an increase in the level of ownership or degree of influence has been eliminated. | January 1, 2017 | No material impact |
| 2016-11 | May 2016 | This amendment covers the SEC Staff's rescinding of certain SEC Staff observer comments that are codified in Topic 605 and Topic 932, effective upon the adoption of Topic 606 and Topic 815, effective to coincide with the effective date of Update 2014-16. | January 1, 2019 | No material impact |

| ASU | Date issued | Description | Effective date | Anticipated impact on Hydro One |
|---|---|---|---|---|
| 2016-13 | June 2016 | The amendment provides users with more decision-useful information about the expected credit losses on financial instruments and other commitments to extend credit held by a reporting entity at each reporting date. | January 1, 2019 | Under assessment |
| 2016-15 | August 2016 | The amendments provide guidance for eight specific cash flow issues with the objective of reducing the existing diversity in practice. | January 1, 2018 | Under assessment |
| 2016-16 | October 2016 | The amendment eliminates the prohibition of recognizing current and deferred income taxes for an intra-entity asset transfer, other than inventory, until the asset has been sold to an outside party. The amendment will permit income tax consequences of such transfers to be recognized when the transfer occurs. | January 1, 2018 | Under assessment |
| 2016-18 | November 2016 | The amendment requires that restricted cash or restricted cash equivalents be included with cash and cash equivalents when reconciling the beginning and end-of-period balances in the statement of cash flows. | January 1, 2018 | Under assessment |
| 2017-01 | January 2017 | The amendment clarifies the definition of a business and provides additional guidance on evaluating whether transactions should be accounted for as acquisitions (or disposals) of assets or businesses. | January 1, 2018 | Under assessment |

## 4. Business Combinations

### Acquisition of Great Lakes Power

On October 31, 2016, Hydro One acquired Great Lakes Power, an Ontario regulated electricity transmission business operating along the eastern shore of Lake Superior, north and east of Sault Ste. Marie, Ontario from Brookfield Infrastructure Holdings Inc. The total purchase price for Great Lakes Power was approximately $376 million, including the assumption of approximately $150 million in outstanding indebtedness. The following table summarizes the determination of the final fair value of the assets acquired and liabilities assumed:

| *(millions of dollars)* | |
|---|---|
| Cash and cash equivalents | 5 |
| Property, plant and equipment | 221 |
| Intangible assets | 1 |
| Regulatory assets | 50 |
| Goodwill | 159 |
| Working capital | (2) |
| Long-term debt | (186) |
| Pension and post-employment benefit liabilities, net | (5) |
| Deferred income taxes | (17) |
| | 226 |

Goodwill of approximately $159 million arising from the Great Lakes Power acquisition consists largely of the synergies and economies of scale expected from combining the operations of Hydro One and Great Lakes Power. Great Lakes Power contributed revenues of

$6 million and less than $1 million of net income to the Company's consolidated financial results for the year ended December 31, 2016. All costs related to the acquisition have been expensed through the Consolidated Statements of Operations and Comprehensive Income. Great Lakes Power's financial information is not material to the Company's consolidated financial results for the year ended December 31, 2016 and therefore, has not been disclosed on a pro forma basis. On January 16, 2017, the name of Great Lakes Power was changed to Hydro One Sault Ste. Marie LP.

## Agreement to Purchase Orillia Power

On August 15, 2016, the Company reached an agreement to acquire Orillia Power Distribution Corporation (Orillia Power), an electricity distribution company located in Simcoe County, Ontario, from the City of Orillia for approximately $41 million, including the assumption of approximately $15 million in outstanding indebtedness and regulatory liabilities, subject to closing adjustments. The acquisition is subject to regulatory approval by the OEB.

## Acquisition of Woodstock Hydro

On October 31, 2015, Hydro One acquired Woodstock Hydro Holdings Inc. (Woodstock Hydro), an electricity distribution company located in southwestern Ontario. The total purchase price for Woodstock Hydro was approximately $32 million. The purchase price was finalized and the Company made the final purchase price payment of $3 million in 2016. The following table summarizes the determination of the fair value of the assets acquired and liabilities assumed:

| *(millions of dollars)* | |
|---|---|
| Working capital | 4 |
| Property, plant and equipment | 27 |
| Intangible assets | 1 |
| Deferred income tax assets | 2 |
| Goodwill | 22 |
| Long-term debt | (17) |
| Derivative instruments | (3) |
| Post-retirement and post-employment benefit liability | (1) |
| Regulatory liabilities | (1) |
| Other long-term liabilities | (2) |
| | 32 |

Goodwill of approximately $22 million arising from the Woodstock Hydro acquisition consists largely of the synergies and economies of scale expected from combining the operations of Hydro One and Woodstock Hydro. All of the goodwill was assigned to Hydro One's Distribution Business segment. Woodstock Hydro contributed revenues of $12 million and net income of $2 million to the Company's consolidated financial results for the year ended December 31, 2015. All costs related to the acquisition have been expensed through the Consolidated Statements of Operations and Comprehensive Income. Woodstock Hydro's financial information is not material to the Company's consolidated financial results for the year ended December 31, 2015 and therefore, has not been disclosed on a pro forma basis.

## Acquisition of Haldimand Hydro

On June 30, 2015, Hydro One acquired Haldimand County Utilities Inc. (Haldimand Hydro), an electricity distribution company located in southwestern Ontario. The total purchase price for Haldimand Hydro was approximately $73 million. The purchase price was finalized in 2016. The following table summarizes the determination of the fair value of the assets acquired and liabilities assumed:

| *(millions of dollars)* | |
|---|---|
| Cash and cash equivalents | 3 |
| Working capital | 5 |
| Property, plant and equipment | 52 |
| Deferred income tax assets | 1 |
| Goodwill | 33 |
| Long-term debt | (18) |
| Regulatory liabilities | (3) |
| | 73 |

Goodwill of approximately $33 million arising from the Haldimand Hydro acquisition consists largely of the synergies and economies of scale expected from combining the operations of Hydro One and Haldimand Hydro. All of the goodwill was assigned to Hydro One's Distribution Business segment. Haldimand Hydro contributed revenues of $32 million and net income of $6 million to the Company's consolidated financial results for the year ended December 31, 2015. All costs related to the acquisition have been expensed through the Consolidated Statements of Operations and Comprehensive Income. Haldimand Hydro's financial information is not material to the Company's consolidated financial results for the year ended December 31, 2015 and therefore, has not been disclosed on a pro forma basis.

### Hydro One Brampton Spin-off

On August 31, 2015, Hydro One completed the spin-off of its subsidiary, Hydro One Brampton. The spin-off was accounted as a non-monetary, nonreciprocal transfer with the Province, based on its carrying values at August 31, 2015. Transactions that immediately preceded the spin-off as well as the spin-off were as follows:

- Hydro One subscribed for 357 common shares of Hydro One Brampton for an aggregate subscription price of $53 million; and
- Hydro One transferred to a company wholly owned by the Province all the issued and outstanding shares of Hydro One Brampton as a dividend-in-kind; and all of the long-term intercompany debt in aggregate principal amount of $193 million plus accrued interest of $3 million owed by Hydro One Brampton to Hydro One as a return of stated capital of $196 million on its common shares.

As a result of the spin-off, goodwill related to Hydro One Brampton of $60 million was eliminated from the Consolidated Balance Sheet.

## 5. Depreciation And Amortization

| *Year ended December 31*<br>*(millions of dollars)* | **2016** | 2015 |
|---|---|---|
| Depreciation of property, plant and equipment | **612** | 595 |
| Asset removal costs | **90** | 91 |
| Amortization of intangible assets | **56** | 54 |
| Amortization of regulatory assets | **20** | 19 |
| | **778** | 759 |

## 6. Financing Charges

| *Year ended December 31*<br>*(millions of dollars)* | **2016** | 2015 |
|---|---|---|
| Interest on long-term debt | **424** | 417 |
| Interest on short-term notes | **9** | 2 |
| Other | **16** | 14 |
| Less: Interest capitalized on construction and development in progress | **(54)** | (52) |
| Interest earned on investments | **(2)** | (3) |
| Gain on interest-rate swap agreements | **–** | (2) |
| | **393** | 376 |

## 7. Income Taxes

Income taxes / provision for PILs differs from the amount that would have been recorded using the combined Canadian federal and Ontario statutory income tax rate. The reconciliation between the statutory and the effective tax rates is provided as follows:

| *Year ended December 31*<br>*(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| Income taxes / provision for PILs at statutory rate | 235 | 217 |
| Increase (decrease) resulting from: | | |
| Net temporary differences recoverable in future rates charged to customers: | | |
| Capital cost allowance in excess of depreciation and amortization | (53) | (37) |
| Pension contributions in excess of pension expense | (16) | (25) |
| Overheads capitalized for accounting but deducted for tax purposes | (16) | (15) |
| Interest capitalized for accounting but deducted for tax purposes | (14) | (13) |
| Environmental expenditures | (5) | (5) |
| Other | 5 | (6) |
| Net temporary differences | (99) | (101) |
| Net tax benefit resulting from transition from PILs Regime to Federal Tax Regime | – | (19) |
| Hydro One Brampton spin-off | – | 7 |
| Net permanent differences | 3 | 1 |
| Total income taxes / provision for PILs | 139 | 105 |

The major components of income tax expense are as follows:

| *Year ended December 31*<br>*(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| Current income taxes / provision for PILs | 25 | 2,949 |
| Deferred income taxes / provision for (recovery of) PILs | 114 | (2,844) |
| Total income taxes / provision for PILs | 139 | 105 |
| Effective income tax rate | 15.7% | 12.8% |

The provision for current income taxes / PILs is remitted to the CRA (Federal Tax Regime) and the OEFC (PILs Regime). At December 31, 2016, $14 million (2015 – $1 million) receivable from the CRA was included in other current assets and $6 million (2015 – $12 million) receivable from the OEFC was included in due from related parties on the Consolidated Balance Sheet.

In connection with the IPO in 2015, Hydro One's exemption from tax under the Federal Tax Regime ceased to apply. Under the PILs Regime, Hydro One was deemed to have disposed of its assets immediately before it lost its tax exempt status under the Federal Tax Regime, resulting in Hydro One making payments in lieu of tax (Departure Tax) totalling $2.6 billion. To enable Hydro One to make the Departure Tax payment, the Province subscribed for common shares of Hydro One for $2.6 billion in 2015 (see note 21). Hydro One used the proceeds of this share subscription to pay the Departure Tax.

The 2015 total income taxes / provision for PILs included a current provision of $2,600 million and a deferred recovery of $2,810 million resulting from the transition from the PILs Regime to the Federal Tax Regime. The deferred recovery was not included in the rate-setting process. Deferred income tax balances expected to be included in the rate-setting process are offset by regulatory assets and liabilities to reflect the anticipated recovery or disposition of these balances within future electricity rates.

## Deferred Income Tax Assets and Liabilities

Deferred income tax assets and liabilities arise from differences between the carrying amounts and tax basis of the Company's assets and liabilities. At December 31, 2016 and 2015, deferred income tax assets and liabilities consisted of the following:

| *December 31*<br>*(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| **Deferred income tax assets** | | |
| Depreciation and amortization in excess of capital cost allowance | 495 | 937 |
| Non-depreciable capital property | 271 | 271 |
| Post-retirement and post-employment benefits expense in excess of cash payments | 607 | 578 |
| Environmental expenditures | 74 | 75 |
| Non-capital losses | 213 | 62 |
| Investment in subsidiaries | 75 | 55 |
| Other | 30 | 10 |
| | 1,765 | 1,988 |
| Less: valuation allowance | (352) | (333) |
| Total deferred income tax assets | 1,413 | 1,655 |
| Less: current portion | – | 19 |
| | 1,413 | 1,636 |

| *December 31*<br>*(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| **Deferred income tax liabilities** | | |
| Regulatory amounts that are not recognized for tax purposes | (153) | (153) |
| Goodwill | (10) | (10) |
| Capital cost allowance in excess of depreciation and amortization | (64) | (42) |
| Other | (11) | (2) |
| Total deferred income tax liabilities | (238) | (207) |
| Less: current portion | – | – |
| | (238) | (207) |
| Net deferred income tax assets | 1,175 | 1,448 |

The net deferred income tax assets are presented on the Consolidated Balance Sheets as follows:

| *December 31*<br>*(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| Current: | | |
| Other current assets | – | 19 |
| Long-term: | | |
| Deferred income tax assets | 1,235 | 1,636 |
| Deferred income tax liabilities | (60) | (207) |
| Net deferred income tax assets | 1,175 | 1,448 |

The valuation allowance for deferred tax assets as at December 31, 2016 was $352 million (2015 – $333 million). The valuation allowance primarily relates to temporary differences for non-depreciable assets and investments in subsidiaries. As of December 31, 2016, the Company had non-capital losses carried forward available to reduce future years' taxable income, which expire as follows:

| *Year of expiry* *(millions of dollars)* | **2016** | 2015 |
|---|---|---|
| 2034 | **2** | 2 |
| 2035 | **222** | 232 |
| 2036 | **580** | – |
| Total losses | **804** | 234 |

## 8. Accounts Receivable

| *December 31* *(millions of dollars)* | **2016** | 2015 |
|---|---|---|
| Accounts receivable – billed | **431** | 379 |
| Accounts receivable – unbilled | **442** | 458 |
| Accounts receivable, gross | **873** | 837 |
| Allowance for doubtful accounts | **(35)** | (61) |
| Accounts receivable, net | **838** | 776 |

The following table shows the movements in the allowance for doubtful accounts for the years ended December 31, 2016 and 2015:

| *Year ended December 31* *(millions of dollars)* | **2016** | 2015 |
|---|---|---|
| Allowance for doubtful accounts – January 1 | **(61)** | (66) |
| Write-offs | **37** | 37 |
| Additions to allowance for doubtful accounts | **(11)** | (32) |
| Allowance for doubtful accounts – December 31 | **(35)** | (61) |

## 9. Other Current Assets

| *December 31* *(millions of dollars)* | **2016** | 2015 |
|---|---|---|
| Regulatory assets *(Note 12)* | **37** | 36 |
| Materials and supplies | **19** | 21 |
| Deferred income tax assets *(Notes 3, 7)* | **–** | 19 |
| Prepaid expenses and other assets | **46** | 29 |
| | **102** | 105 |

## 10. Property, Plant And Equipment

| *December 31, 2016* *(millions of dollars)* | Property, Plant and Equipment | Accumulated Depreciation | Construction in Progress | Total |
|---|---|---|---|---|
| Transmission | 14,692 | 4,862 | 910 | 10,740 |
| Distribution | 9,656 | 3,305 | 243 | 6,594 |
| Communication | 1,233 | 777 | 20 | 476 |
| Administration and service | 1,632 | 924 | 61 | 769 |
| Easements | 628 | 67 | – | 561 |
| | 27,841 | 9,935 | 1,234 | 19,140 |

| *December 31, 2015* *(millions of dollars)* | Property, Plant and Equipment | Accumulated Depreciation | Construction in Progress | Total |
|---|---|---|---|---|
| Transmission | 13,704 | 4,621 | 853 | 9,936 |
| Distribution | 9,205 | 3,177 | 238 | 6,266 |
| Communication | 1,165 | 704 | 28 | 489 |
| Administration and service | 1,531 | 848 | 36 | 719 |
| Easements | 622 | 64 | – | 558 |
| | 26,227 | 9,414 | 1,155 | 17,968 |

Financing charges capitalized on property, plant and equipment under construction were $52 million in 2016 (2015 – $50 million).

## 11. Intangible Assets

| *December 31, 2016* *(millions of dollars)* | Intangible Assets | Accumulated Amortization | Development in Progress | Total |
|---|---|---|---|---|
| Computer applications software | 621 | 326 | 53 | 348 |
| Other | 5 | 4 | – | 1 |
| | 626 | 330 | 53 | 349 |

| *December 31, 2015* *(millions of dollars)* | Intangible Assets | Accumulated Amortization | Development in Progress | Total |
|---|---|---|---|---|
| Computer applications software | 579 | 270 | 24 | 333 |
| Other | 7 | 4 | – | 3 |
| | 586 | 274 | 24 | 336 |

Financing charges capitalized to intangible assets under development were $2 million in 2016 (2015 – $1 million). The estimated annual amortization expense for intangible assets is as follows: 2017 – $54 million; 2018 – $54 million; 2019 – $45 million; 2020 – $27 million; and 2021 – $26 million.

## 12. Regulatory Assets And Liabilities

Regulatory assets and liabilities arise as a result of the rate-setting process. Hydro One has recorded the following regulatory assets and liabilities:

| *December 31*<br>*(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| **Regulatory assets:** | | |
| Deferred income tax regulatory asset | 1,587 | 1,445 |
| Pension benefit regulatory asset | 900 | 952 |
| Post-retirement and post-employment benefits | 243 | 240 |
| Environmental | 204 | 207 |
| Retail settlement variance account | 145 | 110 |
| Debt premium | 32 | – |
| Share-based compensation | 31 | 10 |
| Distribution system code exemption | 10 | 10 |
| 2015-2017 rate rider | 7 | 20 |
| B2M LP start-up costs | 5 | 8 |
| Pension cost variance | 4 | 37 |
| Other | 14 | 12 |
| Total regulatory assets | 3,182 | 3,051 |
| Less: current portion | 37 | 36 |
| | 3,145 | 3,015 |
| **Regulatory liabilities:** | | |
| Green Energy expenditure variance | 69 | 76 |
| External revenue variance | 64 | 87 |
| CDM deferral variance | 54 | 53 |
| Deferred income tax regulatory liability | 4 | 23 |
| Other | 18 | 16 |
| Total regulatory liabilities | 209 | 255 |
| Less: current portion | – | 19 |
| | 209 | 236 |

### Deferred Income Tax Regulatory Asset and Liability

Deferred income taxes are recognized on temporary differences between the carrying amount of assets and liabilities in the financial statements and the corresponding tax bases used in the computation of taxable income. The Company has recognized regulatory assets and liabilities that correspond to deferred income taxes that flow through the rate-setting process. In the absence of rate-regulated accounting, the Company's income tax expense would have been recognized using the liability method and there would be no regulatory accounts established for taxes to be recovered through future rates. As a result, the 2016 income tax expense would have been higher by approximately $104 million (2015 – $101 million).

### Pension Benefit Regulatory Asset

In accordance with OEB rate orders, pension costs are recovered on a cash basis as employer contributions are paid to the pension fund in accordance with the *Pension Benefits Act* (Ontario). The Company recognizes the net unfunded status of pension obligations on the Consolidated Balance Sheets with an offset to the associated regulatory asset. A regulatory asset is recognized because management considers it to be probable that pension benefit costs will be recovered in the future through the rate-setting process. The pension benefit obligation is remeasured to its fair value at each year end based on an annual actuarial report, with an offset to the associated regulatory asset, to the extent of the remeasurement adjustment. In the absence of rate-regulated accounting, 2016 OCI would have been higher by $52 million (2015 – $284 million).

### Post-Retirement and Post-Employment Benefits

The Company recognizes the net unfunded status of post-retirement and post-employment obligations on the Consolidated Balance Sheets with an incremental offset to the associated regulatory assets. A regulatory asset is recognized because management considers it to be probable that post-retirement and post-employment benefit costs will be recovered in the future through the rate-setting process. The post-retirement and post-employment benefit obligation is remeasured to its fair value at each year end based on an annual actuarial report, with an offset to the associated regulatory asset, to the extent of the re-measurement adjustment. In the absence of rate-regulated accounting, 2016 OCI would have been lower by $3 million (2015 – higher by $33 million).

## Environmental

Hydro One records a liability for the estimated future expenditures required to remediate environmental contamination. Because such expenditures are expected to be recoverable in future rates, the Company has recorded an equivalent amount as a regulatory asset. In 2016, the environmental regulatory asset decreased by $1 million (2015 – $24 million) to reflect related changes in the Company's PCB liability, and increased by $10 million (2015 – $1 million) due to changes in the land assessment and remediation liability. The environmental regulatory asset is amortized to results of operations based on the pattern of actual expenditures incurred and charged to environmental liabilities. The OEB has the discretion to examine and assess the prudency and the timing of recovery of all of Hydro One's actual environmental expenditures. In the absence of rate-regulated accounting, 2016 operation, maintenance and administration expenses would have been higher by $9 million (2015 – lower by $23 million). In addition, 2016 amortization expense would have been lower by $20 million (2015 – $19 million), and 2016 financing charges would have been higher by $8 million (2015 – $10 million).

## Retail Settlement Variance Account (RSVA)

Hydro One has deferred certain retail settlement variance amounts under the provisions of Article 490 of the OEB's Accounting Procedures Handbook. In March 2015, the OEB approved the disposition of the total RSVA balance accumulated from January 2012 to December 2013, including accrued interest, to be recovered through the 2015-2017 Rate Rider.

## Debt Premium

The value of debt assumed in the acquisition of Great Lakes Power has been recorded at fair value in accordance with US GAAP – Business Combinations. The OEB allows for recovery of interest at the coupon rate of the Senior Secured Bonds and a regulatory asset has been recorded for the difference between the fair value and face value of this debt. The debt premium is recovered over the remaining term of the debt (see note 15).

## Share-based Compensation

The Company recognizes costs associated with share grant plans in a regulatory asset as management considers it probable that share grant plans costs will be recovered in the future through the rate-setting process. In the absence of rate-regulated accounting, 2016 operation, maintenance and administration expenses would have been higher by $9 million (2015 – $5 million).

## Distribution System Code (DSC) Exemption

In June 2010, Hydro One Networks filed an application with the OEB regarding the OEB's new cost responsibility rules contained in the OEB's October 2009 Notice of Amendment to the DSC, with respect to the connection of certain renewable generators that were already connected or that had received a connection impact assessment prior to October 21, 2009. The application sought approval to record and defer the unanticipated costs incurred by Hydro One Networks that resulted from the connection of certain renewable generation facilities. The OEB ruled that identified specific expenditures can be recorded in a deferral account subject to the OEB's review in subsequent Hydro One Network distribution applications. In March 2015, the OEB approved the disposition of the DSC exemption deferral account at December 31, 2013, including accrued interest, which is being recovered through the 2015-2017 Rate Rider. In addition, the OEB also approved Hydro One's request to discontinue this deferral account. There were no additions to this regulatory account in 2015 or 2016.

## 2015-2017 Rate Rider

In March 2015, as part of its decision on Hydro One Networks' distribution rate application for 2015-2019, the OEB approved the disposition of certain deferral and variance accounts, including RSVAs and accrued interest. The 2015-2017 Rate Rider account includes the balances approved for disposition by the OEB and is being disposed in accordance with the OEB decision over a 32-month period ending on December 31, 2017.

## B2M LP Start-up Costs

In December 2015, OEB issued its decision on B2M LP's application for 2015-2019 and as part of the decision approved the recovery of $8 million of start-up costs relating to B2M LP. The costs are being recovered over a four-year period which began in 2016, in accordance with the OEB decision.

## Pension Cost Variance

A pension cost variance account was established for Hydro One Networks' transmission and distribution businesses to track the difference between the actual pension expenses incurred and estimated pension costs approved by the OEB. The balance in this regulatory account reflects the excess of pension costs paid as compared to OEB-approved amounts. In March 2015, the OEB approved the disposition of the distribution business portion of the total pension cost variance account at December 31, 2013, including accrued interest, which is being recovered through the 2015-2017 Rate Rider. In the absence of rate-regulated accounting, 2016 revenue would have been higher by $25 million (2015 – lower by $6 million).

### Green Energy Expenditure Variance

In April 2010, the OEB requested the establishment of deferral accounts which capture the difference between the revenue recorded on the basis of Green Energy Plan expenditures incurred and the actual recoveries received.

### External Revenue Variance

In May 2009, the OEB approved forecasted amounts related to export service revenue, external revenue from secondary land use, and external revenue from station maintenance and engineering and construction work. In November 2012, the OEB again approved forecasted amounts related to these revenue categories and extended the scope to encompass all other external revenues. The external revenue variance account balance reflects the excess of actual external revenues compared to the OEB-approved forecasted amounts.

### CDM Deferral Variance Account

As part of Hydro One Networks' application for 2013 and 2014 transmission rates, Hydro One agreed to establish a new regulatory deferral variance account to track the impact of actual Conservation and Demand Management (CDM) and demand response results on the load forecast compared to the estimated load forecast included in the revenue requirement. The balance in the CDM deferral variance account relates to the actual 2013 and 2014 CDM compared to the amounts included in 2013 and 2014 revenue requirements, respectively. There were no additions to this regulatory account in 2016.

## 13. Accounts Payable and Other Current Liabilities

| *December 31*<br>*(millions of dollars)* | **2016** | 2015 |
|---|---|---|
| Accounts payable | **181** | 155 |
| Accrued liabilities | **659** | 598 |
| Accrued interest | **105** | 96 |
| Regulatory liabilities *(Note 12)* | **–** | 19 |
| | **945** | 868 |

## 14. Other Long-Term Liabilities

| *December 31*<br>*(millions of dollars)* | **2016** | 2015 |
|---|---|---|
| Post-retirement and post-employment benefit liability *(Note 18)* | **1,641** | 1,560 |
| Pension benefit liability *(Note 18)* | **900** | 952 |
| Environmental liabilities *(Note 19)* | **177** | 185 |
| Asset retirement obligations *(Note 20)* | **9** | 9 |
| Long-term accounts payable and other liabilities | **25** | 17 |
| | **2,752** | 2,723 |

## 15. Debt and Credit Agreements

### Short-Term Notes and Credit Facilities

Hydro One meets its short-term liquidity requirements in part through the issuance of commercial paper under Hydro One Inc.'s Commercial Paper Program which has a maximum authorized amount of $1.5 billion. These short-term notes are denominated in Canadian dollars with varying maturities up to 365 days. The Commercial Paper Program is supported by Hydro One Inc.'s committed revolving credit facilities totalling $2.3 billion.

On August 15, 2016, Hydro One Inc. terminated its $1.5 billion revolving standby credit facility maturing in June 2020 and its $800 million three-year senior, revolving term credit facility maturing in October 2018 (collectively Prior Credit Facilities). On the same date, Hydro One Inc. entered into a new credit agreement for a $2.3 billion revolving credit facility maturing in June 2021 (New Credit Facility). The New Credit Facility ranks equally with any existing and future senior debt of Hydro One Inc., and has customary covenants substantially similar to the covenants under the Prior Credit Facilities. In addition, on November 7, 2016, the maturity date of Hydro One's $250 million credit facility was extended from November 2020 to November 2021.

At December 31, 2016, Hydro One's consolidated committed, unsecured and undrawn credit facilities totalling $2,550 million consisted of the following:

| *(millions of dollars)* | Maturity | Amount |
|---|---|---|
| Hydro One Inc. | | |
| Revolving standby credit facility | June 2021 | 2,300 |
| Hydro One | | |
| Five-year senior, revolving term credit facility | November 2021 | 250 |
| Total | | 2,550 |

The Company may use the credit facilities for working capital and general corporate purposes. If used, interest on the credit facilities would apply based on Canadian benchmark rates. The obligation of each lender to make any credit extension under its credit facility is subject to various conditions including that no event of default has occurred or would result from such credit extension.

### Long-Term Debt

At December 31, 2016, $10,523 million long-term debt was issued by Hydro One Inc. under Hydro One Inc.'s Medium-Term Note (MTN) Program. The maximum authorized principal amount of notes issuable under the current MTN Program prospectus filed in December 2015 is $3.5 billion. At December 31, 2016, $1.2 billion remained available for issuance until January 2018. In addition, at December 31, 2016, the Company had long-term debt of $184 million assumed as part of the Great Lakes Power acquisition.

The following table presents outstanding long-term debt at December 31, 2016 and 2015:

| *December 31*<br>*(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| 4.64% Series 10 notes due 2016 | – | 450 |
| Floating-rate Series 27 notes due 2016[1] | – | 50 |
| 5.18% Series 13 notes due 2017 | 600 | 600 |
| 2.78% Series 28 notes due 2018 | 750 | 750 |
| Floating-rate Series 31 notes due 2019[1] | 228 | 228 |
| 1.48% Series 37 notes due 2019[2] | 500 | – |
| 4.40% Series 20 notes due 2020 | 300 | 300 |
| 1.62% Series 33 notes due 2020[2] | 350 | 350 |
| 1.84% Series 34 notes due 2021 | 500 | – |
| 3.20% Series 25 notes due 2022 | 600 | 600 |
| 2.77% Series 35 notes due 2026 | 500 | – |
| 7.35% Debentures due 2030 | 400 | 400 |
| 6.93% Series 2 notes due 2032 | 500 | 500 |
| 6.35% Series 4 notes due 2034 | 385 | 385 |
| 5.36% Series 9 notes due 2036 | 600 | 600 |
| 4.89% Series 12 notes due 2037 | 400 | 400 |
| 6.03% Series 17 notes due 2039 | 300 | 300 |
| 5.49% Series 18 notes due 2040 | 500 | 500 |
| 4.39% Series 23 notes due 2041 | 300 | 300 |
| 6.59% Series 5 notes due 2043 | 315 | 315 |
| 4.59% Series 29 notes due 2043 | 435 | 435 |
| 4.17% Series 32 notes due 2044 | 350 | 350 |
| 5.00% Series 11 notes due 2046 | 325 | 325 |
| 3.91% Series 36 notes due 2046 | 350 | – |
| 3.72% Series 38 notes due 2047 | 450 | – |
| 4.00% Series 24 notes due 2051 | 225 | 225 |
| 3.79% Series 26 notes due 2062 | 310 | 310 |
| 4.29% Series 30 notes due 2064 | 50 | 50 |
| Hydro One Inc. long-term debt | 10,523 | 8,723 |
| 6.6% Senior Secured Bonds due 2023 (Face value – $112 million) | 144 | – |
| 4.6% Note Payable due 2023 (Face value – $36 million) | 40 | – |
| Great Lakes Power long-term debt | 184 | – |
| | 10,707 | 8,723 |
| Add: Net unamortized debt premiums[3] | 15 | 17 |
| Add: Unrealized mark-to-market loss (gain)[2] | (2) | 1 |
| Less: Deferred debt issuance costs[3] | (40) | (34) |
| Total long-term debt | 10,680 | 8,707 |

[1] The interest rates of the floating-rate notes are referenced to the 3-month Canadian dollar bankers' acceptance rate, plus a margin.

[2] The unrealized mark-to-market net gain relates to $50 million of the Series 33 notes due 2020 and $500 million Series 37 notes due 2019 (2015 – loss relates to $50 million of the Series 33 notes due 2020). The unrealized mark-to-market net gain is offset by a $2 million (2015 – $1 million) unrealized mark-to-market net loss (2015 – gain) on the related fixed-to-floating interest-rate swap agreements, which are accounted for as fair value hedges. See note 16 – Fair Value of Financial Instruments and Risk Management for details of fair value hedges.

[3] Effective January 1, 2016, deferred debt issuance costs and net unamortized debt premiums were reclassified from other long-term assets and other long-term liabilities, respectively, as an offset to long-term debt upon adoption of ASU 2015-03 (see note 3). Balances as at December 31, 2015 were updated to reflect the retrospective adoption of ASU 2015-03.

The total long-term debt is presented on the consolidated balance sheets as follows:

| *December 31* *(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| Current liabilities: | | |
| Long-term debt payable within one year | 602 | 500 |
| Long-term liabilities: | | |
| Long-term debt | 10,078 | 8,207 |
| Total long-term debt | 10,680 | 8,707 |

In 2016, Hydro One issued $2,300 million (2015 – $350 million) of long-term debt under the MTN Program, and repaid $502 million (2015 – $550 million) of total long-term debt.

Principal repayments and related weighted average interest rates are summarized by the number of years to maturity in the following table:

| Years to Maturity | Long-term Debt Principal Repayments *(millions of dollars)* | Weighted Average Interest Rate *(%)* |
|---|---|---|
| 1 year | 602 | 5.2 |
| 2 years | 753 | 2.8 |
| 3 years | 731 | 1.4 |
| 4 years | 653 | 2.9 |
| 5 years | 503 | 1.9 |
| | 3,242 | 2.8 |
| 6 – 10 years | 1,234 | 3.3 |
| Over 10 years | 6,195 | 5.2 |
| | 10,671 | 4.3 |

Interest payment obligations related to long-term debt are summarized by year in the following table:

| Year | Interest Payments *(millions of dollars)* |
|---|---|
| 2017 | 456 |
| 2018 | 425 |
| 2019 | 402 |
| 2020 | 384 |
| 2021 | 370 |
| | 2,037 |
| 2022-2026 | 1,703 |
| 2027+ | 4,405 |
| | 8,145 |

## 16. Fair Value of Financial Instruments and Risk Management

Fair value is considered to be the exchange price in an orderly transaction between market participants to sell an asset or transfer a liability at the measurement date. The fair value definition focuses on an exit price, which is the price that would be received in the sale of an asset or the amount that would be paid to transfer a liability.

Hydro One classifies its fair value measurements based on the following hierarchy, as prescribed by the accounting guidance for fair value, which prioritizes the inputs to valuation techniques used to measure fair value into three levels:

Level 1 inputs are unadjusted quoted prices in active markets for identical assets or liabilities that Hydro One has the ability to access.

An active market for the asset or liability is one in which transactions for the asset or liability occur with sufficient frequency and volume to provide ongoing pricing information.

Level 2 inputs are those other than quoted market prices that are observable, either directly or indirectly, for an asset or liability. Level 2 inputs include, but are not limited to, quoted prices for similar assets or liabilities in an active market, quoted prices for identical or similar assets or liabilities in markets that are not active and inputs other than quoted market prices that are observable for the asset or liability, such as interest-rate curves and yield curves observable at commonly quoted intervals, volatilities, credit risk and default rates. A Level 2 measurement cannot have more than an insignificant portion of the valuation based on unobservable inputs.

Level 3 inputs are any fair value measurements that include unobservable inputs for the asset or liability for more than an insignificant portion of the valuation. A Level 3 measurement may be based primarily on Level 2 inputs.

## Non-Derivative Financial Assets and Liabilities

At December 31, 2016 and 2015, the Company's carrying amounts of cash and cash equivalents, accounts receivable, due from related parties, short-term notes payable, accounts payable, and due to related parties are representative of fair value because of the short-term nature of these instruments.

## Fair Value Measurements of Long-Term Debt

The fair values and carrying values of the Company's long-term debt at December 31, 2016 and 2015 are as follows:

| *December 31*<br>*(millions of dollars)* | 2016<br>Carrying Value | 2016<br>Fair Value | 2015<br>Carrying Value | 2015<br>Fair Value |
|---|---|---|---|---|
| Long-term debt | | | | |
| $50 million of MTN Series 33 notes | 50 | 50 | 51 | 51 |
| $500 million of MTN Series 37 notes | 498 | 498 | – | – |
| Other notes and debentures | 10,132 | 11,462 | 8,656 | 9,942 |
| | 10,680 | 12,010 | 8,707 | 9,993 |

## Fair Value Measurements of Derivative Instruments

At December 31, 2016, Hydro One Inc. had interest-rate swaps in the amount of $550 million (2015 – $50 million) that was used to convert fixed-rate debt to floating-rate debt. These swaps are classified as a fair value hedges. Hydro One Inc.'s fair value hedge exposure was equal to about 5% (2015 – 1%) of its total long-term debt. At December 31, 2016, Hydro One Inc. had the following interest-rate swaps designated as fair value hedges:

- a $50 million fixed-to-floating interest-rate swap agreement to convert $50 million of the $350 million MTN Series 33 notes maturing April 30, 2020 into three-month variable rate debt; and
- two $125 million and one $250 million fixed-to-floating interest-rate swap agreements to convert the $500 million MTN Series 37 notes maturing November 18, 2019 into three-month variable rate debt.

At December 31, 2016 and 2015, the Company had no interest-rate swaps classified as undesignated contracts.

## Fair Value Hierarchy

The fair value hierarchy of financial assets and liabilities at December 31, 2016 and 2015 is as follows:

| *December 31, 2016*<br>*(millions of dollars)* | Carrying Value | Fair Value | Level 1 | Level 2 | Level 3 |
|---|---|---|---|---|---|
| Assets: | | | | | |
| Cash and cash equivalents | 50 | 50 | 50 | – | – |
| | 50 | 50 | 50 | – | – |
| Liabilities: | | | | | |
| Short-term notes payable | 469 | 469 | 469 | – | – |
| Long-term debt, including current portion | 10,680 | 12,010 | – | 12,010 | – |
| Derivative instruments | | | | | |
| Fair value hedges – interest-rate swaps | 2 | 2 | 2 | – | – |
| | 11,151 | 12,481 | 471 | 12,010 | – |

| December 31, 2015 (millions of dollars) | Carrying Value | Fair Value | Level 1 | Level 2 | Level 3 |
|---|---|---|---|---|---|
| Assets: | | | | | |
| Cash and cash equivalents | 94 | 94 | 94 | – | – |
| Derivative instruments | | | | | |
| Fair value hedge – interest-rate swap | 1 | 1 | 1 | – | – |
| | 95 | 95 | 95 | – | – |
| Liabilities: | | | | | |
| Short-term notes payable | 1,491 | 1,491 | 1,491 | – | – |
| Long-term debt, including current portion | 8,707 | 9,993 | – | 9,993 | – |
| | 10,198 | 11,484 | 1,491 | 9,993 | – |

Cash and cash equivalents include cash and short-term investments. The carrying values are representative of fair value because of the short-term nature of these instruments.

The fair value of the hedged portion of the long-term debt is primarily based on the present value of future cash flows using a swap yield curve to determine the assumption for interest rates. The fair value of the unhedged portion of the long-term debt is based on unadjusted period-end market prices for the same or similar debt of the same remaining maturities.

There were no significant transfers between any of the fair value levels during the years ended December 31, 2016 and 2015.

## Risk Management

Exposure to market risk, credit risk and liquidity risk arises in the normal course of the Company's business.

### Market Risk

Market risk refers primarily to the risk of loss that results from changes in costs, foreign exchange rates and interest rates. The Company is exposed to fluctuations in interest rates as its regulated return on equity is derived using a formulaic approach that takes into account anticipated interest rates. The Company is not currently exposed to material commodity price risk or material foreign exchange risk.

The Company uses a combination of fixed and variable-rate debt to manage the mix of its debt portfolio. The Company also uses derivative financial instruments to manage interest-rate risk. The Company utilizes interest-rate swaps, which are typically designated as fair value hedges, as a means to manage its interest rate exposure to achieve a lower cost of debt. The Company may also utilize interest-rate derivative instruments to lock in interest-rate levels in anticipation of future financing.

A hypothetical 100 basis points increase in interest rates associated with variable-rate debt would not have resulted in a significant decrease in Hydro One's net income for the years ended December 31, 2016 or 2015.

For derivative instruments that are designated and qualify as fair value hedges, the gain or loss on the derivative instrument as well as the offsetting loss or gain on the hedged item attributable to the hedged risk are recognized in the Consolidated Statements of Operations and Comprehensive Income. The net unrealized loss (gain) on the hedged debt and the related interest-rate swaps for the years ended December 31, 2016 and 2015 was not significant.

### Credit Risk

Financial assets create a risk that a counterparty will fail to discharge an obligation, causing a financial loss. At December 31, 2016 and 2015, there were no significant concentrations of credit risk with respect to any class of financial assets. The Company's revenue is earned from a broad base of customers. As a result, Hydro One did not earn a significant amount of revenue from any single customer. At December 31, 2016 and 2015, there was no significant accounts receivable balance due from any single customer.

At December 31, 2016, the Company's provision for bad debts was $35 million (2015 – $61 million). Adjustments and write-offs were determined on the basis of a review of overdue accounts, taking into consideration historical experience. At December 31, 2016, approximately 6% (2015 – 6%) of the Company's net accounts receivable were aged more than 60 days.

Hydro One manages its counterparty credit risk through various techniques including: entering into transactions with highly rated counterparties; limiting total exposure levels with individual counterparties; entering into master agreements which enable net settlement and the contractual right of offset; and monitoring the financial condition of counterparties. The Company monitors current credit exposure to counterparties both on an individual and an aggregate basis. The Company's credit risk for accounts receivable is limited to the carrying amounts on the Consolidated Balance Sheets.

Derivative financial instruments result in exposure to credit risk since there is a risk of counterparty default. The credit exposure of derivative contracts, before collateral, is represented by the fair value of contracts at the reporting date. At December 31, 2016 and 2015, the counterparty credit risk exposure on the fair value of these interest-rate swap contracts was not significant. At December 31, 2016, Hydro One's credit exposure for all derivative instruments, and applicable payables and receivables, had a credit rating of investment grade, with four financial institutions as the counterparty.

## Liquidity Risk

Liquidity risk refers to the Company's ability to meet its financial obligations as they come due. Hydro One meets its short-term liquidity requirements using cash and cash equivalents on hand, funds from operations, the issuance of commercial paper, and the revolving standby credit facilities. The short-term liquidity under the Commercial Paper Program, revolving standby credit facilities, and anticipated levels of funds from operations are expected to be sufficient to fund normal operating requirements.

At December 31, 2016, accounts payable and accrued liabilities in the amount of $840 million (2015 – $753 million) were expected to be settled in cash at their carrying amounts within the next 12 months.

## 17. Capital Management

The Company's objectives with respect to its capital structure are to maintain effective access to capital on a long-term basis at reasonable rates, and to deliver appropriate financial returns. In order to ensure ongoing access to capital, the Company targets to maintain strong credit quality. At December 31, 2016 and 2015, the Company's capital structure was as follows:

| *December 31*<br>*(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| Long-term debt payable within one year | **602** | 500 |
| Short-term notes payable | **469** | 1,491 |
| Less: cash and cash equivalents | **50** | 94 |
| | **1,021** | 1,897 |
| Long-term debt | **10,078** | 8,207 |
| Preferred shares | **418** | 418 |
| Common shares | **5,623** | 5,623 |
| Retained earnings | **3,950** | 3,806 |
| Total capital | **21,090** | 19,951 |

Hydro One Inc. and Great Lakes Power have customary covenants typically associated with long-term debt. Hydro One Inc.'s long-term debt and credit facility covenants limit permissible debt to 75% of its total capitalization, limit the ability to sell assets and impose a negative pledge provision, subject to customary exceptions. At December 31, 2016, Hydro One Inc. and Great Lakes Power were in compliance with all covenants and limitations.

## 18. Pension and Post-retirement and Post-employment Benefits

Hydro One has a defined benefit pension plan (Pension Plan), a defined contribution pension plan (DC Plan), a supplementary pension plan, and post-retirement and post-employment benefit plans.

### Defined Contribution Pension Plan

Hydro One established a DC Plan effective January 1, 2016. The DC Plan is mandatory and covers eligible management employees hired on or after January 1, 2016, as well as management employees hired before January 1, 2016 who were not eligible or had not irrevocably elected to join the Pension Plan as of September 30, 2015. Members of the DC Plan have an option to contribute 4%, 5% or 6% of their pensionable earnings, with matching contributions by Hydro One.

Hydro One contributions to the DC Plan for the year ended December 31, 2016 were less than $1 million (2015 – $nil). At December 31, 2016, Company contributions payable included in accrued liabilities on the Consolidated Balance Sheets were less than $1 million (2015 – $nil).

## Defined Benefit Pension Plan, Supplementary Pension Plan, and Post-Retirement and Post-Employment Plans

The Pension Plan is a defined benefit contributory plan which covers all regular employees of Hydro One and its subsidiaries. The Pension Plan provides benefits based on highest three-year average pensionable earnings. For Management employees who commenced employment on or after January 1, 2004, and for Society of Energy Professionals-represented staff hired after November 17, 2005, benefits are based on highest five-year average pensionable earnings. After retirement, pensions are indexed to inflation. Membership in the Pension Plan was closed to Management employees who were not eligible or had not irrevocably elected to join the Pension Plan as of September 30, 2015. These employees are eligible to join the DC Plan.

Company and employee contributions to the Pension Plan are based on actuarial valuations performed at least every three years. Annual Pension Plan contributions for 2016 of $108 million (2015 – $177 million) were based on an actuarial valuation effective December 31, 2015 (2015 – based on an actuarial valuation effective December 31, 2013) and the level of pensionable earnings. Estimated annual Pension Plan contributions for 2017 and 2018 are approximately $105 million and $102 million, respectively, based on the actuarial valuation as at December 31, 2015 and projected levels of pensionable earnings.

Future minimum contributions beyond 2018 will be based on an actuarial valuation effective no later than December 31, 2018. Contributions are payable one month in arrears. All of the contributions are expected to be in the form of cash.

The Hydro One Supplemental Pension Plan (Supplemental Plan) provides members of the Pension Plan with benefits that would have been earned and payable under the Pension Plan but for limitations imposed by the *Income Tax Act* (Canada). The Supplemental Plan obligation is included with other post-retirement and post-employment benefit obligations on the Consolidated Balance Sheets.

Hydro One recognizes the overfunded or underfunded status of the Pension Plan, and post-retirement and post-employment benefit plans (Plans) as an asset or liability on its Consolidated Balance Sheets, with offsetting regulatory assets and liabilities as appropriate. The underfunded benefit obligations for the Plans, in the absence of regulatory accounting, would be recognized in AOCI. The impact of changes in assumptions used to measure pension, post-retirement and post-employment benefit obligations is generally recognized over the expected average remaining service period of the employees. The measurement date for the Plans is December 31.

| *Year ended December 31* | Pension Benefits | | Post-Retirement and Post-Employment Benefits | |
|---|---|---|---|---|
| *(millions of dollars)* | **2016** | 2015 | **2016** | 2015 |
| **Change in projected benefit obligation** | | | | |
| Projected benefit obligation, beginning of year | **7,683** | 7,535 | **1,610** | 1,582 |
| Current service cost | **144** | 146 | **42** | 43 |
| Employee contributions | **45** | 40 | **–** | – |
| Interest cost | **308** | 302 | **67** | 64 |
| Benefits paid | **(354)** | (334) | **(43)** | (47) |
| Net actuarial loss (gain) | **(52)** | (6) | **14** | (27) |
| Change due to Hydro One Brampton spin-off | **–** | – | **–** | (5) |
| Projected benefit obligation, end of year | **7,774** | 7,683 | **1,690** | 1,610 |
| **Change in plan assets** | | | | |
| Fair value of plan assets, beginning of year | **6,731** | 6,299 | **–** | – |
| Actual return on plan assets | **370** | 582 | **–** | – |
| Benefits paid | **(354)** | (334) | **(43)** | (47) |
| Employer contributions | **108** | 177 | **43** | 47 |
| Employee contributions | **45** | 40 | **–** | – |
| Administrative expenses | **(26)** | (33) | **–** | – |
| Fair value of plan assets, end of year | **6,874** | 6,731 | **–** | – |
| Unfunded status | **900** | 952 | **1,690** | 1,610 |

Hydro One presents its benefit obligations and plan assets net on its Consolidated Balance Sheets as follows:

| *December 31* *(millions of dollars)* | Pension Benefits 2016 | 2015 | Post-Retirement and Post-Employment Benefits 2016 | 2015 |
|---|---|---|---|---|
| Other assets | 1[1] | – | – | – |
| Accrued liabilities | – | – | 56 | 50 |
| Pension benefit liability | 900 | 952 | – | – |
| Post-retirement and post-employment benefit liability | – | – | 1,641[2] | 1,560 |
| Net unfunded status | 899 | 952 | 1,697 | 1,610 |

[1] Represents the funded status of Great Lakes Power's defined benefit pension plan.

[2] Includes $7 million (2015 – $nil) relating to Great Lakes Power's post-employment benefit plans.

The funded or unfunded status of the pension, post-retirement and post-employment benefit plans refers to the difference between the fair value of plan assets and the projected benefit obligations for the Plans. The funded/unfunded status changes over time due to several factors, including contribution levels, assumed discount rates and actual returns on plan assets.

The following table provides the projected benefit obligation (PBO), accumulated benefit obligation (ABO) and fair value of plan assets for the Pension Plan:

| *December 31* *(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| PBO | 7,774 | 7,683 |
| ABO | 7,094 | 7,020 |
| Fair value of plan assets | 6,874 | 6,731 |

On an ABO basis, the Pension Plan was funded at 97% at December 31, 2016 (2015 – 96%). On a PBO basis, the Pension Plan was funded at 88% at December 31, 2016 (2015 – 88%). The ABO differs from the PBO in that the ABO includes no assumption about future compensation levels.

## Components of Net Periodic Benefit Costs

The following table provides the components of the net periodic benefit costs for the years ended December 31, 2016 and 2015 for the Pension Plan:

| *Year ended December 31* *(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| Current service cost, net of employee contributions | 144 | 146 |
| Interest cost | 308 | 302 |
| Expected return on plan assets, net of expenses | (432) | (406) |
| Amortization of actuarial losses | 96 | 119 |
| Prior service cost amortization | – | 2 |
| Net periodic benefit costs | 116 | 163 |
| Charged to results of operations[1] | 48 | 81 |

[1] The Company follows the cash basis of accounting consistent with the inclusion of pension costs in OEB-approved rates. During the year ended December 31, 2016, pension costs of $108 million (2015 – $177 million) were attributed to labour, of which $48 million (2015 – $81 million) was charged to operations, and $60 million (2015 – $96 million) was capitalized as part of the cost of property, plant and equipment and intangible assets.

The following table provides the components of the net periodic benefit costs for the years ended December 31, 2016 and 2015 for the post-retirement and post-employment benefit plans:

| *Year ended December 31*<br>*(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| Current service cost, net of employee contributions | 42 | 43 |
| Interest cost | 67 | 64 |
| Amortization of actuarial losses | 15 | 14 |
| Prior service cost amortization | – | – |
| Net periodic benefit costs | 124 | 121 |
| Charged to results of operations | 55 | 55 |

## Assumptions

The measurement of the obligations of the Plans and the costs of providing benefits under the Plans involves various factors, including the development of valuation assumptions and accounting policy elections. When developing the required assumptions, the Company considers historical information as well as future expectations. The measurement of benefit obligations and costs is impacted by several assumptions including the discount rate applied to benefit obligations, the long-term expected rate of return on plan assets, Hydro One's expected level of contributions to the Plans, the incidence of mortality, the expected remaining service period of plan participants, the level of compensation and rate of compensation increases, employee age, length of service, and the anticipated rate of increase of health care costs, among other factors. The impact of changes in assumptions used to measure the obligations of the Plans is generally recognized over the expected average remaining service period of the plan participants. In selecting the expected rate of return on plan assets, Hydro One considers historical economic indicators that impact asset returns, as well as expectations regarding future long-term capital market performance, weighted by target asset class allocations. In general, equity securities, real estate and private equity investments are forecasted to have higher returns than fixed-income securities.

The following weighted average assumptions were used to determine the benefit obligations at December 31, 2016 and 2015:

| | Pension Benefits | | Post-Retirement and Post-Employment Benefits | |
|---|---|---|---|---|
| *Year ended December 31* | 2016 | 2015 | 2016 | 2015 |
| Significant assumptions: | | | | |
| Weighted average discount rate | 3.90% | 4.00% | 3.90% | 4.10% |
| Rate of compensation scale escalation (long-term) | 2.50% | 2.50% | 2.50% | 2.50% |
| Rate of cost of living increase | 2.00% | 2.00% | 2.00% | 2.00% |
| Rate of increase in health care cost trends[1] | – | – | 4.36% | 4.36% |

[1] 6.25% per annum in 2017, grading down to 4.36% per annum in and after 2031 (2015 – 6.38% in 2016, grading down to 4.36% per annum in and after 2031).

The following weighted average assumptions were used to determine the net periodic benefit costs for the years ended December 31, 2016 and 2015. Assumptions used to determine current year-end benefit obligations are the assumptions used to estimate the subsequent year's net periodic benefit costs.

| *Year ended December 31* | 2016 | 2015 |
|---|---|---|
| Pension Benefits: | | |
| Weighted average expected rate of return on plan assets | 6.50% | 6.50% |
| Weighted average discount rate | 4.00% | 4.00% |
| Rate of compensation scale escalation (long-term) | 2.50% | 2.50% |
| Rate of cost of living increase | 2.00% | 2.00% |
| Average remaining service life of employees *(years)* | 15 | 13 |
| Post-Retirement and Post-Employment Benefits: | | |
| Weighted average discount rate | 4.10% | 4.00% |
| Rate of compensation scale escalation (long-term) | 2.50% | 2.50% |
| Rate of cost of living increase | 2.00% | 2.00% |
| Average remaining service life of employees *(years)* | 15.3 | 13.8 |
| Rate of increase in health care cost trends[1] | 4.36% | 4.36% |

[1] 6.38% per annum in 2016, grading down to 4.36% per annum in and after 2031 (2015 – 6.52% in 2015, grading down to 4.36% per annum in and after 2031).

The discount rate used to determine the current year pension obligation and the subsequent year's net periodic benefit costs is based on a yield curve approach. Under the yield curve approach, expected future benefit payments for each plan are discounted by a rate on a third-party bond yield curve corresponding to each duration. The yield curve is based on "AA" long-term corporate bonds. A single discount rate is calculated that would yield the same present value as the sum of the discounted cash flows.

The effect of a 1% change in health care cost trends on the projected benefit obligation for the post-retirement and post-employment benefits at December 31, 2016 and 2015 is as follows:

| *December 31*<br>*(millions of dollars)* | **2016** | 2015 |
|---|---|---|
| Projected benefit obligation: | | |
| Effect of a 1% increase in health care cost trends | **289** | 252 |
| Effect of a 1% decrease in health care cost trends | **(221)** | (196) |

The effect of a 1% change in health care cost trends on the service cost and interest cost for the post-retirement and post-employment benefits for the years ended December 31, 2016 and 2015 is as follows:

| *Year ended December 31*<br>*(millions of dollars)* | **2016** | 2015 |
|---|---|---|
| Service cost and interest cost: | | |
| Effect of a 1% increase in health care cost trends | **23** | 22 |
| Effect of a 1% decrease in health care cost trends | **(17)** | (16) |

The following approximate life expectancies were used in the mortality assumptions to determine the projected benefit obligations for the pension and post-retirement and post-employment plans at December 31, 2016 and 2015:

| **December 31, 2016 Life expectancy at 65 for a member currently at** | | | | December 31, 2015 Life expectancy at 65 for a member currently at | | | |
|---|---|---|---|---|---|---|---|
| **Age 65** | | **Age 45** | | Age 65 | | Age 45 | |
| **Male** | **Female** | **Male** | **Female** | Male | Female | Male | Female |
| **22** | **24** | **23** | **24** | 23 | 25 | 24 | 26 |

## Estimated Future Benefit Payments

At December 31, 2016, estimated future benefit payments to the participants of the Plans were:

| *(millions of dollars)* | **Pension Benefits** | Post-Retirement and Post-Employment Benefits |
|---|---|---|
| 2017 | 321 | 56 |
| 2018 | 331 | 57 |
| 2019 | 340 | 60 |
| 2020 | 349 | 62 |
| 2021 | 358 | 64 |
| 2022 through to 2026 | 1,910 | 355 |
| Total estimated future benefit payments through to 2026 | 3,609 | 654 |

## Components of Regulatory Assets

A portion of actuarial gains and losses and prior service costs is recorded within regulatory assets on Hydro One's Consolidated Balance Sheets to reflect the expected regulatory inclusion of these amounts in future rates, which would otherwise be recorded in OCI. The following table provides the actuarial gains and losses and prior service costs recorded within regulatory assets:

| *Year ended December 31* <br> *(millions of dollars)* | **2016** | 2015 |
|---|---|---|
| **Pension Benefits:** | | |
| Actuarial loss (gain) for the year | **35** | (181) |
| Amortization of actuarial losses | **(96)** | (119) |
| Prior service cost amortization | **–** | (2) |
| | **(61)** | (302) |
| **Post-Retirement and Post-Employment Benefits:** | | |
| Actuarial loss (gain) for the year | **14** | (27) |
| Amortization of actuarial losses | **(15)** | (14) |
| Prior service cost amortization | **–** | – |
| | **(1)** | (41) |

The following table provides the components of regulatory assets that have not been recognized as components of net periodic benefit costs for the years ended December 31, 2016 and 2015:

| *Year ended December 31* <br> *(millions of dollars)* | **2016** | 2015 |
|---|---|---|
| **Pension Benefits:** | | |
| Prior service cost | **–** | – |
| Actuarial loss | **900** | 952 |
| | **900** | 952 |
| **Post-Retirement and Post-Employment Benefits:** | | |
| Actuarial loss | **243** | 240 |
| | **243** | 240 |

The following table provides the components of regulatory assets at December 31 that are expected to be amortized as components of net periodic benefit costs in the following year:

| *December 31* | Pension Benefits | | Post-Retirement and Post-Employment Benefits | |
|---|---|---|---|---|
| *(millions of dollars)* | **2016** | 2015 | **2016** | 2015 |
| Prior service cost | **–** | – | **–** | – |
| Actuarial loss | **79** | 96 | **6** | 8 |
| | **79** | 96 | **6** | 8 |

## Pension Plan Assets

### Investment Strategy

On a regular basis, Hydro One evaluates its investment strategy to ensure that Pension Plan assets will be sufficient to pay Pension Plan benefits when due. As part of this ongoing evaluation, Hydro One may make changes to its targeted asset allocation and investment strategy. The Pension Plan is managed at a net asset level. The main objective of the Pension Plan is to sustain a certain level of net assets in order to meet the pension obligations of the Company. The Pension Plan fulfills its primary objective by adhering to specific investment policies outlined in its Summary of Investment Policies and Procedures (SIPP), which is reviewed and approved by the Human Resource Committee of Hydro One's Board of Directors. The Company manages net assets by engaging knowledgeable external investment managers who are charged with the responsibility of investing existing funds and new funds (current year's employee and employer contributions) in accordance with the approved SIPP. The performance of the managers is monitored through a governance structure. Increases in net assets are a direct result of investment income generated by investments held by the Pension Plan and contributions to the Pension Plan by eligible employees and by the Company. The main use of net assets is for benefit payments to eligible Pension Plan members.

### Pension Plan Asset Mix

At December 31, 2016, the Pension Plan target asset allocations and weighted average asset allocations were as follows:

| | Target Allocation (%) | Pension Plan Assets (%) |
|---|---|---|
| Equity securities | 55.0 | 58.7 |
| Debt securities | 35.0 | 33.6 |
| Other[1] | 10.0 | 7.7 |
| | 100.0 | 100.0 |

[1] Other investments include real estate and infrastructure investments.

At December 31, 2016, the Pension Plan held $11 million (2015 – $9 million) Hydro One corporate bonds and $450 million (2015 – $420 million) of debt securities of the Province.

### Concentrations of Credit Risk

Hydro One evaluated its Pension Plan's asset portfolio for the existence of significant concentrations of credit risk as at December 31, 2016 and 2015. Concentrations that were evaluated include, but are not limited to, investment concentrations in a single entity, concentrations in a type of industry, and concentrations in individual funds. At December 31, 2016 and 2015, there were no significant concentrations (defined as greater than 10% of plan assets) of risk in the Pension Plan's assets.

The Pension Plan manages its counterparty credit risk with respect to bonds by investing in investment-grade and government bonds and with respect to derivative instruments by transacting only with financial institutions rated at least "A+" by Standard & Poor's Rating Services, DBRS Limited, and Fitch Ratings Inc., and "A1" by Moody's Investors Service, and also by utilizing exposure limits to each counterparty and ensuring that exposure is diversified across counterparties. The risk of default on transactions in listed securities is considered minimal, as the trade will fail if either party to the transaction does not meet its obligation.

### Fair Value Measurements

The following tables present the Pension Plan assets measured and recorded at fair value on a recurring basis and their level within the fair value hierarchy at December 31, 2016 and 2015:

| *December 31, 2016 (millions of dollars)* | Level 1 | Level 2 | Level 3 | Total |
|---|---|---|---|---|
| Pooled funds | – | 20 | 425 | 445 |
| Cash and cash equivalents | 146 | – | – | 146 |
| Short-term securities | – | 127 | – | 127 |
| Corporate shares – Canadian | 911 | – | – | 911 |
| Corporate shares – Foreign | 2,985 | 113 | – | 3,098 |
| Bonds and debentures – Canadian | – | 1,943 | – | 1,943 |
| Bonds and debentures – Foreign | – | 193 | – | 193 |
| Total fair value of plan assets[1] | 4,042 | 2,396 | 425 | 6,863 |

[1] At December 31, 2016, the total fair value of Pension Plan assets excludes $27 million of interest and dividends receivable, $15 million of purchased investments payable, $9 million of pension administration expenses payable, and $7 million of sold investments receivable.

| *December 31, 2015* *(millions of dollars)* | Level 1 | Level 2 | Level 3 | Total |
|---|---|---|---|---|
| Pooled funds | – | 23 | 301 | 324 |
| Cash and cash equivalents | 191 | – | – | 191 |
| Short-term securities | – | 80 | – | 80 |
| Corporate shares – Canadian | 807 | – | – | 807 |
| Corporate shares – Foreign | 2,931 | 116 | – | 3,047 |
| Bonds and debentures – Canadian | – | 2,072 | – | 2,072 |
| Bonds and debentures – Foreign | – | 201 | – | 201 |
| Total fair value of plan assets[1] | 3,929 | 2,492 | 301 | 6,722 |

[1] At December 31, 2015, the total fair value of Pension Plan assets excludes $27 million of interest and dividends receivable, and $18 million relating to accruals for pension administration expense and foreign exchange contracts payable.

See note 16 – Fair Value of Financial Instruments and Risk Management for a description of levels within the fair value hierarchy.

## Changes in the Fair Value of Financial Instruments Classified in Level 3

The following table summarizes the changes in fair value of financial instruments classified in Level 3 for the years ended December 31, 2016 and 2015. The Pension Plan classifies financial instruments as Level 3 when the fair value is measured based on at least one significant input that is not observable in the markets or due to lack of liquidity in certain markets. The gains and losses presented in the table below may include changes in fair value based on both observable and unobservable inputs.

| *Year ended December 31* *(millions of dollars)* | **2016** | 2015 |
|---|---|---|
| Fair value, beginning of year | **301** | 144 |
| Realized and unrealized gains | **23** | 51 |
| Purchases | **151** | 106 |
| Sales and disbursements | **(50)** | – |
| Fair value, end of year | **425** | 301 |

There were no significant transfers between any of the fair value levels during the years ended December 31, 2016 and 2015.

The Company performs sensitivity analysis for fair value measurements classified in Level 3, substituting the unobservable inputs with one or more reasonably possible alternative assumptions. These sensitivity analyses resulted in negligible changes in the fair value of financial instruments classified in this level.

## Valuation Techniques Used to Determine Fair Value

Pooled funds mainly consist of private equity, real estate and infrastructure investments. Private equity investments represent private equity funds that invest in operating companies that are not publicly traded on a stock exchange. Investment strategies in private equity include limited partnerships in businesses that are characterized by high internal growth and operational efficiencies, venture capital, leveraged buyouts and special situations such as distressed investments. Real estate and infrastructure investments represent funds that invest in real assets which are not publicly traded on a stock exchange. Investment strategies in real estate include limited partnerships that seek to generate a total return through income and capital growth by investing primarily in global and Canadian limited partnerships. Investment strategies in infrastructure include limited partnerships in core infrastructure assets focusing on assets that generate stable, long-term cash flows and deliver incremental returns relative to conventional fixed-income investments. Private equity, real estate and infrastructure valuations are reported by the fund manager and are based on the valuation of the underlying investments which includes inputs such as cost, operating results, discounted future cash flows and market-based comparable data. Since these valuation inputs are not highly observable, private equity and infrastructure investments have been categorized as Level 3 within pooled funds.

Cash equivalents consist of demand cash deposits held with banks and cash held by the investment managers. Cash equivalents are categorized as Level 1.

Short-term securities are valued at cost plus accrued interest, which approximates fair value due to their short-term nature. Short-term securities are categorized as Level 2.

Corporate shares are valued based on quoted prices in active markets and are categorized as Level 1. Investments denominated in foreign currencies are translated into Canadian currency at year-end rates of exchange.

Bonds and debentures are presented at published closing trade quotations, and are categorized as Level 2.

## 19. Environmental Liabilities

The following tables show the movements in environmental liabilities for the years ended December 31, 2016 and 2015:

| *Year ended December 31, 2016* *(millions of dollars)* | PCB | Land Assessment and Remediation | Total |
|---|---|---|---|
| Environmental liabilities, January 1 | 148 | 59 | 207 |
| Interest accretion | 7 | 1 | 8 |
| Expenditures | (11) | (9) | (20) |
| Revaluation adjustment | (1) | 10 | 9 |
| Environmental liabilities, December 31 | 143 | 61 | 204 |
| Less: current portion | 18 | 9 | 27 |
| | 125 | 52 | 177 |

| *Year ended December 31, 2015* *(millions of dollars)* | PCB | Land Assessment and Remediation | Total |
|---|---|---|---|
| Environmental liabilities, January 1 | 172 | 67 | 239 |
| Interest accretion | 8 | 2 | 10 |
| Expenditures | (8) | (11) | (19) |
| Revaluation adjustment | (24) | 1 | (23) |
| Environmental liabilities, December 31 | 148 | 59 | 207 |
| Less: current portion | 12 | 10 | 22 |
| | 136 | 49 | 185 |

The following tables show the reconciliation between the undiscounted basis of the environmental liabilities and the amount recognized on the Consolidated Balance Sheets after factoring in the discount rate:

| *December 31, 2016* *(millions of dollars)* | PCB | Land Assessment and Remediation | Total |
|---|---|---|---|
| Undiscounted environmental liabilities | 158 | 66 | 224 |
| Less: discounting accumulated liabilities to present value | 15 | 5 | 20 |
| Discounted environmental liabilities | 143 | 61 | 204 |

| *December 31, 2015* *(millions of dollars)* | PCB | Land Assessment and Remediation | Total |
|---|---|---|---|
| Undiscounted environmental liabilities | 168 | 61 | 229 |
| Less: discounting accumulated liabilities to present value | 20 | 2 | 22 |
| Discounted environmental liabilities | 148 | 59 | 207 |

At December 31, 2016, the estimated future environmental expenditures were as follows:

| *(millions of dollars)* | |
|---|---|
| 2017 | 27 |
| 2018 | 26 |
| 2019 | 25 |
| 2020 | 29 |
| 2021 | 36 |
| Thereafter | 81 |
| | 224 |

Hydro One records a liability for the estimated future expenditures for land assessment and remediation and for the phase-out and destruction of PCB-contaminated mineral oil removed from electrical equipment when it is determined that future environmental remediation expenditures are probable under existing statute or regulation and the amount of the future expenditures can be reasonably estimated.

There are uncertainties in estimating future environmental costs due to potential external events such as changes in legislation or regulations, and advances in remediation technologies. In determining the amounts to be recorded as environmental liabilities, the Company estimates the current cost of completing required work and makes assumptions as to when the future expenditures will actually be incurred, in order to generate future cash flow information. A long-term inflation rate assumption of approximately 2% has been used to express these current cost estimates as estimated future expenditures. Future expenditures have been discounted using factors ranging from approximately 2.0% to 6.3%, depending on the appropriate rate for the period when expenditures are expected to be incurred. All factors used in estimating the Company's environmental liabilities represent management's best estimates of the present value of costs required to meet existing legislation or regulations. However, it is reasonably possible that numbers or volumes of contaminated assets, cost estimates to perform work, inflation assumptions and the assumed pattern of annual cash flows may differ significantly from the Company's current assumptions. In addition, with respect to the PCB environmental liability, the availability of critical resources such as skilled labour and replacement assets and the ability to take maintenance outages in critical facilities may influence the timing of expenditures.

### PCBs

The Environment Canada regulations, enacted under the *Canadian Environmental Protection Act, 1999*, govern the management, storage and disposal of PCBs based on certain criteria, including type of equipment, in-use status, and PCB-contamination thresholds. Under current regulations, Hydro One's PCBs have to be disposed of by the end of 2025, with the exception of specifically exempted equipment. Contaminated equipment will generally be replaced, or will be decontaminated by removing PCB-contaminated insulating oil and retro filling with replacement oil that contains PCBs in concentrations of less than 2 ppm.

The Company's best estimate of the total estimated future expenditures to comply with current PCB regulations is $158 million (2015 – $168 million). These expenditures are expected to be incurred over the period from 2017 to 2025. As a result of its annual review of environmental liabilities, the Company recorded a revaluation adjustment in 2016 to reduce the PCB environmental liability by $1 million (2015 – $24 million).

### Land Assessment and Remediation

The Company's best estimate of the total estimated future expenditures to complete its land assessment and remediation program is $66 million (2015 – $61 million). These expenditures are expected to be incurred over the period from 2017 to 2032. As a result of its annual review of environmental liabilities, the Company recorded a revaluation adjustment in 2016 to increase the land assessment and remediation environmental liability by $10 million (2015 – $1 million).

## 20. Asset Retirement Obligations

Hydro One records a liability for the estimated future expenditures for the removal and disposal of asbestos-containing materials installed in some of its facilities and for the decommissioning of specific switching stations located on unowned sites. Asset retirement obligations, which represent legal obligations associated with the retirement of certain tangible long-lived assets, are computed as the present value of the projected expenditures for the future retirement of specific assets and are recognized in the period in which the liability is incurred, if a reasonable estimate of fair value can be made. If the asset remains in service at the recognition date, the present value of the liability is added to the carrying amount of the associated asset in the period the liability is incurred and this additional carrying amount is depreciated over the remaining life of the asset. If an asset retirement obligation is recorded in respect of an out-of-service asset, the asset retirement cost is charged to results of operations. Subsequent to the initial recognition, the liability is adjusted for any revisions to the estimated future cash flows associated with the asset retirement obligation, which can occur due to a number of factors including, but not limited to, cost escalation, changes in technology applicable to the assets to be retired, changes in legislation or regulations, as well as for accretion of the liability due to the passage of time until the obligation is settled. Depreciation expense is adjusted prospectively for any increases or decreases to the carrying amount of the associated asset.

In determining the amounts to be recorded as asset retirement obligations, the Company estimates the current fair value for completing required work and makes assumptions as to when the future expenditures will actually be incurred, in order to generate future cash flow information. A long-term inflation assumption of approximately 2% has been used to express these current cost estimates as estimated future expenditures. Future expenditures have been discounted using factors ranging from approximately 3.0% to 5.0%, depending on the appropriate rate for the period when expenditures are expected to be incurred. All factors used in estimating the Company's asset retirement obligations represent management's best estimates of the cost required to meet existing legislation or regulations. However, it is reasonably possible that numbers or volumes of contaminated assets, cost estimates to perform work, inflation assumptions and the assumed pattern of annual cash flows may differ significantly from the Company's current assumptions. Asset retirement obligations are reviewed annually or more frequently if significant changes in regulations or other relevant factors occur. Estimate changes are accounted for prospectively.

At December 31, 2016, Hydro One had recorded asset retirement obligations of $9 million (2015 – $9 million), primarily consisting of the estimated future expenditures associated with the removal and disposal of asbestos-containing materials installed in some of its facilities. The amount of interest recorded is nominal.

## 21. Share Capital

### Common Shares

The Company is authorized to issue an unlimited number of common shares. At December 31, 2016 and 2015, the Company had 595 million common shares issued and outstanding.

The amount and timing of any dividends payable by Hydro One is at the discretion of the Hydro One Board of Directors and is established on the basis of Hydro One's results of operations, maintenance of its deemed regulatory capital structure, financial condition, cash requirements, the satisfaction of solvency tests imposed by corporate laws for the declaration and payment of dividends and other factors that the Board of Directors may consider relevant.

### Common Share Offerings

In November 2015, Hydro One and the Province completed an initial public offering (IPO) on the Toronto Stock Exchange of approximately 15% of its 595 million outstanding common shares. In April 2016, the Province completed a secondary offering of approximately 83.3 million or 14% common shares of Hydro One on the Toronto Stock Exchange. Hydro One did not receive any of the proceeds from the sale of the common shares by the Province.

### Preferred Shares

The Company is authorized to issue an unlimited number of preferred shares, issuable in series. At December 31, 2016, two series of preferred shares are authorized for issuance: the Series 1 preferred shares and the Series 2 preferred shares. At December 31, 2016, the Company had 16,720,000 Series 1 preferred shares and no Series 2 preferred shares issued and outstanding.

Hydro One may from time to time issue preferred shares in one or more series. Prior to issuing shares in a series, the Hydro One Board of Directors is required to fix the number of shares in the series and determine the designation, rights, privileges, restrictions and conditions attaching to that series of preferred shares. Holders of Hydro One's preferred shares are not entitled to receive notice of, to attend or to vote at any meeting of the shareholders of Hydro One except that votes may be granted to a series of preferred shares when dividends have not been paid on any one or more series as determined by the applicable series provisions. Each series of preferred shares ranks on parity with every other series of preferred shares, and are entitled to a preference over the common shares and any other shares ranking junior to the preferred shares, with respect to dividends and the distribution of assets and return of capital in the event of the liquidation, dissolution or winding up of Hydro One.

For the period commencing from the date of issue of the Series 1 preferred shares and ending on and including November 19, 2020, the holders of Series 1 preferred shares are entitled to receive fixed cumulative preferential dividends of $1.0625 per share per year, if and when declared by the Board of Directors, payable quarterly. The dividend rate will reset on November 20, 2020 and every five years thereafter at a rate equal to the sum of the then five-year Government of Canada bond yield and 3.53%. The Series 1 preferred shares will not be redeemable by Hydro One prior to November 20, 2020, but will be redeemable by Hydro One on November 20, 2020 and on November 20 of every fifth year thereafter at a redemption price equal to $25.00 for each Series 1 preferred share redeemed, plus any accrued or unpaid dividends. The holders of Series 1 preferred shares will have the right, at their option, on November 20, 2020 and on November 20 of every fifth year thereafter, to convert all or any of their Series 1 preferred shares into Series 2 preferred shares on a one-for-one basis, subject to certain restrictions on conversion. At December 31, 2016, no preferred share dividends were in arrears.

The holders of Series 2 preferred shares will be entitled to receive quarterly floating rate cumulative dividends, if and when declared by the Board of Directors, at a rate equal to the sum of the then three-month Government of Canada treasury bill rate and 3.53% as reset quarterly. The Series 2 preferred shares will not be redeemable by Hydro One prior to November 20, 2020, but will be redeemable by Hydro One at a redemption price equal to $25.00 for each Series 2 preferred share redeemed, if redeemed on November 20, 2025 or on November 20 of every fifth year thereafter, or $25.50 for each Series 2 preferred share redeemed, if redeemed on any other date after November 20, 2020, in each case plus any accrued or unpaid dividends. The holders of Series 2 preferred shares will have the right, at their option, on November 20, 2025 and on November 20 of every fifth year thereafter, to convert all or any of their Series 2 preferred shares into Series 1 preferred shares on a one-for-one basis, subject to certain restrictions on conversion.

## Reorganization

Prior to the completion of the IPO, Hydro One and Hydro One Inc. completed a series of transactions (Pre-IPO Transactions) that resulted in, among other things, on October 31, 2015, Hydro One acquiring all of the issued and outstanding shares of Hydro One Inc. from the Province and issuing new common shares and preferred shares to the Province.

The following tables present the changes to common and preferred shares as a result of Pre-IPO Transactions, as well as the movement in the number of common and preferred shares during the year ended December 31, 2015. There was no movement in common or preferred shares during the year ended December 31, 2016.

| | | Preferred Shares | |
|---|---|---|---|
| *(millions of dollars)* | Common Shares | Equity | Temporary Equity |
| Common shares issued – purchase and cancellation of preferred shares *(c)* | 323 | – | (323) |
| Acquisition of Hydro One Inc. *(d)* | | | |
| Common shares of Hydro One Inc. acquired by Hydro One | (3,441) | – | – |
| Common shares of Hydro One issued to Province | 3,023 | – | – |
| Preferred shares of Hydro One issued to Province | – | 418 | – |
| Common shares issued *(e)* | 2,600 | – | – |
| Total Pre-IPO Transactions adjustment | 2,505 | 418 | (323) |

| | | Preferred Shares | |
|---|---|---|---|
| *(number of shares)* | Common Shares | Equity | Temporary Equity |
| Number of shares – January 1, 2015 *(a)* | 100,000 | – | 12,920,000 |
| Common shares issued *(b)* | 100,000 | – | – |
| Pre-IPO Transactions: | | | |
| Common shares issued – purchase and cancellation of preferred shares *(c)* | 2,640 | – | (12,920,000) |
| Acquisition of Hydro One Inc. *(d)* | | | |
| Common shares of Hydro One Inc. acquired by Hydro One | (102,640) | – | – |
| Common shares of Hydro One issued to Province | 12,197,500,000 | – | – |
| Preferred shares of Hydro One issued to Province | – | 16,720,000 | – |
| Common shares issued *(e)* | 2,600,000,000 | – | – |
| Common shares consolidation *(f)* | (14,202,600,000) | – | – |
| Number of shares – December 31, 2015 | 595,000,000 | 16,720,000 | – |

(a) At January 1, 2015, all common and preferred shares represent the shares of Hydro One Inc.
(b) On August 31, 2015, Hydro One was incorporated under the *Business Corporations Act* (Ontario) and issued 100,000 common shares to the Province for proceeds of $100,000.
(c) On October 31, 2015, Hydro One Inc. purchased and cancelled 12,920,000 preferred shares of Hydro One Inc. previously held by the Province for cancellation at a price equal to the redemption price of the preferred shares totalling $323 million, which was satisfied by the issuance to the Province of 2,640 common shares of Hydro One Inc.
(d) On October 31, 2015, all of the issued and outstanding common shares of Hydro One Inc. were acquired by Hydro One from the Province in return for 12,197,500,000 common shares of Hydro One and 16,720,000 Series 1 preferred shares of Hydro One.
(e) On November 4, 2015, Hydro One issued 2.6 billion common shares to the Province for proceeds of $2.6 billion.
(f) On November 4, 2015, the common shares of Hydro One were consolidated by way of articles of amendment approved by the Province as sole shareholder so that, after such consolidation, 595,000,000 common shares of Hydro One were issued and outstanding.

## Share Ownership Restrictions

The *Electricity Act* imposes share ownership restrictions on securities of Hydro One carrying a voting right (Voting Securities). These restrictions provide that no person or company (or combination of persons or companies acting jointly or in concert) may beneficially own or exercise control or direction over more than 10% of any class or series of Voting Securities, including common shares of the Company (Share Ownership Restrictions). The Share Ownership Restrictions do not apply to Voting Securities held by the Province, nor to an underwriter who holds Voting Securities solely for the purpose of distributing those securities to purchasers who comply with the Share Ownership Restrictions.

## 22. Dividends

In 2016, preferred share dividends in the amount of $19 million (2015 – $13 million) and common share dividends in the amount of $577 million (2015 – $875 million) were declared. The 2016 common share dividends include $77 million for the post-IPO period from November 5 to December 31, 2015, and $500 million for the year ended December 31, 2016.

In August 2015, Hydro One declared a dividend in-kind on its common shares payable in all of the issued and outstanding shares of Hydro One Brampton (see note 4).

## 23. Earnings Per Share

Basic earnings per common share (EPS) is calculated by dividing net income attributable to common shareholders of Hydro One by the weighted average number of common shares outstanding. Diluted EPS is calculated by dividing net income attributable to common shareholders of Hydro One by the weighted average number of common shares outstanding adjusted for the effects of potentially dilutive stock-based compensation plans, including the share grant plans and the Long-term Incentive Plan, which are calculated using the treasury stock method.

| *Year ended December 31* | 2016 | 2015 |
|---|---|---|
| Net income attributable to common shareholders *(millions of dollars)* | 721 | 690 |
| Weighted average number of shares | | |
| Basic | 595,000,000 | 496,272,733 |
| Effect of dilutive stock-based compensation plans *(Note 24)* | 1,700,823 | 94,691 |
| Diluted | 596,700,823 | 496,367,424 |
| EPS | | |
| Basic | $1.21 | $1.39 |
| Diluted | $1.21 | $1.39 |

## Pro forma Adjusted non-GAAP Basic and Diluted EPS

The following pro forma adjusted non-GAAP basic and diluted EPS has been prepared by management on a supplementary basis which assumes that the total number of common shares outstanding was 595,000,000 in each of the years ended December 31, 2016 and 2015. The supplementary pro forma disclosure is used internally by management subsequent to the IPO of Hydro One to assess the Company's performance and is considered useful because it eliminates the impact of a different number of shares outstanding and held by the Province prior to the IPO. EPS is considered an important measure and management believes that presenting it for all periods based on the number of outstanding shares on, and subsequent to, the IPO provides users with a comparable basis to evaluate the operations of the Company.

| *Year ended December 31* *(unaudited)* | 2016 | 2015 |
|---|---|---|
| Net income attributable to common shareholders *(millions of dollars)* | 721 | 690 |
| Pro forma weighted average number of common shares | | |
| Basic | 595,000,000 | 595,000,000 |
| Effect of dilutive stock-based compensation plans *(Note 24)* | 1,700,823 | 94,691 |
| Diluted | 596,700,823 | 595,094,691 |
| Pro forma adjusted non-GAAP EPS | | |
| Basic | $1.21 | $1.16 |
| Diluted | $1.21 | $1.16 |

The above pro forma adjusted non-GAAP basic and diluted EPS does not have any standardized meaning in US GAAP.

## 24. Stock-based Compensation

### Share Grant Plans

At December 31, 2016, Hydro One had two share grant plans (Share Grant Plans), one for the benefit of certain members of the Power Workers' Union (the PWU Share Grant Plan) and one for the benefit of certain members of The Society of Energy Professionals (the Society Share Grant Plan).

The PWU Share Grant Plan provides for the issuance of common shares of Hydro One from treasury to certain eligible members of the Power Workers' Union annually, commencing on April 1, 2017 and continuing until the earlier of April 1, 2028 or the date an eligible employee no longer meets the eligibility criteria of the PWU Share Grant Plan. To be eligible, an employee must be a member of the Pension Plan on April 1, 2015, be employed on the date annual share issuance occurs and continue to have under 35 years of service. The requisite service period for the PWU Share Grant Plan begins on July 3, 2015, which is the date the share grant plan was ratified by the PWU. The number of common shares issued annually to each eligible employee will be equal to 2.7% of such eligible employee's salary as at April 1, 2015, divided by $20.50, being the price of the common shares of Hydro One in the IPO. The aggregate number of common shares issuable under the PWU Share Grant Plan shall not exceed 3,981,763 common shares. In 2015, 3,979,062 common shares were granted under the PWU Share Grant Plan.

The Society Share Grant Plan provides for the issuance of common shares of Hydro One from treasury to certain eligible members of The Society of Energy Professionals annually, commencing on April 1, 2018 and continuing until the earlier of April 1, 2029 or the date an eligible employee no longer meets the eligibility criteria of the Society Share Grant Plan. To be eligible, an employee must be a member of the Pension Plan on September 1, 2015, be employed on the date annual share issuance occurs and continue to have under 35 years of service. Therefore the requisite service period for the Society Share Grant Plan begins on September 1, 2015. The number of common shares issued annually to each eligible employee will be equal to 2.0% of such eligible employee's salary as at September 1, 2015, divided by $20.50, being the price of the common shares of Hydro One in the IPO. The aggregate number of common shares issuable under the Society Share Grant Plan shall not exceed 1,434,686 common shares. In 2015, 1,433,292 common shares were granted under the Society Share Grant Plan.

The fair value of the Hydro One Limited 2015 share grants of $111 million was estimated based on the grant date share price of $20.50 and is recognized using the graded-vesting attribution method as the share grant plans have both a performance condition and a service condition. No shares were granted under the Share Grant Plans in 2016. Total share based compensation recognized during 2016 was $21 million (2015 – $10 million) and was recorded as a regulatory asset.

A summary of share grant activity under the Share Grant Plans during years ended December 31, 2016 and 2015 is presented below:

| *Year ended December 31, 2016* | Share Grants *(number of common shares)* | Weighted-Average Price |
|---|---|---|
| Share grants outstanding – January 1, 2016 | 5,412,354 | $20.50 |
| Granted (non-vested) | – | – |
| Forfeited | (77,939) | $20.50 |
| Share grants outstanding – December 31, 2016 | 5,334,415 | $20.50 |

| *Year ended December 31, 2015* | Share Grants *(number of common shares)* | Weighted-Average Price |
|---|---|---|
| Share grants outstanding – January 1, 2015 | – | – |
| Granted (non-vested) | 5,412,354 | $20.50 |
| Share grants outstanding – December 31, 2015 | 5,412,354 | $20.50 |

### Directors' DSU Plan

Under the Company's Directors' DSU Plan, directors can elect to receive credit for their annual cash retainer in a notional account of DSUs in lieu of cash. Hydro One's Board of Directors may also determine from time to time that special circumstances exist that would reasonably justify the grant of DSUs to a director as compensation in addition to any regular retainer or fee to which the director is entitled.

Each DSU represents a unit with an underlying value equivalent to the value of one common share of the Company and is entitled to accrue common share dividend equivalents in the form of additional DSUs at the time dividends are paid, subsequent to declaration by Hydro One's Board of Directors.

| *Year ended December 31*<br>*(number of DSUs)* | 2016 | 2015 |
|---|---|---|
| DSUs outstanding – January 1 | 20,525 | – |
| DSUs granted | 78,558 | 20,525 |
| DSUs outstanding – December 31 | 99,083 | 20,525 |

For the year ended December 31, 2016, an expense of $2 million (2015 – less than $1 million) was recognized in earnings with respect to the DSU Plan. At December 31, 2016, a liability of $2 million (December 31, 2015 – less than $1 million), related to outstanding DSUs has been recorded at the closing price of the Company's common shares of $23.58 and is included in accrued liabilities on the Consolidated Balance Sheets.

## Employee Share Ownership Plan

Effective December 15, 2015, Hydro One established an Employee Share Ownership Plan (ESOP). Under the ESOP, certain eligible management and non-represented employees may contribute between 1% and 6% of their base salary towards purchasing common shares of Hydro One. The Company matches 50% of the employee's contributions, up to a maximum Company contribution of $25,000 per calendar year. In 2016, Company contributions made under the ESOP were $2 million (2015 – $nil).

## Long-term Incentive Plan

Effective August 31, 2015, the Board of Directors of Hydro One adopted an LTIP. Under the LTIP, long-term incentives are granted to certain executive and management employees of Hydro One and its subsidiaries, and all equity-based awards will be settled in newly issued shares of Hydro One from treasury, consistent with the provisions of the plan. The aggregate number of shares issuable under the LTIP shall not exceed 11,900,000 shares of Hydro One.

The LTIP provides flexibility to award a range of vehicles, including restricted share units (RSUs), performance share units (PSUs), stock options, share appreciation rights, restricted shares, deferred share units and other share-based awards. The mix of vehicles is intended to vary by role to recognize the level of executive accountability for overall business performance.

During 2016, the Company granted awards under its LTIP, consisting of PSUs and RSUs, all of which are equity settled, as follows:

| *Year ended December 31, 2016* | Number of PSUs | Number of RSUs |
|---|---|---|
| Units outstanding – January 1, 2016 | – | – |
| Units granted | 235,420 | 258,970 |
| Units forfeited | (4,820) | (4,820) |
| Units outstanding – December 31, 2016 | 230,600 | 254,150 |

The grant date total fair value of the awards was $12 million (2015 – $nil). The compensation expense recognized by the Company relating to these awards during 2016 was $3 million (2015 – $nil).

# 25. Noncontrolling Interest

On December 16, 2014, transmission assets totalling $526 million were transferred from Hydro One Networks to B2M LP. This was financed by 60% debt ($316 million) and 40% equity ($210 million). On December 17, 2014, the Saugeen Ojibway Nation (SON) acquired a 34.2% equity interest in B2M LP for consideration of $72 million, representing the fair value of the equity interest acquired. The SON's initial investment in B2M LP consists of $50 million of Class A units and $22 million of Class B units.

The Class B units have a mandatory put option which requires that upon the occurrence of an enforcement event (i.e. an event of default such as a debt default by the SON or insolvency event), Hydro One purchase the Class B units of B2M LP for net book value on the redemption date. The noncontrolling interest relating to the Class B units is classified on the Consolidated Balance Sheet as temporary equity because the redemption feature is outside the control of the Company. The balance of the noncontrolling interest is classified within equity.

The following tables show the movements in noncontrolling interest for the years ended December 31, 2016 and 2015:

| *Year ended December 31, 2016* *(millions of dollars)* | Temporary Equity | Equity | Total |
|---|---|---|---|
| Noncontrolling interest – January 1, 2016 | 23 | 52 | 75 |
| Distributions to noncontrolling interest | (3) | (6) | (9) |
| Net income attributable to noncontrolling interest | 2 | 4 | 6 |
| Noncontrolling interest – December 31, 2016 | 22 | 50 | 72 |

| *Year ended December 31, 2015* *(millions of dollars)* | Temporary Equity | Equity | Total |
|---|---|---|---|
| Noncontrolling interest – January 1, 2015 | 21 | 49 | 70 |
| Distributions to noncontrolling interest | (1) | (4) | (5) |
| Net income attributable to noncontrolling interest | 3 | 7 | 10 |
| Noncontrolling interest – December 31, 2015 | 23 | 52 | 75 |

## 26. Related Party Transactions

The Province is the majority shareholder of Hydro One. The IESO, Ontario Power Generation Inc. (OPG), OEFC, OEB, and Hydro One Brampton are related parties to Hydro One because they are controlled or significantly influenced by the Province.

| Related Party | Transaction | Year ended December 31 2016 *(millions of dollars)* | 2015 |
|---|---|---|---|
| Province[1] | Dividends paid | 451 | 888 |
| | Common shares issued[2] | – | 2,600 |
| | IPO costs subsequently reimbursed by the Province[3] | – | 7 |
| IESO | Power purchased | 2,096 | 2,318 |
| | Revenues for transmission services | 1,549 | 1,548 |
| | Distribution revenues related to rural rate protection | 125 | 127 |
| | Distribution revenues related to the supply of electricity to remote northern communities | 32 | 32 |
| | Funding received related to Conservation and Demand Management programs | 63 | 70 |
| OPG | Power purchased | 6 | 11 |
| | Revenues related to provision of construction and equipment maintenance services | 5 | 7 |
| | Costs expensed related to the purchase of services | 1 | 1 |
| OEFC | Payments in lieu of corporate income taxes[4] | – | 2,933 |
| | Power purchased from power contracts administered by the OEFC | 1 | 6 |
| | Indemnification fee paid (terminated effective October 31, 2015) | – | 8 |
| OEB | OEB fees | 11 | 12 |
| Hydro One Brampton[1] | Revenues from management, administrative and smart meter network services | 3 | 1 |

[1] On August 31, 2015, Hydro One Inc. completed the spin-off of its subsidiary, Hydro One Brampton, to the Province.

[2] On November 4, 2015, Hydro One issued common shares to the Province for proceeds of $2.6 billion.

[3] In 2015, Hydro One incurred certain IPO related expenses totalling $7 million, which were subsequently reimbursed to the Company by the Province.

[4] In 2015, Hydro One made PILs to the OEFC totalling $2.9 billion, including Departure Tax of $2.6 billion.

Sales to and purchases from related parties are based on the requirements of the OEB's Affiliate Relationships Code. Outstanding balances at period end are interest free and settled in cash.

The amounts due to and from related parties as a result of the transactions referred to above are as follows:

| *December 31* *(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| Due from related parties | 158 | 191 |
| Due to related parties[1] | (147) | (138) |

[1] Included in due to related parties at December 31, 2016 are amounts owing to the IESO in respect of power purchases of $143 million (2015 – $134 million).

## 27. Consolidated Statements of Cash Flows

The changes in non-cash balances related to operations consist of the following:

| *Year ended December 31* *(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| Accounts receivable | (60) | 245 |
| Due from related parties | 33 | 33 |
| Materials and supplies | 2 | 2 |
| Prepaid expenses and other assets | (15) | 4 |
| Accounts payable | 19 | (23) |
| Accrued liabilities | 53 | (15) |
| Due to related parties | 9 | (89) |
| Accrued interest | 9 | (4) |
| Long-term accounts payable and other liabilities | 6 | – |
| Post-retirement and post-employment benefit liability | 78 | 60 |
| | 134 | 213 |

### Capital Expenditures

The following table reconciles between investments in property, plant and equipment and the amount presented in the Consolidated Statements of Cash Flows after accounting for capitalized depreciation and the net change in related accruals:

| *Year ended December 31* *(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| Capital investments in property, plant and equipment | (1,630) | (1,623) |
| Capitalized depreciation and net change in accruals included in capital investments in property, plant and equipment | 30 | 28 |
| Capital expenditures – property, plant and equipment | (1,600) | (1,595) |

The following table reconciles between investments in intangible assets and the amount presented in the Consolidated Statements of Cash Flows after accounting for the net change in related accruals:

| *Year ended December 31* *(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| Capital investments in intangible assets | (67) | (40) |
| Net change in accruals included in capital investments in intangible assets | 6 | 3 |
| Capital expenditures – intangible assets | (61) | (37) |

## Capital Contributions

Hydro One enters into contracts governed by the OEB Transmission System Code when a transmission customer requests a new or upgraded transmission connection. The customer is required to make a capital contribution to Hydro One based on the shortfall between the present value of the costs of the connection facility and the present value of revenues. The present value of revenues is based on an estimate of load forecast for the period of the contract with Hydro One. Once the connection facility is commissioned, in accordance with the OEB Transmission System Code, Hydro One will periodically reassess the estimated of load forecast which will lead to a decrease, or an increase in the capital contributions from the customer. The increase or decrease in capital contributions is recorded directly to fixed assets in service. In 2016, capital contributions from these reassessments totalled $21 million (2015 – $57 million), which represents the difference between the revised load forecast of electricity transmitted compared to the load forecast in the original contract, subject to certain adjustments.

## Supplementary Information

| *Year ended December 31* <br> *(millions of dollars)* | **2016** | 2015 |
|---|---|---|
| Net interest paid | **418** | 416 |
| Income taxes / PILs paid | **32** | 2,933 |

# 28. Contingencies

## Legal Proceedings

Hydro One is involved in various lawsuits, claims and regulatory proceedings in the normal course of business. In the opinion of management, the outcome of such matters will not have a material adverse effect on the Company's consolidated financial position, results of operations or cash flows.

Hydro One Inc., Hydro One Networks, Hydro One Remote Communities, and Norfolk Power Distribution Inc. are defendants in a class action suit in which the representative plaintiff is seeking up to $125 million in damages related to allegations of improper billing practices. A certification motion in the class action is pending. Due to the preliminary stage of legal proceedings, an estimate of a possible loss related to this claim cannot be made.

## Transfer of Assets

The transfer orders by which the Company acquired certain of Ontario Hydro's businesses as of April 1, 1999 did not transfer title to some assets located on Reserves (as defined in the *Indian Act* (Canada)). Currently, the OEFC holds these assets. Under the terms of the transfer orders, the Company is required to manage these assets until it has obtained all consents necessary to complete the transfer of title of these assets to itself. The Company cannot predict the aggregate amount that it may have to pay, either on an annual or one-time basis, to obtain the required consents. In 2016, the Company paid approximately $1 million (2015 – $1 million) in respect of consents obtained. If the Company cannot obtain the required consents, the OEFC will continue to hold these assets for an indefinite period of time. If the Company cannot reach a satisfactory settlement, it may have to relocate these assets to other locations at a cost that could be substantial or, in a limited number of cases, to abandon a line and replace it with diesel-generation facilities. The costs relating to these assets could have a material adverse effect on the Company's results of operations if the Company is not able to recover them in future rate orders.

# 29. Commitments

The following table presents a summary of Hydro One's commitments under leases, outsourcing and other agreements due in the next 5 years and thereafter.

| *December 31, 2016* <br> *(millions of dollars)* | 2017 | 2018 | 2019 | 2020 | 2021 | Thereafter |
|---|---|---|---|---|---|---|
| Outsourcing agreements | 165 | 102 | 94 | 2 | 2 | 9 |
| Long-term software/meter agreement | 17 | 17 | 16 | 17 | 1 | 5 |
| Operating lease commitments | 11 | 10 | 6 | 10 | 3 | 2 |

### Outsourcing Agreements

Inergi LP (Inergi), an affiliate of Capgemini Canada Inc., provides services to Hydro One, including settlements, source to pay services, pay operations services, information technology, finance and accounting services. The agreement with Inergi for these services expires in December 2019. In addition, Inergi provides customer service operations outsourcing services to Hydro One. The agreement for these services expires in February 2018.

Brookfield Global Integrated Solutions (formerly Brookfield Johnson Controls Canada LP) (Brookfield) provides services to Hydro One, including facilities management and execution of certain capital projects as deemed required by the Company. The agreement with Brookfield for these services expires in December 2024.

### Long-term software/meter agreement

Trilliant Holdings Inc. and Trilliant Networks (Canada) Inc. (collectively Trilliant) provide services to Hydro One for the supply, maintenance and support services for smart meters and related hardware and software, including additional software licences, as well as certain professional services. The agreement with Trilliant for these services expires in December 2025, but Hydro One has the option to renew for an additional term of five years at its sole discretion.

### Operating Leases

Hydro One is committed as lessee to irrevocable operating lease contracts for buildings used in administrative and service-related functions and storing telecommunications equipment. These leases have typical terms of between three and five years, but several leases have lesser or greater terms to address special circumstances and/or opportunities. Renewal options, which are generally prevalent in most leases, have similar terms of three to five years. All leases include a clause to enable upward revision of the rental charge on an annual basis or on renewal according to prevailing market conditions or pre-established rents. There are no restrictions placed upon Hydro One by entering into these leases. During the year ended December 31, 2016, the Company made lease payments totalling $11 million (2015 – $7 million).

### Other Commitments

#### Prudential Support

Purchasers of electricity in Ontario, through the IESO, are required to provide security to mitigate the risk of their default based on their expected activity in the market. As at December 31, 2016, Hydro One Inc. provided prudential support to the IESO on behalf of its subsidiaries using parental guarantees of $329 million (2015 – $329 million), and on behalf of a distributor using guarantees of $1 million (2015 – $1 million). In addition, as at December 31, 2016, Hydro One Inc. provided letters of credit in the amount of $24 million (2015 – $15 million), including $17 million (2015 – $15 million) to the IESO. The IESO could draw on these guarantees and/or letters of credit if these subsidiaries or distributor fail to make a payment required by a default notice issued by the IESO. The maximum potential payment is the face value of any letters of credit plus the amount of the parental guarantees.

#### Retirement Compensation Arrangements

Bank letters of credit have been issued to provide security for Hydro One Inc.'s liability under the terms of a trust fund established pursuant to the supplementary pension plan for eligible employees of Hydro One Inc. The supplementary pension plan trustee is required to draw upon these letters of credit if Hydro One Inc. is in default of its obligations under the terms of this plan. Such obligations include the requirement to provide the trustee with an annual actuarial report as well as letters of credit sufficient to secure Hydro One Inc.'s liability under the plan, to pay benefits payable under the plan and to pay the letter of credit fee. The maximum potential payment is the face value of the letters of credit. At December 31, 2016, Hydro One Inc. had letters of credit of $150 million (2015 – $139 million) outstanding relating to retirement compensation arrangements.

## 30. Segmented Reporting

Hydro One has three reportable segments:

- The Transmission Business, which comprises the transmission of high voltage electricity across the province, interconnecting more than 70 local distribution companies and certain large directly connected industrial customers throughout the Ontario electricity grid;
- The Distribution Business, which comprises the delivery of electricity to end customers and certain other municipal electricity distributors; and
- Other Business, which includes certain corporate activities and the operations of the Company's telecommunications business.

The designation of segments has been based on a combination of regulatory status and the nature of the services provided. Operating segments of the Company are determined based on information used by the chief operating decision maker in deciding how to allocate resources and evaluate the performance of each of the segments. The Company evaluates segment performance based on income before financing charges and income taxes from continuing operations (excluding certain allocated corporate governance costs).

The accounting policies followed by the segments are the same as those described in the summary of significant accounting policies (see note 2).

| *Year ended December 31, 2016* *(millions of dollars)* | Transmission | Distribution | Other | Consolidated |
|---|---|---|---|---|
| Revenues | 1,584 | 4,915 | 53 | 6,552 |
| Purchased power | – | 3,427 | – | 3,427 |
| Operation, maintenance and administration | 382 | 608 | 79 | 1,069 |
| Depreciation and amortization | 390 | 379 | 9 | 778 |
| Income (loss) before financing charges and income taxes | 812 | 501 | (35) | 1,278 |
| Capital investments | 988 | 703 | 6 | 1,697 |

| *Year ended December 31, 2015* *(millions of dollars)* | Transmission | Distribution | Other | Consolidated |
|---|---|---|---|---|
| Revenues | 1,536 | 4,949 | 53 | 6,538 |
| Purchased power | – | 3,450 | – | 3,450 |
| Operation, maintenance and administration | 414 | 633 | 88 | 1,135 |
| Depreciation and amortization | 374 | 380 | 5 | 759 |
| Income (loss) before financing charges and income taxes | 748 | 486 | (40) | 1,194 |
| Capital investments | 943 | 711 | 9 | 1,663 |

## Total Assets by Segment:

| *December 31* *(millions of dollars)* | 2016 | 2015 |
|---|---|---|
| Transmission | 13,007 | 12,045 |
| Distribution | 9,337 | 9,200 |
| Other | 3,007 | 3,049 |
| Total assets | 25,351 | 24,294 |

All revenues, costs and assets, as the case may be, are earned, incurred or held in Canada.

## 31. Subsequent Events

### Dividends

On February 9, 2017, preferred share dividends in the amount of $4 million and common share dividends in the amount of $125 million ($0.21 per common share) were declared.

# 1 Introduction

Hydro One Remote Communities Inc. ("**Remotes**") has prepared this Distribution System Plan ("**DSP**") in accordance with the Ontario Energy Board's ("**OEB**'s") *Chapter 5 Consolidated Distribution System Plan Filing Requirements* dated March 28, 2013 (the "**Filing Requirements**") as part of its 4th Generation IR Application based on a 2018 forward test-year cost of service review ("**the Application**").

## 1.1 Objectives & Scope of Work

Remotes' DSP has been prepared to support the four key objectives from the OEB's *Renewed Regulatory Framework for Electricity Distributors: A Performance-Based Approach* ("**RRFE**"):

1. Customer Focus: services are provided in a manner that responds to identified customer preferences;
2. Operational Effectiveness: continuous improvement in productivity and cost performance is achieved; and utilities deliver on system reliability and quality objectives;
3. Public Policy Responsiveness: utilities deliver on obligations mandated by government (e.g., in legislation and in regulatory requirements imposed further to Ministerial directives to the Board); and
4. Financial Performance: financial viability is maintained; and savings from operational effectiveness are sustainable.

## 1.2 Outline of Report

This DSP has been organized using the same headings as the Filing Requirements, with the corresponding section number from the Filing Requirements included in brackets for each heading.

The report contains four sections, including this introductory section as Section 1. Section 2 provides a high-level overview of the DSP including coordinated planning with third parties and performance measurement for continuous improvement. Section 3 provides an overview of Remotes' asset management process, including an overview of the assets managed and asset lifecycle optimization policies and practices. Section 4 provides a summary of Remotes' capital expenditure plan including an overview of the capital expenditure planning process, an assessment of the system capability for Renewable Energy Generation ("**REG**"), and justification of material projects.

## 1.3 Background & Drivers

Remotes' capital investments over the planning period have been aligned to the four categories of system access, system renewal, system service, and general plant. Table 1-1 summarizes Remotes' drivers for each investment category over the forecast period.

Table 1-1: Remotes' Investment Drivers over the Forecast Period

| Investment Category | Drivers | Projects/Activities |
|---|---|---|
| System access | Customer service requests | New customer connections and service upgrades<br>Fixed price layouts<br>Service cancellations |
| System renewal | Asset failure | Damage claims<br>Defective meter replacements |
| | Assets at the end of their service life due to failure risk | Small external demand requests<br>Distribution system improvements<br>Generator replacements<br>Generator overhauls<br>Diesel plant civil improvements<br>Day and bulk fuel tank replacements |
| System service | System capacity | Generator upgrades |
| | System reliability and operational efficiency | Supervisory Control and Data Acquisition ("**SCADA**") and Programmable Logic Controller ("**PLC**") upgrades |
| General plant | Non-system physical plant | Housing improvements<br>Storage buildings and miscellaneous civil projects<br>Minor fixed assets |

System access investments are modifications to Remotes' distribution system (including asset relocations) that Remotes performs to provide customers with access to electricity services via the distribution system.

System renewal investments involve replacing and/or refurbishing system assets to extend the service life of the assets and thereby maintain the ability of Remotes' distribution system and generation fleet to provide customers with electricity services at reasonable rates.

System service investments are modifications to Remotes' distribution system and generation assets to ensure that the system continues to meet Remotes' operational objectives, while addressing anticipated future customer electricity service requirements.

General plant investments are modifications, replacements, or additions to Remotes' assets that are not part of its distribution or generation system, including land and buildings, tools and equipment, rolling stock, Information Technology ("**IT**") equipment, and software used to support day-to-day business and operations activities.

## 1.4 Description of the Utility Company

Remotes is an integrated generation and distribution company licensed to generate and distribute electricity within 21 isolated communities in Northern Ontario. Remotes is entirely debt-financed and operates as a break-even company with no return on equity.

Remotes is driven by its corporate vision, mission, and business values. Together, they provide the basis to deliver on targeted performance objectives.

Figure 1-1: Remotes' Corporate Vision, Mission, and Values

**Corporate Vision:** "We will be the leading electrical utility and a trusted partner to remote communities in Ontario's North."

**Corporate Mission:** "We supply safe, reliable and affordable electricity to remote communities by focussing on continuous improvement, operational excellence and outstanding customer service."

**Corporate Values:**

- Employee and public safety;
- Customers and community relationships;
- Environmental sustainability;
- Business integrity;
- Teamwork;
- Actively engaged employees;
- Operational excellence;
- Innovative thinking; and
- Continuous improvement.

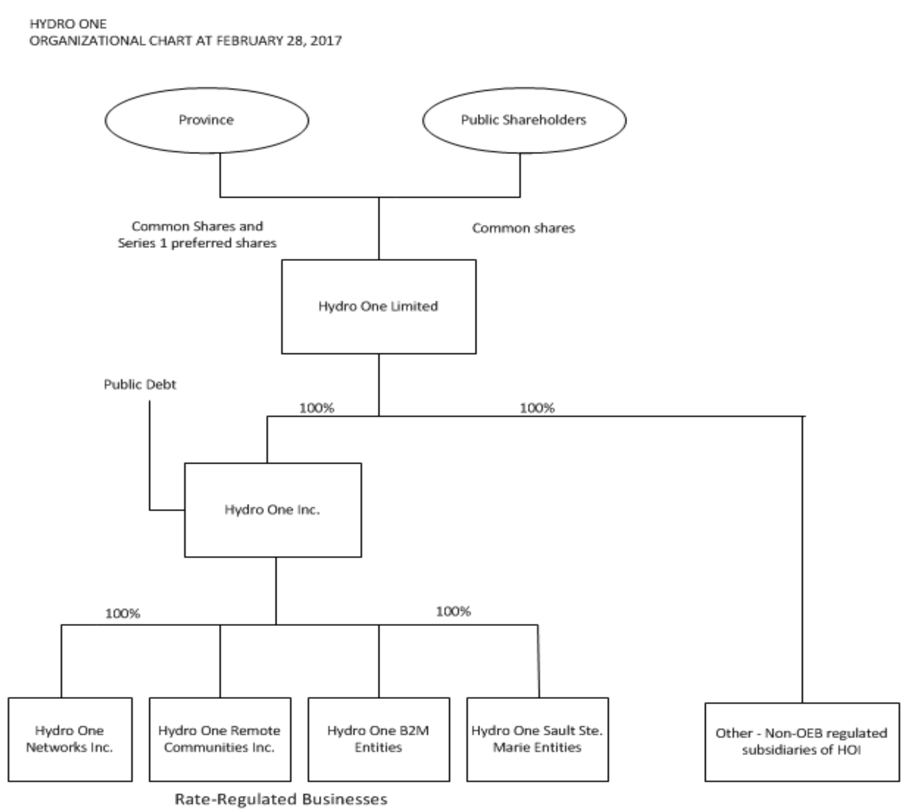
Remotes functions in a unique environment. Extremely low customer densities, a harsh climate, logistical challenges related to transportation, the absence of an integrated transmission system, and complex funding arrangements with third parties set Remotes apart from other Ontario distributors.

The communities served by Remotes are isolated and scattered across the Far North of Ontario. Thirteen communities are not accessible by year-round road and can be reached only by aircraft, winter roads or, in the case of one community, by barge, air, or winter road. The size and isolation of Remotes' service territory also means that the transportation and accommodation of staff, fuel, and equipment are key drivers of its costs. The company's reliance on winter roads for access to communities is also a major driver of work scheduling and completion activities, as scheduled projects may require deferral where winter roads cannot be constructed due to weather conditions, leading to project deferrals and the ensuing higher fuel and maintenance expenditures.

Remotes inherited Ontario Hydro's obligations to provide electricity to off-grid communities, which obligations were originally negotiated with the federal and provincial governments. Under these arrangements, the federal and provincial governments funded the original capital installation of facilities. In First Nation communities, the arrangements with the federal government ("the **Agreements**"), through Indigenous and Northern Affairs Canada ("**INAC**") remain in place. The Agreements specify that Remotes is responsible for funding the ongoing operation and maintenance of the system and that INAC is responsible for funding capital related to system expansions and capital upgrades. In the 1990s, INAC devolved responsibility for community infrastructure to First Nation communities. INAC now transfers funding to First Nations, who are responsible for administering most of the INAC's program funds. Therefore, Remotes' asset planning is a three-party process involving First Nation Band Councils, INAC, and Remotes. The timing and amount of funds available from INAC for funding upgrades is limited by overall funding constraints. Funding for new stations and larger engines must compete with other departmental priorities and may not be available in the year investment is required.

Remotes is wholly-owned by Hydro One Inc., which also owns 100% of Hydro One Networks Inc. Hydro One Inc. is, in turn, 100% owned by Hydro One Limited, whose ownership is split between public shareholders (through a Toronto Stock Exchange listing) and the Province of Ontario. As a subsidiary of Hydro One Inc., Remotes has access to operational, legal, regulatory, and financial expertise in the energy industry, and to leading technology and world-class expertise in innovation, engineering and design. As a small business, Remotes understands its customers and works closely with them.

Figure 1-2: Hydro One Inc. Corporate Structure



Remotes is licensed to provide both generation and distribution services outside of the competitive electricity market through its licences ED-2003-0037 and EG-2003-0138, which identify its service territory and generation facilities. Remotes is obligated to maintain system integrity and to comply with codes, legislation, regulations, and market rules. However, Remotes is exempt from certain requirements that are not applicable to its operations due to the unique nature of its business.

### 1.4.1 Service Area including Map

Remotes' service territory is spread out across Northern Ontario, as depicted in Figure 1-3. Remotes is currently licensed to generate and distribute within 21 isolated communities. These communities are shown in red in Figure 1-3 Collins and Whitesand, which are served via the Armstrong distribution system. Fifteen of these communities are First Nation communities, and thirteen are air access only.

Figure 1-3: Map of Remotes Service Territory

Three additional communities are anticipated to be added to Remotes' service area in the years 2018 to 2020: Cat Lake, Pikangikum, and Wunnumin Lake.

Table 1-2: List of Communities Serviced by Remotes

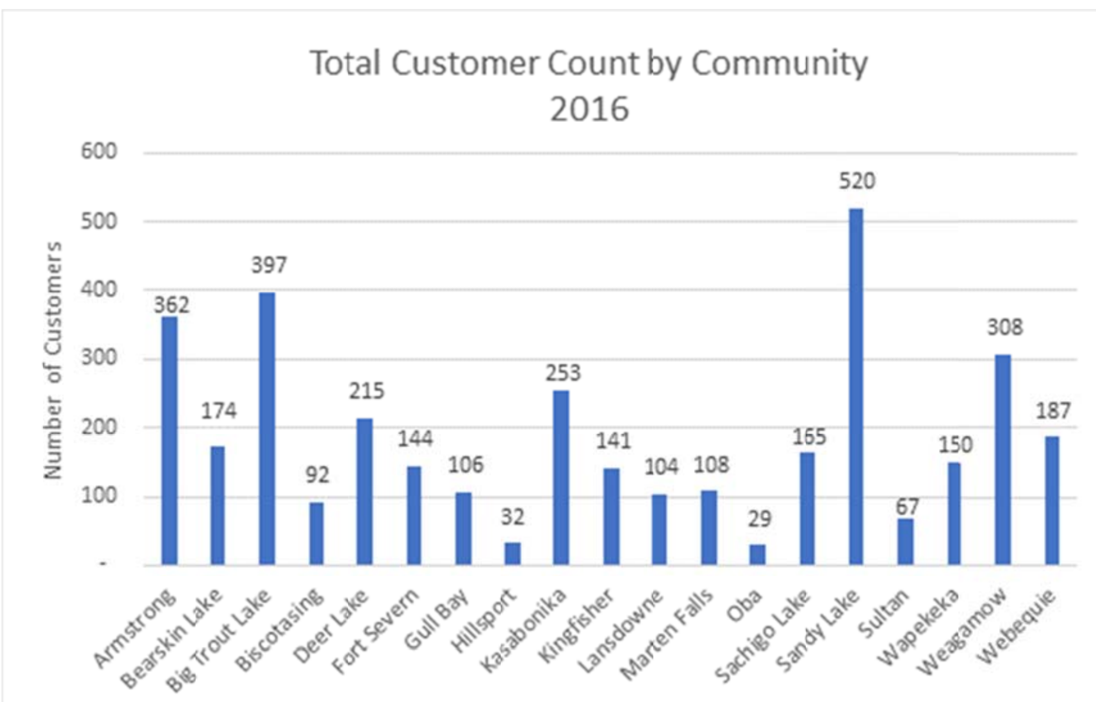
| **Presently Served by Remotes** | | |
|---|---|---|
| Armstrong | Gull Bay | Sachigo Lake |
| Bearskin Lake | Hillsport | Sandy Lake |
| Big Trout Lake | Kasabonika Lake | Sultan |
| Biscotasing | Kingfisher Lake | Wapekeka |
| Collins* | Lansdowne House | Weagamow |
| Deer Lake | Marten Falls | Webequie |
| Fort Severn | Oba | Whitesand* |
| **Anticipated to be Served by Remotes in the Near Term** | | |
| Cat Lake (2018) | Pikangikum (2019) | Wunnumin (2020) |

**Energy for Collins and Whitesand is provided from Armstrong*

## 1.4.2 Electricity Distribution

Remotes' 19 self-sufficient, stand-alone generation/distribution systems serve a total of 3,554 customers based on the 2016 year-end count. Figure 1-4 depicts the customer counts across those 19 systems. Customers in Collins and Whitesand are included in the Armstrong count.

Figure 1-4: Customer Count by Community in 2016



These communities are expected to grow slightly over the forecast period, as shown in Table 1-3. The largest anticipated customer increase is due to the three new communities which are expected to join Remotes' service area over the forecast period: Cat Lake (2018), Pikangikum (2019) and Wunnumin Lake (2020).

Table 1-3: Forecast Customer Counts in the Years 2017 to 2022 by Community

| Year | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 |
|---|---|---|---|---|---|---|
| Armstrong | 366 | 367 | 370 | 372 | 374 | 377 |
| Bearskin Lake | 180 | 182 | 184 | 186 | 189 | 191 |
| Big Trout Lake | 403 | 405 | 409 | 413 | 417 | 421 |
| Biscotasing | 94 | 95 | 96 | 96 | 97 | 98 |

| Wunnumin | - | - | - | 175 | 178 | 180 |
| **Total** | **3,627** | **3,762** | **4,336** | **4,549** | **4,605** | **4,649** |

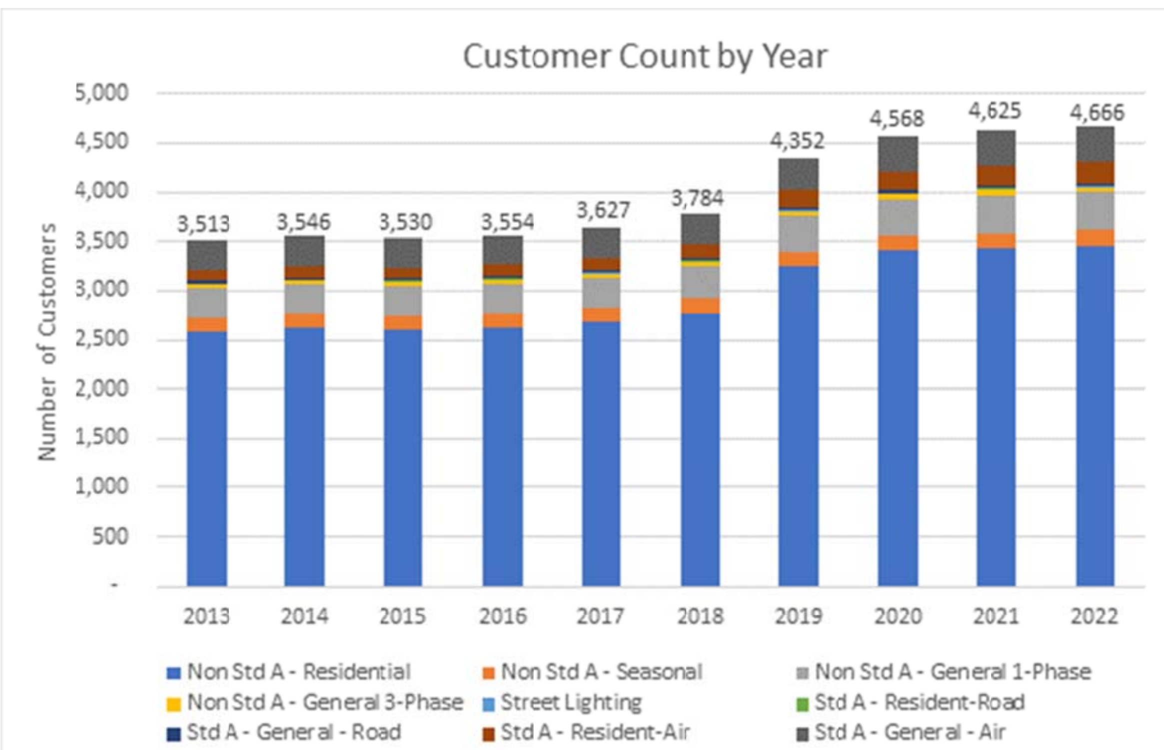
*O. Reg. 442/01*, a provincial regulation under the *Ontario Energy Board Act, 1998,* sets out two broad categories of customers that Remotes serves: customers who receive Rural or Remote Rate Protection ("**RRRP**") (which includes residential, General Service, and street lighting "**Non-Standard A**" customers); and customers occupying government premises, defined as customers who receive direct or indirect funding from government ("**Standard A**" customers). Standard A customers include the Ontario Ministry of Transportation, Health Canada, and INAC. Customer classes in this category are defined depending on the access to the community (air or road) and the type of service (residential or General Service). Non-Standard A customers are all other residents and businesses who received subsidized rates through the RRRP. The Non-Standard A customers are grouped by the type of service: residential or General Service. Residential customer classes are divided into seasonal and year-round, while General Service customer classes are divided into single-phase and three-phase service. Table 1-4 summarizes the definitions of the customer classes served by Remotes.

Table 1-4: Summary of Customer Classes Served by Remotes

| Customer Type | Definition | Customer Classes |
|---|---|---|
| Standard A | Government-funded (e.g. Health Canada, INAC) | Residential – air access<br>Residential – road access<br>General Service – air access<br>General Service – road access |
| Non-Standard A | Non-government-funded | Residential year-round<br>Residential seasonal<br>General Service single-phase<br>General Service three-phase |
| Street lighting | Community-owned public lighting | Street lighting |

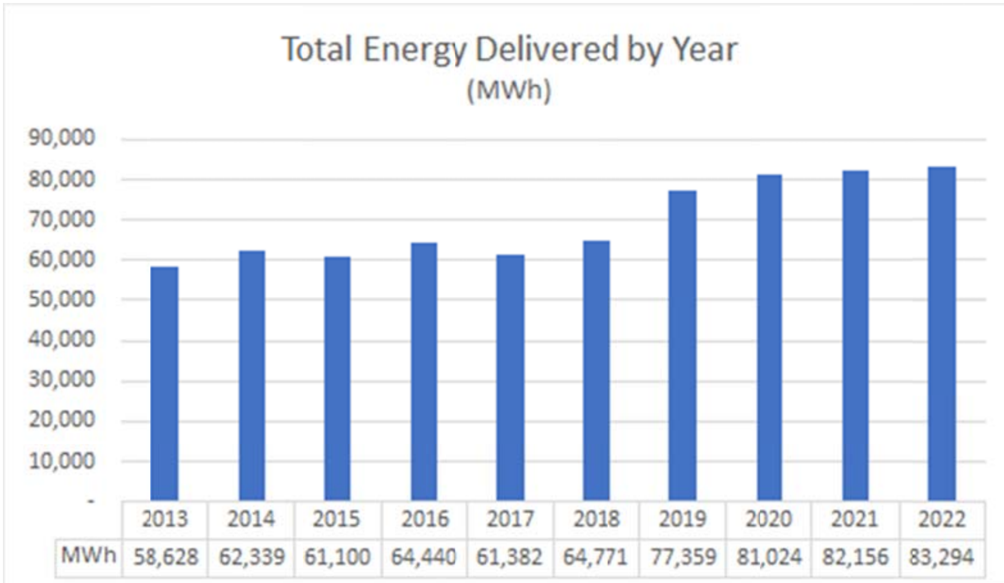
As depicted in Figure 1-5, the customer base has been stable over the historical period, but is expected to grow in the next five years with the addition of the three new communities. The largest step increase is projected for 2019 when Remotes begins serving Pikangikum.

Figure 1-5: Year-end (2013-2016) and Forecast (2017-2022) Customer Counts



The total annual amount of energy delivered remained generally consistent over the historical period, as shown in Figure 1-6, but is expected to increase over the forecast period as new communities are added.

Figure 1-6: Total Annual MWh Delivered



### 1.4.3 Electricity Generation

Remotes generates electricity to meet its obligations under Section 29 of the *Electricity Act, 1998,* since the communities it serves are not connected to Ontario's bulk electricity system. The main source of electricity supplied to the communities are 57 diesel-fuelled generators with a combined capacity of 31,000 kW. Remotes also owns wind turbine generators and hydroelectric generating facilities. There are wind turbines at four sites: three in Kasabonika with a capacity of 10 kW each, and one in Big Trout Lake with a capacity of 60 kW. There are two hydroelectric generating facilities in Deer Lake sized 225 kW each and one in Sultan with 150 kW capacity.

### 1.4.4 Energy Conservation and Demand Management

Remotes' energy Conservation and Demand Management ("**CDM**") program aims to reduce the kWh usage in the communities as a means of managing system costs and improving the affordability of electricity bills for the company's customers. To assist Remotes in the development and delivery of CDM programs the company entered into several partnerships with the participating First Nation communities, Northwest Company, Elephant Thoughts Energy Conservation Youth Camps, and MGM Electrical Commercial Lighting Retrofit Program. The scope, nature and impact of the resulting programs are discussed below. Remotes program is supplemented by programs aimed at First Nation communities managed by the Ontario Power Authority ("OPA") [now the Independent Electricity System Operator ("**IESO**")] and federal programs.

#### 1.4.4.1 Programs over the Historical Period

The following CDM programs were created and implemented over the past five years. Each program was promoted to customers by Remotes and through community representatives.

**Community Conservation Pilot Program**

Since 2006, Remotes offered an array of free products and financial support to the communities, enabling them to hire local Energy Conservation Officers to act as a key liaison, or community spokesperson, and installation support. The program was offered in partnership with local Band Councils and provided hands-on practical training as well as community information sessions. The program has been discontinued due to difficulty in engaging Band Councils as partners and in hiring, training, and retaining local resources to carry out the program.

**Mail in Rebate Program**

This program is application-based and presents a mail-back rebate on Energy Star and other energy efficient products when purchased.

**Energy Conservation Youth Camps**

The primary purpose of this CDM program was to engage community youth aged seven to twelve to learn about energy and water conservation. Camps were held over multiple days and delivered by an external provider responsible for developing a hands-on, age-appropriate curriculum. The program was delivered in four communities, with the delivery costs being shared with the participating communities. The program was discontinued due to limited community interest.

**Community Conservation Competitions**

This program created friendly competition among community members to drive a conscious effect to conserve electricity. Participants were eligible to win cash prizes for saving the most electricity based on their historic data. This program was implemented in one community over a few months. Although the participating community decreased its consumption by 12% during the competition, longer-term results were not sustained and the program is no longer offered.

**Commercial Lighting Retrofit**

Designed to assist commercial and Standard A customers reduce their energy consumption, this program assists customers with upgrades to their lighting systems. Remotes facilitates detailed lighting audits and upgrade cost estimations by a third-party company. Remotes does not have any industrial customers and has very few commercial and institutional customers, making the uptake of this program limited. Remotes continues to market this program.

**Holiday Lighting Exchange**

This program was offered on a community-by-community basis. The intent of this program was to switch out old incandescent holiday lighting with LED options. As lighting exchanges were offered in all the First Nation communities and have been completed by interested customers, opportunities for further deployment of holiday lights are limited.

**Rebate–Fridge Roundup**

This program was offered to all communities with Northern Stores in partnership with Northwest Company. The program offered free pickup and disposal of old refrigerators and a rebate if a participant purchased a new Energy Star refrigerator. Only two communities signed up, with only a handful of customers participating. Based on the limited uptake, the program is no longer marketed.

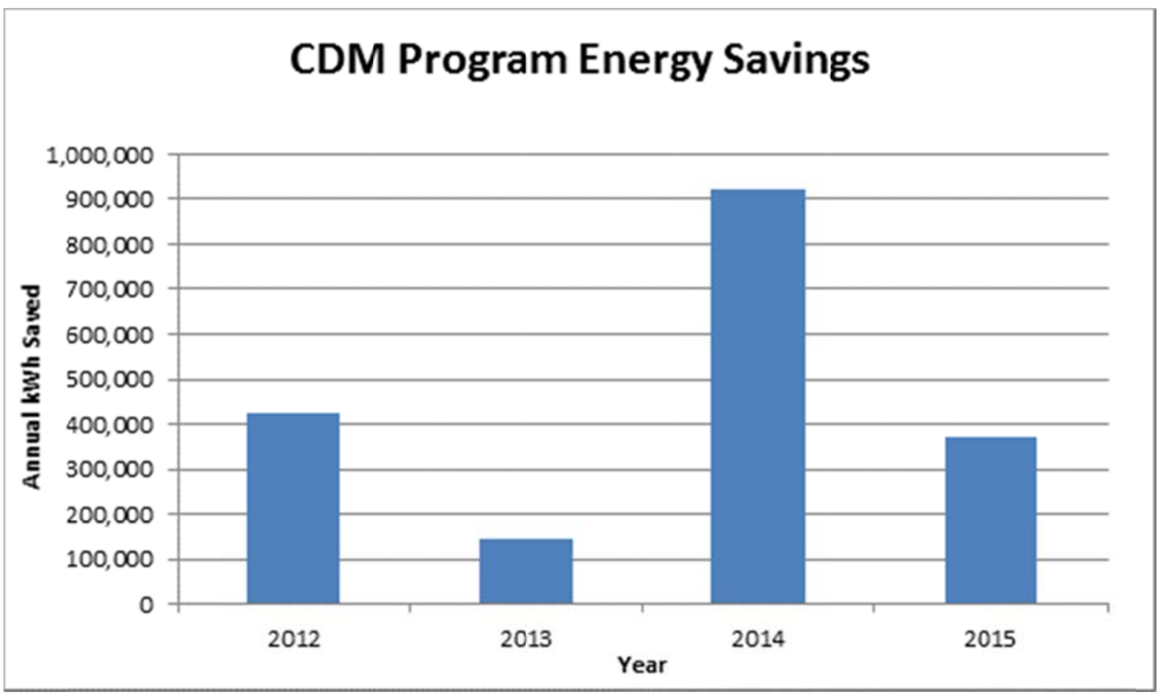
**Street Lighting Retrofit**

This program targets communities with existing streetlight systems and provides financial assistance to retrofit existing inefficient lamps to LED replacements. It is available to each of the seven communities with streetlight systems. To date, only one has taken advantage of the program. Remotes will continue making this program accessible for the remaining six communities until the upgrades are complete.

### 1.4.4.2 Achievements

Figure 1-7 depicts the combined energy savings of Remotes' CDM program for the years 2012 to 2015. The amount of kWh savings is directly related to the amount of participation at the community level and the amount of product installed.

Figure 1-7: CDM Program Energy Savings, 2012-2015



Externally-funded programs impacted program uptake over the historical period. Both the federal government and the IESO offered similar programs in the communities.

### 1.4.4.3 Challenges and Future Outlooks

There are numerous challenges affecting the execution of Remotes' CDM programs. First, the isolation of the communities means that there are limited opportunities to exchange large items such as refrigerators, since they must be transported out of the communities over winter roads. The OPA (now the IESO) and the federal government both offered communities opportunities to create community energy plans. From those plans, Band Councils expressed interest primarily in renewable energy development and in grid connection. In particular, renewable energy fits well with community priorities for environmental protection and as a means of creating local business opportunities. Interest from Band Councils on partnering in CDM initiatives was comparatively limited. Without strong support for the CDM programs from Band Councils, recruiting, training, and keeping local resources in place is challenging.

Remotes' customer base consists primarily of residential customers and lacks large commercial and industrial segments that provide material CDM program attainments for the rest of the province. Given the small number of customers and funding for similar programs from CDM, there are limited opportunities for savings.

Remotes is not included as part of the province-wide Conservation First Framework and, therefore, has not been allocated a budget or program achievement targets under the current framework.

Considering the above-noted factors, Remotes has allocated its resources in support of REG investments to better align itself with the preference of community leadership. Future CDM activities undertaken by Remotes will focus on community education and awareness, the kWh benefits of which cannot be readily attributed to specific measurable decreasing demand.

# 2 Distribution System Plan (5.2)

This section provides a high-level overview of the DSP including information on coordinated planning with third parties and performance measurement for continuous improvement.

## 2.1 Distribution System Plan Overview (5.2.1)

Remotes operates 19 isolated distribution systems in 21 communities in Northern Ontario. Remotes' service area will be expanding to include three additional communities. There are over 1,000 kilometres between the northernmost community, Fort Severn, and the southernmost community, Biscotasing. Thirteen of these communities are accessible by air only, meaning that Remotes' personnel, stationed in Thunder Bay, must fly to and from the communities when work is required. Given the extensive use of air transportation, cargo costs become an important consideration for the budget optimization efforts. The transportation of cargo is also an important planning consideration, as equipment and building materials cannot be purchased in the communities, can be too large to fly in regular cargo planes, and must therefore be trucked in over the six-week winter road season. If weather does not permit, winter roads may not be available to transport freight. Remotes keeps equipment and lodgings for its crews in each community to facilitate multiday project construction and maintenance activities and alleviate air transportation costs.

In the absence of a transmission system connection, Remotes is the generator and distributor for its customers. Cat Lake, anticipated to be added to Remotes' service area in 2018, is the only community connected to the transmission system. Much of the capital and system operations and maintenance ("**O&M**") expenditures is related to the upkeep and replacement of the diesel generator fleet. Remotes has a rigorous program to manage its generator fleet, including maintenance, overhauls, and replacements based on the number of operational hours ("**engine-hours**"). Diesel fuel is by far the single most significant cost for Remotes.

Planning for growth in Remotes' service territory is complex and somewhat unpredictable. Funding for growth-related capital is mainly a federal responsibility. INAC faces funding constraints and an overwhelming need for infrastructure in First Nations communities. The need for electricity infrastructure competes with requirements for schools, housing, water treatment plants, etc. The timing for funding approvals and the amount of funding available is uncertain and requires planning flexibility to accommodate growth within these communities. The federal government also has rules related to the timeframe in which the funding is spent and a project is completed. If funding is not spent within the federal government's time frame, the funding is returned to federal general revenues or deployed to another needed project. Consequently, funding levels and projects may be determined late in INAC's fiscal year and if funding becomes available, Remotes adjusts its planned work program to accommodate upgrade projects.

The provincial government plans to connect 16 remote communities to the transmission system. Nine of these communities are presently served by Remotes and seven are operated by Independent Power Authorities ("**IPA**s"). The provincial and federal governments have indicated that all the communities must be served by a licensed distribution company to connect to the grid. Five IPAs have requested service from

Remotes. Two of these IPA communities, Pikangikum and Wunnumin Lake, are planned to be included in Remotes' service territory over the forecast period. Although an Order-in-Council has been issued by the Minister of Energy, the Remote Community Connection Plan is still in draft form. Wataynikaneyap ("**Watay**") Power, the future owner and operator of the new transmission facilities, is commencing the development and approval process. An IESO-led study is considering the feasibility of leveraging Remotes' diesel generators for backup power supply once these communities are grid-connected.

In summary, these unique operating conditions are reflected in Remotes' DSP.

### 2.1.1 Key Elements of the DSP (5.2.1a)

To understand the key elements of Remotes' DSP, it is first important to understand the prospective business conditions driving the size and mix of capital investments required to achieve planning objectives over the forecast period. Capital investments are divided into three main categories of distribution, generation, and general plant. Each of these is discussed in a separate section below.

#### 2.1.1.1 Distribution

Table 2-1 presents the distribution capital expenditures and system O&M costs for both the historical and forecast period. In accordance with the OEB requirements, the distribution capital expenditures are separated into three investment categories of system access, system renewal, and system service – although Remotes made no system service investments over the historical period and plans no such investments over the forecast period. General plant investments are described separately in Section 2.1.1.3.

Table 2-1: Historical and Forecast Capital Expenditures and System O&M - Distribution

| Investment Category | Historical ($'000) | | | | | Forecast ($'000) | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 |
| **System Access** | | | | | | | | | | |
| Gross | 597 | 605 | 800 | 534 | 872 | 912 | 1,065 | 1,121 | 1,143 | 1,166 |
| Contributions & Removals | (474) | (574) | (757) | (464) | (872) | (912) | (1,065) | (1,121) | (1,143) | (1,166) |
| Net | 123 | 31 | 42 | 70 | - | - | - | - | - | - |
| **System Renewal** | | | | | | | | | | |
| Gross | 1,291 | 739 | 681 | 895 | 742 | 772 | 899 | 947 | 965 | 983 |
| Contributions & Removals | (535) | (235) | (137) | (135) | (241) | (250) | (290) | (304) | (311) | (313) |
| Net | 756 | 504 | 544 | 760 | 501 | 522 | 609 | 643 | 654 | 670 |
| **System Service** | | | | | | | | | | |
| Gross | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| **Total Capital** | | | | | | | | | | |
| Gross | **1,889** | **1,344** | **1,481** | **1,428** | **1,614** | **1,684** | **1,964** | **2,068** | **2,108** | **2,149** |
| Contributions & Removals | **(1,010)** | **(809)** | **(895)** | **(599)** | **(1,113)** | **(1,162)** | **(1,355)** | **(1,425)** | **(1,454)** | **(1,479)** |
| **Distribution Capital, Net** | **879** | **535** | **586** | **830** | **501** | **522** | **609** | **643** | **654** | **670** |
| **Distribution O&M** | **4,981** | **4,105** | **3,260** | **3,908** | **4,197** | **4,393** | **5,055** | **5,567** | **5,671** | **5,496** |
| **Total Spend, Distribution** | **5,860** | **4,640** | **3,846** | **4,738** | **4,698** | **4,915** | **5,664** | **6,210** | **6,325** | **6,166** |

#### 2.1.1.1.1 System Access

System access investments are a small portion of Remotes' spending over the forecast period. The size and mix of investments in this category are largely determined by customer requests and other external factors. The work is 100% recoverable from the requesting parties, and includes service cancellations, fixed price layouts, new customer connections, and service upgrades. Service cancellations are initiated by customers to ensure that monthly billing ceases. Most cancellations are a result of house fires or customer requests to disconnect services that are no longer needed. Fixed price layouts are provided when requested by customers in a cost-effective manner while ensuring compliance with Remotes' Distribution Standards as required under *O. Reg. 22/04*, the electrical distribution safety regulation under the *Electricity Act, 1998*. New customer connections and service upgrades are also driven by customers seeking connection to the system where sufficient capacity is available.

#### 2.1.1.1.2 System Renewal

A large portion of distribution capital investment in the system renewal category falls under Distribution System Improvements. Major distribution system capital improvements are made in one or two communities per year – depending on the size of the community – along with minor betterment projects in other communities. These betterments typically entail replacements of aging or defective poles, conductor restringing, and pole re-alignments based on the asset condition surveys in the community. Betterments and system upgrades are made to facilitate system reliability and joint-use of poles. New Viper switches are installed based on the power system reliability in the community, cold-load pickup, and operating experience. Viper switches allow on-site operator response as well as operating flexibility to limit the impact of lengthy outages to customers.

Other distribution system capital investment in the system renewal category includes Defective Meter Replacements, Minor Storm Damage Repair, Damage Claims, and Small External Demand Requests. Defective Meter Replacements and storm damage repairs mainly depend on severe weather occurrences, particularly lightning, wind, and ice storms. Damage claims work entails repairs to equipment resulting from damaged caused by members of the public.

Although the number of distribution assets under management by Remotes is expected to increase over the forecast period when the new communities are added to the service area, no major increase in distribution system renewal spending has been planned since INAC is funding upgrades to the distribution lines before they are transferred to Remotes. This will, however, affect the amount of O&M expenditures in the future to maintain this equipment. Increased metering costs have been budgeted based on the anticipated service area additions.

The planned increase in spending on these programs over the forecast period is modest.

#### 2.1.1.1.3 System Service

There are currently no system service programs budgeted on the distribution side.

### 2.1.1.2 Generation

Table 2-2 depicts the generation capital expenditures and system O&M costs for both the historical and forecast period. The generation capital investments are divided into the system renewal and system service categories. Generation investments do not fall into the system access category, since it entails distribution system work to connect work to connect customers, such as metering and service layouts. General plant investments are described separately in Section 2.1.1.3.

Table 2-2: Historical and Forecast Capital Expenditures and System O&M - Generation

| **Investment Category** | **Historical ($'000)** | | | | | **Forecast ($'000)** | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | **2013** | **2014** | **2015** | **2016** | **2017** | **2018** | **2019** | **2020** | **2021** | **2022** |
| **System Renewal** | | | | | | | | | | |
| Gross | 3,651 | 4,064 | 1,172 | 2,659 | 1,795 | 1,788 | 2,847 | 3,582 | 3,994 | 2,426 |

### 2.1.1.2.1 System Renewal

Generation system renewal spending for the management of Remotes' 57 generator units accounts for, on average, 60% of Remotes' budgeted net capital expenditures over the forecast period. Generation programs in the system renewal category are largely driven by condition of the units. The number of hours that an engine operates, not age, determines when a generator should be replaced or overhauled. Remotes performs this work in accordance with manufacturer's recommendations. Remotes also considers the maintenance history (reliability) of the unit, future capacity requirements and access to parts when making repair or replacement decisions. Generating station civil improvements are budgeted based the condition of the foundations and structures as determined through inspections. Day and bulk tank replacements are planned based on the need to replace end-of-life fuel tanks determined by condition and compliance.

### 2.1.1.2.2 System Service

Generation programs in the system service category make up a significant portion of Remotes' gross capital expenditures, but many of these projects are funded externally.

Generator upgrade projects are driven by capacity requirements and are 100% recoverable. SCADA and PLC programs are non-recoverable system service investments over the forecast period, which are driven by the requirement for improved plant data acquisition and control, generator asset management, and operator interaction through a modern Human-Machine Interface ("**HMI**").

#### 2.1.1.3 General Plant

General plant investments are modifications, replacements, or additions to Remotes' assets that are not part of its distribution or generation system. Individual programs in the general plant category over the forecast period fall below the materiality threshold ($283,000). These investments include life extension of staff housing in each community, driven by the condition of the lodging. Investments into storage buildings and other miscellaneous civil projects are made based on the need to have a suitable location that is large enough to store and perform maintenance on large equipment such as backhoes and Radial Boom Derricks ("**RBD**s"). This need is partly due to the transportation issues that exist in the Remotes. Other investments into minor fixed assets are made to purchase items such as storage containers and snow buckets.

Table 2-3: Historical and Forecast Capital Expenditures – General Plant

| Investment Category | Historical ($'000) | | | | | Forecast ($'000) | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 |
| **General Plant** | | | | | | | | | | |
| Gross | 691 | 677 | 473 | 914 | 1,085 | 565 | 572 | 581 | 590 | 598 |
| Contributions & Removals | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| **Net** | **691** | **677** | **473** | **914** | **1,085** | **565** | **572** | **581** | **590** | **598** |

### 2.1.2 Anticipated Sources of Cost Savings (5.2.1b)

#### 2.1.2.1 Historical Achievements

Remotes has introduced many programs over the past few years to improve efficiency, contain current costs, and mitigate future cost increases. Through prudent planning and DSP execution. Remotes will continue to realize cost savings over the forecast period.

Table 2-4 illustrates the anticipated cost savings delivered through these programs.

1 Table 2-4: Summary of Cost Savings 2017-2022

| Cost Savings | Historical ($) | | | | Forecast ($) | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 |
| Winter Road Fuel Savings | 1,144,998 | 3,516,961 | 1,170,388 | 496,576 | 570,783 | 570,783 | 570,783 | 570,783 | 570,783 | 570,783 |
| First Nation Fuel Savings | 407,642 | 347,572 | 177,023 | 658,264 | 643,151 | 643,151 | 643,151 | 643,151 | 643,151 | 643,151 |
| Meter Reader Savings | 758,819 | 873,007 | 952,415 | 1,370,443 | 1,370,857 | 1,374,653 | 1,379,422 | 1,384,341 | 1,388,536 | 1,393,624 |
| Operator Savings | 6,825,617 | 9,797,954 | 9,727,773 | 9,825,312 | 9,825,312 | 9,790,318 | 9,861,849 | 9,934,095 | 9,971,020 | 10,044,718 |
| Webshare Savings | - | - | 79,200 | 79,200 | 79,200 | 79,200 | 79,200 | 79,200 | 79,200 | 79,200 |
| **Total** | **9,137,076** | **14,535,494** | **12,106,799** | **12,429,796** | **12,489,304** | **12,458,105** | **12,534,405** | **12,611,571** | **12,652,690** | **12,731,477** |

2

Diesel fuel is Remotes' single largest cost component. Winter road fuel savings is the cost difference between trucking fuel in over winter roads compared to flying it in. Similarly, First Nation fuel savings is the cost difference between trucking fuel in over winter roads and storing it in First Nation tank farms compared to flying it in.

Meter reading and operator savings are differences in cost between contracting with a local person in the community and using workforce resources from Remotes. Usually, Remotes reads its own meters but contacts the First Nation band councils for local employment. Contracting with local resources offers job opportunities within economically disadvantaged communities.

Webshare savings result from accessing data such as 3D scans via Webshare instead of flying to the site for tasks such as preliminary design updates. The estimated value also includes productivity gains from a reduction in the time required to gather accurate information such as nameplate data.

In addition to these sources of cost savings that have been described and estimated over the forecast period, Remotes engages in numerous initiatives to reduce costs that are less readily quantifiable.

As the condition of diesel generators deteriorate, they become less fuel-efficient and, therefore, costlier to operate. Capital investments to replace or overhaul generators mitigate the loss of efficiency thereby reducing the fuel costs to operate the generator. Generator upgrades, although driven by capacity constraints, have the added efficiency cost benefit of replacing an older generator. Due to the continuous improvement of generator technology, new diesel generators installed in the field have higher nameplate efficiency than the older models they replace, amplifying the fuel savings. Remotes uses automatic generator dispatch to optimize the efficiency of its fuel consumption. Planned replacements, overhauls, and upgrades reduce the risk cost associated with owning and operating the generator.

Good project scheduling, planning and execution contribute to cost savings in terms of avoided costs. This includes project scoping to bundle assets into a single project for optimization of resource mobilization and demobilization. This approach reduces the cost of air transportation of personnel and also ensures crews perform all known work required when they visit a remote community.

Planned replacements of distribution assets through the Distribution System Improvements program are a cost-effective way to manage these assets. The betterment of one community per year is planned to focus Remotes' efforts and reduce the number of flights. This program focuses on the worst sections of feeders identified during inspections. This proactive work reduces future trouble call costs increasing the system's resiliency to storms through pole replacements, conductor restringing, and pole realignments.

SCADA and PLC upgrades planned over the forecast period will result in improved system data acquisition and control with an HMI at several generating stations. The improved SCADA system will reduce the number of trips required for troubleshooting when the alarm can be cleared remotely. The new HMI will reduce the operator response time though improved interaction and alarm handling. The data collected by these new systems are expected to be used to drive asset management decisions in the future and to better monitor the condition of the diesel generator fleet.

As part of the generator replacements and upgrades, old generators are brought back from the site and sent out for investment recovery. Removed generators can be used as spares or for spare parts to derive the most value out of the retired asset.

Generator upgrade projects factor in the available transformation capacity of the Generator Step-Up transformers ("**GSU**s"). If the existing GSU can provide adequate supply for the community and is in serviceable condition, it remains in service. This serves to reduce the capital cost requirement of the project.

New generating station construction incorporates the *Remotes Station Design Guidelines*. By following standardized designs, Remotes reduces the design, engineering, and construction costs of these projects. Since these projects do not affect the rate base, these cost savings are passed on directly to INAC. Furthermore, the use of standardized generating station designs allows Remotes' crews to follow existing work practices and manuals for the upkeep of the stations, improving operational efficiency.

New connections and fixed price layouts are planned using standardized designs that meet the requirements of *O. Reg. 22/04*. This decreases the engineering and design costs of projects, while still providing high-quality layouts. Since these programs are customer-funded, these cost savings are passed directly to customers.

Additional cost savings are achieved through the sharing of software and IT systems with Remotes' parent company, Hydro One Inc. The cost sharing is defined in Service Level Agreements between Remotes and Hydro One Inc.

#### 2.1.2.2 Investments in Efficiency

Over the past five years, Remotes has invested in civil improvements such as walkways and garages to reduce time that crews spend shovelling snow on sites, digging out hydro trucks from heavy snow, reducing the time to respond to emergencies, and/or commencing work in the station. Investments in RBDs have improved crews' ability to perform line work in the communities. However, the distance and time required to get to and from site makes these efficiency improvements difficult to quantify. Remotes has focussed on improvements to its procurement planning to ensure that materials can be transported to site over winter road and jobs executed when planned. With this DSP, Remotes is investing in the building blocks necessary to modernize an off-grid electricity system. Besides maintaining the fuel efficiency from the original PLC-SCADA system, the new SCADA system is expected to improve Remotes' ability to diagnose the cause of failures from the Thunder Bay office. Along with the improved 3-D drawings of the plant, this will help to ensure that field staff have the materials required to fix the failure when they get to site. It may also reduce the time required for field staff to troubleshoot on site, or improve the ability for operators to respond to outages. Other Ontario utilities have uncovered ways to use improved data from their assets to reduce trouble costs, and Remotes expects to leverage modern communication systems to create similar impacts on its business.

Remotes has experience with the impact of high penetration hydro-electric power in Sultan, where the renewable resource can fully power the community during the summer months reducing engine hours and required engine maintenance. Solar power is a new technology in a Canadian off-grid where limited solar resource, small scale, expensive installation costs and distribution system penetration have delayed implementation. This is the technology supported by the federal and provincial governments. Solar-battery installations may have an impact on winter peak, but is more a more promising technology for the potential to reduce engine hours during the summer months. With limited operational experience with this technology, Remotes is not yet able to estimate the impact on engine hours, but the potential is there for the two planned solar projects in Fort Severn and Gull Bay.

By participating in, and advocating for the Watay project, Remotes is working toward a large fuel cost reduction, much lower emissions and reduced capital and OM&A expenditures on diesel plants, and a more flexible power solution for its customers.

### 2.1.3 Period Covered by DSP (5.2.1c)

This DSP covers a historical period of 2013 to 2016, 2017 is the Bridge Year. The forecast period is 2018 to 2022, where 2018 is the forward Test Year.

### 2.1.4 Vintage of the Information (5.2.1d)

The information contained within this DSP should be considered “current” as of January 2, 2017.

### 2.1.5 Important Changes to Asset Management Processes (5.2.1e)

This is Remotes’ first DSP filing; therefore, there are no changes to its asset management process compared to a previous DSP filing. Remotes’ previous Cost of Service filing did not include an Asset Management Plan.

### 2.1.6 DSP Contingencies (5.2.1f)

The execution of Remotes’ investment programs is contingent upon various external factors. The most important of these factors are external funding requirements (through INAC), nature and volume of customer-initiated work, transportation requirements, resource availability, and regional electricity infrastructure requirements.

**External Funding Considerations**

INAC provides funding for programs, services and initiatives to First Nation, Inuit and Northern communities, governments and individuals, as well as to Aboriginal and Métis organizations. Under the terms of the electrification agreements, INAC is responsible for funding generation and distribution capital upgrades associated with load growth in First Nation communities served by Remotes. When a generation upgrade project is needed to provide additional capacity, Remotes works closely with the First Nation community through the funding and approval process. The First Nation community has the final say in the technical design of the project based on the feasible options outline by Remotes, which is usually the most cost effective option. Since this type of project must be customer-initiated, the year of execution depends on the First Nation community meeting all the requirements before starting the project and on the availability of INAC funding. Remotes mitigates this risk through its strong community outreach program and involvement of the First Nation representatives early in the planning process. Due to federal funding constraints and competing priorities for INAC capital, the available INAC funding is insufficient to finance required station upgrades in the communities; however, this issue was partially resolved in 2013 following extensive engagements with INAC. The resulting capital funding allocations commencing in 2014 relieved connection constraints in some of the communities. While Remotes is confident in the ability of the communities to secure funding planned incremental capacity upgrade projects based on strong relationship with INAC, it notes that external factors outside of its control always present certain risks. For instance, INAC operates on a fixed annual capital budget that covers all capital needs within communities, not just electricity, meaning that funding availability can be affected by emergency funding requirements in the IPAs communities, for other capital requirements or by centrally determined Federal Government's funding priorities.

**Customer-Initiated Projects**

The year-to-year changes in scope, nature, and volume of customer-initiated projects all affect Remotes' pace and prioritization of work execution activities. Customer-initiated projects include metering, service cancellations, damage claims, small external demand requests, fixed price layouts, new customer connections, and service upgrades. The level of expenditures required for these activities fluctuates between years based on the volume of work requested by customers. However, these fluctuations do not affect the rate base, since this work is 100% recoverable from the requesting customers.

**Transportation Challenges**

Transportation is the third major contingency affecting Remotes' project execution. Many of the First Nation communities are not accessible by year-round roads. While personnel can be flown to and from the communities, large assets such as generators and GSUs must be transported by land. To do this, the environmental conditions must be favourable to allow for safe transportation of heavy equipment along winter roads. An entire year can pass without a winter road to a community becoming available, in which case the project is typically deferred. Remotes has the option of hiring a specialized transport plane to deliver the heavy equipment when there is no winter road available, but the cost is not usually justifiable. Remotes accepts the risk posed by winter roads to its project execution as a part of its unique operating conditions and modifies its capital plans when required.

**Resource Availability**

There is a lack of skilled trades contract resources living in the communities, and there are very few contractors who work in them. Remotes employs regular and casual staff, apprentices, and contract staff to complete capital and maintenance work. Work in the communities requires a number of different skilled trades including line maintainers, distribution technicians, environmental technicians, mechanics, electricians, and carpenters who specialize in distribution system upkeep, generator upkeep, and civil construction. Remotes also uses specialized resources for tasks such as vehicle servicing hydroelectric maintenance, and SCADA/PLC upgrades. Internal resource deployment is prioritized based on the urgency of the work required. Remotes' overarching priority is to keep its generators running to keep the lights on in the communities. Depending on the scope and nature of unplanned work that arises from time to time, planned investments may be deferred if resources are unavailable. For instance, if there is an unplanned engine failure, resources can be pulled from capital jobs to perform maintenance work to keep the power on. To mitigate this risk, Remotes focuses on planned maintenance and capital upgrade work to reduce the amount of unplanned work that can stretch resource availability. Examples of planned projects and programs include distribution system improvements, generator overhauls, and generator replacements.

**Regional Electricity Infrastructure Requirements**

Remotes is a participant in the Regional Planning Process for the North of Dryden region, which is part of the Northwest Ontario Planning Region and covers the Remote Community Connection Plan. The 2014 draft Remote Community Connection Plan is a business case which informed a July 29, 2016, Order-in-Council from the Provincial Government. The Order confirms the need for the project to connect 16 remote communities to the transmission system. Nine of these communities are presently served by Remotes. The provincial and federal governments have indicated that communities must be served by licenced distributors to qualify for grid connection. Five of the communities now served by IPAs have now requested service from Remotes. Remotes expects to take over service of two of these communities within the next five years. The potential construction of a transmission line to the communities currently served by Remotes is not expected to affect the investments in the communities over the five-year period comprising this DSP, as the transmission construction activities are anticipated in the medium- to longer-term. As the transmission connection plans mature and firm up, Remotes will review its investment plans for the appropriate timeframes and make any amendments that may be warranted based on discussions with other parties involved.

**Other Contingencies**

Other contingencies that may affect the size and mix of capital investments over the forecast period include inclement weather, joint-use requests, and investments into minor fixed assets. While inclement weather can delay projects, it generally does not lead to project deferral; rather inclement weather is an investment driver for repairs to the distribution system due to ice, wind, and storms. Joint-use pole requests are included as part of the Distribution System Improvements program and are contingent on external requests by third parties such as Bell or the local First Nation. Planned work requirements include pole replacements and reframing to accommodate telecommunication lines on the poles. Customers benefit from the efficiencies realized due to joint-use of assets. Forty per cent of the cost of joint-use projects are funded by external parties. Investments into minor fixed assets are budgeted based on the expected needs each year, but the actual investments are driven by specific needs that occur within the year.

## 2.2 Coordinated Planning with Third Parties (5.2.2)

### 2.2.1 Records of Engagement (5.2.2a)

Remotes regularly engages its customers and leaders of the First Nation communities it serves, federal government agencies such as INAC, provincial government bodies such as the OEB and the Ministry of Energy, the IESO, and other electricity distributors and transmitters.

### 2.2.1.1 Customer Engagement

#### 2.2.1.1.1 Customer Advisory Board Meeting

On June 23, 2016, Remotes held its annual Customer Advisory Board meeting.

**Purpose of the Engagement:**

The annual Customer Advisory Board meeting facilitates feedback from the Customer Advisory Board on several topics such as updates to the Ontario Electricity Support Program, priority setting, and REG investments.

**Engagement Initiation:**

Remotes initiated the engagement.

**Other Participants in the Engagement:**

Other participants in the engagement are members of the Customer Advisory Board. The Customer Advisory Board includes commercial and residential customers in representing communities serviced by Remotes. Customers apply to be members of the Board and Remotes' management chooses representatives based on these applications. Customers must live or work in Remotes' service territory, be willing to attend meetings, and be willing to offer constructive advice about Remotes' services.

**Final Deliverables**

Members of the Customer Advisory Board voted to indicate their opinion regarding the prioritization of the company's key focus areas. The resulting relative priority allocation is shown in Table 2-5.

Table 2-5: Priorities Ranked by Customer Advisory Board

| Work Program Component | Relative Customer Priority |
|---|---|
| Affordability | 37.8% |
| Renewable energy | 24.3% |
| Load growth | 16.2% |
| Reliability | 10.8% |
| Customer service | 8.1% |
| Environmental protection | 2.7% |

**Effect on the DSP**

When setting its priorities for planning and ranking projects, Remotes took into consideration the priorities of its Customer Advisory Board outlined in Table 2-5. More information regarding the impact of this prioritization on the company's planning can be found in Section 4.2.

### 2.2.1.1.2 Customer Workshop

On November 23 and 24, 2016, Remotes jointly hosted a workshop with the Opiikapawin Services Limited Partnership, a partnership of the First Nation communities who are the majority owners of on the Watay project. Community representatives from nine of the communities Remotes serves were invited to attend the workshop. The community representatives each included a member the Band Council, a member of the Watay Board of Directors, and the community Remote Electrification Readiness Program worker (a community member who has been hired in the community to work on community readiness for connection to the grid). Representatives from INAC and OEB staff also attended this workshop.

**Purpose of the Engagement:**

The customer workshop provided an open discussion to plan for grid connection. The workshop also discussed Remotes' services, determined the preferences/priorities of the customers attending the workshop, and assisted OEB staff in carrying out their engagement with First Nation communities to determine First Nation Energy rates.

**Engagement Initiation:**

Together with the Tribal Councils, Remotes initiated the workshop.

**Other Participants in the Engagement:**

Other participants in the workshop included OEB staff, INAC, and the following First Nation communities:

- Bearskin Lake
- Big Trout Lake
- Kasabonika Lake
- Kingfisher Lake
- Sachigo Lake
- Wapekeka
- Weagamow Lake

Representatives from Sandy Lake and Deer Lake planned to attend, but weather restricted their travel.

**Final Deliverables**

The workshop provided recommendations in eight areas:

1. Backup generation: Remotes, INAC, and the First Nations will continue to work together to establish a backup generation plan for all the communities that are involved in the Watay project. Remotes will assess its own generation assets and will, on request from INAC and the local IPA community, assess the existing generation in the IPA communities. Further, each First Nation community representative will evaluate which individual buildings have backup generators installed (see Section 2.2.1.3.4 for more details). Any new construction of essential service infrastructure needs to include backup generation (school, clinic, water plant, sewage, etc.).

2. Environmental stewardship: Remotes and the First Nations will develop an environmental plan including annual reporting (see Section 2.3.4.2 on performance measures).

3. Affordability and rates: Participants expressed support for OEB staff's recommendations to make electricity more affordable for First Nation customers.

4. Customer Service: community representatives noted that most communications are with Band Councils and that Remotes should interact directly with community members. They expressed the desire for Remotes to hire a designated liaison in the First Nations who could engage directly with the community, improve accessibility to support programs (OESP and LEAP), and to improve disconnection communication with customers.

5. Priority setting: First Nation participants voted on a list of priorities for Remotes, indicating which aspects are most important to Remotes' customers.

Table 2-6: Priorities Ranked by First Nation Communities

| Work Program Component | Relative Customer Priority |
|---|---|
| Environmental protection | 21.5% |
| Community relations | 14.9% |
| Renewable energy | 14.9% |
| Customer service | 14.0% |
| Affordability | 14.0% |
| Reliability | 11.6% |
| Safety | 9.1% |

6. Housing connections: Remotes should attend housing and public works conferences to improve understanding and communication between First Nations and Remotes on housing construction and permits.

7. Safety and emergency response: Remotes should provide information in electrical safety at regional conferences.

8. Community relations: Remotes should develop a Community Relations and Engagement Policy that includes Remotes and First Nation roles and responsibilities.

9. Access to conservation and renewable programs: Remotes should increase customer engagement when designing CDM and REG participation programs so that they are accessible, meaningful, and used.

The detailed summary of this workshop can be found in Appendix E: 2016 Customer Workshop.

**Effect on the DSP**

Based on this workshop and on discussions with Band Councils, Remotes has worked closely with First Nations and other parties on several renewable energy studies, which are discussed in further detail in Section 2.2.1.4.

When setting its priorities for planning and ranking projects, Remotes took into consideration the priorities of its customers outlined in Table 2-6. Environmental stewardship is consistently identified as paramount to the First Nation communities and is accounted in all stages of project planning, ranking, engineering, and design. More information about these priorities can be found in Section 4.2.1. Remotes has also identified several measures related to environmental stewardship that it tracks. These measures are listed in Section 2.3.4.

Remotes is registered to the rigorous ISO 14001 standard and aims for continuous improvements in all aspects of environmental management.

Specific investments have been planned over the forecast period with environmental protection in mind. Day and bulk fuel tank replacements are planned over the forecast period to ensure compliance with the latest codes and reduce the risk of a fuel leak. New diesel generator replacements and upgrades are much more efficient than older generators and offer better structural integrity, resulting in lower emissions and reduced risk of ground contamination through leaks. Distribution System Improvements include replacement of distribution transformers exhibiting signs of leaking oil or other defects. Storage building projects in the general plant category include construction of proper facilities for vehicle storage and maintenance that reduce the environmental risk of these activities. Remotes is also working with customers to deploy customer-owned renewable technologies.

Joint infrastructure planning between Remotes and the First Nation communities is a continuous process. Remotes attends housing and public works conferences to improve its understanding of the communities' concerns and priorities, and provide information regarding its own plans, risks, or constraints as may be relevant. These meetings also drive the budgetary process for new customer connections, service upgrades, and fixed price layouts. In respect to the costs of these services, Remotes endeavours to reduce its costs through the methods listed in Section 2.1.2, such as using standardized designs that are compliant with *Ontario Regulation 22/04*. Remotes has also created opportunities for the connection of customer-owned renewable generation, with 15 projects currently in service.

### 2.2.1.2

Remotes operates in First Nation communities under funding agreements negotiated with INAC. Remotes and INAC representatives meet annually as a part of the ongoing planning program. Remotes also engages INAC regularly on the matter concerning the execution of specific projects and community outreach initiatives.

**Purpose of Engagements:**

The purpose of these engagements is to review the available generation capacity based on the historical and projected peak loads in the communities to forecast and plan necessary generation capital projects in the communities. Collaboration with INAC reduces costs and the overall risk related to power supply in the remote communities.

**Engagement Initiation:**

Remotes typically initiates the engagements.

**Other Participants in the Engagement:**

Other participants in the engagements typically include INAC's capital management staff and the assigned First Nation project management team.

**Final Deliverables**

Generation capital project meetings are held to initiate specific INAC-funded projects and to monitor project process. Once a project funding is initiated, Remotes participates and generally facilitates regular meetings. The meetings are held throughout the project to determine acceptable designs, timelines, and project progress. These meetings are held to meet the needs of the First Nation project management team and INAC capital management staff.

**Effect on the DSP**

Engagement with INAC is critical to the development and successful execution of generation upgrade projects listed in the system service category, given INAC's responsibility for capital project funding. Remotes and INAC have jointly identified the need to invest in Wapekeka, Fort Severn, Sandy Lake, Weagamow, and one of either Deer Lake or Kasabonika (to be re-evaluated over the forecast period) based on the available capacity and forecast load growth. These projects are entirely funded by the First Nation communities who, in turn, must apply for the funding from INAC. Remotes works closely with INAC to ensure the proper funding is in place for these projects to proceed.

INAC's role in the ultimate execution of the projects over the planned timelines is critical. In 2011, INAC experienced material funding constraints, rendering it unable to fund upgrades. As communities (and their load requirements) continued to grow, Remotes found itself in situations where it was unable to connect new electrical services. Remotes considered replacing engines with larger engines, but the cost to replace auxiliary systems was more expensive than funding a simple engine replacement, making these short-term solutions incompatible with the company's budgetary considerations and focus on efficiency. Following this experience, Remotes worked with INAC to modify the upgrade process so that smaller projects could be put in service quickly should a similar situation occur in the future.

#### 2.2.1.3 Transmission Connection Engagement

Remotes participates in all aspects of the engagements related to the connection of several northern communities to the bulk transmission system. The key engagements are related to transmission connection planning, transmission connection funding, regulatory support for IPAs, and diesel generation backup.

### 2.2.1.3.1 Transmission Connection Planning

**Purpose of the Engagement:**

The purpose of this engagement is to plan a transmission line that, if built, would connect several First Nation communities currently served by Remotes, along with several IPAs, thus expanding the service territory of Remotes.

**Engagement Initiation:**

The IESO initiated the engagement.

**Other Participants in the Engagement:**

Other participants in the engagement were the IESO, First Nations representatives, and representatives from federal and provincial governments.

**Final Deliverables**

During 2013 and 2014, as part of this planning process, the IESO asked Remotes to provide information to support this planning process. Information provided included historical load in the communities, historical peak load information, and aggregated information historical diesel usage and costs. At the IESO's invitation, Remotes also has attended three broad stakeholder meetings where the IESO discussed future transmission plans in the northwest. Although no new stations are currently planned, a transmission connection date should eventually be provided.

**Effect on the DSP**

While the anticipated timeline of the transmission line construction falls outside the forecast period of the DSP, this project will affect Remotes' planning considerations over the medium-to-long term. In the interim period, Remotes continues to be required to offer reliable electricity service in the communities, and enable the load growth through capital upgrades funded by INAC. Remotes anticipates maintenance of the diesel generation assets until the day the transmission connection work is completed and a diesel backup study determines the optimal path forward. However, in recognition of this eventuality and as a means of managing its budget, Remotes reduced its funding requests for this interim period and has recommended customers to downsize their requests from INAC. An example of a project deferred in this manner, is the foregone Weagamow tank storage upgrade driven by the anticipated connection.

The revised upgrade process now allows for station modifications to allow customers to connect to the system. Remotes is also exploring innovative approaches to increase capacity such as the tie-line between Wapekeka and Big Trout Lake and the connection of customer-owned renewable energy in Fort Severn.

### 2.2.1.3.2 Transmission Connection Funding

**Purpose of the Engagement:**

The purpose of this engagement is to develop a funding agreement for the transmission connection project.

**Engagement Initiation:**

Watay Power initiated the engagement.

**Other Participants in the Engagement:**

Other participants in the engagement were Watay Power and representatives from federal and provincial governments.

**Final Deliverables**

Watay Power is the transmission company that was identified as the future owner-operator of the transmission line to be constructed. Watay Power is owned by 22 First Nations in the north in partnership with Fortis Ontario. The provincial government designated this project in July 2016. The letter from the Minister of Energy is attached as Appendix C: Order-in-Council from the Minister of Energy.

The Order-in-Council identified 16 communities to be connected to the bulk electricity grid at an undetermined date. Nine of these communities are presently served by Remotes, namely:

- Sandy Lake
- Deer Lake
- Kingfisher Lake
- Kasabonika
- Wapekeka
- Kitchenuhmaykoosib Inninuwug (Big Trout Lake)
- Bearskin Lake
- Sachigo Lake
- North Caribou Lake (Weagamow)

In addition, two communities identified in the Order-in-Council are expected to join Remotes' service area over the historical period, namely:

- Wunnumin
- Pikangikum

**Effect on the DSP**

This consultation has allowed Remotes to also explore innovative approaches to increase capacity such as the tie line between Wapekeka and Big Trout Lake. The new distribution line will be necessary once the transmission line reaches the communities; therefore, the incremental cost of building the line earlier than required is much less than the cost avoidance of a larger station upgrade in the communities.

#### 2.2.1.3.3 Regulatory Support for IPAs

**Purpose of the Engagement:**

The purpose of these engagements is to educate communities served by Remotes and other First Nations operating IPAs on the provincial regulations related to electricity generation, transmission, and distribution.

**Engagement Initiation:**

The IESO and Watay Power initiated the engagements.

**Other Participants in the Engagement:**

Other participants in the engagement were the ESA, Watay Power, INAC, Ministry of Energy staff, and First Nation representatives.

**Final Deliverables**

As part of this effort, Remotes met with Chief, Council, and IPA representatives from North Spirit Lake, Wunnumin Lake, Muskrat Dam, Wawakapewin, Pikangikum, Poplar Hill, and Keewaywin. Information shared included ESA requirements, Ontario regulations, OEB programs, and rate setting. To ensure that distribution and generation assets meet provincial standards in the IPA communities, Remotes staff agreed to work with the ESA to inspect the assets in the communities and to identify defects that must be fixed ahead of grid connection. Inspections to date have taken place in Pikangikum, North Spirit Lake, and Wunnumin Lake. Reports are provided to the Tribal Councils and the local First Nations.

**Effect on the DSP**

Activities related to these engagements fall under the non-system O&M category and are not the focus of the DSP. The implementation of these activities will facilitate the successful connection of IPAs to the bulk electricity grid as part of the transmission connection project expected to take place in the medium-to-long term (outside of the planning period of the DSP).

Remotes has performed a considerable amount of work to help the northern IPAs prepare for anticipated grid connection. Based on the proposed transmission line route, the IPAs would be connected before any the communities served by Remotes are connected. The proposed line crosses the traditional lands of these communities, making their participation (and ultimate connection) a critical factor in the project's viability.

#### 2.2.1.3.4 Diesel Backup Study

**Purpose of the Engagement:**

This is an ongoing engagement to assess the feasibility of using diesel generators as a backup power supply to reduce the outage times for remote communities to be served by a new radial transmission line.

**Engagement Initiation:**

The IESO initiated the engagement.

**Other Participants in the Engagement:**

Other participants in the engagement are the IESO, INAC, Watay Power, Tribal Councils, and Ministry of Energy staff.

**Final Deliverables**

The diesel backup study is exploring the development of technology options, regulatory considerations, current and future financial responsibilities, and environmental considerations. A draft study has been prepared for review by all parties involved. Additional community engagement is required before the report is finalized.

**Effect on the DSP**

The likeliest timeline of the transmission line construction falls outside of the forecast period of the DSP. This engagement has not had any commensurate effect on the DSP, but will affect Remotes over the medium-to-long term. The results of the study will determine Remotes' role in the implementation and operation.

### 2.2.1.4 Renewable Energy Studies

**Purpose of the Engagement:**

The Ministry of Energy tasked the IESO with identifying options for renewable energy in the three First Nation communities served by Remotes that the IESO has determined as not economic to connect to the grid (Whitesand, Fort Severn, and Gull Bay).

**Engagement Initiation:**

The Ministry of Energy initiated the engagement, which is being led by the IESO.

**Other Participants in the Engagement:**

Other participants in the engagement are the Ministry of Energy, INAC, and community representatives.

**Final Deliverables**

Remotes met with the IESO, the Ontario Ministry of Energy, and INAC to discuss its Renewable Energy Innovation Diesel Emission Reduction ("**REINDEER**") program and opportunities to expand renewable energy and renewable microgrid projects across the off-grid communities. To date, Remotes has completed a Connection Impact Assessment for a biomass project in Whitesand and has assisted the First Nation and the IESO with technical design aspects of the proposed project. Engagements are also underway for a solar/battery project in Gull Bay and a solar project being constructed in Fort Severn.

**Effect on the DSP**

For all three renewable projects under development, Remotes has a distinct role. First and foremost, Remotes must ensure safe and reliable power to its customers. As such, Remotes is taking an active role in design and technical review of project plans, with integration into existing systems as the core focus given all projects noted are in the initial development stage.

If developed as planned, the biomass generation project in Whitesand is expected to produce electrical output that would displace electrical load within the community and that settlement would be based on the avoided cost of diesel fuel in that community. No firm project timeline has yet been established for this project, although construction is planned to begin in 2025.

A solar generation project, supported by federal and provincial grants, is currently being developed by Fort Severn First Nation and private sector developers. Remotes' role in this project is to ensure the ongoing reliability and stability of the existing microgrid and to ensure that the project can be integrated into the existing generation system. The project is staged, with 40 kW of net-metered solar installed to date. When fully installed, the project will qualify for Remotes' REINDEER program and, consistent with that program, Remotes will pay for the electricity produced based on the avoided cost of diesel fuel.

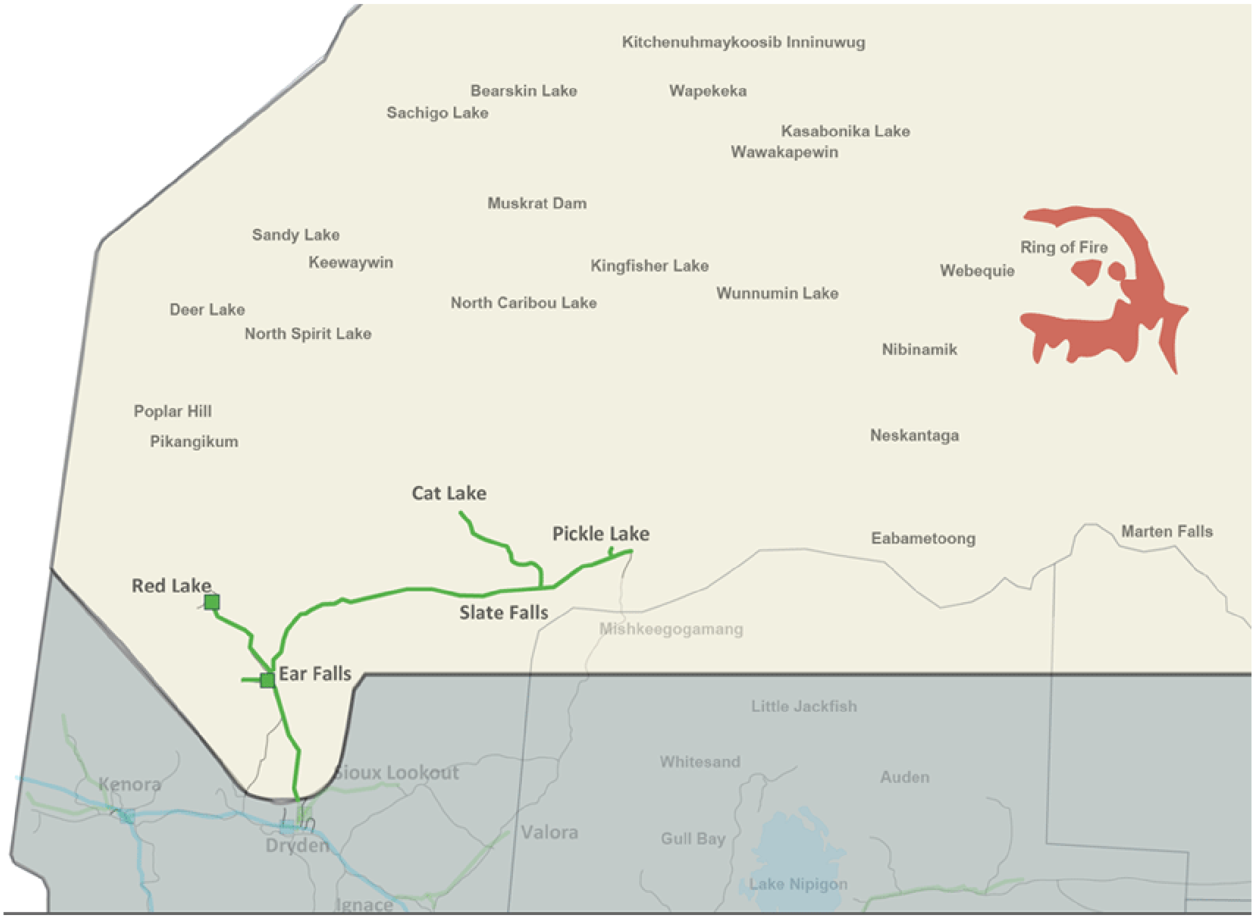
A high penetration solar/battery microgrid project, supported by provincial grants, is also planned for Gull Bay. The project is currently in the very early stages. It is anticipated that the project will also qualify for Remotes' REINDEER program and that settlement will also be based on the avoided cost of diesel fuel in that community.

In terms of generator upgrades and replacements, the three planned sites are not expecting upgrades over the forecast period. The upgrades will, however, affect future capacity.

### 2.2.2 Regional Planning Process (5.2.2b)

Remotes is part of the "North of Dryden" group for the Regional Planning Process. The North of Dryden area extends northward from Dryden to the towns of Ear Falls, Red Lake, Pickle Lake, and surrounding areas depicted in Figure 2-1. Electricity to the sub-region is currently supplied by the 115 kV Hydro One Networks Inc. transmission system. An Integrated Regional Resource Plan ("**IRRP**") was developed to identify the near-term and medium- to long-term electricity supply needs of the area and assess options that are available to address the needs in a timely, reliable, and cost-effective manner. Municipalities and First Nation communities were engaged in the development of the IRRP.

Figure 2-1: North of Dryden Area



The IRRP was published by the IESO on January 27, 2015. Drivers for increased electricity demand in the areas surrounding Red Lake, Pickle Lake, and the Ring of Fire include connecting 21 remote First Nation communities and growth in the mining sector. The IRRP recommended that a new single-circuit 230 kV line from Dryden/Ignace to Pickle Lake should be constructed along with upgrades to existing lines between Dryden and Red Lake for immediate implementation to address near- and medium-term needs for the Pickle Lake and Red Lake areas. The IRRP is included as Appendix B: North of Dryden IRRP.

The OPA (now the IESO) and the representatives of the remote First Nation communities and tribal councils in the area drafted the 2012 Technical Report for the Connection of Remote First Nation Communities in Northwest Ontario. Since the release of the plan in 2012, engagement of the communities has continued and an updated draft Remote Community Connection Plan was posted in August 2014. The updated analysis identifies that there is an economic case to connect up to 21 remote communities at this time, including the Marten Falls First Nation. The remaining communities are not economic to connect at present, largely due to their relatively small size and distance from existing transmission infrastructure.

The 2014 draft Remote Community Connection Plan is a business case which informed a July 29, 2016, Order-in-Council from the provincial government. This order confirms the need for the project to connect 16 remote communities to the transmission system. Nine of these communities are presently served by Remotes and two are expected to be served by Remotes in the future. While this will not affect investments in the communities over the five-year period of this DSP, it is expected that the construction activities of this new transmission line will affect Remotes planning considerations over the medium-to-long term. The order from the Minister of Energy is included as Appendix C: Order-in-Council from the Minister of Energy.

### 2.2.3 IESO Comment Letter (5.2.2c)

A request for a letter of comment was sent to the IESO on March 3, 2017. The OEB expects the letter to include the following:

- the applications it has received from renewable generators through the Feed-in Tariff ("**FIT**") program for connection in the distributor's service area;
- whether the distributor has consulted with the IESO, or participated in planning meetings with the IESO;
- the potential need for co-ordination with other distributors and/or transmitters or others on implementing elements of the REG investments;
- and whether the REG investments proposed in the DSP are consistent with any Regional Infrastructure Plan.

In regards to those points, Remotes noted that:

- Remotes' service area is not eligible for the FIT program and, therefore, there are no FIT applications for connection in Remotes' service area;
- Remotes routinely consults with the IESO on various matters as appropriate;
- Each of the communities served by Remotes is electrically isolated and not connected to the bulk transmission system. Therefore, co-ordination with other distributors and/or transmitters on implementing REG investments is not necessary.
- The Remote Community Connection Plan is still under development for Remotes' region.

The letter sent to the IESO is included as Appendix F: Request for IESO Comment Letter and their response is included as Appendix G: IESO Comment Letter.

## 2.3 Performance Measurement for Continuous Improvement (5.2.3)

This section identifies and defines the methods and measures used to monitor distribution system planning process performance, sets targets, reports on historical performance, and explains how this information has been incorporated into the DSP. These address the three performance outcomes listed in the Filing Requirements; customer-oriented performance, cost efficiency and effectiveness, and asset/system operations performance, environmental stewardship, and safety. Table 2-7 summarizes the performance measure to be tracked by Remotes and the desired outcome for each.

Table 2-7: Summary of Performance Measures Tracked by Remotes

<table>
<tr><th>Performance Outcomes</th><th>Performance Categories</th><th>Measures</th><th>Desired Outcome</th></tr>
<tr><td rowspan="4">Customer-oriented Performance</td><td>Customer Satisfaction</td><td>Customer satisfaction survey results</td><td>≥90%</td></tr>
<tr><td>Consumer Bill Impacts</td><td>Percentage annual rate increase</td><td>3% during a Cost of Service year, 2% otherwise</td></tr>
<tr><td rowspan="2">System Reliability</td><td>SAIDI including Loss of Supply</td><td>≤11.24</td></tr>
<tr><td>SAIFI including Loss of Supply</td><td>≤12.97</td></tr>
<tr><td>Cost Efficiency and Effectiveness</td><td>DSP Implementation Progress</td><td>Gross CAPEX + system O&M – planned vs. actual</td><td>≥90%</td></tr>
<tr><td rowspan="4">Asset/System Operations Performance</td><td>Distribution Losses</td><td>Percentage line loss</td><td>≤3.6%</td></tr>
<tr><td>Diesel Generation Efficiency</td><td>Energy generated from diesel per liter of fuel</td><td>≥3.42 kWh/L</td></tr>
<tr><td>Percentage of Energy Generated from Renewables</td><td>Energy generated per liter of fuel issued (includes non-diesel)</td><td>≥2.41%</td></tr>
<tr><td>Generation Availability</td><td>Percentage of generation availability</td><td>≥99.94%</td></tr>
<tr><td rowspan="5">Environmental Stewardship</td><td rowspan="3">Environmental Protection</td><td>Litres lost to the environment</td><td>≤100</td></tr>
<tr><td>Number of spills</td><td>≤6</td></tr>
<tr><td>Number of category A spills</td><td>0</td></tr>
<tr><td rowspan="2">Greenhouse Gas Emission</td><td>Emission of carbon dioxide equivalents</td><td>Monitor emissions and calculate net emission intensity</td></tr>
<tr><td>Net emission intensity</td><td>≤0.000731 tonnes per kWh</td></tr>
<tr><td rowspan="2">Safety</td><td>Lost-time Injuries</td><td>Number of lost-time injuries</td><td>0</td></tr>
<tr><td>Total Recordable Injuries</td><td>Number of recordable injuries</td><td>≤2</td></tr>
</table>

### 2.3.1 Customer-oriented Performance

Customer focus is a key outcome of the RRFE. Therefore, Remotes has identified several measures for customer-oriented performance in the categories of customer satisfaction, consumer bill impacts, and system reliability.

#### 2.3.1.1 Customer Satisfaction

The satisfaction of its customers is very important to Remotes. The motivation for tracking this metric is based on consumer, regulatory, and corporate drivers.

##### 2.3.1.1.1 Definition (5.2.3a)

Customer survey results are used to gain insights into Remotes' performance relative to customers' needs and expectations. Customer surveys have been conducted approximately every two years since 2003. In 2015, Viewpoints Research conducted its most recent telephone survey of 205 residential, business, and government-supported organization customers served by Remotes.

Customer satisfaction is measured as the percentage of customers who responded "very satisfied" or "satisfied" with the electrical service they receive from Remotes, as reported in the customer satisfaction survey. Remotes' target for overall satisfaction is to be greater than or equal to 90 per cent.

##### 2.3.1.1.2 Historical Performance (5.2.3b)

Figure 2-2 depicts the customer satisfaction survey results for each year of the survey.

Figure 2-2: Customer Satisfaction with Electrical Service

Overall satisfaction with the electrical service received from Remotes in 2015 is 91%, which is above the target. This is similar to levels recorded in 2009 and 2011 but is down from the 97% reported in the previous survey.

#### 2.3.1.1.3 Effects on the DSP (5.2.3c)

Customers were asked to indicate the primary reason(s) for satisfaction with Remotes. Table 2-8 summarizes the reasons for satisfaction cited by customers.

Table 2-8: Reasons for Customer Satisfaction

| Reasons for satisfaction | 2015 | 2013 | 2011 | 2009 | 2007 | 2005 | 2003 |
|---|---|---|---|---|---|---|---|
| Electricity there when needed | 65% | 51% | 49% | 40% | 42% | 43% | 43% |
| Good/improved service | 20% | 15% | 26% | 18% | 20% | 19% | 19% |
| Reliability has improved | 12% | 17% | 25% | 20% | 12% | 10% | 10% |
| Fair rates | 4% | 6% | 10% | 5% | 5% | 6% | 6% |
| Customer service | 10% | 10% | 11% | 13% | 3% | 4% | 4% |
| Company doing the best they can | 4% | 2% | 6% | 5% | 3% | 4% | 4% |
| Environmental practices | 0% | 1% | 2% | 2% | <1% | 1% | 1% |
| Rates/problems not their fault | 1% | NA | NA | NA | NA | NA | NA |
| No reason/other/unsure | 12% | 19% | 10% | 27% | 26% | 26% | 26% |

*Percentages do not total 100% because customers were permitted more than one response.*

Having electricity available when they want it continues to be the main driver of customer satisfaction, as was identified by 65% of the surveyed utilities. This is 14% more than the previous survey in 2013, and 25% more than in 2009.

Twenty per cent of customers attributed their satisfaction to good or improved service, and 12% listed improved reliability. Satisfaction with customer service has held steady during this time, with ten per cent of customers indicating this as a key reason for their satisfaction.

The results indicate a need to continue to invest in system reliability as the main driver for customer satisfaction. Remotes has identified several investments over the forecast period planned to improve reliability. Distribution System Improvements replace defective poles, restring conductors, and re-align poles based on asset condition, to improve the system's reliability during storms. Distribution System Improvements also include the installation of new Viper switches to isolate upstream customers from downstream power outages. On the generation side, Remotes performs generator replacements and overhauls in accordance with manufacturer's recommendations to maintain the reliability of its supply. While not primarily driven by reliability improvements, generator upgrade projects have the added benefit of improved power supply reliability.

#### 2.3.1.2 Consumer Bill Impacts

Remotes understands that the cost of living in the north is high. Remotes dedicates significant efforts to keep monthly bills affordable and works with its customers to facilitate timely bill payments. Remotes helps its customers conserve electricity, arrange payment programs, and find programs and services to reduce the overall cost of electricity. The motivation for tracking this metric is based on consumer and legislative drivers.

##### 2.3.1.2.1 Definition (5.2.3a)

Remotes tracks the percentage of annual rate increase for the total bill payable by a typical year-round residential customer who consumes 750 kWh/month. The bill impact for all customers, including residential, is limited to the average distribution increase in a Cost of Service year, historically about three per cent, and by inflation in other years, historically about two per cent, based on legislative requirements.

##### 2.3.1.2.2 Historical Performance (5.2.3b)

The 2013 rate year was the last Cost of Service application for Remotes. and a typical year-round residential customer (750 kWh/month consumption) would have seen a 3.41% bill increase. Table 2-9 depicts the annual percentage bill increase for a year-round residential customer each year from 2013 to 2017, as well as the five-year average.

Table 2-9: Annual Bill Impacts for a Year-Round Residential Customer (2013-2017)

| Year | 2013 | 2014 | 2015 | 2016 | 2017 | 5-year Average |
|---|---|---|---|---|---|---|
| **Percentage Annual Consumer Bill Increase** | 3.45% | 1.7% | 1.6% | 2.1% | 1.9% | 2.15% |

##### 2.3.1.2.3 Effects on the DSP (5.2.3c)

The projects and programs planned in this DSP have been paced and prioritized with consumer bill impacts in mind. To lessen its rate impacts, Remotes has implemented and will continue to implement several cost-saving measures such as those listed in Section 2.1.2.

#### 2.3.1.3 System Reliability

Remotes' goal is to ensure that the power is there when customers reach for the switch. The motivation for tracking this metric is based on consumer, regulatory, and corporate drivers.

##### 2.3.1.3.1 Definition (5.2.3a)

The key metrics that Remotes tracks to measure reliability are the System Average Interruption Frequency Index ("**SAIFI**"), System Average Interruption Duration Index ("**SAIDI**"), and Customer Average Interruption Duration Index ("**CAIDI**"). SAIFI is the average frequency of sustained power interruptions and is calculated by dividing the total number of customer interruptions over a given year by the total number of customers served. SAIDI is the average outage duration and is calculated by dividing the total number of customer-hours of sustained interruptions over a given year by the number of customers served. An interruption is considered sustained if it lasts for at least one minute. CAIDI reflects the average time for electricity service to be restored following an outage and is calculated by dividing the total customer-hours of sustained interruptions over a given year by the total number of sustained interruptions for that year (also by dividing SAIDI by SAIFI).

Over the historical period, Remotes' targets for SAIDI were 12.4 hours including loss of supply and 5.13 hours excluding loss of supply. Its SAIFI targets were 15.6 interruptions including loss of supply and 3.79 interruptions excluding loss of supply.

Over the forecast period, Remotes' target for SAIDI is 11.24 hours including loss of supply and its target for SAIFI is 12.97 interruptions including loss of supply. Remotes does not maintain a target for SAIDI or SAIFI excluding loss of supply since, from the customers' perspective, the reason for a power outage is not as important as the power outage itself.

Remotes does not set a target for CAIDI since, being the ratio of SAIDI to SAIFI, it is a redundant metric and CAIDI can increase while SAIDI and SAIFI both improve. Moreover, CAIDI was recently removed from the OEB's *Reporting and Record Keeping Requirements*. However, historical information on CAIDI is included for reference, as mandated by the Filing Requirements.

### 2.3.1.3.2 Historical Performance (5.2.3b)

Figure 2-3 and Figure 2-4 show the SAIFI and SAIDI performance with and without loss of supply for the years 2013 to 2016.

Figure 2-3: SAIFI Including and Excluding Loss of Supply (2013-2016)

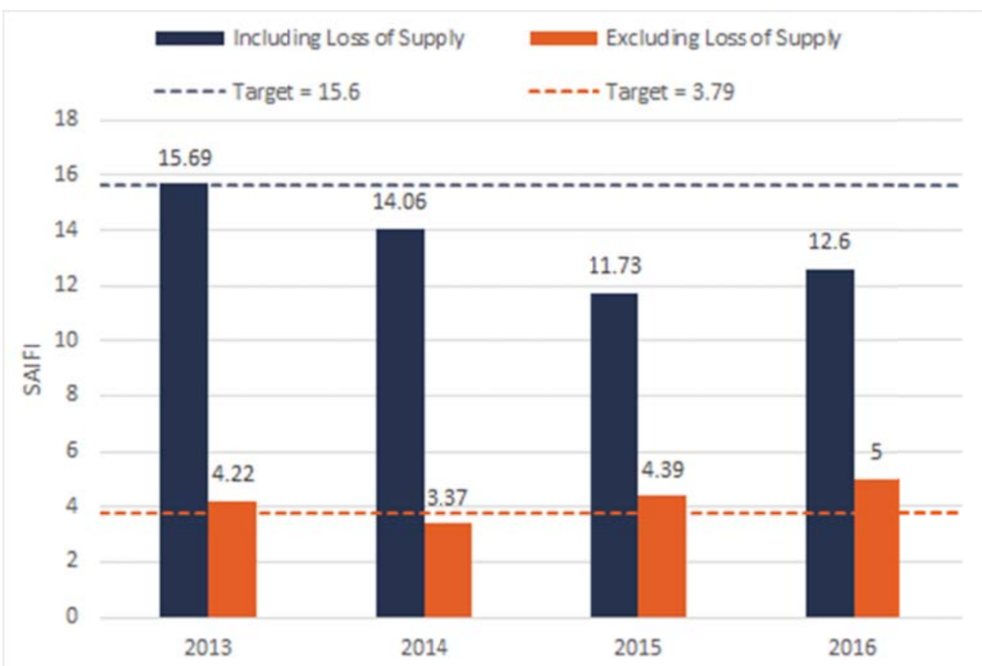


Figure 2-4: SAIDI Including and Excluding Loss of Supply (2013-2016)

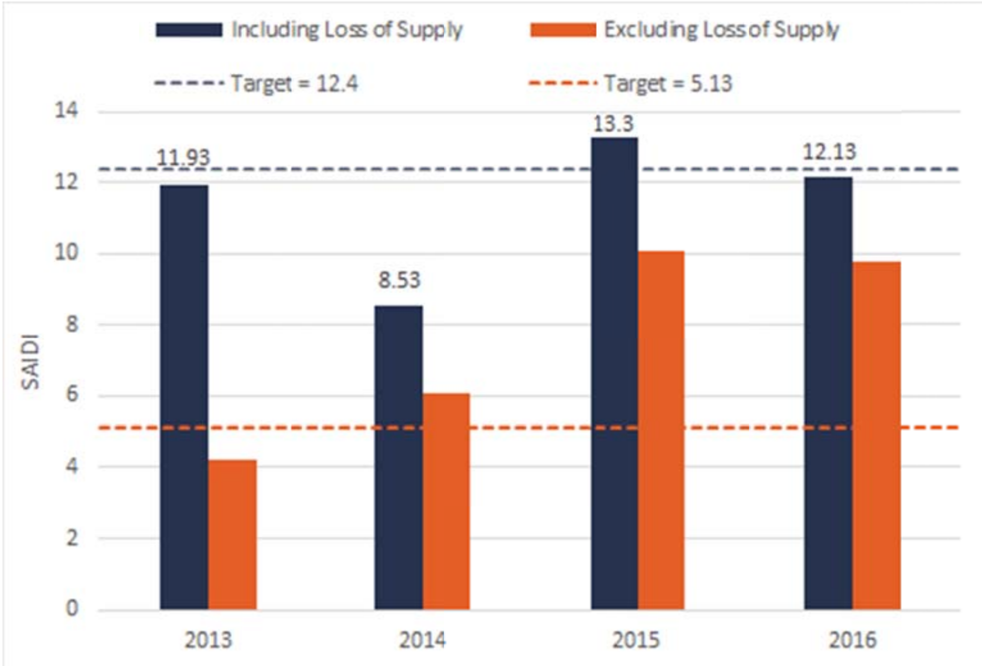


When including loss of supply, both the SAIFI and SAIDI are below or very close to the target over the historical period. Excluding it, however, both metrics have exceeded the targets over the past several years, with SAIDI doing so by a significant amount. Based on the IEEE Standard 1366-2012 definition of a Major Event Day (“**MED**”), Remotes has not experienced any MEDs in any of the communities it serves.

Remotes has increased the number of planned distribution outages compared to 2012, which is the primary reason for the above-target performance. In addition, Hillsport had a major outage due to aging equipment where parts are no longer readily available. A new part was able to be fabricated locally to restore equipment to reliable service. This is a small community with just 32 customers, so it would be impractical to allocate a lot of capital to this community. Remotes pre-purchased two new generators so that if one fails it can be replaced by the other. Other material contributing factors to the SAIDI and SAIFI results include a commissioning-related outage at Weagamow, a bulk tank lockout at Deer Lake, an extended outage on the Collins line, and a long outage in Gull Bay.

Table 2-10 and Table 2-11 summarize Remotes’ reliability performance over the historical period of 2013-2016, including CAIDI. The annual performance is highlighted for years when the target was not met.

Table 2-10: Customer Service Indicators Results with Loss of Supply

| Performance Measure | Target | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|
| **SAIDI** | ≤12.4 | 11.93 | 8.53 | 13.3 | 12.13 |
| **SAIFI** | ≤15.6 | 15.69 | 14.06 | 11.73 | 12.6 |
| **CAIDI** | | 0.76 | 0.61 | 1.13 | 0.96 |

Table 2-11: Customer Service Indicators Results without Loss of Supply

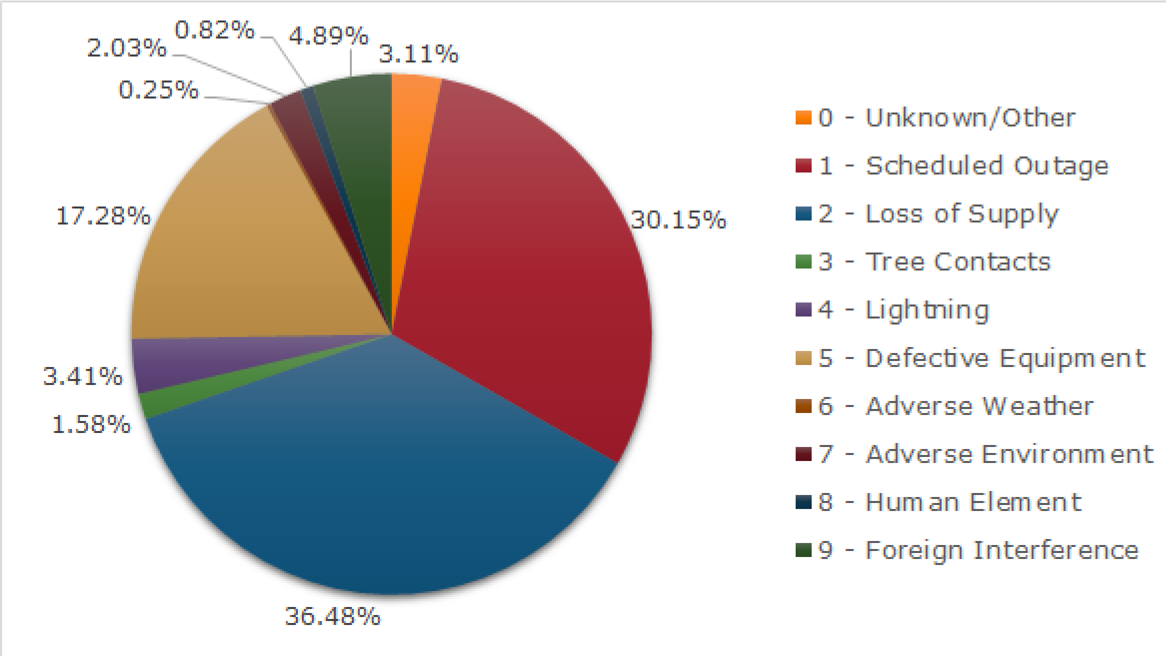
| Performance Measure | Target | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|
| **SAIDI** | ≤5.13 | 4.21 | 6.06 | 10.08 | 9.81 |
| **SAIFI** | ≤3.79 | 4.22 | 3.37 | 4.39 | 5.0 |
| **CAIDI** | | 1.00 | 1.80 | 2.30 | 1.96 |

### 2.3.1.3.3 Effects on the DSP (5.2.3c)

Over the historical period, SAIDI has trended upward while SAIFI has trended downwards. Therefore, while the average duration of interruptions experienced by customers has increased, the average number of outages experienced has decreased. One way to reduce outage durations is through a fast response time. Remotes has a highly trained and skilled workforce including engineers, mechanics, line maintainers, electricians, and technicians stationed in Thunder Bay who are prepared to respond to an emergency 24 hours a day, seven days a week. In addition, there are trained operators in the communities who can respond to outages. However, if skilled trades are required to fix the cause of the outage, transportation can hinder power restoration efforts.

Remotes monitors and analyzes the root cause of power interruptions. Each power outage that occurs on Remotes' distribution system is recorded and an outage cause code is assigned. The number of customer interruption hours for each cause code provides a picture of the root cause of power interruptions. Figure 2-5 depicts the customer interruption duration by cause code for the years 2013 through 2016. The top three categories affecting Remotes' reliability are loss of supply (36.48%), scheduled outages (30.15%), and defective equipment (17.28%).

Figure 2-5: Customer Interruption-Hours by Cause Code (2013-2016)



Loss of supply outages have had the biggest impact on Remotes' customers over the historical period. These outages occur due to problems at the generating station such as the generator, fuel supply system, station auxiliary systems, PLC, circuit breakers, or transformers. Remotes has planned several investments over the forecast period to address loss of supply outages. Generator overhauls are planned to refurbish the engine based on manufacturers' guidelines to maintain the reliable operation of the generator. After two overhauls, it is no longer economical to overhaul the generator and its replacement is planned. Remotes has planned several generator replacements over the forecast period based on the maintenance history of the unit, the number of engine-hours, and the asset condition. SCADA and PLC upgrades at Remotes' generating stations will improve outage response time by enabling remote alarm handling and troubleshooting.

Non-capital investments to reduce loss of supply outages includes planned maintenance on generators as described in Section 3.3.1.2. Remotes is in the process of reviewing which maintenance activities will be beneficial to manage its GSUs.

Scheduled outages were a large part of the power interruptions in 2016. Remotes mitigates the impact of these outages through proactive planning and advanced notice with the affected communities. The planning approach of bundling of work in a community should help to reduce the number of outages and duration customers experience on an annual basis.

Defective equipment caused 22% of the power outages affecting customers in 2016. Remotes has planned various projects and programs in the DSP to address defective equipment outages. On the distribution system, investments will be made to replace aging and defective poles, restring conductors, and realign poles. Remotes is also planning to install new Viper switches on its distribution system to protect upstream customers from downstream faults and to improve the cold load pickup capability of the system.

## 2.3.2 Cost Efficiency and Effectiveness

Cost efficiency and effectiveness with respect to planning quality and DSP implementation is an important part of the Filing Requirements. Therefore, Remotes has identified a measure for cost efficiency and effectiveness in the categories of DSP implementation progress.

### 2.3.2.1 DSP Implementation Progress

DSP implementation progress measures the success of the execution of the capital programs outlined in the DSP. The motivation for tracking this metric is based on regulatory and corporate drivers.

#### 2.3.2.1.1 Definition (5.2.3a)

The metric used is actual gross capital spending and O&M as a percentage of the business plan. The target going forward is based on the historical period average: 90% or more, and reflects the uncertain amounts and timing of INAC funding, as well as contingencies related to the transportation of materials to the north.

#### 2.3.2.1.2 Historical Performance (5.2.3b)

Historical performance is displayed in Table 2-12. The percentage of spending relative to plan varies due to reprioritization of work priorities during the year. Remotes' top priority is to keep the lights on and respond to trouble calls on the systems. The next priority is customer-requested work including connections and capacity upgrades. Since these projects are externally-initiated, Remotes' resources may be redeployed from planned capital projects to accommodate customer needs.

Table 2-12: Actual Spending as Percentage of Business Plan

| Program | Historical | | | | |
|---|---|---|---|---|---|
| | 2013 | 2014 | 2015 | 2016 | Average |
| **Distribution** | | | | | |
| Distribution O&M | 80.30% | 94.85% | 92.64% | 87.39% | 88.80% |
| Distribution Capital | 91.89% | 73.92% | 82.87% | 80.56% | 82.31% |
| **Total Distribution** | 83.28% | 88.85% | 89.96% | 85.47% | 86.89% |
| **Generation** | | | | | |
| Generation O&M | 101.65% | 104.82% | 81.19% | 81.79% | 92.36% |
| Generation Capital | 64.65% | 68.32% | 141.54% | 114.10% | 97.15% |
| **Total Generation** | 88.48% | 92.74% | 98.24% | 89.09% | 92.14% |
| **Other** | | | | | |
| Common O&M | 109.35% | 77.40% | 75.45% | 57.95% | 80.04% |
| Environment O&M | 120.09% | 115.54% | 100.60% | 107.50% | 110.93% |
| Facilities Capital | 47.59% | 78.55% | 15.06% | 128.03% | 67.31% |
| MFA Capital | 214.47% | 93.66% | 131.21% | 62.96% | 125.57% |
| **Total Other** | 92.41% | 96.67% | 61.20% | 101.14% | 87.85% |
| **Total Projects** | 88.76% | 92.30% | 89.73% | 89.57% | 90.09% |

#### 2.3.2.1.3 Effects on the DSP (5.2.3c)

Remotes’ DSP has been informed by the targets derived based on historical performance measurement. Remotes carefully plans project expenditures through its budgeting process. Distribution capital investments have been planned in such a manner that they can be executed by Remotes’ crews, apprentices and casual staff. Generation capital investments have been planned through considerable coordination with INAC and the remote communities. Remotes’ generation capital budgeting process allows for investments to shift between communities as their needs evolve over the forecast period.

## 2.3.3 Asset/System Operations Performance

Asset/system operations performance provides a good measurement of Remotes’ asset management strategy effectiveness. Therefore, Remotes has identified several measures for asset/system operations performance in the categories of distribution losses, diesel generation efficiency, total generation efficiency, and generation availability.

### 2.3.3.1 Distribution Losses

Losses on the distribution system increase the amount of energy generation required to serve the downstream load. Distribution losses should be minimized wherever possible. The motivation for tracking this metric is based on corporate drivers.

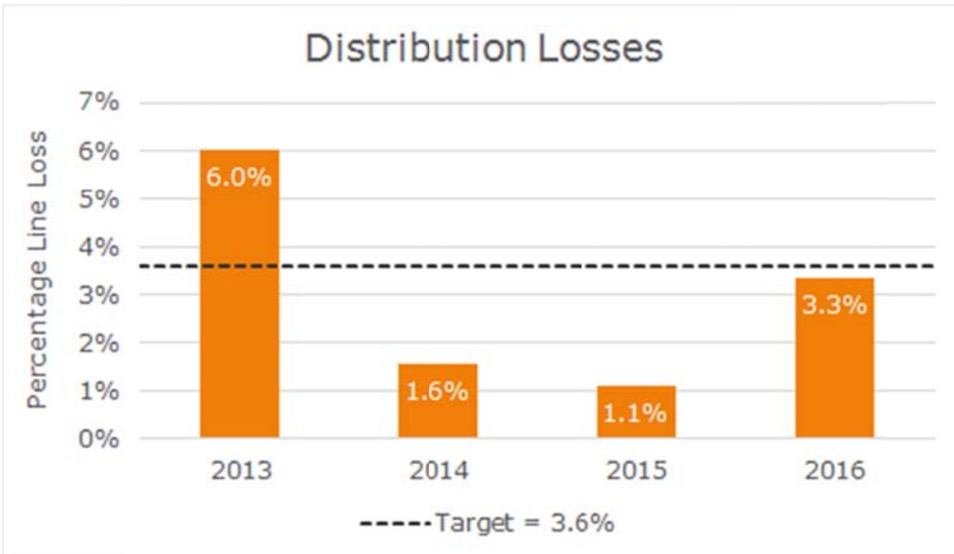
#### 2.3.3.1.1 Definition (5.2.3a)

Remotes tracks its distribution losses as the difference between the energy generated and energy sold, measured as a percentage of the total energy generated (all in kWh). The target for this metric is 3.6% or less.

#### 2.3.3.1.2 Historical Performance (5.2.3b)

The distribution losses over the last four years are presented in the figure below. Remotes exceeded its target in 2013, but has met the target since.

Figure 2-6: Distribution Losses 2013-2016



#### 2.3.3.1.3 Effects on the DSP (5.2.3c)

Remotes has not planned any investments with distribution losses as the primary driver; however, Distribution System Improvements such as conductor restringing and distribution transformer replacements reduce losses on the distribution system.

### 2.3.3.2 Diesel Generation Efficiency

Remotes strives to improve the efficiency of its diesel generation fleet through its procurement process, maintenance programs, and capital investment strategies. The motivation for tracking this metric is based on corporate drivers.

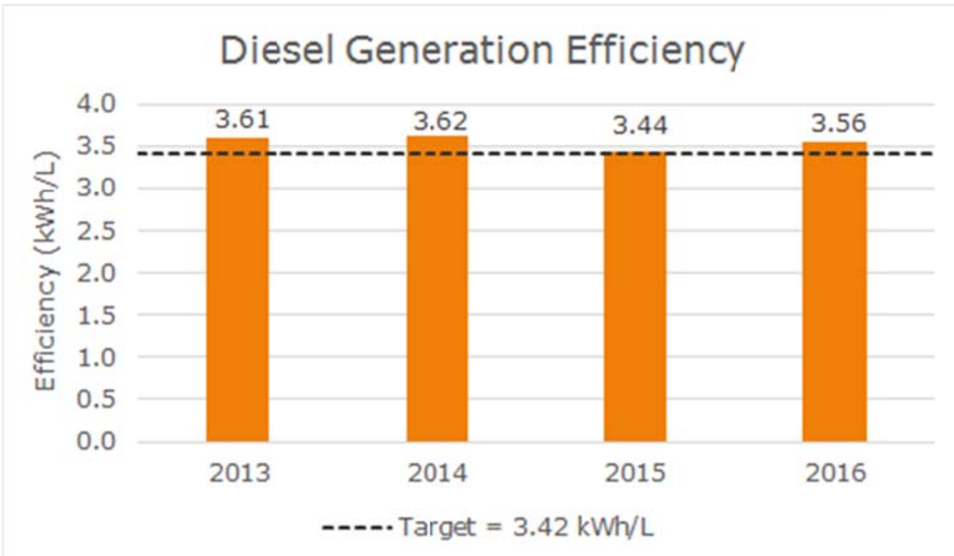
#### 2.3.3.2.1 Definition (5.2.3a)

Remotes calculates its generation efficiency as the amount of energy generated (in kWh) per litre of fuel consumed. The annual target for this metric is an average of 3.42 kWh per litre or greater.

#### 2.3.3.2.2 Historical Performance (5.2.3b)

Figure 2-7 depicts the efficiency of diesel generation for the years 2013 to 2016. The diesel generation efficiency is above target each year but has trended slightly downward since 2013. Diesel generation efficiency depends largely on the load profile in the community as optimized by the generator control scheme. Efficiency also depends on the number of out-of-service units.

Figure 2-7: Diesel Generation Efficiency 2013-2016



#### 2.3.3.2.3 Effects on the DSP (5.2.3c)

To reverse the downward trend, Remotes will continue to invest capital into generation replacements and overhauls. Generator replacements planned over the forecast period replace older, less efficient generators with newer, more efficient ones. Generator overhauls planned over the forecast period improve the efficiency of the refurbished units. While not a significant driver for the investment, generator upgrades have the same efficiency benefit as the replacement projects. The generator upgrades are contingent on INAC funding.

### 2.3.3.3 Percentage of Energy Generated using Renewables

By investing in non-diesel generation assets, such as wind, solar, and hydroelectric, Remotes can reduce its reliance on diesel fuel, which is important to Remotes' customers.

#### 2.3.3.3.1 Definition (5.2.3a)

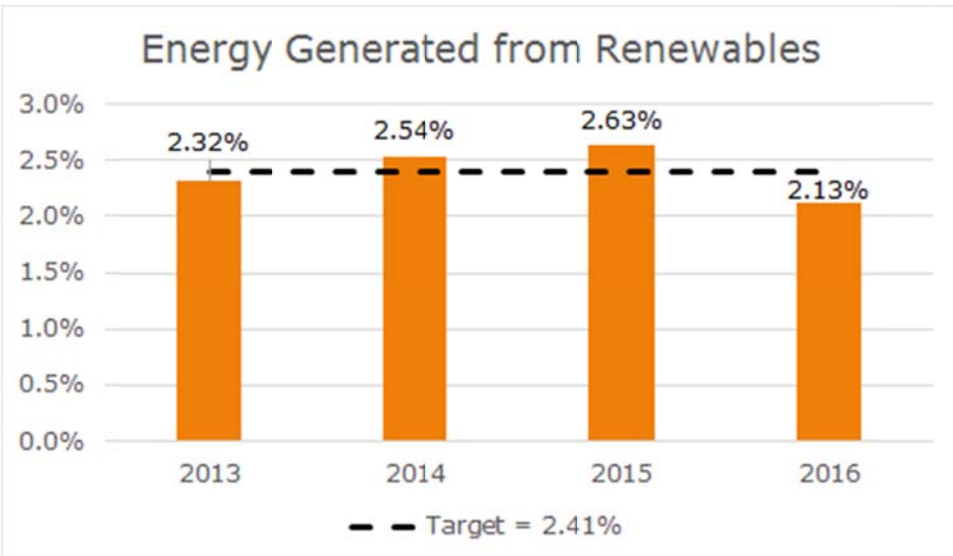
The percentage of energy generated using renewables is calculated by dividing the kWh generated from wind, solar, and hydroelectric sources (owned by Remotes) by the total kWh of energy generated by Remotes. The target over the forecast period is based on the historical period average: 2.41% or greater.

#### 2.3.3.3.2 Historical Performance (5.2.3b)

Remotes currently owns three hydroelectric stations and four wind turbines. Remotes does not currently own any solar generation equipment, but projects in Fort Severn and Gull Bay are currently planned. Fifteen customer-owned solar installations are in service and more are planned.

Figure 2-8 depicts the percentage of energy generated from renewables for the years 2013 through 2016. The amount of energy generated each year fluctuates based on the demand in the community and, in the case of the wind turbines, due to intermittency of the source. The percentage of energy generated from renewables also depends on the condition of the generating units. Recent projects have refurbished, rebuilt, and overhauled the renewable generators to improve their condition. The drop in 2016 is largely due to less energy generated from the Deer Lake hydroelectric generators. In 2016, Deer Lake generated 31% of its total energy from renewable sources, which is close to the previous three-year average of 28%. However, total energy consumption in Deer Lake in 2016 was 21% less than the previous three-year average. Since 65% of Remotes' renewable generation capacity is installed in Deer Lake, the community's consumption affects the metric.

Figure 2-8: Percentage of Energy Generated from Renewable Sources (2013-2016)



#### 2.3.3.3.3 Effects on the DSP (5.2.3c)

There are no capital investments into the existing renewable generator fleet planned over the forecast period, since refurbishments are to be made over the forecast period. Remotes will continue to maintain its renewable fleet to ensure its reliable operation. Several studies are underway to install biomass and solar projects in three remote communities, as described in Section 2.2.1.4.

### 2.3.3.4 Generator Availability

Generation availability is a good indicator of the success of Remotes' capital and maintenance programs and provides an indicator for power reliability. The motivation for tracking this metric is based on consumer and corporate drivers.

#### 2.3.3.4.1 Definition (5.2.3a)

Generation availability is calculated annually using the total duration of unplanned outages over the year. The availability is then the number of hours of unplanned outages subtracted from the number of hours in the year, as a percentage of the total number of hours in the year. Remotes' target for this metric over the forecast period is based on the historical period average: 99.94% or greater.

#### 2.3.3.4.2 Historical Performance (5.2.3b)

The average generation availability for each year of the historical period is shown Table 2-13. Remotes exceeded its target in each of these years

Table 2-13: Percentage of Generation Availability 2013-2016

| Year | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|
| Generation Availability | 99.86% | 99.97% | 99.97% | 99.96% |

The methodology looks at all outages under OEB Cause Code 2 that are one (1) minute or greater.

#### 2.3.3.4.3 Effects on the DSP (5.2.3c)

Similar to system reliability, generation availability drives investment into generation assets. Capital investment into Remotes' generation fleet, through planned replacements and overhauls, addresses generator availability. Generation upgrade projects also improve generation availability, since an older generator is replaced with a newer one and the decommissioned generator can be salvaged for spare parts to enable faster emergency repair times. Remotes' rigorous asset management program includes preventive maintenance on generators, which will reduce generator downtime.

## 2.3.4 Environmental Stewardship

Environmental stewardship is the top priority for many of Remotes' customers. Therefore, Remotes tracks an additional category of measures related to greenhouse gas emissions and environmental protection.

### 2.3.4.1 Greenhouse Gas Emissions

Most of Remotes' electricity is generated using diesel fuel since it is currently the most reliable and cost-effective method. Remotes is cognisant of the greenhouse gas contributions of its fleet and, therefore, monitors its emissions. The motivation for tracking this metric is based on consumer and corporate drivers.

#### 2.3.4.1.1 Definition (5.2.3a)

Remotes tracks greenhouse gas emissions from its electricity generation fleet. Generators within the 19 generating stations burn diesel fuel to produce electricity, directly emitting greenhouse gases to the atmosphere.

The metrics tracked by Remotes that relate to greenhouse gas emissions are:

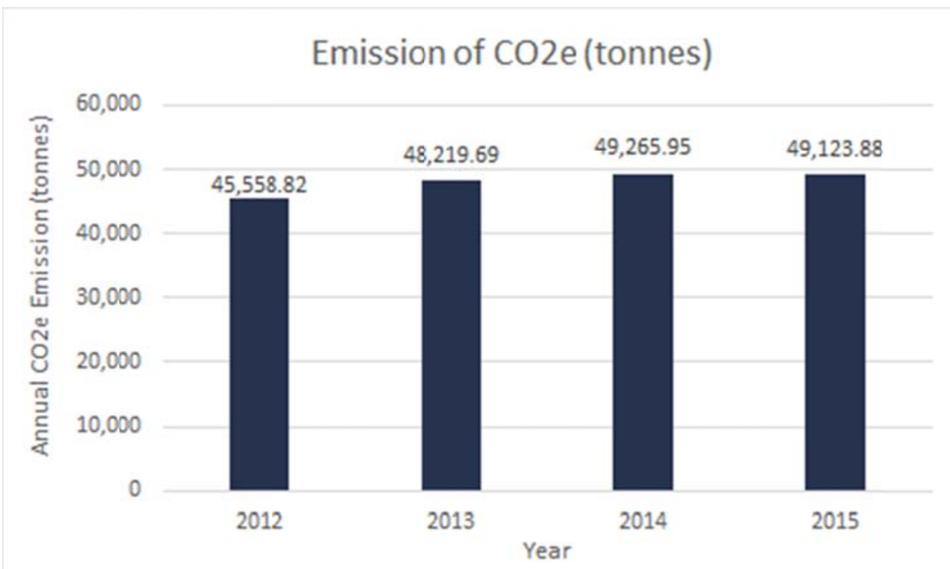
- Emission of carbon dioxide equivalents (“**$CO_2$e**”) measured in tonnes.
- Net emission intensity (tonnes of $CO_2$e per kWh of total energy generated).

The target set for the emission intensity for 2015 is less than or equal to 0.000731 tonnes of $CO_2$e per kWh.

#### 2.3.4.1.2 Historical Performance (5.2.3b)

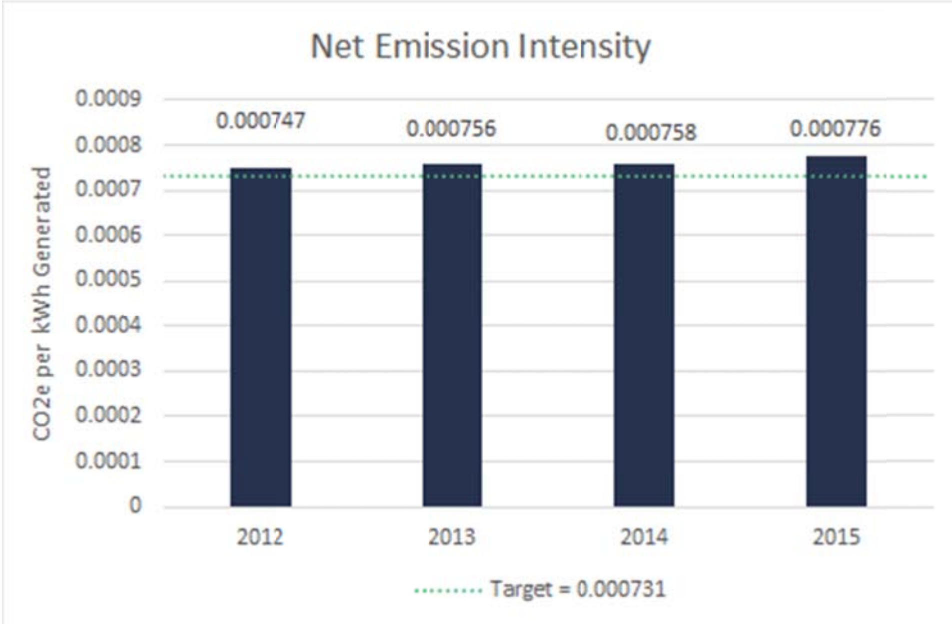
Figure 2-9 shows Remotes’ $CO_2$e emissions from diesel electricity generation over the historical period of 2012 to 2015.

Figure 2-9: Greenhouse Gas Emissions from Generators 2012-2015



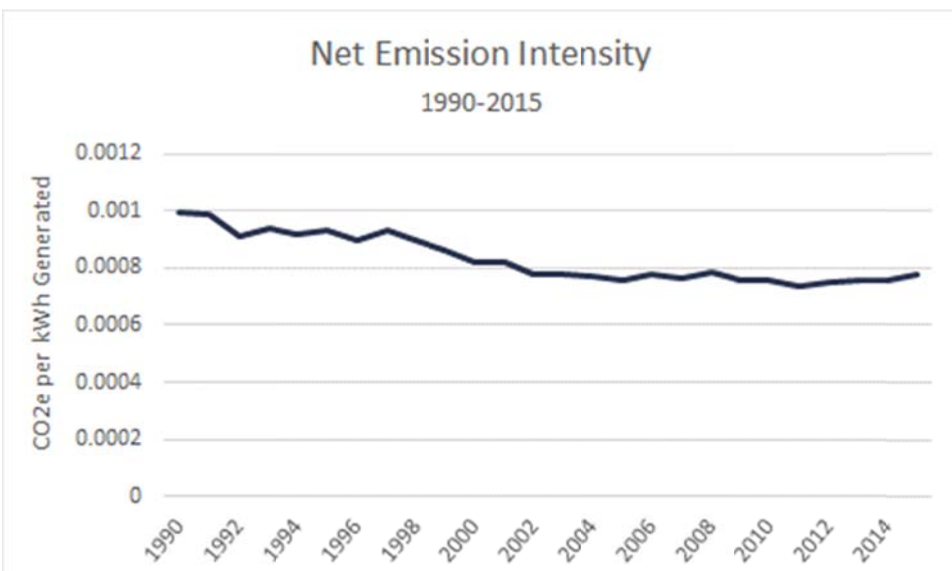
Remotes has increased its direct emissions from electricity generation for the past years. This is due to increases in the electricity demand. Therefore, Remotes’ focus is to reduce its net emission intensity. The net emission intensity for the years is shown in Figure 2-10.

Figure 2-10: Net Emission Intensity from Generators 2012-2015



The net emission intensity has trended upward for the past few years and is above the target. This is due to less energy generated from renewable sources. As mentioned in Section 2.3.3.3, recent refurbishments to the renewable generators are expected to improve their reliability and reduce the net emissions intensity; however, the wind turbine generators will be run to failure since they are not economical to replace. This may affect the net emission intensity.

Figure 2-11: Tonnes of CO2e Emitted per kWh Generated 1990-2015



The long-term trend depicted in Figure 2-11 indicates that significant improvements have been made, but continued innovation is needed to further reduce the net emission intensity.

#### 2.3.4.1.3 Effects on the DSP (5.2.3c)

Remotes has invested in renewable generation and offers the opportunity to purchase renewable electricity from its customers. Remotes is working with many local communities and their partners on high penetration renewable projects to help meet their electricity needs. Improvements in diesel generator technology will also improve the net emission intensity. As Remotes replaces older generators with newer ones through its replacement and upgrade programs and overhauls generators, it is expected that the net emission intensity will decrease.

### 2.3.4.2 Environmental Protection

Remotes works hard to reduce its overall environmental impact and takes environmental protection seriously. Metrics tracked under this category are high-priority to the First Nation communities served by Remotes. The motivation for tracking these metrics is based on legislative, consumer, and corporate drivers.

#### 2.3.4.2.1 Definition (5.2.3a)

The metrics tracked in this category are:

- Litres of fuel lost to the environment
- Number of spills
- Number of Category A spills

The *Ontario Environmental Protection Act* defines "spill" as, when used with reference to a pollutant, means a discharge

1. into the natural environment;
2. from or out of a structure, vehicle, or other container; and
3. that is abnormal in quality or quantity considering all the circumstances of the discharge.

The measure for the number of spills refers only to spills caused by Hydro One Inc. personnel (including Remotes' personnel).

A "Category A" spill is defined as a spill which causes or may cause one or more of the following adverse effects:

1. Widespread injury or damage to plant or animal life.
2. Harm or material discomfort to any person.
3. An adverse effect on the health of any person.
4. The impairment of the safety of any person.

Remotes' annual targets are not more than 100 litres of fuel lost to the environment, not more than six spills, and zero Category A spills.

#### 2.3.4.2.2 Historical Performance (5.2.3b)

Table 2-14 summarizes Remote's environmental protection performance over the historical period.

Table 2-14: Environmental Protection Measures – Historical Performance

| | Target | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|
| **Litres of fuel lost to the environment** | ≤100 | 0 | 10 | 20 | 0 |
| **Number of spills** | ≤6 | 2 | 4 | 8 | 0 |
| **Number of Category A spills** | 0 | 0 | 0 | 0 | 0 |

In 2015, there was an increase in the number of spills reported due to:

- Renewed commitment on self-reporting including small spills.
- Training and education of both staff and operators on proper reporting procedure.
- Increase in transportation work equipment ("**TWE**"), therefore more TWE spills.
- Increase in coolant/antifreeze spills related to equipment failures.

As of 2015, staff and contractors were trained to report all spills, no matter how small, including emissions or stains from a parked TWE and small spills within the diesel generating station, which Remotes staff previously just cleaned up.

#### 2.3.4.2.3 Effects on the DSP (5.2.3c)

Several projects and programs planned over the forecast period reduce the risk of spills or fuel lost to the environment. Several projects will replace bulk and day fuel tanks to bring them up to compliance and reduce the risk of a spill. Generator replacement, overhaul, and upgrade projects reduce the risk of fuel being lost of a spill occurring from the generator itself. On the distribution side, Distribution System Improvements replace distribution transformers showing signs of oil leak or significant deterioration.

## 2.3.5 Safety

Safety is very important to Remotes. In addition to including safety in its Corporate Mission and Corporate Values, Remotes tracks safety metrics on its scorecard.

### 2.3.5.1 Employee Safety

Remotes continuously strives for an injury-free workplace and measures employee safety in terms of lost-time injuries and recordable injuries.

#### 2.3.5.1.1 Definition (5.2.3a)

The Workplace Safety and Insurance Board defines a lost-time injury as "when a worker suffers a work-related injury/disease which results in being off work past the day of accident, loss of wages/earnings, or a permanent disability/impairment". Remotes strives for zero lost-time injuries.

The U.S. Department of Labor's Occupation Health and Safety Administration defines a recordable injury as one that results in "death, days away from work, restricted work or transfer to another job, medical treatment beyond first aid, or loss of consciousness" and may also include "a significant injury or illness diagnosed by a physician or other licensed health care professional" even if it does not meet the aforementioned criteria. Remotes strives for less than two recordable injuries per year.

### 2.3.5.1.2 Historical Performance (5.2.3b)

The number of lost-time injuries for the years 2013 through 2016 is shown in Table 2-15. In 2013, employees experienced two exertion injuries and one slip/trip/fall that required medical attention.

Table 2-15: Employee Safety over the Historical Period

| | Target | 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|
| **Number of lost-time injuries** | 0 | 0 | 0 | 0 | 0 |
| **Number of recordable injuries** | ≤2 | 3 | 1 | 1 | 0 |

### 2.3.5.1.3 Effects on the DSP (5.2.3c)

Safety is considered when planning any job; from the simplest repair to the most complicated capital construction. At a minimum, no project or program compromises safety. From a capital planning perspective, the proactive replacement of generation and distribution assets improves safety by reducing the probability of an incident due to an unplanned failure.

# 3 Asset Management Process (5.3)

Remotes' asset management process is the systematic approach used to plan and optimize ongoing capital and O&M expenditures on the isolated electrical systems it owns (i.e. generation and distribution assets). The purpose of this section is to provide the OEB and other stakeholders with an understanding of Remotes' asset management process, as well as direct links between the process and the expenditure decisions that comprise Remotes' capital investment plan.

## 3.1 Asset Management Process Overview (5.3.1)

This section presents Remotes' asset management objectives and the components of Remotes' asset management process.

### 3.1.1 Asset Management Objectives (5.3.1a)

Remotes applies established asset management principals in managing its assets. The management of Remotes' assets involves optimizing and sustaining the assets over their lifecycles and factors in performance, cost, and risk. The management of the assets is carried out consistent with Remotes' strategic direction.

Remotes' vision is to be the leading utility and a trusted partner to remote communities in Ontario's north. Its mission is to supply safe, reliable, and affordable electricity to remote communities by focusing on continuous improvement, operational excellence, and outstanding customer service.

Remotes' strategic asset management objectives are divided into four categories of strategic business values: health and safety, stewardship, excellence, and innovation. The objectives are derived from the following corporate mission and vision statements. They are ranked as follows:

**1. Health and Safety**

- Ensure public and worker health and safety.

**2. Stewardship**

- Align development work with government policies, priorities, and directives.
- Ensure safe, reliable and efficient operation of the Remotes' system.
- Ensure long-term sustainability of existing assets and equipment; system reliability and security; and customer satisfaction and environmental integrity.
- Meet all applicable regulatory, legal and industry requirements.
- Enable and facilitate efficient connection of customers and maximize connection of renewable resources.
- Facilitate and enable the effective transformation and re-configuration of Remotes' system into a modern, intelligent, and customer-centric system.
- Ensure compliance in meeting potential new environmental air emission requirements.
- Manage existing assets consistent with Remotes' environmental management system and with a strong focus on energy efficiency.

- Keep informed and identify potential integration options into the grid, and assess if there is a strong business case.
- Maximize/optimize useful asset life for overall cost-benefit by balancing competing requirements for operating performance, costs, and risks.
- Keep informed of Smart Grid advancement for appropriate application at the Remotes' distribution system.
- Level and prioritize sustainment work scope and volumes for greater effectiveness and flexibility within applicable resource constraints (e.g., financial, staff).
- Develop the Remotes' system with a strong focus on energy efficiency, environmental awareness, and meeting potential new environmental air emission requirements.
- Maintain an appropriate balance and flexibility between sustainment and development work.
- Discuss and collaborate with affected First Nations and Métis communities on development.
- Discuss and collaborate with affected public and stakeholders on related Remotes development.
- If directed by the government; manage existing third party remote community energy systems.

**3. Excellence**

- Develop, retain, and have available a skilled, trained, productive, and flexible workforce for sustainment work, development work, and operating work.
- Focus on properly-planned and preventive work which emphasizes excellence and safety in achieving results, while eliminating 'firefighting' and corrective maintenance.
- Ensure the effective development of modern, reliable, cost- effective, safe, efficient and flexible systems which are customer-oriented and meets customers' needs.
- Develop and operate the Remotes' system and manage existing assets, using quality information, including databases, information systems and processes.

**4. Innovation**

- Leverage innovative and practical technologies, processes and standards in the development and operation of Remotes' system, and to improve asset and system performance, operations, and maintenance.
- Leverage effective and innovative ways and means to meet the needs of customers, including customer choice and the enablement of value services to the customers.
- Demonstrate leadership in Remotes' system technology advancement.

### 3.1.2 Components of the Asset Management Process (5.3.1b)

Figure 3-1 depicts Remotes' asset management process for diesel generators, including the role of the Asset Condition Assessment ("**ACA**"). Diesel generators are maintained as per manufacturer-published recommendations, including complete overhauls after specified hours. After two (2) overhauls, a diesel generator is typically replaced as the lifecycle has then been extended twice, parts can become obsolete and to improve fuel efficiency. Some units may be identified for earlier replacement subject to specific issues discovered during its lifecycle. Replacement may be advanced or lengthened accordingly. The engine replacement program also includes work related to auxiliaries and sometimes station transformers and breakers. Auxiliary work is evaluated on a case-by-case basis given the site, the existing equipment in service and the proposed replacement. In the past, strong community load growth has triggered frequent station upgrades which involve replacing diesel generators prior to them reaching their full life term.

Figure 3-1: Remotes' Asset Management Process for Diesel Generators

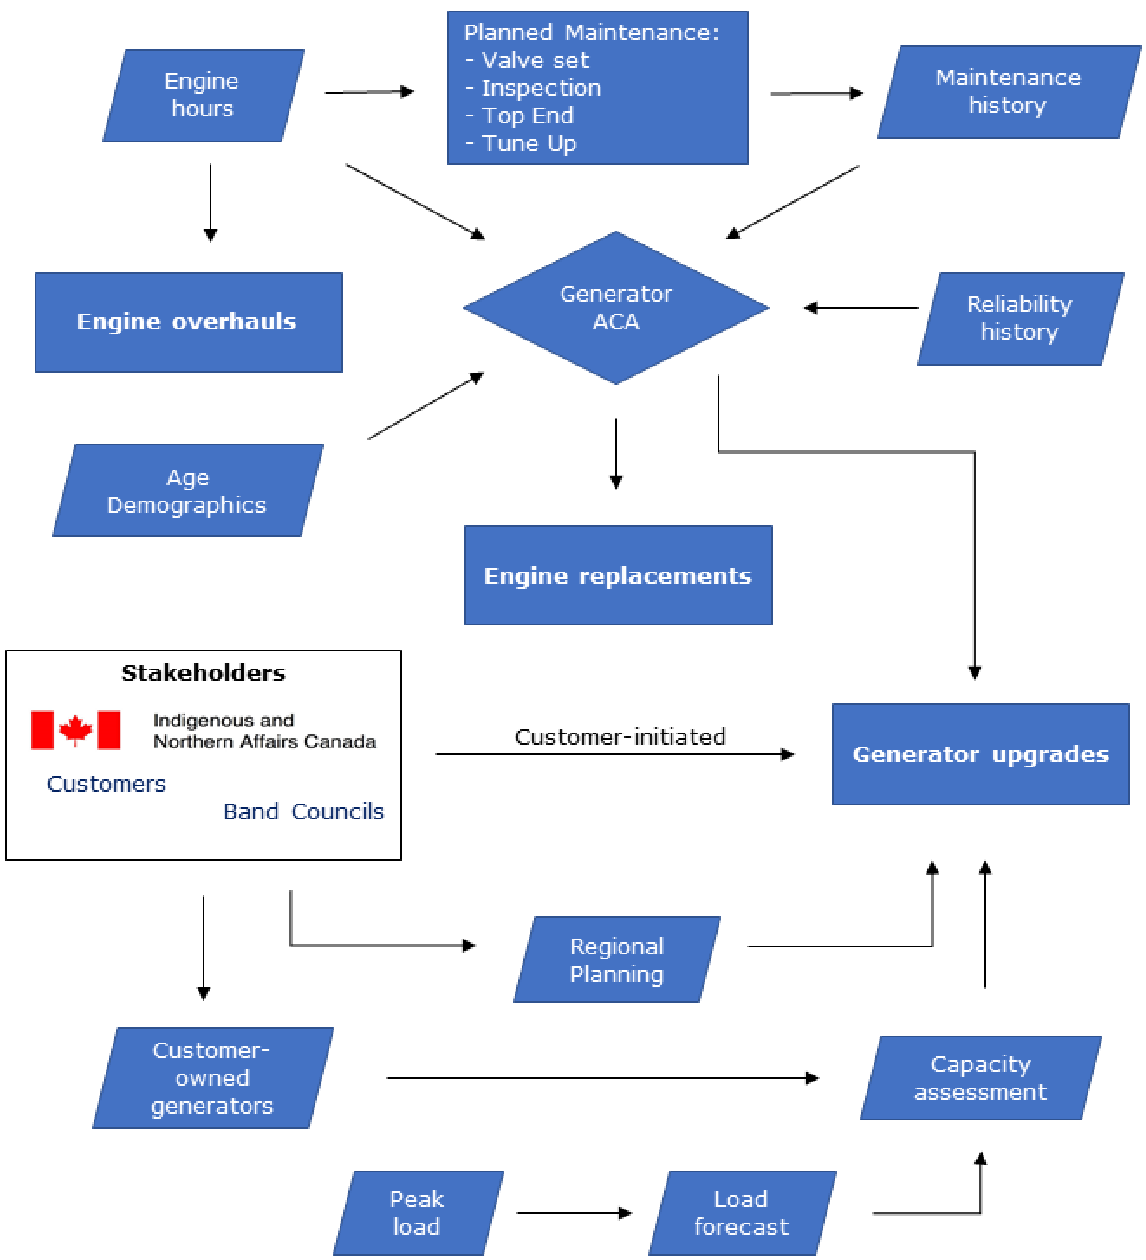


Figure 3-2 and Figure 3-3 depict Remotes' asset management process for its hydroelectric generators and wind turbines, respectively. Both types of generators undergo maintenance every six months. Capital work for hydroelectric generators, including replacement or refurbishment, is planned based on the ACA. The wind turbines owned by Remotes are run to failure.

Figure 3-2: Remotes' Asset Management Process for Hydroelectric Generators

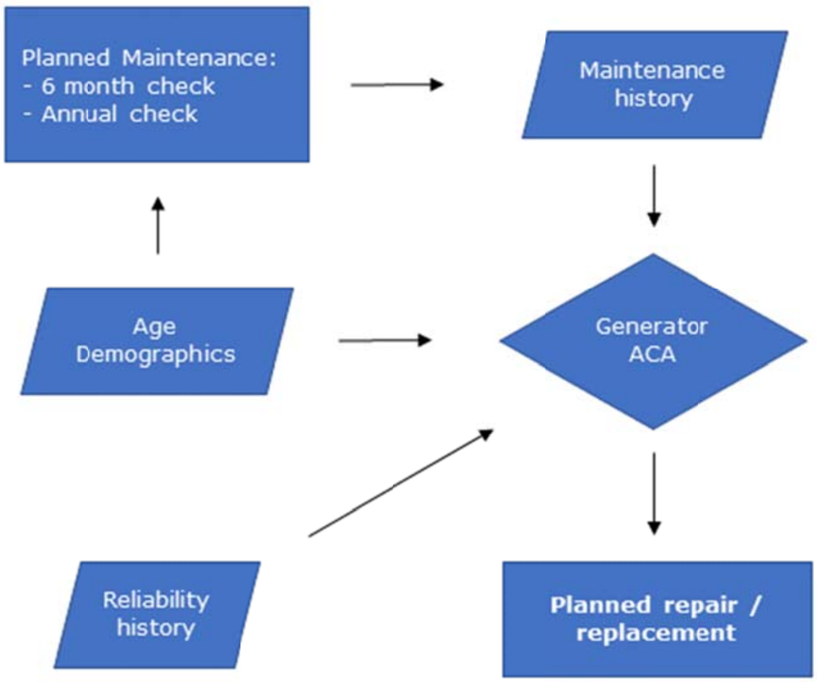

Figure 3-3: Remotes' Asset Management Process for Wind Turbines

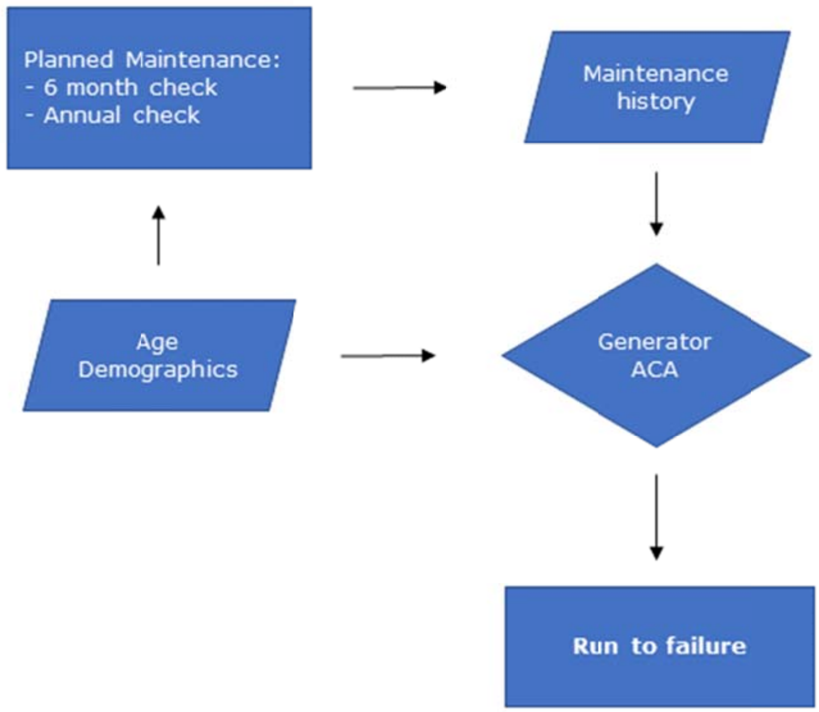
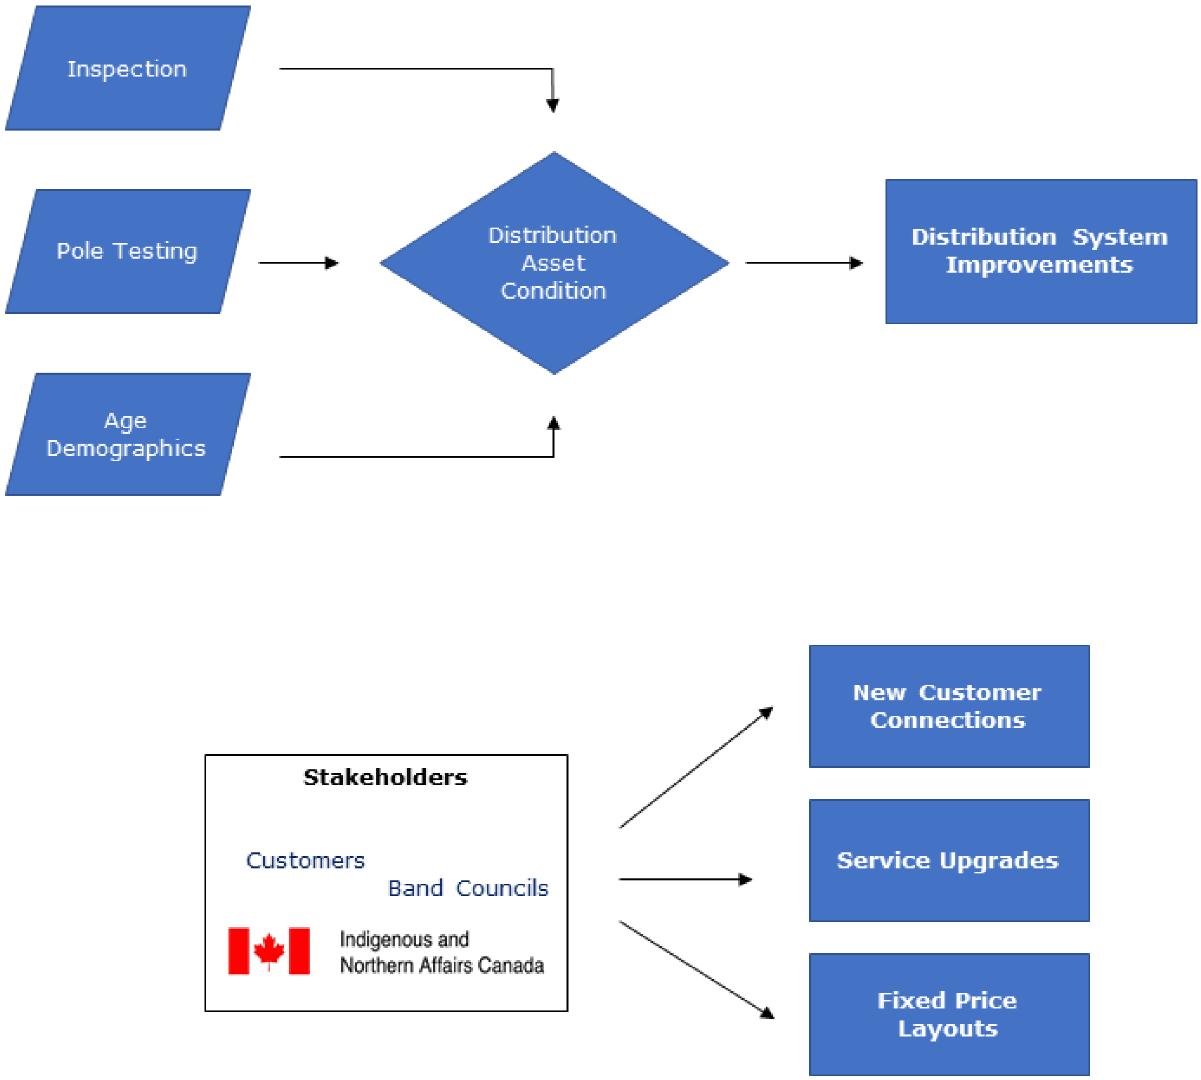


On the distribution side, a community is selected for a betterment project each year based on asset condition, demographics and inspection results. This includes work such as pole replacements, conductor restringing, and pole re-alignment. New customer connections, service upgrades, and fixed price layouts are planned based on customer input. Figure 3-4 depicts Remotes' distribution asset management process.

Figure 3-4: Remotes' Distribution Asset Management Process



## 3.2 Overview of Assets Managed (5.3.2)

This section presents a description of Remotes' service area, a summary of the system configuration, demographic and condition information for major distribution and generation assets, and the system utilization relative to planning criteria.

### 3.2.1 Description of the Service Area (5.3.2a)

Remotes' distribution system serves 21 remote communities, each with specific needs. Nineteen of these sites have stand-alone generation systems. These communities are comparatively small and most do not have year-round road access. As a predominantly isolated and remote distribution system, Remotes serves very few customers spread over a large area.

Remotes' service territory is vulnerable to weather extremes owing to its geographical location in northern Ontario. The ability of staff to respond and repair facilities can be hampered by severe weather, especially with respect to cancelled or delayed flights or a plane's inability to land including when a flight has been attempted. These factors directly impact the reliability of the system.

Owing to Remotes predominantly overhead line distribution system, vegetation management is an important factor in managing reliability impacts and associated costs which may result from tree encroachment and contact with the overhead lines. Regular and routine vegetation management-related maintenance needs to be carried out in a dispersed service territory exposed to tree-related reliability impacts. Based on Remotes' historical performance (see Section 2.3.1.3.3), its vegetation management program has been effective at reducing the number of tree contact outages.

Economic growth in the communities has historically been and is expected to continue to be low. As shown in Table 1-3, a slight growth in the numbers of customers has been forecast in most communities. As customers plug in more devices, electricity usage is becoming more intensive. Table 4-10 presents the resultant peak load forecast for each community based on these factors.

### 3.2.2 Summary of System Configuration (5.3.2b)

#### 3.2.2.1 Distribution

Since the communities serviced by Remotes are far apart and isolated, the distribution systems are separate and independent. The distribution voltage for these distribution systems ranges from 4.16 kV to 27.6 kV. There are approximately 242 kilometres of distribution lines which deliver the electricity to the 21 communities through 19 isolated distribution systems. Each distribution system consists of just one feeder. Table 3-1 summarizes the distribution system configuration.

Table 3-1: Summary of Remotes' Distribution System Configurations

| | |
|---|---|
| Number of 27.6 kV systems | 15 |
| Number of 4.16 kV systems | 4 |
| Total number of distribution systems | 19 |
| Circuit km – 27.6 kV | 220 |
| Circuit km – 4.16 kV | 22 |
| Total km of distribution lines | 242 |

The number of circuit kilometres in the communities anticipated to be added to Remotes' service area over the plan period cannot be readily estimated at this time.

#### 3.2.2.2 Generation

Remotes owns 64 generators, of which 57 run on diesel fuel. They are rated between 60 kW to 1500 kW. Each station houses between two and four diesel generators. Most of the stations have three generators, sized to meet the loads at different times of the day. The generators are automated to run to maximize fuel efficiency by matching generator size to the electricity load of the community. Remotes handles over 17 million litres of diesel fuel each year, depending on the electrical demand of the communities.

Three hydroelectric generators and four wind turbines comprise the remaining generation. The capacities hydroelectric generators range from 150 to 225 kW, while the capacities of the wind turbines range from 10 to 60 kW.

Table 3-2 shows a complete list of Remotes' generators and GSUs by community.

Table 3-2: Generator and GSU Capacity

| Community | Generation Unit | Generator Capacity (kW) | Engine Speed (rpm) | GSU Size (kVA) |
|---|---|---|---|---|
| Armstrong | A | 725 | 1800 | 3 x 333 |

| Total Wind Generation Capacity | | 90 | | |
| **Total Capacity** | | **31,650** | | **22,746** |

In addition, there are three generators in Wunnumin Lake, which Remotes is anticipating it will manage once this community is added to its service area.

### 3.2.3 Asset Demographics and Condition Information (5.3.2c)

The main categories of assets managed by Remotes are:

- Generators
- GSUs
- Poles
- Distribution Transformers

Table 3-3 shows Remotes' current asset count.

Table 3-3: Asset Counts for Major In-service Generation and Distribution Assets

| Generators | GSUs | Poles | Distribution Transformers |
|---|---|---|---|
| 64 | 47 | 4662 | 1138 |

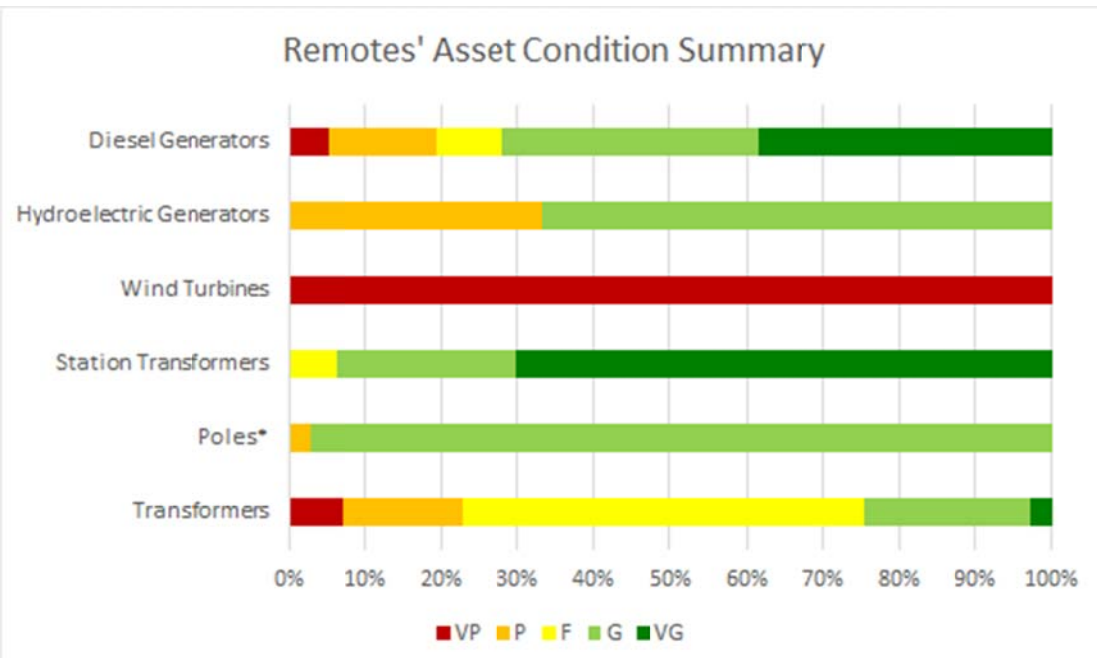
Asset Condition Assessment ("**ACA**") results are based on a consistent approach with the objective of applying a clear and unambiguous interpretation across the asset classes. Assets are divided into five, categories from Very Good to Very Poor based on the definitions in Table 3-4.

Table 3-4: Definition of Asset Conditions

| Condition | Description | Requirements |
|---|---|---|
| Very Good ("**VG**") | Some aging or minor deterioration of a limited number of components | Normal maintenance |
| Good ("**G**") | Significant deterioration of some components | Normal maintenance |
| Fair ("**F**") | Widespread significant deterioration or serious deterioration of specific components | Perform risk assessment; manage risk; consider replacement or refurbishment in five to ten years |
| Poor ("**P**") | Widespread serious deterioration | Plan for replacement or refurbishment within the next five years |
| Very Poor ("**VP**") | Extensive serious deterioration | Plan for immediate replacement or refurbishment |

Figure 3-5 summarizes the condition of Remotes' assets, as compiled on January 2, 2017. Note that poles have only have three condition categories: VP, P, and G.

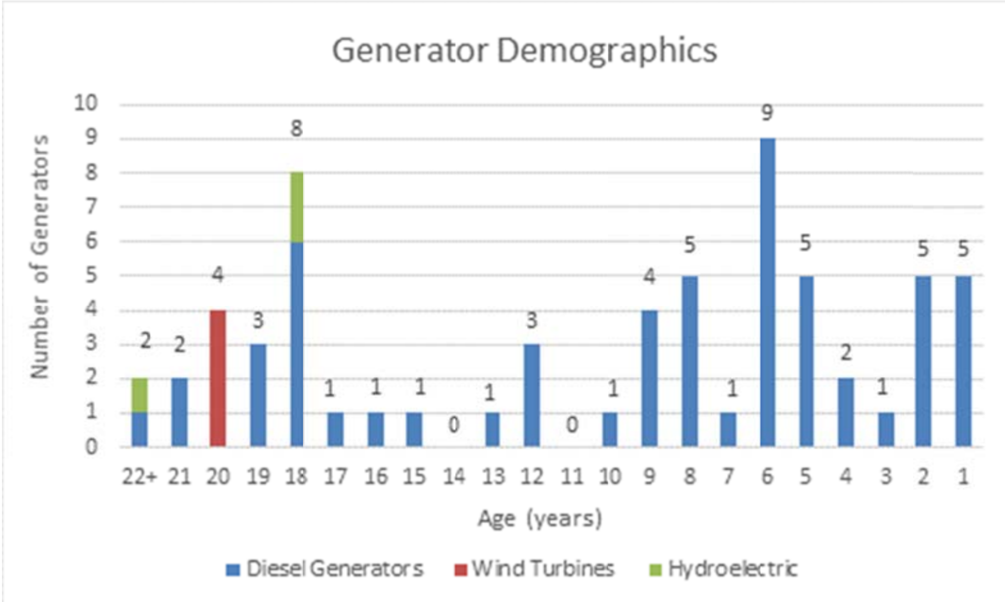
Figure 3-5: Summary of Remotes' Asset Condition Assessment



## 3.2.3.1 Generators

Remotes owns 64 generators, of which 57 run on diesel fuel. The remainder are three hydroelectric generators and four wind turbines. The age demographics for these generators are shown in Figure 3-6.

Figure 3-6: Age Demographics for Generators



The results of the ACA on Remotes' generators – based on engine-hours and operating experience – are summarized in Table 3-5. Table 3-6 presents the detailed in-service year, engine-hours, and condition of each unit. The condition scores of the wind turbines are driven by their ages, but these units are not economical to replace proactively and are run to failure. The conditions of the hydroelectric generators are based on inspections. The poor condition hydroelectric generator in Sultan is being repaired.

Table 3-5: Summary of the ACA for Generators

| | VP | P | F | G | VG |
|---|---|---|---|---|---|
| Diesel Generators | 3 | 8 | 5 | 19 | 22 |
| Hydroelectric | 0 | 1 | 0 | 2 | 0 |
| Wind | 4 | 0 | 0 | 0 | 0 |

Table 3-6: Generator In-service Year, Engine-hours, and Condition

| Community | Generation Unit | In-service Year | Engine-hours | Condition |
|---|---|---|---|---|
| Armstrong | A | 2015 | 7,297 | VG |
| | B | 2011 | 17,014 | G |

**temporary unit*

Three of the diesel generators are in Very Poor condition: Big Trout Lake A, Hillsport B, and Marten Falls B. Marten Falls was last overhauled in February 2016 and its replacement is planned for when it reaches 80,000 engine-hours. Remotes is planning to procure a new generator for Big Trout Lake A in 2018 and to replace the unit in 2019. Hillsport B was last overhauled in 2016.

Eight of the diesel generators are in Poor condition: Bearskin Lake A, Big Trout Lake B, Deer Lake C, Hillsport A, Kasabonika A, Marten Falls A, Sultan A, and Sultan B. Bearskin Lake A was last overhauled in 2013. Remotes is planning to replace Big Trout Lake B in 2020. Deer Lake C is scheduled for replacement in 2021 and 2022. Hillsport and Sultan are both small communities that have temporary units that can be moved among the sites to manage the impact of an unplanned failure. A new generator to replace Kasabonika A will be procured in 2022. A new generator Marten Falls A has been procured and its replacement timing is under consideration.

Remotes also projects the number of engine-hours for each of its diesel generators for each year of the forecast period. Table 3-7 presents the year-end forecast for the years 2017 to 2022. A unit is highlighted in red on the year it exceeds the number of manufacturer-recommended engine-hours. Exceeding manufacturer-recommended hours increases the probability of a failure of the unit.

Table 3-7: Forecast Engine-hours for Diesel Generators

| Community | Generation Unit | Forecast Engine-hours | | | | | |
|---|---|---|---|---|---|---|---|
| | | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 |
| Armstrong | A | 12,142 | 16,961 | 21,781 | 26,601 | 31,421 | 36,240 |

| Weagamow | A | 11,896 | 13,992 | 16,088 | 18,185 | 20,281 | 22,377 |
| | B | 5,515 | 7,958 | 10,401 | 12,844 | 15,286 | 17,729 |
| | C | 16,767 | 18,615 | 20,462 | 22,309 | 24,156 | 26,004 |

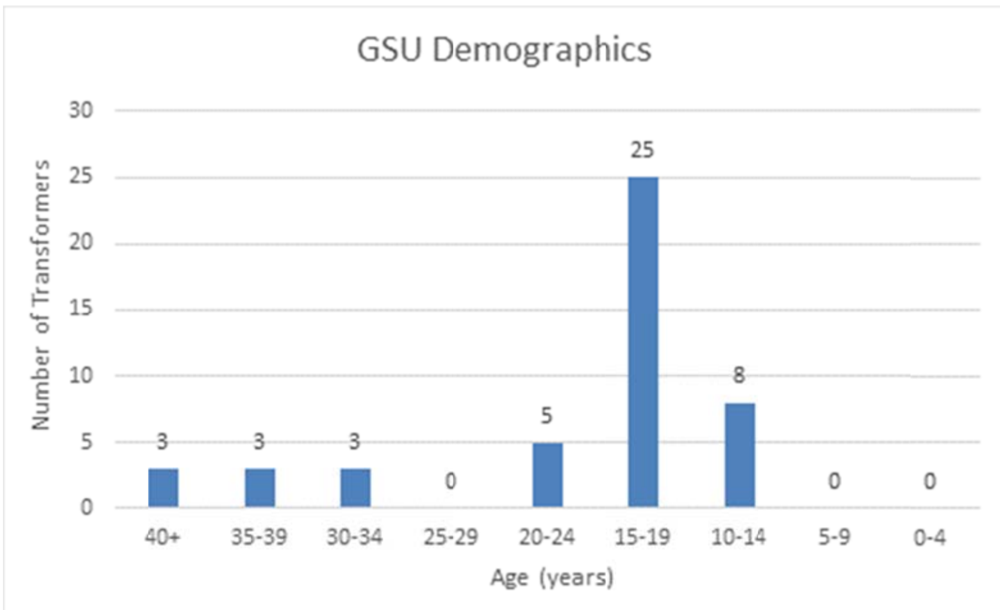
| | | | | | | | |
|---|---|---|---|---|---|---|---|
| Webequie | G1 | 15,975 | 18,187 | 20,398 | 22,610 | 24,821 | 27,033 |
| | G2 | 34,462 | 39,786 | 45,111 | 50,436 | 55,761 | 61,085 |
| | G3 | 7,574 | 8,709 | 9,843 | 10,978 | 12,113 | 13,248 |

Many of these generators are already being managed based on the ACA results. In addition, a new generator for Biscotasing B will be procured in 2022, and a new generator for Gull Bay B will be procured and installed in 2021.

#### 3.2.3.2 Generator Step-up Transformers

The age demographics for the in-service GSUs owned by Remotes are shown in Figure 3-7.

Figure 3-7: Age Demographics for GSUs



The ACA results of the in-service GSUs, determined using age-based health indices, are shown in Table 3-8.

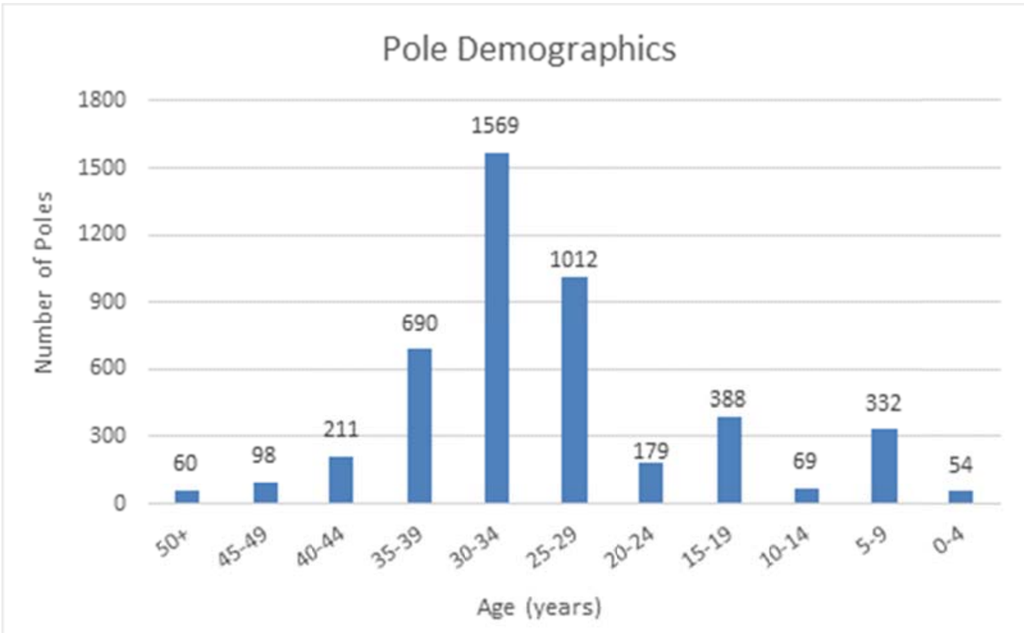
Table 3-8: Summary of the ACA for GSUs

| VP | P | F | G | VG |
|---|---|---|---|---|
| 0 | 0 | 3 | 11 | 33 |

### 3.2.3.3 Poles

Remotes owns 4,662 poles, a large portion of which are between 25 and 35 years old. The average pole age on the system is 28 years. Figure 3-8 presents the pole age demographics.

Figure 3-8: Age Demographics for Poles



Remotes' ACA for poles considers three categories:

- Very Poor – emergency replacement
- Poor – replace within five years
- Good – no replacement over next five years

An inspection was done on 3,977 of Remotes' wood poles in 2016 in every community. The inspections did not include the line from Armstrong to Collins, which is too expensive to patrol. The community of Collins does not have road or plane access and must be reached by train. The poles on this line are, therefore, replaced only on emergency response. The inspection included the following:

1. A hammer test is performed on each pole and values recorded as follows:
    a. OK (no action required)
    b. Hollow
2. A prodding test for surface rot or deterioration is performed on each pole and values recorded as follows:
    a. Light
    b. Medium
    c. Severe
3. A visual (condition) test is performed and values rated follows:
    a. Like New

b. Good
c. Fair
d. Poor
e. Very Poor

Other visual defects, for example woodpecker damage, are assessed as part of the inspection.

Table 3-9 summarizes the results of the ACA for poles. Over the next five years, Remotes is planning to replace 115 poles identified to be in poor condition. Additional pole replacements are typically required to maintain clearances.

Table 3-9: Summary of the ACA for Poles

| Emergency | Replace Within 5 Years | No Replacement Within 5 Years |
|---|---|---|
| 0 | 115 | 3,871 |

Based on the age demographics, a significant number of poles will be approaching end-of-life around the year 2040. Actual end-of-life assessment will be made based on condition. Remotes has kept this in mind for its long-term planning, but does not warrant any additional investment over the short term.

### 3.2.3.4 Distribution Transformers

Remotes currently owns about 1,138 distribution transformers. Figure 3-9 shows the age demographics for Remotes' distribution transformers and Table 3-10 presents the condition summary based on the age demographics.

Figure 3-9: Age Demographics for Distribution Transformers

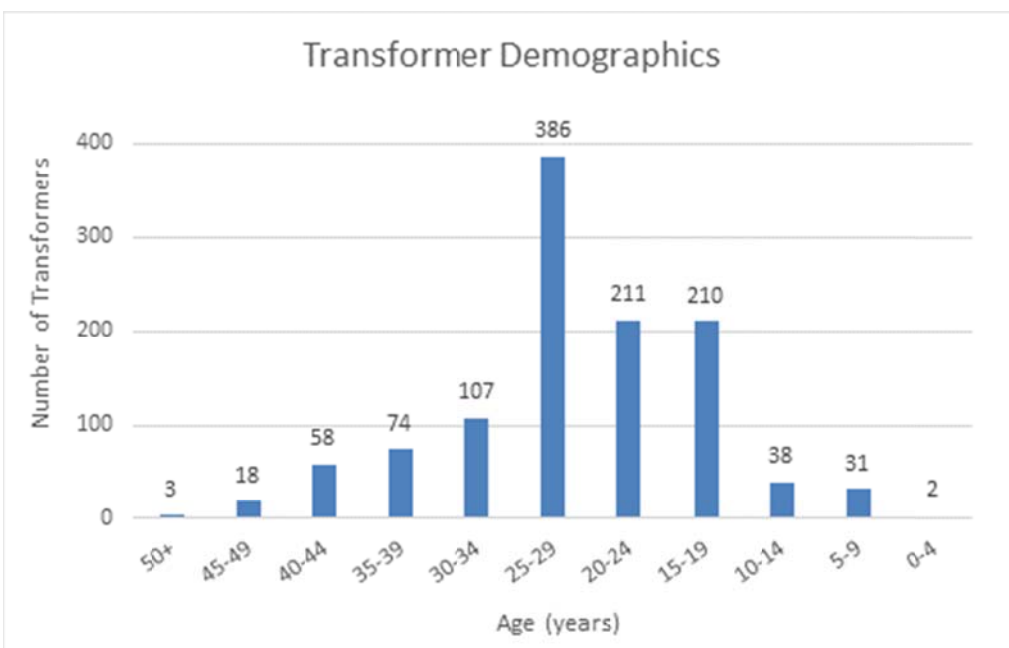


Table 3-10: Summary of the ACA Results for Distribution Transformers

| VP | P | F | G | VG |
|---|---|---|---|---|
| 79 | 181 | 597 | 248 | 33 |

## 3.2.4 System Utilization (5.3.2d)

As specific communities expand, Remotes' equipment is electrically loaded and stressed to higher levels. When loading and stresses exceed the equipment design capability and nameplate ratings, the equipment must be replaced with higher capacity equipment to ensure safety and reliability of supply. Table 3-11 illustrates the peak load in each community over the past four years, along with the community's station capacity and the connection limit (85% of the station capacity).

Table 3-11: Peak Load and Station Rating by Community

| Community | Station Rating | Connection Limit | Peak Load (kW) 2013 | 2014 | 2015 | 2016 |
|---|---|---|---|---|---|---|
| **Armstrong** | 1450 | 1233 | 1021 | 1035 | 974 | 980 |
| **Bearskin Lake** | 1000 | 850 | 609 | 594 | 589 | 640 |
| **Big Trout Lake** | 1600 | 1360 | 1322 | 1395 | 1260 | 1277 |
| **Biscotasing** | 156 | N/A* | 145 | 170 | 166 | 146 |
| **Deer Lake** | 1795 | 1526 | 1357 | 1230 | 1220 | 1230 |
| **Fort Severn** | 1000 | 850 | 574 | 554 | 650 | 589 |
| **Gull Bay** | 430 | 366 | 334 | 316 | 288 | 325 |
| **Hillsport** | 125 | N/A* | 81 | 82 | 91 | 94 |
| **Kasabonika Lake** | 1600 | 1360 | 990 | 972 | 1106 | 1018 |
| **Kingfisher Lake** | 650 | 553 | 623 | 649 | 605 | 614 |
| **Lansdowne House** | 875 | 744 | 499 | 577 | 535 | 451 |
| **Marten Falls** | 650 | 553 | 489 | 493 | 494 | 475 |
| **Oba** | 120 | N/A* | 79 | 76 | 69 | 64 |
| **Sachigo Lake** | 1000 | 850 | 718 | 672 | 701 | 677 |
| **Sandy Lake** | 3050 | 2593 | 2576 | 2515 | 2370 | 2528 |
| **Sultan** | 150 | N/A* | 186 | 167 | 154 | 120 |
| **Wapekeka** | 865 | 735 | 643 | 628 | 621 | 595 |
| **Weagamow** | 1300 | 1105 | 1096 | 1025 | 966 | 979 |
| **Webequie** | 1000 | 850 | 625 | 615 | 647 | 633 |

**no load growth*

In communities where there is no load growth, the connection limit is not relevant planning criteria. These communities have a high number of seasonal customers and the peak loads often occur on holiday weekends.

Remotes existing feeder conductors have ample capacity for the loads in the communities. Most communities are served by 25 kV feeders with the remainder of smaller communities served by 4.16 kV systems. Given the small load sizes (below 3MW), the feeder conductors can carry loads several times larger than the current community peak load.

The generation station transformers are sized appropriately for the diesel generation station maximum load. Accordingly, the transformers are changed as part of the generation station upgrade process. The funding for the First Nation communities' generation station upgrades, which includes the replacement of the station transformers, is provided by the Federal government.

## 3.3 Asset Lifecycle Optimization and Risk Management (5.3.3)

This section presents Remotes' asset lifecycle optimization and risk management policies and practices.

### 3.3.1 Asset Lifecycle Optimization Policies and Practices (5.3.3a)

Remotes' assets are managed based on a lifecycle management approach, which considers and balances asset performance, costs and associated risks during the asset service life to achieve asset optimization. Remotes investigated the relationship between capital spending and system O&M costs. Regardless of the capital spending, generator maintenance is required every 2,500 engine-hours. Due to the associated flight and fuel costs of this maintenance, there is no reduction to system O&M costs from capital investment.

#### 3.3.1.1 Asset Replacement and Refurbishment Policies

Replacements and refurbishments of distribution assets include planned improvements and component replacements required to maintain the operation of distribution lines and associated equipment. They consist mainly of betterment projects and system upgrades, based on the asset age demographics and inspection results on asset condition in the community. The betterments include pole replacements, conductor restringing, and pole re-alignments.

Diesel generators are maintained as per manufacturer-published recommendations including complete overhauls after specified hours. The decision to replace or refurbish a generator is based on economics. Medium-speed (1800 rpm) units are rebuilt after 20,000 engine-hours, while low-speed (1200 rpm) units are overhauled between 32,000 and 40,000 engine-hours. After two overhauls, it is no longer economical to refurbish the generator as the life has been extended twice, parts may be obsolete and to improve fuel efficiency. Therefore, medium-speed generators are replaced after 60,000 engine-hours and low-speed generators are replaced between 96,000 and 120,000 engine-hours. Some units may be identified for earlier replacement subject to specific issues and asset condition discovered during its lifecycle. Replacement may be advanced or lengthened accordingly. A diesel generator replacement includes replacement of the auxiliary equipment and, often, replacement of the GSUs and breakers based on an assessment of their age, condition, and available capacity.

#### 3.3.1.2 Maintenance Policies, Planning Criteria and Assumptions

Remotes' maintenance programs are defined for each asset listed below. In addition to the asset-specific programs, Remotes performs routine maintenance and inspections of various aspects and elements of the generating station.

**Engines and Generators**

Maintenance of engines and generators can be divided into planned and unplanned maintenance.

Planned maintenance of diesel generating units prevents premature equipment and system failures and contributes to service reliability. It includes all work performed on the diesel engine and associated generator in accordance with standard maintenance procedures as prescribed by the engine manufacturer. Intensive maintenance procedures are scheduled based on engine hours and vary from year to year. Inspections on engines are done every 5,000 hours.

Unplanned maintenance includes maintenance and repair of diesel generating units in response to trouble reports and equipment/component failures. This work is required to keep the station generating units available and operating to satisfy the rated station capacity required to meet community load. The program may identify the need for repairs/component replacement that would not be accomplished in the planned maintenance program.

**Tank Farms**

Planned maintenance of tank farms and associated equipment includes regular inspections of all bulk fuel storage tanks, transfer pumps, control circuitry, piping and valves in the tank farm and the fuel delivery kiosk. This work helps prevent premature failures and ensures the tank farm remains in working condition throughout its entire asset life. Tank farm inspections occur at all 19 stations. A review of outstanding fuel compliance audit findings is carried out to develop a long-term action plan. Corrective actions will be undertaken on a planned basis to address significant tank and fuel system defects as identified.

Unplanned maintenance of tank farms is a response to tank farm and fuel system problems and includes repair work required to keep the generating station fuel offload, bulk storage tanks and fuel transfer equipment in standard operating condition.

Remotes audits its fuel storage, fuel systems, fuel handling and record keeping in each community for compliance with federal and provincial regulations on a four-year cycle. Regulations related to fuel systems, storage and handling and record keeping are reviewed regularly and changes are incorporated into compliance reviews/audits. The reviews encompass the entirety of the fuel systems and identify opportunities for improvement, required testing or minor modifications, and areas of non-conformance. The audits look for items such as training, pipe corrosion, protection of pipes from vehicles, fire safety, and supports for above-ground tanks. When areas of non-compliance are noted, capital improvements to meet regulatory standards are scheduled based on condition of the assets and severity of the defect. In 2016, Remotes invited representatives of the provincial regulatory authority, the Technical Standards and Safety Authority, to participate in these compliance review/audits to improve the quality of the audit process and to improve its understanding of the regulatory requirements.

**Facilities**

Maintenance of facilities includes minor civil repair work required to maintain 19 generating station buildings, 14 staff houses, the Thunder Bay service center, fences, yards/sites which includes annual inspections and annual sampling of water facilities for all staff houses and generating stations. Planned maintenance of facilities ensures they may be used for projected asset life without the need for major refurbishments.

**REG Maintenance**

REG maintenance includes inspection and repair of equipment at REG facilities (water/wind powered) such as generating units and associated equipment. Maintenance is required to keep these stations and associated facilities in a standard operating condition. This program involves primarily planned inspection and maintenance of the hydro-electric stations located at Deer Lake and Sultan. The yearly maintenance involves hydraulic system maintenance, gear box maintenance, generator maintenance, switchgear and control maintenance, and turbine checks.

Unplanned maintenance may also be performed in response to issues identified during routine station operation. This can include, but is not limited to, the repairs and modifications of the water intake and outflow facilities, the generator units and auxiliary equipment, generator gears, communications equipment, and the station building/site.

**Auxiliary Systems**

Maintenance work on Generating Station auxiliary equipment is required to keep them in standard operating condition. The work is performed based on the results of diagnostic tests such as coolant sample analysis, along with normal cyclical maintenance, as part of an annual inspection or along with a major engine maintenance or overhaul procedure. Auxiliary equipment includes secondary heating, primary cooling, ventilation, overhead crane inspections, electrical, control and fire protection systems. Auxiliary systems maintenance includes, the main breaker cabinet, the station PLC, secondary heating, primary cooling, ventilation, pump controls, overhead crane inspections, station air compressors, DC batteries, station service electrical equipment and fire protection systems and all fuel system equipment and controls within the station.

**GSUs**

Remotes does not currently maintain its GSUs but is investigating which maintenance activities will be beneficial to manage the risk of these assets.

**Distribution Assets**

Maintenance on distribution assets is intended to ensure that the overall reliability of the distribution systems is maintained and improved, customer commitments are met, and all legislative and regulatory requirements are met. Data collected over past years identifies the required minor maintenance tasks in the communities.

Planned maintenance includes corrective and preventative line maintenance. The Distribution System Code requires that all local distribution companies patrol their distribution lines on a five-year cycle, to identify structural problems, damaged equipment and components that may cause a power interruption, as well as any hazards such as leaning poles, damaged equipment enclosures and vandalism. Preventative maintenance includes maintenance that is primarily cyclical in nature, including maintenance of equipment (load brake switches, electronic switches), as a means of reducing unplanned outages.

### 3.3.2 Asset Lifecycle Risk Management Policies and Practices (5.3.3b)

The assets that make up the two major asset categories for generation and distribution are grouped into 15 different asset classes. These asset classes are further allocated to one of three asset priority categories: Priority 1 (P1); Priority 2 (P2); and Priority 3 (P3). The priorities reflect the criticality of the asset class to the Remotes' system, and include consideration of factors such as: public safety and employee health & safety; the importance of the asset to the sustained operation and reliability of the Remotes' system; electricity security; new equipment procurement lead times; regulatory and environmental requirements; and economics.

P1 assets represent the highest priority assets and are of high value and high risk to the business, receiving proportionally more of the total sustainment program funds. P2 assets are next in priority and, although they include high-risk assets, these generally require comparatively moderate program funds. Finally, P3 assets are lowest in priority with low program funds and lower risk to the business.

The allocation of the 15 asset classes into the three asset priority categories is indicated in Table 3-12. Capital expenditures identified in this DSP are selected and prioritized per this priority.

Table 3-12: Prioritization of Assets

| | **P1: High Priority** | **P2: Moderate Priority** | **P3: Low Priority** |
|---|---|---|---|
| **Generation** | • Generation<br>• Station Transformers<br>• Fuel System & Fuel Inventory<br>• Land Assessment & Remediation | • Generation Circuit Breakers<br>• Protection & Control<br>• Oil Containment | • Generation Station Service (AC/DC) |
| **Distribution** | • Overhead Line Sections<br>• Wood Poles<br>• Distribution Transformers<br>• Right of Way Vegetation | • Switches & Fuses<br>• Distribution: Operating Transformer Spares | • Meters |

The continued performance of these assets is managed through capital investment and maintenance programs discussed in Section 3.3.1.2. Most communities have three diesel generators, rated for different capacities to optimize fuel efficiency. In case of a generator outage, the other generators can be used to mitigate the effects of the next contingency if a lengthy repair is required. Remotes keeps a spare transformer at each community to mitigate the impact of an outage. If a transformer fails, the community experiences a power interruption until the power can be switched to the spare – typically four hours.

# 4 Capital Expenditure Plan (5.4)

This section provides information on Remotes' capital investment program – derived from its asset management process – over the forecast period.

## 4.1 Summary (5.4.1)

### 4.1.1 Ability to Connect New Load (5.4.1a)

With population changes and more intensive use of electricity in remote communities, the overall number of new load connections for Remotes has increased. Due to the size of the communities served by Remotes, small changes in the electricity usage can have a large impact on the ability to connect new load.

Over the forecast period, capacity upgrades are planned in six of Remotes' diesel generation stations; Big Trout Lake, Deer Lake or Kasabonika, Fort Severn, Sandy Lake, Wapekeka and Weagamow. The peak load in these communities will surpass, or will be close to surpassing, 85% of the station rating in the next five years.

### 4.1.2 Capital Expenditures over the Forecast Period (5.4.1b)

Figure 4-1 depicts the net capital expenditures planned for each year of the forecast period. The investments are divided into system access, distribution system renewal, distribution system service, generation system renewal, generation system service, and general plant. There are planned expenditures in the system access category over the forecast period, but these projects and programs are 100% recoverable and, therefore, there is no forecast net spending. There are no planned expenditures that fall into the distribution system service category over the forecast period.

Figure 4-1: Net Capital Expenditure Forecast by Investment Category

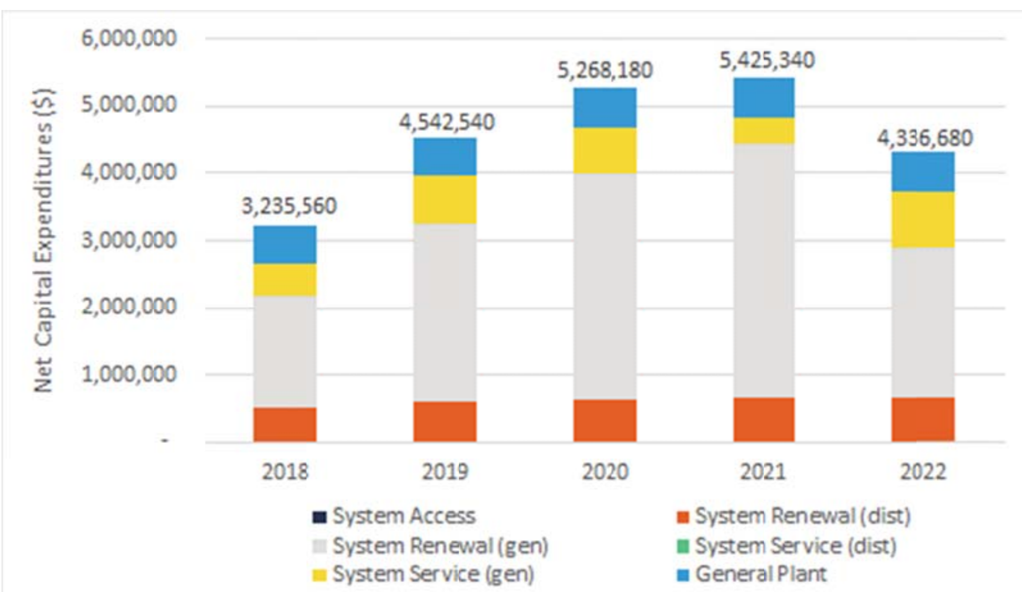

Table 4-1 presents the breakdown of capital expenditures on the distribution system, which includes system access and system renewal investments.

Table 4-1: Capital Expenditure Forecast by Investment Category - Distribution

| Investment Categories | Forecast ($) | | | | |
|---|---|---|---|---|---|
| | 2018 | 2019 | 2020 | 2021 | 2022 |
| **System Access (gross)** | 912,000 | 1,065,000 | 1,121,000 | 1,143,000 | 1,166,000 |
| Contributions & Removals | (912,000) | (1,065,000) | (1,121,000) | (1,143,000) | (1,166,000) |
| Net | 0 | 0 | 0 | 0 | 0 |

| **General Plant (gross)** | 565,000 | 572,000 | 581,000 | 590,000 | 598,000 |
| Contributions & Removals | 0 | 0 | 0 | 0 | 0 |
| Net | 565,000 | 572,000 | 581,000 | 590,000 | 598,000 |

## 4.1.3 D

The following information provides a brief outline of the outputs of the asset management and capital expenditure planning process that have affected capital expenditures in the four investment categories.

### 4.1.3.1

System access investments include service cancellations, fixed price layouts, new customer connections, and service upgrades, all of which are initiated by customers. Gross expenditures are forecast based on historical levels and the actual spending each year depends on the number and nature of the customer requests received. System access investments over the forecast period are all 100% recoverable from customers and, as such, Remotes has not forecast net expenditures in this category.

### 4.1.3.2

Investments in the system renewal category comprise 73% of the forecast period net capital expenditures. These investments are driven by assets reaching the end of their service life as determined by the ACA, and include meter replacements, damage claims and storm damage restoration, pole replacements, system upgrades, and betterments. For the generation assets, system renewal work includes engine replacements, engine overhauls, diesel plant civil improvements, and fuel tank replacements.

### 4.1.3.3

System service investments includes solely investments related to generation equipment, which account for approximately 14% of the net capital expenditures over the forecast period. This work, however, constitutes a large part of Remotes' gross capital cost – equivalent to about 52%. This discrepancy is attributable to the fact that bulk of the work that falls into this category entails customer-requested generation project work that is fully funded by INAC. Projects comprising this category for the forecast period include generation station upgrades in Big Trout Lake, Deer Lake or Kasabonika (to be reassessed close to 2022), Fort Severn, Sandy Lake, Wapekeka, and Weagamow. Other investments in this category include generation station SCADA and PLC replacements, with upgrades planned in Weagamow and Kingfisher in 2018.

#### 4.1.3.4

Investments in the general plant category account for approximately 12% of the net capital expenditures and include housing improvements and other civil projects based on the building assessment (see Appendix H: Hydro One Remotes Roof Assessment Report) and investments into minor fixed assets.

### 4.1.4 L

The budgeted costs of projects and programs above the materiality threshold ($283,000) are presented below for each investment category.

#### 4.1.4.1

The only material program under the category of system access is new customer connections & service upgrades. The planned gross cost for this project can be seen in the table below, but the costs are 100% recoverable.

Table 4-4: Material System Access Projects over the Forecast Period

| Project | 2018 | 2019 | 2020 | 2021 | 2022 |
|---|---|---|---|---|---|
| New Customer Connections & Service Upgrades | 658,000 | 768,000 | 809,000 | 824,000 | 840,000 |
| Contributions | (658,000) | (768,000) | (809,000) | (824,000) | (840,000) |
| Net | 0 | 0 | 0 | 0 | 0 |

The year-over-year increase in the forecasted expenditures is driven by potential expansion of the service territory.

#### 4.1.4.2 System Renewal

##### 4.1.4.2.1 Distribution

Distribution system improvements are the only material project on the distribution side in the system renewal category. The forecast expenditures are illustrated in Table 4-5.

Table 4-5: Material Distribution System Renewal Projects over the Forecast Period

| Project | 2018 | 2019 | 2020 | 2021 | 2022 |
|---|---|---|---|---|---|
| Distribution System Improvements | 636,000 | 743,000 | 783,000 | 797,000 | 813,000 |
| Contributions & Removals | (216,320) | (253,160) | (265,960) | (271,640) | (273,560) |
| Net | 419,680 | 489,840 | 517,040 | 525,360 | 539,440 |

This work varies year to year based on the size, nature, and volume of joint use activity and asset degradation. The yearly increase can be accounted for by the expansion of the service territory.

#### 4.1.4.2.2 Generation

Engine replacements and engine overhauls make up a substantial part of system renewal investments. The gross and net expenditures for replacements and overhauls are shown in Table 4-6.

Table 4-6: Engine Replacements and Overhauls over the Forecast Period

| Project | 2018 | 2019 | 2020 | 2021 | 2022 |
|---|---|---|---|---|---|
| Engine Replacements | - | - | - | 1,317,000 | 1,318,000 |
| Big Trout Lake A Replacement | 767,000 | 1,423,000 | - | - | - |
| Big Trout Lake B Replacement | - | - | 1,425,000 | - | - |
| Removals (10%) | (76,700) | (142,300) | (142,500) | (131,700) | (131,800) |
| Net | 690,300 | 1,280,700 | 1,282,500 | 1,185,300 | 1,186,200 |
| Engine Overhauls | 675,000 | 688,000 | 702,000 | 718,000 | 732,000 |
| Removals (10%) | (67,500) | (68,800) | (70,200) | (71,800) | (73,200) |
| Net | 607,500 | 619,200 | 631,800 | 646,200 | 658,800 |
| **Total (net)** | **1,297,800** | **1,899,900** | **1,914,300** | **1,831,500** | **1,845,000** |

Other material projects in this category include tank replacements and diesel plant civil improvements. The expenditures are shown in Table 4-7.

Table 4-7: Fuel Tank Replacements and Diesel Plant Civil Improvements

| Project | 2018 | 2019 | 2020 | 2021 | 2022 |
|---|---|---|---|---|---|
| Sultan Bulk Tank Farm | - | - | - | 274,000 | - |
| Armstrong Day Tank | - | - | 438,000 | - | - |
| Big Trout Bulk Tanks & Day Tanks | - | - | 657,000 | 1,317,000 | - |
| Oba Bulk Tank | - | 383,000 | - | - | - |
| Diesel Plant Civil Improvements | 346,000 | 353,000 | 360,000 | 368,000 | 376,000 |
| **Total** | **346,000** | **736,000** | **1,455,000** | **1,959,000** | **376,000** |

### 4.1.4.3 System Service

#### 4.1.4.3.1 Distribution

There are currently no planned projects on the distribution side of the system service category.

#### 4.1.4.3.2 Generation

Table 4-8 shows the forecast generation projects in the system service category that meet the materiality threshold. Most of them are generation station upgrades. In addition to capacity upgrades in Big Trout Lake and Wapekeka, an integration of controls for these two generation stations is planned. All the station upgrades are (100% recoverable from INAC. Other generation projects in the system service category include controls and SCADA upgrades at the generating stations.

Table 4-8: Material Generation System Service Projects over the Forecast Period

| Project | 2018 | 2019 | 2020 | 2021 | 2022 |
|---|---|---|---|---|---|
| Generator Upgrades | | | | | |
| Big Trout Lake - Wapekeka Upgrade & Connection | 2,149,000 | 3,252,000 | 1,364,000 | - | - |
| Deer Lake or Kasabonika | - | - | - | 1,364,000 | 4,962,000 |
| Fort Severn | - | - | 3,042,000 | 3,657,000 | - |
| Sandy Lake | 367,000 | 881,000 | 1,311,000 | - | - |
| Weagamow | 2,832,000 | 1,993,000 | - | - | - |
| Contributions | (5,348,000) | (6,126,000) | (5,717,000) | (5,021,000) | (4,962,000) |
| Net | 0 | 0 | 0 | 0 | 0 |
| Controls/SCADA Upgrades | | | | | |
| Sandy Lake & Biscotasing - Bulk Tank Platform & Controls | - | - | - | - | 495,000 |
| SCADA & PLC Replacements & High-Speed Internet | 505,000 | 726,000 | 675,000 | 391,000 | 353,000 |
| **Total (net)** | **505,000** | **726,000** | **675,000** | **391,000** | **848,000** |

### 4.1.4.4 General Plant

Table 4-9 lists the planned expenditures in the general plant category over the forecast period. Programs in this category include housing improvements, storage buildings, miscellaneous civil projects, and minor fixed assets. None of these programs exceed the materiality threshold.

Table 4-9: General Plant Spending over the Forecast Period

| | 2018 | 2019 | 2020 | 2021 | 2022 |
|---|---|---|---|---|---|
| General Plant | 565,000 | 572,000 | 581,000 | 590,000 | 598,000 |

### 4.1.5 Information pertaining to the Regional Planning Process (5.4.1e)

The 2014 draft Remote Community Connection Plan is a business case which informed a July 29, 2016, Order-in-Council from the Provincial Government. This order confirms the intention for the project to connect 16 remote communities to the transmission system. Nine of these communities are presently served by Remotes and at least two are expected to be served by Remotes in the future. While this will not affect investments in the communities over the five-year period of this DSP, it has affected the investments INAC makes in generation assets, and it is expected that the construction activities of this new transmission line will affect Remotes planning considerations over the medium-to-long term. The order from the Minister of Energy is included as Appendix C: Order-in-Council from the Minister of Energy.

Since the Remote Community Connection Plan is still in its draft form, the connection dates for the communities served by Remotes are not firmly established at this time. Furthermore, there is the possibility of retaining Remotes' diesel generation fleet for community electricity supply backup, as per the diesel backup study (see Section 2.2.1.3.4). Based on the need to continue to provide customers with a reliable supply of electricity in the near term and the possibility of retaining the generator fleet to serve as backup power supply, Remotes' generator replacement and overhaul programs have not been affected by the Regional Planning Process.

Regional electricity infrastructure requirements have been accounted for in Remotes' generator upgrade plan. In anticipation of the new transmission lines reaching the communities of Big Trout Lake (Kitchenuhmaykoosib Inninuwug) and Wapekeka, a new distribution line is being constructed as an integrated, cost-effective approach to increase the capacity of both communities, as well as improving the robustness of the electricity supply. The new distribution line will be required to connect the communities to the new transmission line. The peak load in Weagamow is forecast to reach the connection limit in 2019; therefore, Remotes intends to proceed with the generator upgrade in this community. The project plan accounts for the anticipated future connection of this community and tank storage upgrades have been foregone as a more near-term approach due to the long-term uncertainties. The peak load in Sandy Lake is forecast to reach the connection limit in 2018, so the generator upgrade project in Sandy Lake will also proceed.

### 4.1.6 Customer Engagement Activities (5.4.1f)

Remotes listens to its customers and, in First Nations communities, works closely with Band Councils to help them meet community electricity needs and preferences. Remotes regularly communicates and meets with their customers throughout the year. The focus of communication efforts is with First Nation communities that comprise approximately 90% of the customer base. Each community has a direct contact with Remotes. Communication takes place in many forms including email, phone, letter, conference call, or face-to-face meetings. Remotes' customers have asked for more face-to-face meetings, so Remotes has increased the frequency that it visits the communities and has started including its customer service staff in community meetings.

Funding arrangements with INAC also require Remotes to meet with INAC and local First Nations to plan capital projects. Since 2009, the Director of Remotes has had specific performance targets to meet face-to–face at least eight times per year with First Nation Band Councils or Tribal Councils to discuss areas of mutual concerns and to maintain open lines of communication. Other staff also meet with First Nation Band Councils or Tribal Councils regularly to discuss topics such as:

**<u>All Communities – Normal Activities & Communication</u>**

- Connections, collections, work in community
- Customer renewables
- Insurance
- Snowplowing
- Gravel
- Planned housing
- Winter road tolls
- Equipment rental
- Temporary labour
- Charity and sponsorship
- Meter reading
- Operator contracts
- Disconnections
- Winter road conditions
- Third party staff house use
- Environmental - site
- Forestry line clearing
- Community emergencies/disruptions
- Public Safety
- Community energy overview, load, peak, assets
- Energy forecast and housing, community development

**<u>Communities Not Served by Remotes</u>**

- Our services, asset assessment and condition, transferring to Hydro One Networks Inc.
- Grid line development

**<u>Communities No Longer Served by Remotes</u>**

- Remediation

**<u>Collins/Namaygoosisagagun First Nation (Armstrong Area)</u>**

- Trouble response

**Whitesand First Nation (Armstrong Area)**

- First Nation biomass renewable project (including IESO and CIA package), technical and operational meetings
- Distribution expansion and ownership
- Reindeer rates
- Load growth and peak
- Emissions

**Bearskin**

- First Nation fuel purchase – winter road
- Generation upgrades
- Heat traces
- Remediation of old site (bio cell)
- Reliability
- Renewables
- Third party financing

**Big Trout/Kitchenuhmaykoosib Inninuwug**

- First Nation fuel purchase – winter road
- Connection restrictions
- Proposed line between Big Trout Lake and Wapekeka
- Long term payment plan
- Leaning poles
- Community sub-contractor concerns
- Fuel truck operations – kiosk spill
- Windmill production
- Urgent fuel needs
- Outage - lengthy
- University research project
- Loaned fuel
- Arena usage
- Fuel wagon delivery
- Forestry concerns, tree replanting

**Deer Lake**

- Generation upgrades
- School solar
- Shoulder Blade falls hydel production and operation
- Community restrictions
- Third party financing
- Long term payment plan
- Housing connections – urgent
- Conservation and demand management
- Funding support
- Long term operating agreement – Shoulder Blade
- Potential fuel farm

**Fort Severn**

- First Nation fuel purchase – winter road and barge
- Community solar project – large scale installation
- Renewable projects – roof mounted
- Letters of funding support
- Secondary heat – water treatment plant
- Fuel quality
- Generation upgrade
- Generation trouble response
- Load restrictions
- New school
- Wind turbine – old and proposed
- Old Hydro house – sale
- Renewable study support
- Conservation and demand management
- Site expansion

**Gull Bay**

- Consumption
- Solar – micro grid project (OPG)
- Hydroelectric discussion
- Emissions
- Rates
- Rate relief
- Land permits
- Future diesel upgrade

**Kasabonika**

- Generation upgrades
- Damage claim
- Connection restrictions
- Fibre
- Renewable research
- Petrokas tank farm upgrades
- Fuel contract award
- Gravel misuse
- Wind turbine production
- Christmas lights
- Petrokas operation and maintenance
- Noise complaint – wind
- New store

**Kingfisher**

- Generation upgrades
- Connection restrictions
- Site environmental
- Kingfisher preferred fuel suppliers

- Solar installation
- Yard expansion
- Surplus equipment sale
- Recycling oil

**Lansdowne**

- Generation upgrades
- Connection restrictions
- Community centre load impacts

**Marten Falls**

- Long term arrears
- Connection restrictions
- Outages
- Account set up
- Fuel sale – third party
- Winter road delivery and logistics

**Sachigo**

- First Nation fuel purchase – winter road
- Generation upgrades
- Flights to Sachigo
- First Nation pipe leak
- Third party financing letter
- First Nation tank farm design and operation
- Timing of collections trip

**Sandy Lake**

- First Nation fuel purchase – winter road
- Low fuel levels
- Financing letters of support
- First Nation tank farm upgrades and operations
- Duck River Hydroelectric development
- Old Hydro house
- Loaned fuel

**Wapekeka**

- Generation upgrades
- Connection restrictions
- Proposed line between Big Trout Lake and Wapekeka
- Technical diesel generation station study
- School fire and replacement
- Long term payment plan
- Fawn River Hydroelectric
- Wapekeka Solar
- Community fuel deliveries

**Weagamow/North Caribou First Nation**

- Generation upgrades
- Connections restrictions
- Proposed solar project
- Streetlight retrofit
- Conservation and demand management
- Temporary power agreement and operation
- Emergency response
- Site environmental
- Christmas lights
- Trailer extension
- House permit
- Certificate of Approval and Environmental Compliance Approval ownership
- Tank farm project
- Road development
- Site expansion

**Webequie**

- Remediation of old site
- Long term payments and arrears
- Public safety
- Solar connection
- Sale of old Hydro house
- Airport operations

**Other First Nation Partners (Tribal Councils)**

These partners include Matawa First Nations Management, Keewaytinook Okimakanak, Shibogama First Nations Council, Nishnawbe Aski Nation, Windigo First Nations Council, and Independent First Nations Alliance.

- Project or issues supporting specific communities above.

### 4.1.7 System Development over the Forecast Period (5.4.1g)

System development over the forecast period is presented with respect to load and customer growth, smart grid, and REG accommodation.

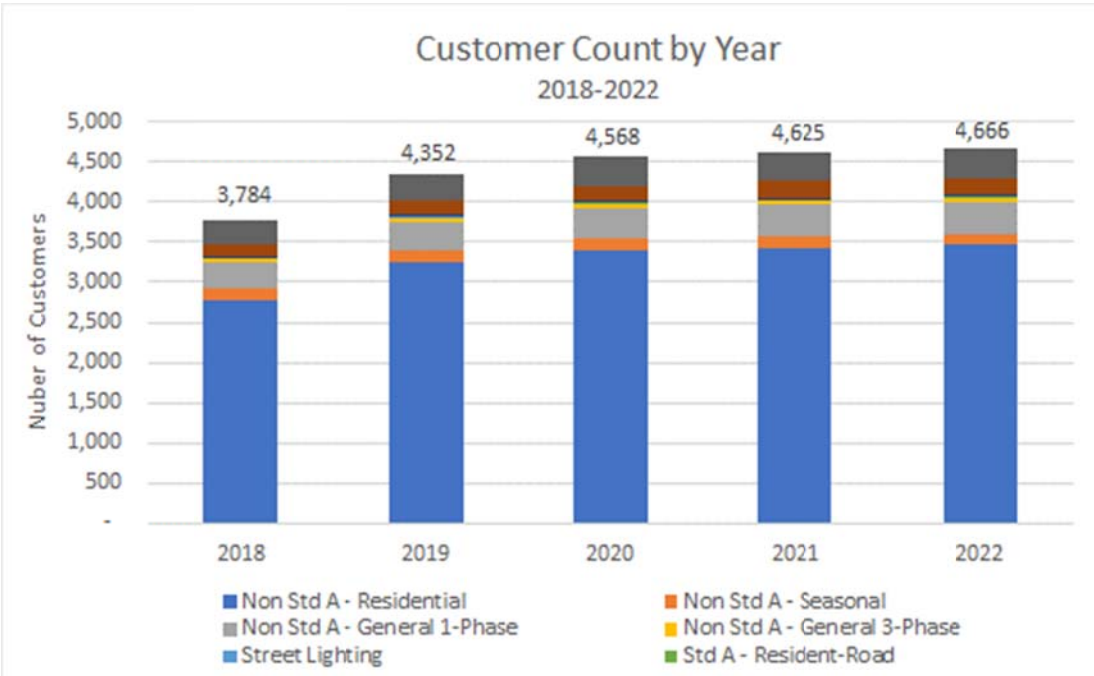
#### 4.1.7.1 Load and Customer Growth

Remotes' service area is expected to expand to include three new communities during the forecast period. One of these, Cat Lake, is already connected to the Hydro One Networks Inc. transmission system in northwestern Ontario; therefore, Remotes will only be responsible for power distribution in this community. This transfer is planned for 2018, is contingent upon an agreement with the community, and will result in a customer increase of 111. Watay Power is planning to build a distribution line to the community of Pikangikum in 2017 to 2018, in advance of other community connections. If the line is built, then Remotes will operate the distribution assets in the community, with distribution lines servicing about

2,300 people and 532 customers. Remotes assessed the generation and distribution assets in Wunnumin Lake. With limited capital investments, Remotes could safely and reliably operate the distribution and generation assets in the community. A transfer of service to Remotes is planned for 2020, prior to the community's connection to the grid, adding 176 new customers to Remotes service territory.

Remotes' total customer growth is shown in Figure 4-2. The annual load growth in Remotes' existing communities is forecasted to be around 3.5%.

Figure 4-2: Remotes' Customer Growth over the Forecast Period



Remotes uses historical load to predict future annual increase in each community. The predicted increase is then used to calculate future peak load. Table 4-10 summarizes future annual increase, peak load for 2017-2022 and current station rating and connection limit by community. The community load is highlighted in yellow where it is forecast to exceed the connection limit and highlighted in orange where it is forecast to exceed the station capacity.

To account for the load growth, Remotes has scheduled six generating station upgrades in the next five years in Big Trout Lake, Wapekeka, Sandy Lake, Weagamow, Fort Severn, and either Deer Lake or Kasabonika, depending on the actual load growth and the availability of INAC funding.

Table 4-10: Forecast Peak Load by Community

| Community | Future Annual Increase | Peak Load (kW) 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | Station Rating (kW) | Connection Limit (kW) |
|---|---|---|---|---|---|---|---|---|---|
| **Armstrong** | 3.0% | 1035 | 1066 | 1098 | 1131 | 1164 | 1199 | 1450 | 1233 |
| **Bearskin Lake** | 2.5% | 614 | 629 | 645 | 661 | 678 | 695 | 1000 | 850 |
| **Big Trout Lake** | 4.0% | 1381 | 1436 | 1493 | 1553 | 1615 | 1680 | 1600 | 1360 |
| **Biscotasing** | 0.0% | 100 | 100 | 100 | 100 | 100 | 100 | 156 | N/A* |
| **Deer Lake** | 4.0% | 1340 | 1394 | 1449 | 1507 | 1568 | 1630 | 1795 | 1526 |
| **Fort Severn** | 6.0% | 689 | 730 | 774 | 821 | 870 | 922 | 1000 | 850 |
| **Gull Bay** | 1.0% | 314 | 317 | 320 | 324 | 327 | 330 | 430 | 366 |
| **Hillsport** | 0.0% | 80 | 80 | 80 | 80 | 80 | 80 | 125 | N/A* |
| **Kasabonika** | 4.5% | 1156 | 1208 | 1262 | 1319 | 1378 | 1440 | 1600 | 1360 |
| **Kingfisher Lake** | 4.0% | 652 | 678 | 705 | 734 | 763 | 793 | 1055 | 897 |
| **Lansdowne** | 5.0% | 584 | 613 | 644 | 676 | 710 | 745 | 875 | 744 |
| **Marten Falls** | 1.5% | 501 | 509 | 517 | 524 | 532 | 540 | 650 | 553 |
| **Oba** | 0.0% | 75 | 75 | 75 | 75 | 75 | 75 | 120 | N/A* |
| **Sachigo Lake** | 3.0% | 731 | 753 | 775 | 799 | 823 | 847 | 1000 | 850 |
| **Sandy Lake** | 2.5% | 2535 | 2598 | 2663 | 2730 | 2798 | 2868 | 3050 | 2593 |
| **Sultan** | 0.0% | 130 | 130 | 130 | 130 | 130 | 130 | 150 | N/A* |
| **Wapekeka** | 3.0% | 651 | 670 | 691 | 711 | 733 | 755 | 865 | 735 |
| **Weagamow** | 3.0% | 1062 | 1094 | 1127 | 1160 | 1195 | 1231 | 1425 | 1211 |
| **Webequie** | 2.0% | 660 | 673 | 687 | 700 | 714 | 729 | 1000 | 850 |

**no load growth*

### 4.1.7.2 Smart Grid Development

Remotes' investment plan includes the installation of Viper switches on the distribution system to improve reliability and cold-load pickup. SCADA and PLC upgrades at Remotes' generating stations will also facilitate a more dynamic and responsive grid operation, providing improved acquisition and alarm handling capabilities from a remote location. In some situations, this will allow for remote monitoring, control and restoration of power after an interruption.

#### 4.1.7.3 REG Accommodation

A biomass project is being developed in Whitesand under Remotes' REINDEER program in cooperation with the IESO. If the project develops as planned, it is anticipated that electrical output could displace electrical load within the community and that settlement would be based on the avoided cost of diesel fuel in that community. No project timeline has yet been developed for the construction of this project.

Another project, supported by federal and provincial grants, is currently being developed by Fort Severn First Nation and private sector developers. Remotes' role in this project is to ensure the ongoing reliability and stability of the existing microgrid and to ensure that the project can be integrated into the existing generation system. The project is staged, with 40 kW of net-metered solar installed to date. When fully installed, the project will qualify for Remotes' REINDEER program and, consistent with that program, Remotes will pay for the electricity produced based on the avoided cost of diesel fuel.

A 360-kW solar/battery microgrid project, supported by provincial grants, is also planned for Gull Bay. The project is currently in the very early stages. It is anticipated that the project will also qualify for Remotes' REINDEER program and that settlement will also be based on the avoided cost of diesel fuel in that community.

### 4.1.8 Customer Preference, Technological Opportunity, Innovation (5.4.1h)

A list and brief description of projects/programs planned in response to customer preferences (e.g. data access and visibility, participation in distributed generation, load management); to take advantage of technology-based opportunities to improve operational efficiency, asset management, and the integration of distributed generation and complex loads; and to study or demonstrate innovative processes, services, business models, or technologies is provided below.

#### 4.1.8.1 Customer Preferences

Distribution system investments in the system access category are initiated by customers. The total capital costs of these programs are shown in Table 4-11.

Table 4-11: Customer-requested Distribution Projects

| Project | 2018 | 2019 | 2020 | 2021 | 2022 |
|---|---|---|---|---|---|
| Service Cancellations | 148,000 | 173,000 | 182,000 | 186,000 | 190,000 |
| Fixed Price Layouts | 106,000 | 124,000 | 130,000 | 133,000 | 136,000 |
| New Customer Connections & Service Upgrades | 658,000 | 768,000 | 809,000 | 824,000 | 840,000 |
| **Total (gross)** | **912,000** | **1,065,000** | **1,121,000** | **1,143,000** | **1,166,000** |
| Contributions & Removals | (912,000) | (1,065,000) | (1,121,000) | (1,143,000) | (1,166,00) |
| **Total (net)** | **0** | **0** | **0** | **0** | **0** |

Generator upgrades are also customer-requested. Table 4-12 lists the total capital cost of the generator upgrades planned over the forecast period.

Table 4-12: Customer-requested Generation Projects

| Project | 2018 | 2019 | 2020 | 2021 | 2022 |
|---|---|---|---|---|---|
| BTL-Wapekeka Upgrade & Connection | 2,149,000 | 3,252,000 | 1,364,000 | 0 | 0 |
| Deer Lake or Kasabonika | 0 | 0 | 0 | 1,364,000 | 4,962,000 |
| Fort Severn | 0 | 0 | 3,042,000 | 3,657,000 | 0 |
| Sandy Lake | 367,000 | 881,000 | 1,311,000 | 0 | 0 |
| Weagamow | 2,832,000 | 1,993,000 | | 0 | 0 |
| **Total (gross)** | **5,348,000** | **6,126,000** | **5,717,000** | **5,021,000** | **4,962,000** |
| Contributions & Removals | (5,348,000) | (6,126,000) | (5,717,000) | (5,021,000) | (4,962,000) |
| **Total (net)** | **0** | **0** | **0** | **0** | **0** |

## 4.1.8.2 Technology-based Opportunities

Planned investments into PLC and SCADA systems, as well as fuel tank controllers will improve operational efficiency and asset management capabilities. These investments entail communication upgrade, SCADA hardware and software upgrade, and PLC hardware and software upgrade. Table 4-13 lists the planned expenditures over the forecast period.

Table 4-13: Projects in response to Technology-based Opportunities

| Project | 2018 | 2019 | 2020 | 2021 | 2022 |
|---|---|---|---|---|---|
| SCADA & PLC Replacements & High-Speed Internet | 505,000 | 726,000 | 675,000 | 391,000 | 353,000 |
| Sandy Lake & Biscotasing - Bulk Tank Platform & Controls | - | - | - | - | 495,000 |
| **Total** | **505,000** | **726,000** | **675,000** | **391,000** | **848,000** |

## 4.1.8.3 Innovative Processes, Services, Business Models, or Technologies

Remotes has not planned any projects/programs to study or demonstrate innovative process, services, business models, or technologies.

## 4.2 Capital Expenditure Planning Process Overview (5.4.2)

### 4.2.1 Planning Objectives, Assumptions, and Criteria (5.4.2a)

Business planning is performed annually and focuses on the development of a six-year plan. The current plan contains the detailed 2017 budget and the 2018 to 2022 forecast. The business plan incorporates the same strategic objectives outlined in Section 3.1.1.

To facilitate the preparation of the business plan, an economic outlook is developed and included with the planning instructions issued. This includes forecasts of key economic statistics, interest rates, labour escalation rates, income tax rates, and cost rates for benefits.

Remotes manages its diesel generating stations by limiting the peak load at the station to 85% of the station's rating (known as the connection limit). This threshold allows for consumption growth as existing customers connect more devices to the grid without compromising the ability to supply power during peak load. When the peak load in the community nears the connection limit and additional load growth is forecast, the station upgrade planning process commences. In communities where there is no load growth, the connection limit is not relevant planning criteria. These communities have a high number of seasonal customers and the peak loads often occur on holiday weekends.

Remotes currently owns REG facilities in Big Trout Lake (wind), Deer Lake (hydroelectric), Kasabonika (wind), and Sultan (hydroelectric). New facilities are planned in Fort Severn (net-metered solar) and Gull Bay (solar/battery). A biomass generating station is planned in Whitesand. Customers in Big Trout Lake and Wapekeka have requested an additional 67.5 kW of community-owned solar generation, to be placed on appropriate non-Standard A customer accounts. Remotes' customers also have the ability to install their own REG facilities and sell power to Remotes; 15 small customer-owned solar net metering projects are now in service.

### 4.2.2 Non-Distribution System Alternatives to Relieving Capacity (5.4.2b)

Remotes' service areas do not include large industrial customers who offer the most potential for effective demand response and other peak shaving programs. Remotes engages in CDM activities as described in Section 1.4.4; however, Remotes' customers have expressed a disinterest in CDM and a preference towards REG. Further customer engagement has emphasized electricity availability rather than CDM (see Appendix E: 2016 Customer Workshop). Therefore, when relieving system capacity and operational constraints, Remotes considers alternatives on both the distribution and generation side, including REG investments, as well as the planned transmission system connection.

### 4.2.3 Processes, Tools, and Methods (5.4.2c)

The typical annual business planning process consists of six stages:

1. Strategic direction and goals established;
2. Risk review and investment requirements;
3. Confirmation of strategic direction and goals with Hydro One Inc.;

4. Development of economic outlook and forecast assumptions;
5. Development of plans and work programs; and
6. Approval by Hydro One Inc. Senior Management and Board of Directors.

Capital expenditures are identified based on Remotes' asset management process (as described in Section 4.2.3). Annually, required investments are determined based on asset condition, engine hours, load growth and external factors such as INAC funding and winter roads.

Several projects/programs are treated as non-discretionary since they are customer-initiated and fully recoverable. These include:

- Generator upgrades;
- New customer connections and service upgrades;
- Fixed price layouts; and
- Service cancellations.

Other investments are then ranked against seven risk categories: customer/reliability, regulatory, financial, operational efficiency, environmental, safety, and reputation. The outcome of this process is a list of investments that is consistent with Remotes' strategic goals and considers levels of investment and associated risk mitigation. A final investment plan is then endorsed and confirmed by the Hydro One Inc. senior management team.

The decision to defer a project due to limited resources is made based on risk. Typically, civil projects, motor controller upgrades, and PLC upgrades are deferred when required.

## 4.2.4 Customer Engagement (5.4.2d)

### 4.2.4.1 Customer Acceptance and Feedback

Generation upgrade projects are championed by the community in need of capacity. When Remotes has determined that a generation upgrade is needed, it approaches the community to inform them and the community must apply to INAC for funding. If the community decides not to support the upgrade, then they would not apply for funding and the project would not go through. Therefore, generation upgrade projects identified in this DSP are supported by the communities in which the upgrades will occur.

Remotes revised its capital processes in response to feedback from its customers and a decreasing availability of funding from the federal government. In the past, there were ongoing connection constraints due to an unavailability of funding from INAC. Remotes' new generation upgrade process reduces both the cost and time required for generation upgrades and has reduced the number of communities with connection restrictions.

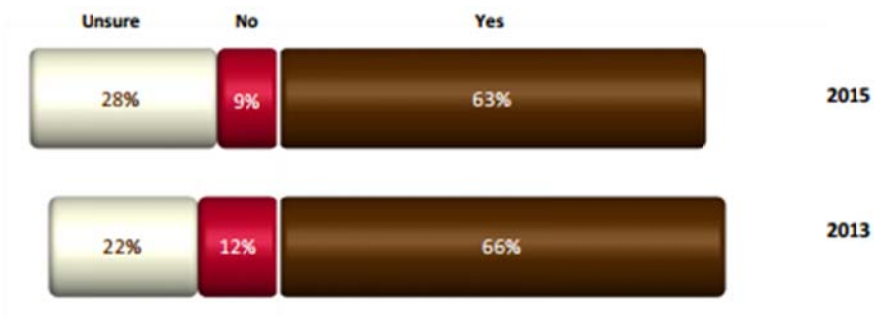
### 4.2.4.2 Customer Surveys

In 2015, Viewpoints Research conducted its most recent telephone survey of 205 residential, business, and government-supported organization customers served by Remotes. Many of the questions in this survey have been tracked from earlier customer surveys administered about every two years since 2003. In addition to the customer satisfaction results discussed in Section 2.3.1.1, other findings of the customer survey which reflect customer needs, priorities, and preferences include improved reliability, handling of customer contact, ways to improve service, helpfulness of staff, and environmental protection. The complete customer survey is attached as Appendix D: Customer Satisfaction Survey Results.

**Environmental Protection**

Sixty-three per cent of respondents said Remotes takes environmental protection in the community seriously down three per cent since 2013. Nine per cent said Remotes does not take it seriously, also down three per cent since the previous survey. Twenty-eight per cent of respondents were unsure.

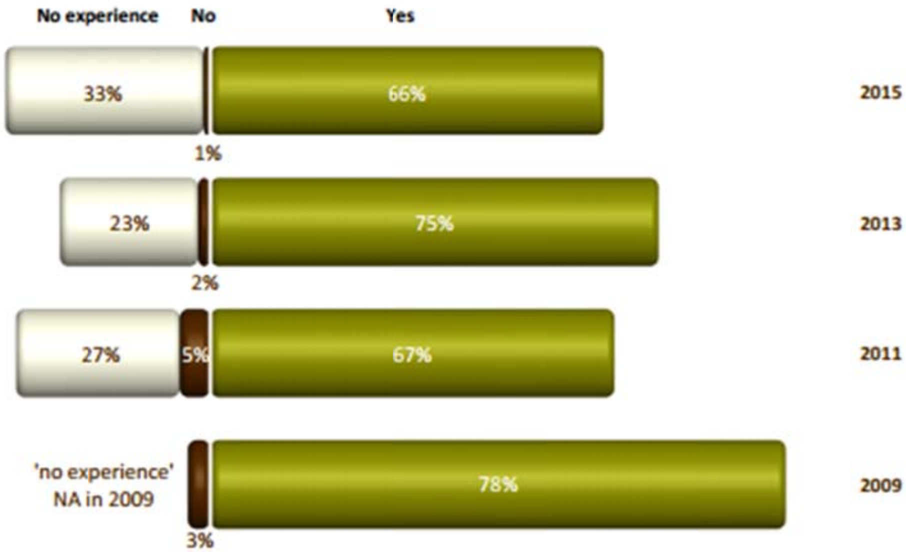
Figure 4-3: Does Remotes Take Local Environmental Protection Seriously?



**Staff is Polite & Helpful**

Sixty-six per cent of customers indicated that Remotes' personnel are generally polite and helpful when they come to their community to do things such as bring the electricity back on, which is nine per cent less than the previous survey and its lowest since tracking began on this question in 2009. On the contrary, just one per cent of customers said staff are not polite and helpful, which is the most favourable response achieved to date. One in three customers said they did not have any experience to answer this question.

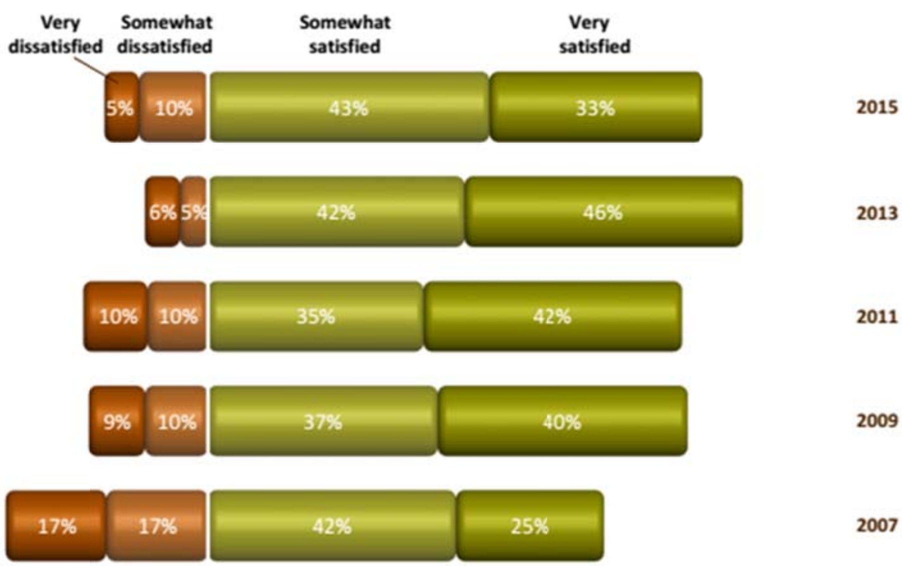
Figure 4-4: Staff Polite & Helpful



**Handling of Customer Contact**

When customers call Remotes' office, they can expect a person to answer the phone within 30 seconds. Figure 4-5 illustrates customer satisfaction with problem resolution. Between 2013 and 2015, customer satisfaction with how Remotes handled their contact dropped from 88% to 76%, but is still the second highest satisfaction rating since tracking began. Those who said they were very satisfied with their contact with Remotes is down 13% to 33%, its lowest level since 2007.

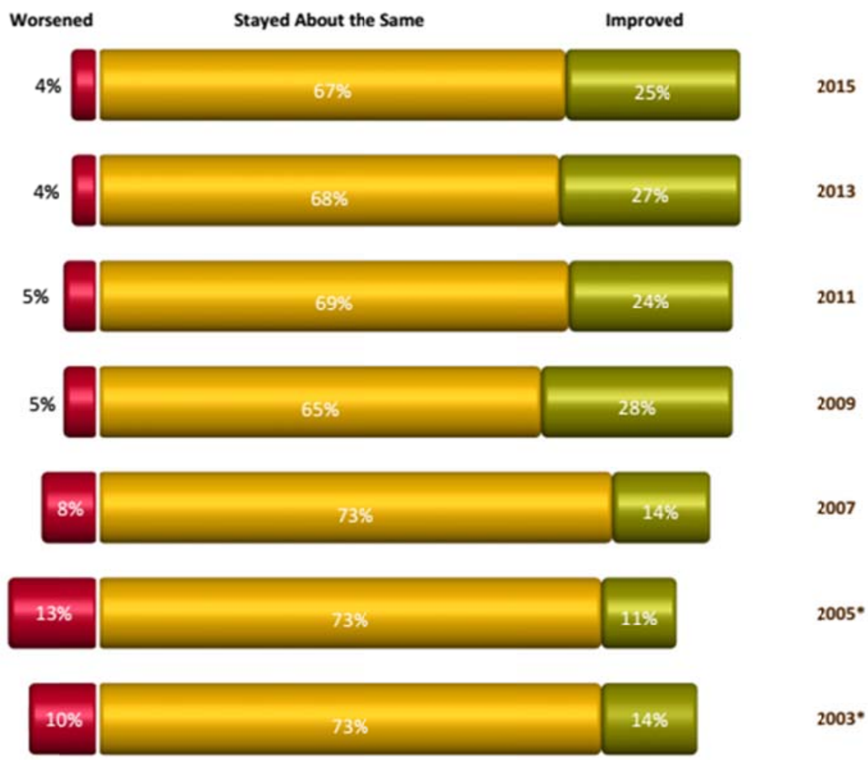
Figure 4-5: Customer Satisfaction with Problem Resolution



**Perceptions of Reliability**

Figure 4-6 illustrates changes in customers' impressions of their electrical service since 2003. After remaining stable below 15% from 2003 to 2007, the proportion of customers who believe the reliability of their electricity service has improved in the past few years has remained at or above 24% since. In 2015, 25% said they believe reliability has improved, while 67% of customers said it has stayed about the same. The proportion of customers who believe the reliability has worsened is approximately four per cent.

Figure 4-6: Customer Impression of Reliability

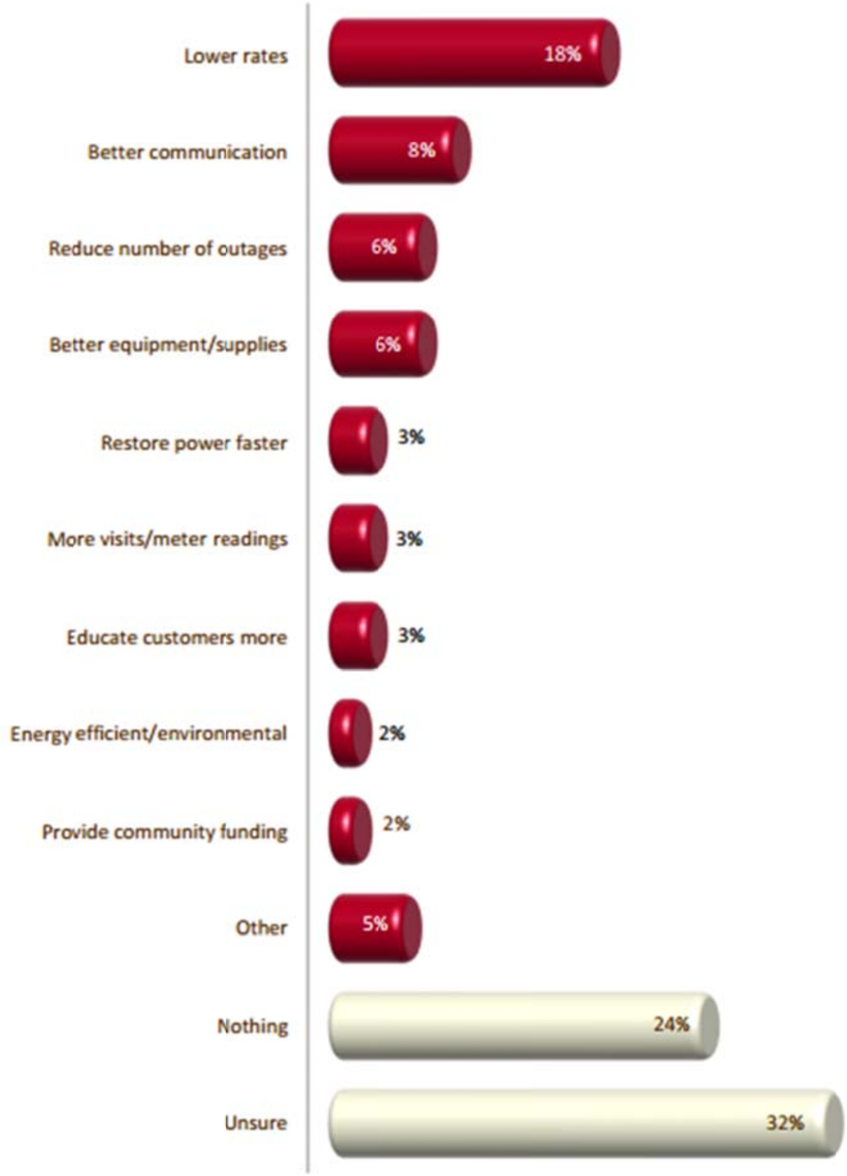


*In these years, respondents were given the option to say that reliability has worsened/improved somewhat or a lot. These responses have been combined on this chart.*

**Ways to Improve Service to Customers**

When asked what Remotes could be doing to improve service to customers, the most frequently mentioned improvement is lowering rates (mentioned by 18% of customers). The desire for better communications was mentioned by eight per cent of respondents, while reducing the number of outages and using better equipment and supplies were each mentioned by six per cent of respondents. When respondents offered an answer that could not be classified on the list of response categories provided to interviewers, their answers were recorded verbatim by the interviewer. Figure 4-7 summarizes the response to this question.

Figure 4-7: Ways to Improve Service Identified by Customers



## 4.2.5 REG Investment Prioritization (5.4.2e)

Remotes' customers have indicated that REG is important to them; therefore, the accommodation of REG is given high priority in terms of resources made available by Remotes. However, plans to install new REG in three communities are funded by the communities themselves through INAC and are compared to other investments by Remotes as part of the rate base. Remotes will pay the communities for the power produced based on the diesel fuel cost avoided.

## 4.3 System Capability Assessment for REG (5.4.3)

### 4.3.1 Forecast REG Connections (5.4.3a/5.4.3b)

Remotes' service areas are not included in the FIT program offered by the IESO. However, Remotes provides its customers with the option to install REG and sell energy to the grid based on the avoided diesel fuel cost.

A biomass project is being developed in Whitesand under Remotes' REINDEER program. If the project develops as planned, it is anticipated that electrical output could displace electrical load within the community and that settlement would be based on the avoided cost of diesel fuel in that community. No project timeline has yet been developed for the construction of this project.

Another project, supported by federal and provincial grants, is currently being developed by Fort Severn First Nation and private sector developers. Remotes' role in this project is to ensure the ongoing reliability and stability of the existing microgrid and to ensure that the project can be integrated into the existing generation system. The project is staged, with 40 kW of net-metered solar installed to date. When fully installed, the project will qualify for Remotes' REINDEER program and, consistent with that program, Remotes will pay for the electricity produced based on the avoided cost of diesel fuel.

A solar/battery microgrid project, supported by provincial grants, is also planned for Gull Bay. The project is currently in the very early stages. It is anticipated that the project will also qualify for Remotes' REINDEER program and that settlement will also be based on the avoided cost of diesel fuel in that community.

Fifteen small customer-owned solar net metering projects are now in service.

### 4.3.2 REG Connection Capacity and Constraints (5.4.3c/5.4.3d)

There are no constraints on Remotes' distribution system that would prevent the connection of REG. The sizes of REG projects are limited by the load in the communities and the integration with existing generation.

### 4.3.3 Embedded Distributor Constraints (5.4.3e)

Remotes does not have an embedded distributor.

## 4.4 Capital Expenditure Summary (5.4.4)

Table 4-14 presents the historical and forecast capital expenditures and system O&M. Since this is Remotes' first DSP filing, historical years do not include plan and variance numbers for each investment category.

1 Table 4-14: Historical and Forecast Capital Expenditure and System O&M

| Category | Historical | | | | | | | | | | | | | | | Forecast | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 2013 | | | 2014 | | | 2015 | | | 2016 | | | 2017 | | | 2018 | 2019 | 2020 | 2021 | 2022 |
| | Plan | Act | Var | Plan | Act | Var | Plan | Act | Var | Plan | Act | Var | Plan | Act* | Var | Plan | | | | |

2 **0 months of actual data included in 2017.*

### 4.4.1 Variances in Net Capital Expenditures

The variances in the system access category cannot be calculated as a percentage since there is no planned spending each year based on 100% contributed capital. Therefore, variances in this category are due to not all the cost being recovered from customers.

The annual Remotes' capital and operation and maintenance work programs are subject to many different contributing factors beyond Remotes' control. This can result in large variances in the annual expenditures. Some of these factors include:

**Uncertainty of INAC funding**

Funding for growth-related capital is mainly a federal responsibility. INAC faces funding constraints and both the timing for funding approvals and amounts of funding available are uncertain and require planning flexibility. INAC funding approvals may be determined in-year, after Remotes' business plan is approved. INAC design, approval and funding cycles are also lengthy and complex in nature. In response to customer needs to connect to the electrical system, Remotes adjusts its planned work program to accommodate upgrade projects.

**Remote Community Accessibility**

Most of Remotes' communities are accessible only by air or winter roads. Due to the cost of air transportation, and to the size and weight of some of the equipment and materials required to perform work programs, winter roads are relied upon for transportation. If the appropriate weather conditions are not met in order to construct winter roads, it is not feasible to get the equipment and materials to site and therefore the work must be deferred.

**Failures**

Remotes maintains its fleet of generators as guided by the original manufacturer. Sometimes a unit may fail unexpectedly. Responses to failures are initially treated as maintenance. In order to maintain the supply of power to customers in remote communities and to be prepared for the next system contingency in the community, all failures are treated as an emergency. Because of the minimal generation redundancy, the failure of a subsequent unit may lead to a community going dark. Without running generators, the community has no power, lights, or water. This situation can lead to an evacuation of the community and damage to critical community infrastructure.

**Customer**

Whether generation or distribution in nature, Remotes strives to meet customer and community needs and commitments made to customers. Housing connections, often delay betterments as crews are moved to more impactive customer work. Generation upgrades are critical to community development and well-being, so other generation projects are deferred.

#### 4.4.1.1 2013 Net Capital Variances

2013 net capital expenditures were 30% below plan due to the following:

- Delayed Start for two generator unit replacements in Lansdowne due to the failure of the Deer Lake B unit;
- Re-prioritization of civil staff house improvement projects to instead focus on garage improvements in three communities;
- Deferral of protection upgrades and switchgear work due to increased engineering involvement in the planned replacements in Sandy Lake and Sachigo Lake;
- Redeployment of technical and management staff to the CIS project; and
- The nature of the work required to certify fire systems was determined to be maintenance in nature once the program started.

The variance was partially offset by:

- Unplanned costs for replacement of the Deer Lake B unit; and
- Increased engine overhauls (two additional units).

#### 4.4.1.2 2014 Net Capital Variances

Capital expenditures in 2014 were 32% below plan due to the following:

- A decision to cancel planned replacements of the Wapekeka C unit and the Fort Severn C unit due to an in-year agreement with INAC to fully fund an upgrade of both units;
- Bearskin B unit deferred due to lower than forecast operating hours;
- Marten Falls unit operating and reliability deficiencies were corrected, therefore the unit was not replaced;
- Lower than planned garage construction costs in two communities; and
- A decision to defer to 2015 some of the work associated with refurbishing the Sultan run-of-the-river hydroelectric plant after a catastrophic failure, as the work was more technically complex than originally expected.

The variance was partially offset by:

- Day-tank replacement work required to meet fuel code requirements; and
- Leaking roof of the Deer Lake staff house that necessitated capital repair and the completion of other civil work while staff were at site.

#### 4.4.1.3 2015 Net Capital Variances

Capital expenditures were 62% below plan due to the following:

- A decision to focus on fully recoverable INAC upgrade projects that would allow customers in three communities to connect to the electrical system. This resulted in the removal of connection restrictions for all three communities;
- Engine replacements were lower as they were completed within the scope of these upgrade projects; and
- Day tank improvements, the Wapekeka 600-V upgrade and capital betterments work were also deferred due to this shift in priorities.

The variance was partially offset by:

- Above-plan spending on the Lansdowne A unit engine replacement; and
- The completion of rebuild work at the Sultan run-of-the-river hydroelectric facility.

#### 4.4.1.4 2016 Net Capital Variances

Capital spending was 17% below budget due to the following:

- A decision to reprioritize work to focus on INAC-funded generation upgrades that would allow customers in two communities to connect to the electrical system;
- An engine replacement project was returned to inventory, showing a timing difference on annual capital spending;
- The deferral of the planned replacement of a generator in Hillsport and a generation sustainment project in Marten Falls to focus on INAC-funded upgrade work;
- Lower than planned cost to replace the Bearskin B unit; and
- The Shoulderblade hydroelectric generator rebuild cost less than estimated as the required work was not as significant as expected.

The variance was partially offset by:

- The unplanned replacement of Deer Lake unit B.

### 4.4.2 Trends in Capital Expenditures

The average annual spending in the system access category over the historical period[1] was $53k. System access programs are fully recoverable and are budgeted so. However, occasionally a new-connect is only 50% recoverable from the customer. As this is very rare, it is not budgeted for. The resulting average actual costs come from these partially unrecoverable new connects and also from the net costs of fixed price billings, where the work could not be fully bundled with other work in the community. The forecast spending is $0 each year since programs in this investment category are fully-recoverable.

The average annual spending on distribution system renewal over the historical period[1] was $613k, while the average annual forecast spending is $619k. Although the number of distribution assets under management by Remotes is expected to increase over the forecast period when the new communities are added to the service area, no major increase in distribution system renewal spending has been planned since INAC is funding upgrades to the distribution lines before they are transferred to Remotes. Increased metering costs have been budgeted based on the anticipated service area additions.

The average annual spending on generation system renewal over the historical period[1] was $2.493M, while the average annual forecast spending is $2.732M. Over the historical period, some investments in this category were either deferred or transitioned to a fully-recoverable generator upgrade project. Planned investments over the forecast period to replace generators, overhaul generators, and civil repair work at diesel generating stations are based on the conditions of the respective assets.

[1] 2017 spending based on budgeted amount only.

There were no expenditures in the distribution system service category over the historical period and none have been budgeted over the forecast period.

The average annual spending on generation system service over the historical period[1] was $131k, while the average annual forecast spending is $629k. Gross spending in this category is dominated by generator upgrades, but these costs are fully recoverable. The non-recoverable portion of these costs is mostly attributed to SCADA, PLC, and fuel tank control upgrades. In 2013, Remotes attempted to contract resources to complete the SCADA and PLC project, as specialized information technology, networking, and programming skills are required to complete this project. SCADA and PLC investments were made, but were subsequently expensed in 2014 when the capital portion of the project did not materialize. During 2014 and 2015, Remotes attempted to hire contract staff to perform the work but were unsuccessful due to the unusual nature of Remotes' business and the specific needs required for the system. It was then determined that this type of work required a full-time dedicated professional, with specialized expertise, and the position was filled in 2015. Additional SCADA and PLC upgrades have been budgeted for 2017 and each year of the forecast period. Fuel system improvements were made in Lansdowne in 2013 for $140k and a larger scope of work is planned in 2022 to upgrade the bulk tank platforms and controls in Sandy Lake and Biscotasing (estimated to be $495k).

The average annual spending on general plant over the historical period[1] was $768k, while the average annual forecast spending is just $581k. Facilities improvements in Lansdowne, Kasabonika, and Deer Lake over the historical period were more extensive than those budgeted over the forecast period. Investments into garages, water wells, and the Beaverhall maintenance shop over the historical period were likewise more extensive than the planned improvements over the forecast period.

## 4.5 Justifying Capital Expenditures (5.4.5)

### 4.5.1 Overall Plan (5.4.5.1)

#### 4.5.1.1 Comparative Expenditures by Category over the Historical Period

Comparative capital expenditures by investment category over the historical period are presented in Table 4-15.

Table 4-15: Historical Net Capital Expenditures by Category

| Investment Category | 2013 Actual | 2014 Actual | 2015 Actual | 2016 Actual | 2017 Budget |
|---|---|---|---|---|---|
| System Access | 122,909 | 30,765 | 42,407 | 69,913 | 0 |
| System Renewal – Distribution | 755,858 | 504,031 | 543,694 | 759,715 | 501,360 |
| System Renewal – Generation | 3,401,157 | 3,615,497 | 1,287,531 | 2,434,356 | 1,728,000 |
| System Service – Distribution | 0 | 0 | 0 | 0 | 0 |
| System Service – Generation | 456,184 | (193,493) | (18,768) | 0 | 413,000 |
| General Plant | 690,724 | 677,492 | 472,718 | 914,193 | 1,085,000 |
| **Total** | **5,426,832** | **4,634,292** | **2,327,582** | **4,178,177** | **3,727,360** |

#### 4.5.1.2 Forecast Impact of System Investment on System O&M Costs

Table 4-16 lists summarizes the forecast system O&M spending into four categories: distribution, generation, common (i.e. northern strategies and community relations), and environment (e.g. waste management, spill management and monitoring, incident follow-up, environmental management system implementation).

Table 4-16: Forecast System O&M Expenditures

| Investment Category | 2018 Budget | 2019 Budget | 2020 Budget | 2021 Budget | 2022 Budget |
|---|---|---|---|---|---|
| Distribution O&M | 4,393,000 | 5,055,000 | 5,567,000 | 5,671,000 | 5,496,000 |
| Generation O&M | 15,496,000 | 15,786,000 | 16,737,000 | 17,024,000 | 17,315,000 |
| Common O&M | 339,000 | 336,000 | 241,000 | 273,000 | 320,000 |
| Environment O&M | 1,063,000 | 1,083,000 | 1,105,000 | 1,127,000 | 1,150,000 |
| **Total** | **21,291,000** | **22,260,000** | **23,650,000** | **24,095,000** | **24,281,000** |

Remotes investigated the relationship between capital spending and system O&M costs. Regardless of the capital spending, generator maintenance is required every 2,500 engine-hours. Due to the associated flight and fuel costs of this maintenance, there is no reduction to system O&M costs from capital investment.

#### 4.5.1.3 Investment Drivers by Category

The investment drivers by category are presented in Table 4-17.

Table 4-17: Investment Drivers by Category

| Investment Category | Drivers | Projects/Activities |
|---|---|---|
| System access | Customer service requests | New customer connections and service upgrades<br>Fixed price layouts<br>Service cancellations |
| System renewal | Assets failure | Damage claims<br>Defective meter replacements |
| | Assets at the end of their service life due to failure risk | Small external demand requests<br>Distribution system improvements<br>Generator replacements<br>Generator overhauls<br>Diesel plant civil improvements<br>Day and bulk fuel tank replacements |
| System service | System capacity | Generator upgrades |
| | System reliability and operational efficiency | SCADA and PLC upgrades |
| General plant | Non-system physical plant | Housing improvements<br>Storage buildings and miscellaneous civil projects<br>Minor fixed assets |

#### 4.5.1.4 REG Requirements

As per the REG capacity assessment in Section 4.3, there are no constraints on Remotes' system that would prevent the connection of REG. The sizes of REG projects are limited by the load in the communities.

### 4.5.2 Material Investments (5.4.5.2)

The focus on this section is on projects/activities that meet the materiality threshold set out in Chapter 2 of the Filing Requirements. For this Application, the threshold is $283,000. Appendix A presents the project narratives for the material investments in the 2018 Test Year.

# Appendix A: Business Cases for Material Investments

# Material Investments in the 2018 Test Year

## Table of Contents

# New Customer Connections & Service Upgrades

## 1. Project/Program Description

### 1.1.Current Issue

Capital projects included under this program are customer-initiated requests for connection to Remotes' distribution system and/or expansion of connection capacity to accommodate such requests. With population changes and more intensive use of electricity in remote communities, the overall number of new load connections for Remotes has increased in recent years and is expected to continue growing.

### 1.2. Project Scope

New customer connections vary from year to year and may include provision/expansion of distribution lines, transformers, switches, fuses, meters, and electrical termination facilities.

### 1.3. Main and Secondary Drivers

This program is driven by customer service requests, as per Table 1-1 in Remotes' DSP.

### 1.4. Performance Targets and Objectives

Responding to customer requests is a key factor in maintaining customer satisfaction. Remotes tracks customer satisfaction levels by way of a third-party survey issued every second year, reporting the results as a part of its scorecard.

## 2. Project/Program Justification

### 2.1. Information Used to Justify the Investment

Investments in this program are initiated by customers and 100% recoverable, as specified in Remotes' asset management process.

### 2.2. Alternatives Evaluation

**Alternative 1: Do nothing**

Access to electricity is a key quality of life indicator, so the "do nothing" option is therefore not feasible.

a) Project Design/Implementation Options

New connections and service upgrades are planned using standardized designs that meet the requirements of *O. Reg. 22/04*, made under the *Electricity Act, 1998*.

## 2.3. Project/Program Timing and Expenditure

a) Historical and Future Capital and Related O&M Expenditures

| | Historical Costs ($ '000) | | | | | Future Costs ($ '000) | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | **2013** | **2014** | **2015** | **2016** | **2017*** | **2018** | **2019** | **2020** | **2021** | **2022** |
| Capital (Gross) | 477 | 437 | 559 | 342 | 629 | 658 | 768 | 809 | 824 | 840 |
| Contributions | (354) | (432) | (537) | (317) | (629) | (658) | (768) | (809) | (824) | (840) |
| Removals | (13) | (1) | (18) | (3) | - | - | - | - | - | - |
| **Net Capital** | **110** | **5** | **5** | **22** | **-** | **-** | **-** | **-** | **-** | **-** |
| O&M | - | - | - | - | - | - | - | - | - | - |

*0 months of actual spending included in 2017

b) Start Date
January 1, 2018

c) In-Service Date
December 31, 2018

d) 2018 Test Year Expenditure Timing

| | Forecast Cost ($ '000) | | | |
|---|---|---|---|---|
| | **Q1** | **Q2** | **Q3** | **Q4** |
| Capital (Gross) | 164.5 | 164.5 | 164.5 | 164.5 |
| O&M | - | - | - | - |

e) Comparative Expenditure Information

The work varies year-to-year based on the size, nature, and volume of construction activities in the communities.

## 2.4. Project Benefits

a) Operation Efficiency and Cost Effectiveness

New connections and service upgrades are planned using standardized designs that meet the requirements of *O. Reg. 22/04*. In doing so, Remotes manages the engineering and design costs of these projects, while providing consistent design quality throughout its service territory. Since these programs are customer-funded, the resulting cost savings are passed directly on to customers.

b) Customer

The net benefit to customers is connection to the electrical system.

c) Safety

All new construction conforms to the latest standards for health and safety protections and performance.

d) Cyber-Security, Privacy

New smart meters installed under this program as part of the customer connection or service upgrade meet the latest cyber-security standards.

e) Co-ordination and Interoperability

As for all customer-initiated projects, Remotes works closely with the First Nation community when planning and funding the projects.

f) Economic Development

Connecting new customers to the system encourages economic growth in the community.

g) Environment

The investment will not have any negative environmental effects. Where the scope of a project includes the replacement of distribution transformer(s), newly-procured transformer units meet the latest standards in energy efficiency.

h) Final Economic Evaluation

N/A

i) System Impacts

The connection of new customers to the system impacts the system capacity relative to Remotes' planning criteria and, therefore, impacts the ability to connect additional customers in the future. Remotes accounts for this impact during its planning and works closely with the communities it serves to ensure adequate system capacity is in place to serve their immediate and future needs.

# 3. Prioritization

This is a non-discretionary program since it is driven by customer service requests and the costs are fully recoverable.

# 4. Execution Path

## 4.1. Implementation Plan

Projects within the program are requested by customers. Customers follow a standardized connection process by calling Remotes customer service department. At a high level, the process includes requesting service, designing the layout, and setting up an account. Once the Electrical Safety Authority (ESA) has inspected the premises, connection and construction work takes place after payment is received.

## 4.2. Risks and Risk Mitigation

Connections are priced two ways: variable or fixed. The costs of variable connections 100% recovered and billed as incurred. To maintain affordability of fixed-price connections, travel costs are assumed to be zero and must be coordinated with other work in the community. Every effort is made to fully recover the costs of fixed-price connections; however, when coordination with other work is not possible, fixed-price connections can be under-priced based on the need to meet customer/OEB timelines.

### 4.3. Timing Factors

Year-over-year fluctuations in the volume of work performed under this program vary based on the number of customer requests received each year. The timing of work depends on when the customer request is made.

### 4.4. Cost Factors

The number of customer connections and service upgrades required each year are forecast based on historical trends. The volume of work fluctuates each year depending on the number of requests made by customers. In 2018, it is in anticipated that Cat Lake will be added to Remotes' service area, which has been accounted for in the plan.

Controllable costs are minimized by using standardized designs. Since projects under this program are completely recoverable, the cost savings are passed on to customers.

### 4.5. Customer Preferences

In Remotes' latest customer survey in 2015, 65% of customers stated that having electricity when they need it is a key driver to their satisfaction. New customer connections and service upgrades allow customers to connect to Remotes' distribution system in their community and have vital access to electricity. Projects under this program are initiated by Remotes' customers.

### 4.6.Leave to Construct Approval

N/A

## 5. REG Investment Costs

N/A

# Distribution System Improvements

## 1. Project/Program Description

### 1.1. Current Issue

Decisions to proactively replace distribution system assets are based on inspection and asset condition assessment work performed in 2016. Poles which are hollow, exhibit severe surface rot, woodpecker damage, or otherwise identified to be unsafe, or in poor or very poor condition, require replacement. Leaning poles are realigned and substandard conductors are replaced where deficiencies are identified. Other distribution system defects related to transformers and other equipment are identified during field inspections can also necessitate capital replacement due to failure risk, safety concerns, or as otherwise applicable.

Most of Remotes' existing distribution assets were installed in the 1980s. To ensure a long-term sustainable approach to management of the distribution assets and to smooth out the potential revenue impacts of replacing all the assets in a very short window, Remotes performs betterments based on the age of the assets. Improvements to distribution systems in 2018 also include the installation of Viper switches which enable operators to sectionalize load to improve cold load pickup and to reduce the duration of community-wide distribution outages, by allowing immediate on-site outage response.

### 1.2. Project Scope

This program includes work on all distribution assets – primarily poles, but also conductors, distribution transformers, air break switches, reclosers, and step-up transformers. Major betterments are performed in one or two communities each year and minor betterments to address defects are performed in other communities.

The project scope in 2018 includes major betterments in Sultan and Bearskin Lake. The asset condition assessment identified 17 poles requiring replacement in Bearskin Lake and 32 poles requiring replacement in Sultan. Both major betterments include additional pole replacements to mitigate clearance hazards and substandard designs. In Sultan, the planned betterment work also includes replacing old poles in the community that were not necessarily identified as defective, but require replacement to mitigate uplift and design issues that are created by the replacement of surrounding poles. System bus upgrades may also be required because of the pole replacements. Due to work and planning efficiency and mobilization costs in remote communities, it is always preferred to bundle work.

Starting in 2013, Remotes began installing Viper switches in communities to improve cold load pick up and to enable the operator to respond to community-wide outages caused by problems on the distribution system that the operators are not qualified to respond to. Improvements planned for 2018 include Viper switches to be installed in Lansdowne and Fort Severn. These upgrades are expected to provide the local operator the flexibility to sectionalize load to improve reliability and improve the cold load pickup capability. Remotes plans to install at least one Viper switch in every mid- to large-sized community and is installing Viper switches in two communities per year as part of a multi-year plan.

## 1.3. Main and Secondary Drivers

The main driver for this investment in the system renewal category, as per Table 1-1 in Remotes' DSP, is assets at the end of their service life due to failure risk. The secondary drivers are improved reliability, safety, and cold load pickup on the distribution systems.

## 1.4. Performance Targets and Objectives

Improvements to the distribution systems are critical to maintain system reliability. Proactive replacement of assets under this program improves Remotes' customer-oriented performance and reduces the frequency of outage occurrences (the SAIFI metric). This investment targets outages due to defective equipment, foreign interference, and adverse weather. New Viper switches included in this program improve system reliability by reducing the duration of outages (the SAIDI metric). Reliability is one of the key drivers to customer satisfaction to Remotes' customers. This program also reduces distribution losses through replacement of substandard conductors and distribution transformers.

Improvements to distribution system assets are a key component of Remotes' asset lifecycle optimization policies and practices. Replacements and refurbishments of distribution assets include planned improvements and component replacement required to maintain the operation of distribution lines and associated equipment. Overhead line sections, wood poles, Viper switches, and distribution transformers are the highest priority assets under this program.

Improvements planned for 2018 include Viper switches to be installed in Lansdowne and Fort Severn. In Fort Severn, the fifteen-minute high cold load pickup was 746 kW in 2016, which exceeds the peak load in this community (i.e. 650 kW in 2015) by 15%. In Lansdowne, the cold load pickup was 647 kW in 2015, which exceeds the peak load in this community by 12%. New Viper switches in both locations will improve the cold load pickup and on-site trouble response options in these communities.

## 1.5. Condition of Assets

A detailed inspection on Remotes' poles was done in 2016 and their condition divided into three categories:

- Very Poor - emergency replacement,
- Poor - replace within five years,
- Good - no replacement within five years.

No poles were in very poor condition, but 115 poles were found to be due for replacement in the next five years. The replacements will be divided over the five-year period.

The poles assessed to be in poor condition in the communities of Bearskin Lake and Sultan are targeted in 2018.

| Condition | Very Poor | Poor | Good |
|---|---|---|---|
| **Community** | **Number of Poles** | | |
| Bearskin Lake | 0 | 17 | 284 |
| Sultan | 0 | 32 | 90 |

## 1.6. Customer Impact

a) Customer profile for each community:

| Customer Class | Non Std A – Res. | Non Std A – Seas. | Non Std A – GS 1P | Non Std A – GS 3P | Street Lightning | Std A – Res. – Air | Std A – GS – Air | Total |
|---|---|---|---|---|---|---|---|---|
| **Community** | **Number of Customers** | | | | | | | |
| **Bearskin Lake** | 123 | - | 11 | 4 | - | 9 | 27 | **174** |
| **Fort Severn** | 86 | - | 19 | - | 1 | 10 | 28 | **144** |
| **Lansdowne** | 72 | - | 5 | 2 | 1 | 8 | 16 | **104** |
| **Sultan** | 35 | 23 | 9 | - | - | - | - | **67** |

b) Customer impacts for each community:

The value of customer impact is defined as follows:

- High – less than ten per cent seasonal customers.
- Medium – between 10 and 50% seasonal customers.
- Low – greater than 50% seasonal customers

| Community | Customer Count | Load at Risk (kW peak) | Value of Customer Impact |
|---|---|---|---|
| **Bearskin Lake** | 174 | 640 | High |
| **Fort Severn** | 144 | 650 | High |
| **Lansdowne** | 104 | 577 | High |
| **Sultan** | 67 | 186 | Medium (34% seasonal) |

A planned replacement of 17 poles in Bearskin Lake would likely require three two- to four-hour planned outages affecting 58 customers at a time. An unplanned outage in Bearskin involving a single pole failure would take eight hours to rectify (mobilize crew and flight, flight time, mobilization of pole and replacement on site). With 17 poles nearing end-of-life, such an outage may occur once or twice without the planned project. A similar one-pole failure in Sultan would require nine hours to rectify the outage, due to the longer flight time.

For Viper switches, the operator can respond to a community-wide distribution outage without having to dispatch a crew or can restore the service. The Viper switch is expected to reduce the duration of community-wide outages as well as lessen the adverse operating impacts on costly generation assets.

# 2. Project/Program Justification

## 2.1. Information Used to Justify the Investment

The investment is justified based on inspection results on the distribution system. The communities targeted for major betterments were last inspected in 2016 and the results indicate the need for proactive replacements.

## 2.2.Alternatives Evaluation

**Alternative 1: Do nothing**

In the case of the "do nothing" scenario, the assets are not replaced proactively and are instead run to failure.

**Alternative 2: Major betterment in another community**

One or two communities are selected for a major betterment each year; this alternative considers major betterments that could be done in other communities.

a) Comparison of Project Alternatives

In the case of the "do nothing" option, the distribution assets are run to failure. System reliability and customer satisfaction would suffer due to an increased occurrence of outages. Given the remoteness of the company's service territory, proactive replacements are more cost effective than reactive replacements, as a variety of factors beyond the utility's control could interfere with its ability to conduct the work on a reactive basis. As such, run-to-failure is not an optimal approach in accordance with Remotes' asset lifecycle optimization policies and practices. Planned work results in shorter planned outages times compared to unplanned replacement and allows Remotes to notify its customers before work is done. Pole failures are highly impactful to customers and planned work. Trouble call responses in the remote communities are disproportionately costly to mobilize and very disruptive. In case of an unplanned outage, crews are often pulled from planned jobs and the customers are out of power until the crews can be mobilized and reach the locations.

The 2016 asset condition assessment determined that Sultan has the most poles in need of replacement. While this is a small community with less than 100 customers, 26% of the poles are in need of replacement. Eighty-nine per cent of the poles in this community were installed in 1980 or earlier. Most of the poles are cedar with limited initial treatment, which are attractive homes for birds and insects. Most of these poles were installed to a 40-foot standard and modernizing the distribution system to 45 feet will improve clearances and facilitate additional joint-use applications. Other factors affecting the prioritization of this community include:

- There is an opportunity to also relocate transformers to areas more accessible by vehicles, which will reduce future trouble call costs.
- The working efficiency is major factor for this project since Remotes does not have equipment on site. All vehicles (e.g. trucks, RBDs, backhoes) will need to be brought in, so it is much better to mobilize once.

Bearskin Lake has the second most poles in need of replacement, with 17 assessed to be in poor condition. As shown in Section 1.6(b), the value of customer impacts in this community is high since there are no seasonal customers. There are 174 customers served and 640 kW of peak load at risk.

Major betterments in this community include additional pole replacements to mitigate clearance hazards and substandard designs. Therefore, this community was selected for a major betterment.

b) Comparison of Project Timing Alternatives

Projects in this program are community-focused: increasing the rate of asset replacement in the community would overharvest the assets that can be expected to remain operable in the medium term, while decreasing the rate of asset replacement would not mitigate the failure risk to the system presented by the identified deficiencies of targeted assets. Remotes' asset lifecycle optimization policies and practices state that poles should be replaced before they fail, pose a safety hazard, or cause a service interruption. Where possible, these replacements are made when other planned work in the community is planned to increase efficiency (fewer trips to the community and lower mobilization costs in the community) and minimize the number of planned outages.

c) Analysis of Project Enhancements

The program includes "like-for-like" renewals of distribution assets, whereby an asset identified as a failure risk is replaced with a new asset that conforms to modern distribution system standards. As an enhancement to this program, new Viper switches are installed to improve the reliability and cold load pickup of the distribution systems. Without these new switches, it is expected that the duration of outages experienced by customers would increase. Some "like-for-like" asset renewals include improvement to the most up-to-date standards and practices.

Locations for Viper switches are determined based on the peak load, cold load pick-up needs, and analysis of existing assets in service. In Fort Severn, the fifteen-minute high cold load pickup was 746 kW in 2016, which exceeds the peak load in this community (i.e. 650 kW in 2015) by 15%. In Lansdowne, the cold load pickup was 647 kW in 2015, which exceeds the peak load in this community by 12%. New Viper switches in both locations will improve the cold load pickup and on-site trouble response options in these communities. Once the switches are installed, operators will be able to respond to abnormal situations without having to dispatch a crew. This saves the dispatch cost and delay for customers, typically four hours. Remotes plans to install two Viper switches each year until there is at least one switch in every mid- to large-sized community.

## 2.3. Project/Program Timing and Expenditure

a) Historical and Future Capital and Related O&M Expenditures

| | Historical Costs ($ '000) | | | | | Future Costs ($ '000) | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | **2013** | **2014** | **2015** | **2016** | **2017*** | **2018** | **2019** | **2020** | **2021** | **2022** |
| Capital (Gross) | 1,217 | 543 | 584 | 817 | 610 | 636 | 743 | 783 | 797 | 813 |
| Contributions | (271) | (138) | (72) | (59) | (134) | (140) | (164) | (172) | (176) | (176) |
| Removals | (250) | (64) | (54) | (67) | (73) | (76) | (89) | (94) | (96) | (98) |
| **Net Capital** | **697** | **340** | **458** | **692** | **403** | **420** | **490** | **517** | **525** | **539** |
| O&M | - | - | - | - | - | - | - | - | - | - |

*0 months of actual spending included in 2017

b) Start Date
Mid-summer

c) In-Service Date
Late fall

d) 2018 Test Year Expenditure Timing

| | Forecast Cost ($ '000) | | | |
|---|---|---|---|---|
| | **Q1** | **Q2** | **Q3** | **Q4** |
| Capital (Gross) | - | 210 | 210 | - |
| O&M | - | - | - | - |

e) Comparative Expenditure Information

Comparative costs over the historical period are shown in the table in Section 2.3a above. The historical and future costs include travel, labour, and materials.

## 2.4. Project Benefits

a) Operational Efficiency and Cost Effectiveness

The proactive replacement of distribution system assets allows Remotes to efficiently allocate its resources in a planned manner. In general, proactive replacements are more cost effective than reactive replacements.

b) Customer

Customers benefit from improved reliability, which is a key driver for customer satisfaction.

c) Safety

This investment reduces safety hazards posed by defective poles and other distribution equipment identified during inspections.

d) Cyber-Security, Privacy

The new Viper switches do not include two-way communication; therefore, there is no negative effect on cyber security.

e) Co-ordination, Interoperability

Remotes coordinates with the local First Nations and Band Councils when planning betterment projects.

f) Economic Development

Most of Remotes' customers are First Nations, and many of their suppliers and contractors are First Nation enterprises. Remotes frequently hires local station operators and provides extensive training. The investment will improve the reliability of electrical service, which is conducive to economic growth in the community.

g) Environment

The proactive replacement of distribution transformers included in this investment programs reduces the risk of an oil leak or spill from the deteriorated transformers earmarked for replacement. New distribution transformers installed in the field meet the latest energy efficiency standards.

h) <u>System Impacts</u>

Investments into new Viper switches will improve the cold load pickup of the distribution systems. The investment is also expected to reduce distribution losses via the conductor and distribution transformer replacements.

# 3. Prioritization

## 3.1. Criteria for Prioritization

This program is measured against the following four (4) risk categories:

1. Customer/reliability
2. Regulatory relationship
3. Financial
4. Reputation

a) <u>Customer/reliability</u>

Historical reliability is not tracked on an individual community level. An unexpected and sustained outage in Bearskin Lake would require approximately four hours to arrange a crew and respond on-site. Sultan would take approximately eight to ten hours to dispatch and resolve the issue. Without executing the proposed project, it is expected that the occurrence of outages would increase.

The expected magnitude of reliability improvements in Fort Severn and Lansdowne due to the installation of new Viper switches cannot be readily quantified; however, the installation of this equipment would allow immediate on-site operator response to restore power. The switches facilitate partial loading in case of a generator outage.

b) <u>Regulatory</u>

Without the project as planned, safety and reliability may be compromised, which would constrain Remotes' regulatory relationship.

c) <u>Financial</u>

Absent the project as planned, regular ongoing maintenance would be required on the lines and equipment, which would increase system O&M costs. Emergency repairs are not as efficient as planned maintenance. Trouble costs generally start at $10k due to transportation, while an emergency pole replacement could cost as much as $30k. Bundling the work into a planned project reduces mobilization costs in terms of transportation to the community and within the community itself. Once a crew is in the community, they must excavate a hole (if required to set the pole), load the pole on a pole-trailer, transport it to the location, erect the pole, attach wires and conductors, and frame it with the crossarm and insulators. It takes longer to load and transport a single pole several times than to load several poles at once.

The new Viper switch installations are designed to allow immediate on-site operator response, which reduces travel and trouble call costs.

d) Reputation

Customers deserve and desire power that is good, safe, and reliable.

### 3.2. Consequences of Deferral

Deferring the Distribution System Improvement program would increase the probability that the assets would fail during the year, negatively impacting system reliability. Reactive replacements are more expensive than proactive replacements. Deferred renewal of the distribution system would increase the investment needs in future years and would cause spikes in revenue requirement compare to balance year-over-year investments.

### 3.3.Priority

Customer-initiated work is Remotes' first priority. Capital and maintenance investments into assets (e.g. this program) are prioritized next.

## 4. Execution Path

### 4.1. Implementation Plan

The planned work will be completed by a dedicated lines crew experienced in this type of work. Major betterments in the communities are planned to reduce the amount of resources spent on travel. In the case of minor betterments, the crews typically spend a week in the community to perform the necessary capital and O&M work. Implementation depends on the final scope of work and resourcing. Planning and material lead times both affect the order of project implementation. Sultan is slightly preferred based on asset condition and lower past investment.

### 4.2.Risks and Risk Mitigation

Cost is the largest risk to Remotes' capital projects and programs, since it is costly to transport equipment and crews to the communities. Remotes mitigates this risk through prudent project planning and work execution according to standard operating procedures. Large tools and equipment are stored in each community to reduce costs and mitigate the availability risk.

While the timing and priority of assets to be replaced may change during the year, Distribution System Improvements are well understood and generally meet cost and timing objectives.

### 4.3.Timing Factors

Crews are stationed in Thunder Bay and Remotes keeps lodgings for its crews in each community it serves. There is just one lodging facility per community; therefore, only one crew may be working in a community at a time without resorting to renting additional lodging space. The risk to limited accommodation is mitigated through coordination between crews. If emergency work is required in a community, then the timing of the planned capital investment work may be adjusted.

The ability to safely fly in crews also affects the timing of the project. If for any reason the community is inaccessible, the timing of the project must be adjusted accordingly.

The intensity of asset investment is not expected to fluctuate significantly over the forecast period. In the case that additional emergency capital work on the distribution system is identified during the year, the project plan may be altered to reflect the new priority of the assets to be replaced.

### 4.4.Cost Factors

The final cost of the project is largely affected by transportation costs, but is also affected by labour and material costs. Remotes has significant experience in planning and managing the expenditures associated with its distribution plant, and spending on Distribution System Improvements generally aligns with the budget.

If this program were not executed, it is expected that O&M costs would increase due to more trouble calls to repair the distribution system assets that are not being renewed.

### 4.5. Customer Preferences

In Remotes' latest customer survey in 2015, 65% stated that a reliable source of electricity is a key driver to their satisfaction. An important part of reducing number of outages is replacing distribution assets at their end-of-life, and keeping the distribution system in good condition.

Out of the surveyed customers who indicated that Remotes could improve their service, 32% cited "lower rates" as the most important factor to improve service. In response to these comments, this program has been paced over five years to reduce its rate impact, while still mitigating the risk of asset failures on the distribution system.

# Big Trout Lake A Generator Replacement

## 1. Project/Program Description

### 1.1.Current Issue

The A unit diesel generator in Big Trout Lake is forecast to reach 55,868 engine-hours in 2019 and is rated to be in very poor condition. The manufacturer's published recommendations for generators of this type include complete overhauls after 20,000 hours. In addition, Remotes has determined that a generator should be replaced after two rebuilds, generally at about 60,000 hours. Therefore, an engine replacement has been scheduled for this generator in 2019, with the procurement of the replacement generator to take part in 2018. Assets are often ordered and transported to site a year in advance, to mitigate transportation risks (e.g. bad weather conditions) and long lead times.

### 1.2. Project Scope

Unit A in Big Trout Lake is a medium-speed (1800 rpm), 600-kW unit. The generator was installed in 1996, making it the oldest medium-speed diesel generator deployed in Remotes' system. This unit was selected for replacement based on its age, the actual and forecast engine-hours, and its very poor condition.

### 1.3. Main and Secondary Drivers

The main driver for this investment, as per Table 1-1 in Remotes' DSP, is that the generator is at the end of its service life due to failure risk.

### 1.4.Performance Targets and Objectives

The proposed investment is consistent with Remotes' asset lifecycle optimization policies and practices for diesel generators. Replacement of a generator based on the maintenance history, engine-hours, reliability history, and age reduces outage risk, enhances system reliability, and improves generator efficiency.

System reliability is an important customer-oriented performance measure for Remotes. Remotes tracks its System Average Interruption Frequency Index ("**SAIFI**") and its System Average Interruption Duration Index ("**SAIDI**"), both of which are affected by the timely replacement of generators.

Improvements in fuel economy and emissions performance with new generation units would also result in improved generation efficiency and reduced greenhouse gas emission intensity, both of which are important performance measures for Remotes' customers.

One of Remotes' planning objectives is that the peak load in each community should not exceed 85% of the station rating. Before this limit is reached, an upgrade of the generating station is scheduled. The generation capacity in Big Trout Lake is 1600 kW and the corresponding connection limit is 1360 kW. In 2014 the peak load reached 1395 kW, exceeding the connection limit. A separate project planned for 2018 and 2019 to upgrade the generating station in Wapekeka and connect this community to Big Trout Lake by way of an overhead distribution line to relieve capacity constraints in both communities.

### 1.5. Condition of Assets

The A unit diesel engine-generator set in Big Trout Lake was installed in 1996. As of January 2, 2017, the unit has operated for a total of 48,064 engine-hours. The unit was previously overhauled twice: first in July 2005 after 20,148 engine-hours and then in June 2015 after 44,185 engine-hours.

At the time of proposed replacement in 2019, the generator is forecast to reach 55,868 hours. The unit is already in very poor condition as per asset condition assessment and should accordingly be replaced without undue delays.

### 1.6. Customer Impact

a) Customer profile for the community:

| Customer Class | Non Std A – Res. | Non Std A – Seas. | Non Std A – GS 1P | Non Std A – GS 3P | Street Lightning | Std A – Res. – Air | Std A – GS – Air | Total |
|---|---|---|---|---|---|---|---|---|
| **Community** | **Number of Customers** | | | | | | | |
| **Big Trout Lake** | 301 | - | 30 | 6 | - | 10 | 50 | **397** |

b) Customer impacts for each community:

The table below presents the customer impacts for each community. The value of customer impact is defined as follows:

- High – less than 10% seasonal customers.
- Medium – between 10 and 50% seasonal customers.
- Low – greater than 50% seasonal customers

| Community | Customer Count | Load at Risk (kW peak) | Value of Customer Impact |
|---|---|---|---|
| **Big Trout Lake** | 397 | 1395 | High |

An unplanned outage in the community can be cleared in less than two hours if the operator can respond. Otherwise, the outage time varies depending on the problem. The minimum response time is four hours to dispatch a crew to Big Trout Lake. An unplanned replacement may take up to six months. Remotes maintains an up-to-date contingency analysis for its in-service generation units. If unit A fails, then the other units can continue to serve the load.

## 2. Project/Program Justification

### 2.1. Information Used to Justify the Investment

The A unit generator set in Big Trout Lake was installed in 1996 and has been operated for 48,064 engine-hours as of January 2, 2017. Its estimated engine-hours over the forecast period are shown in the table below.

| **Year** | **2017** | **2018** | **2019** | **2020** | **2021** | **2022** |
|---|---|---|---|---|---|---|
| **Projected Engine-Hours** | 50,774 | 53,321 | 55,868 | 58,415 | 60,962 | 63,509 |

This generator has been overhauled twice and, as per Remotes' asset management process, it is more economical to replace the unit rather than overhaul it a third time. The asset condition assessment determined that this unit is in very poor condition requiring immediate replacement.

## 2.2. Alternatives Evaluation

**Alternative 1: Do nothing**

The "do nothing" option considers that the generator is run to failure without intervention.

**Alternative 2: Overhaul**

The second alternative to a generator replacement is to overhaul the unit.

a) Comparison of Project Alternatives

In the case of the "do nothing" option, the generator is run to failure. An unplanned outage in the community can be cleared in less than two hours if the operator can resolve the issue. Otherwise, the outage time varies depending on the nature problem. The minimum response time is four hours to dispatch a crew to Big Trout Lake. If the failure is irreparable, the outage would likely last a day; otherwise there could be rolling blackouts in the community lasting about a week. This is not the preferred option.

After two overhauls, it is no longer economical to overhaul the generator for a third time. This generator has been overhauled twice previously; therefore, replacement is the preferred option.

b) Comparison of Project Timing Alternatives

If the project was deferred by one year, the probability of increased maintenance and the risk of a catastrophic failure would increase. There is a spare 400-kW unit in the community. In the case of a catastrophic failure, the outage would likely last a day, otherwise there could be rolling blackouts in the community. In the medium term, a replacement would need to be flown in on an emergency basis.

c) Analysis of Project Enhancements

This project is a like-for-like renewal and does not include any project enhancements.

## 2.3. Project/Program Timing and Expenditure

a) Historical and Future Capital and Related O&M Expenditures

| | **Historical Costs ($ '000)** | | | | | **Future Costs ($ '000)** | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | **2013** | **2014** | **2015** | **2016** | **2017*** | **2018** | **2019** | **2020** | **2021** | **2022** |
| Capital (Gross) | - | - | - | - | - | 767 | 1,423 | - | - | - |
| Removals | - | - | - | - | - | (77) | (142) | - | - | - |
| **Net Capital** | **-** | **-** | **-** | **-** | **-** | **690** | **1,281** | **-** | **-** | **-** |
| O&M | - | - | - | - | - | - | - | - | - | - |

*includes 0 months of actual expenditures

b) Start Date
January 2018

c) In-Service Date
September/October 2019

d) 2018 Test Year Expenditure Timing

| | Forecast Costs ($ '000) | | | |
|---|---|---|---|---|
| | **Q1** | **Q2** | **Q3** | **Q4** |
| Capital (Gross) | 383.5 | 383.5 | - | - |
| O&M | - | - | - | - |

e) Comparative Expenditure Information

The planned total gross cost of this investment is $2,190,000 spread over two years - 2018 and 2019, with procurement of replacement generators in 2018 and installation in 2019. To compare the cost to other engine replacement investments, cost per kW should be considered. The capacity of the generator is 600 kW, so the cost per kW is $3,650.

An engine replacement was done in Deer Lake in 2016. The unit replaced is a medium speed (1800 rpm) generator with capacity 635 kW. The total cost of this project was $902,931, which equates to $1,422 per kW. Another replacement was done on the A unit in Lansdowne in 2015, a medium-speed unit rated 275 kW. The total gross cost for this project was $871,190 and the cost per kW was $3,168.

The difference between the cost of these similar investments is primarily due to the difference between the stations. The station in Deer Lake is relatively new. The station in Big Trout was built in the 1980s and is much older and smaller than the Deer Lake station. New generators use digital controls, whereas the controls in the Big Trout Lake station are analogue. The replacement will improve the voltage regulation by moving to three phases rather than a single phase. Finally, Big Trout Lake is located further from all-weather roads and further from the manufacturer.

## 2.4. Benefits

a) Operational Efficiency and Cost Effectiveness

The investment supports operational efficiency since the new engine will be more fuel efficient. Auxiliary work is done alongside the replacement to reduce engine down-time, mobilization, and travel costs. The proactive replacement of a generator unit is cost effective compared to running the unit to failure, which would otherwise incur additional maintenance, outage, and emergency replacement costs.

b) Customer

The net benefit to customers is improved system reliability based on the proactive replacement of the generator.

c) Safety

The safety benefit of the proactive replacement of the generator is risk mitigation of an unplanned generator failure.

d) Cyber-Security, Privacy

The upgrade of auxiliary systems as part of the generator replacement will install fuel and control systems that comply with the latest cyber-security standards.

e) Co-ordination, Interoperability

Remotes uses standardized station designs and all new installations comply with *O. Reg. 22/04*.

Big Trout Lake has been identified to be connected to a new transmission line by an Order-in-Council issued by the Minister of Energy. The anticipated connection date is not presently known and the Regional Planning Process yielded a draft *Remote Community Connection Plan* requiring further consultation.

The planning co-ordinated with another project to connect the distribution systems of Big Trout Lake and Wapekeka and also co-ordinated with the local Band Councils.

f) Economic Development

Most of Remotes' customers are First Nations and many of their suppliers and contractors are First Nation enterprises. Remotes frequently hires local station operators and provides extensive training. A reliable supply of electricity promotes economic growth in the region.

g) Environment

The new diesel generator set will meet the latest energy efficiency and emission performance standards, which have markedly improved since the existing unit was installed (1996). This will reduce the emissions. Furthermore, this investment ensures the reliable operation of this generator, which ensures the PLC can select the most fuel-efficient generator based on the load.

h) System Impacts

The reliable operation of Big Trout Lake Generator A will help maintain system performance.

# 3. Prioritization

## 3.1. Criteria for Prioritization

This program is measured against the following seven risk categories:

1. Customer/reliability
2. Regulatory
3. Financial
4. Efficiency
5. Environment
6. Safety
7. Reputation

a) Customer/reliability

Based on manufacturer guidelines, the probability of increased maintenance and the risk of a catastrophic failure would increase without the planned project. There is a spare 400-kW unit in the community. In the case of a catastrophic failure, the outage would likely last a day, otherwise there could be rolling blackouts in the community. In the medium term, a replacement would need to be flown in on an emergency basis.

b) Regulatory

Without the planned project, safety and reliability may be compromised, which would constrain Remotes' regulatory relationship.

c) Financial

Without the planned project, an increase in trouble with the unit is expected. The minimum response cost is $25,000. Emergency repairs are costlier since an engine may need to be procured and put in service quickly depending on the timing of its failure. Transportation costs for the unit would increase by about $100,000.

d) Efficiency

The new units are expected to be about four per cent more efficient than the older units, raising diesel fuel costs and emission levels.

e) Environment

New generators are designed to reduce emissions. The proactive replacement of the existing unit also mitigates the risk of a spill in the event of a failure.

f) Safety

Proper investment into diesel generators follow best practices recommended by manufacturers to ensure they operate safely.

g) Reputation

Customers deserve and desire power that is good, safe, and reliable.

### 3.2.Consequences of Deferral

Deferring this project would increase the probability that the generator fails, affecting reliability, regulatory relationship, financial risk, generator efficiency, environmental risk, safety risk, and reputation. This would affect the whole community of Big Trout Lake, approximately 400 customers.

### 3.3. Priority

The priority in 2018 is to purchase the engine and transport it to site to ensure that adequate generation is available to the community of Big Trout.

## 4. Execution Path

### 4.1. Implementation Plan

The 2018 costs include the design and procurement of the replacement unit. The replacement generator set is ordered in advance of winter roads. The installation, commissioning, and auxiliary upgrades will be performed in 2019. When integrating new engines into older existing systems; heating, cooling, ventilation, exhaust, electrical, fuel and control systems may be impacted. It is preferred that all necessary auxiliary work be done in conjunction with the engine replacement to reduce engine down-time, mobilization, and travel costs. The work will be done by a dedicated station crew and will be co-ordinated with another project to connect the distribution systems of Big Trout Lake and Wapekeka.

## 4.2. Risks and Risk Mitigation

The biggest risk to completion of the project as planned is in relation to costs and availability of transportation of the new generator to the community. This risk is mitigated through Remotes' staged implementation plan, in which the generator is procured one year earlier than the installation. However, despite the advance procurement, the unavailability of a winter road for an entire season may delay the project execution. If the risk of project delay becomes too great, then Remotes can hire a specialized aircraft to fly in the new unit, adding to the cost of the project.

Another risk to project completion is the availability of crew accommodation. Remotes has lodgings for only one crew in each community. Therefore, only one project can be implemented at a time in a community. If another project with a higher priority should suddenly come up in Big Trout Lake, it could affect the completion of this project. This can be mitigated by seeking to minimize the number of such emergencies through good planning and asset management. In the past, Remotes has also worked closely with the communities it serves to arrange for rental accommodation for its crews in case the lodgings are insufficient for the number of crews required.

Other risks to a project of this magnitude can occur due to manufacturing or installation defects. Remotes mitigates these risks by working closely with its suppliers, assigning trained personnel who are familiar with generator station commissioning, and performing commissioning testing.

## 4.3.Timing Factors

The project timing has been planned as per the implementation plan to allow the procurement of the generator in advance of winter roads, with the installation and commissioning planned for 2019. The timing may be affected by the availability of winter roads prior to the 2019 commissioning.

Project timing can also be affected by weather conditions affecting the ability to safely fly in crews to the community. Under this scenario, the project timing would be shifted in the year.

Remotes operates 19 generating stations serving 21 remote communities and manages 57 generators. The timing of a generator replacement may be affected by shifting priorities for generator replacements in other communities. Big Trout Lake is one of the largest communities served by Remotes (with approximately 400 customers) and Generator A was assessed to be in very poor condition – making its replacement the top priority for generator replacements over the forecast period.

## 4.4.Cost Factors

The cost of transportation is an important factor for replacing generators in remote communities in northern Ontario. The inaccessibility of the communities makes shipping both unreliable and expensive. Labour requirements during installation, commissioning, and testing will also affect the final cost of the project depending if any issues arise.

Without the planned project, O&M costs would increase due to enhanced maintenance requirements and the increased likelihood of trouble calls to the generator.

### 4.5. Customer Preferences

In Remotes' latest customer survey in 2015, 65% stated that a reliable source of electricity is a key driver to their satisfaction. Replacing this generator as per manufacturer's recommendations is an important part of maintaining the reliability of the electricity system in Big Trout Lake.

### 4.6. Leave to Construct Approval

# Generator Overhauls

## 1. Project/Program Description

### 1.1. Current Issue

Diesel engines and their components are subject to deterioration that eventually leads to a decline in equipment performance and reliability, which increases environmental risk, safety risks, and incidence of failures. The engines are designed and manufactured to require capital overhauls at regular intervals to extend service life after a specified number of operating hours. This practice ensures the reliability of the engines and reduces the likelihood of a catastrophic failure. Medium-speed engines (1800 rpm) are overhauled after 20,000 engine-hours and low-speed engines (1200 rpm) are overhauled after 42,000 hours. Usually it is economical to overhaul an engine only twice over its lifecycle.

### 1.2. Project Scope

Four or five diesel generator engine sets are overhauled each year, depending on the size of the units. The engines are selected based on engine-hours and condition. Based on the current and forecast engine-hours, the generator units planned for overhauls will most likely be a subset of the following six:

1. Kasabonika A (1000 kW)
2. Kasabonika C (600 kW)
3. Marten Falls A (650 kW)
4. Marten Falls C (250 kW)
5. Sachigo A (635 kW)
6. Weagamow C (400 kW)

### 1.3. Main and Secondary Drivers

The driver for investments in the system renewal category, as per Table 1-1 in Remotes' DSP, is assets at the end of their service life due to failure risk. The generators in question have all reached the specified number of hours after which they are due for an overhaul according to the engine manufacturer's preventative maintenance procedures. They should therefore be rebuilt to ensure generation reliability and efficiency.

### 1.4. Performance Targets and Objectives

This investment is consistent with Remotes' asset lifecycle optimization policies and practices for diesel generators. Rebuilding generators after a specified number of hours reduces risk and ensures system reliability and generation efficiency.

System reliability is an important customer-oriented performance measure for Remotes. Remotes tracks its System Average Interruption Frequency Index ("**SAIFI**") and its System Average Interruption Duration Index ("**SAIDI**"), both of which are affected by the timely overhauls of generators. System reliability is a key driver of customer satisfaction; therefore, the investment contributes to achieving the customer satisfaction.

The implementation of this program also contributes to the achievement of the desired outcomes for generation availability through improved reliability of the generators and diesel generation efficiency through improved fuel usage.

## 1.5. Condition of Assets

Remotes prepared a forecast of the operating hours for each unit. The forecast will be compared to actual operating hours. The forecast is used to determine priorities for annual overhauls. Information on the other assets in service and seasonality compared to the size of the unit are also used to prioritize work to ensure the least disruption to community reliability.

## 1.6. Customer Impact

a) Customer profile for the community:

| Customer Class | Non Std A – Res. | Non Std A – Seas. | Non Std A – GS 1P | Non Std A – GS 3P | Street Lightning | Std A – Res. – Air | Std A – GS – Air | Total |
|---|---|---|---|---|---|---|---|---|
| **Community** | **Number of Customers** | | | | | | | |
| **Kasabonika** | 206 | - | 14 | 5 | - | 11 | 17 | **253** |
| **Marten Falls** | 76 | - | 9 | 2 | - | 8 | 13 | **108** |
| **Sachigo Lake** | 131 | - | 14 | 1 | 1 | 5 | 13 | **165** |
| **Weagamow** | 244 | - | 24 | 1 | 1 | 12 | 26 | **308** |

b) Customer impacts for each community:

The table below presents the customer impacts for each community, including the expected outage duration and frequency without the planned project. The value of customer impact is defined as follows:

- High – less than 10% seasonal customers.
- Medium – between 10 and 50% seasonal customers.
- Low – greater than 50% seasonal customers

| Community | Customer Count | Load at Risk (kW peak) | Value of Customer Impact |
|---|---|---|---|
| **Kasabonika** | 264 | 1106 | High |
| **Marten Falls** | 113 | 494 | High |
| **Sachigo** | 170 | 718 | High |
| **Weagamow** | 311 | 1096 | High |

An unplanned outage in a community can be cleared in less than two hours if the operator can respond. Otherwise, the outage time varies depending on the nature of the underlying issue. The minimum response time is four hours to dispatch a crew to a community. An unplanned replacement may take up to six months. Marten Falls A is the largest generator in its community; the other three communities have larger generators that can serve the load.

# 2. Project/Program Justification

## 2.1. Information Used to Justify the Investment

Diesel engines and their components are subject to deterioration that negatively impacts equipment performance and system reliability over time. Maintenance and capital overhauls in accordance with manufacturer guidelines mitigate the risk of failure. Manufacturers recommend overhauling engines based on the number of operating hours to retain and extend the life of the unit. To proactively plan overhauls, Remotes forecasts the engine-hours based on historical trends. The units are prioritized for an overhaul based on the actual number of operating hours, the condition of the units, and their likelihood of failure. This review is performed by Remotes' generation staff who have reviewed test results and who perform regular maintenance of the units.

The projected engine-hours for the six engines shortlisted for an overhaul are shown below.

| | Year | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 |
|---|---|---|---|---|---|---|---|
| **Generator** | **Speed** | **Projected Engine-hours** | | | | | |
| **Kasabonika A** | 1200 rpm | 80,400 | 86,714 | 93,029 | 99,344 | 105,659 | 111,973 |
| **Kasabonika C** | 1800 rpm | 19,898 | 21,603 | 23,309 | 25,015 | 26,721 | 28,426 |
| **Marten Falls A** | 1200 rpm | 81,172 | 84,779 | 88,385 | 91,991 | 95,597 | 99,204 |
| **Marten Falls C** | 1800 rpm | 52 | 75 | 98 | 121 | 144 | 167 |
| **Sachigo A** | 1800 rpm | 15,495 | 19,379 | 23,264 | 27,148 | 31,033 | 34,918 |
| **Weagamow C** | 1800 rpm | 16,767 | 18,615 | 20,462 | 22,309 | 24,156 | 26,004 |

## 2.2. Alternatives Evaluation

**Alternative 1: Do nothing**

For the "do nothing" option, regular generator maintenance is continued without any capital overhaul.

**Alternative 2: Generator replacement**

This alternative considers the replacement of the generator instead of the rebuild.

a) <u>Comparison of Project Alternatives</u>

In the case of the "do nothing" option, the generator is run to failure without regard for the manufacturer's recommendations. The greatest risk under this scenario is the loss of remaining life of the generator. For a medium-speed (1800 rpm) generator, an overhaul allows the generator to run for an additional 20,000 hours until its next overhaul or replacement. For a low-speed (1200 rpm) generator, an overhaul allows the generator to run for an additional 42,000 hours until its next overhaul or replacement. Without the overhaul, it is likely that the generator would require an emergency replacement before reaching its maximum number of operating hours. Replacement of the failed generator would be more expensive than the cost of an overhaul. The run to failure strategy also poses an unacceptable safety, environmental, efficiency, and reliability risk (see Section 3.1).

A planned replacement is not the optimal intervention strategy before the second overhaul is performed. None of the engines earmarked for an overhaul have been overhauled twice. The engines can be run for an additional 20,000 or 42,000 hours, at which point the need for an additional overhaul or a replacement will be assessed. The planned replacement of these engines would be about three times the cost of an overhaul and would constitute a loss of useful life. This is not the preferred alternative.

The planned project to overhaul the units is the optimal trade-off between costs and benefits and is the most economic option to extend the lives of these generators.

b) Comparison of Project Timing Alternatives

Remotes owns 57 generator units that are currently in service. If the number of overhauls is decreased each year, the overall risk of failures in at least one community would consequently increase. Based on the forecast number of operating hours, there are more generators that will require overhauls than resources to meet these guidelines. Remotes regularly monitors the generator maintenance records to determine which units are the highest priority to complete.

Remotes already checks its forecast of operating hours against its maintenance records and the results of tests on the units. If the program spending is reduced, then generation redundancy would be compromised across Remotes' service territory. Regular maintenance on the remaining generators would, therefore, also be compromised. Depending on which engines remain in service and on the season, this may necessitate rotating blackouts.

Starting a project in peak load season (midwinter) is avoided to reduce risk to other unit failures, which would run more continuous and at higher loads during this time.

c) Analysis of Project Enhancements

The scope of work does not include any project enhancements in addition to the planned overhauls.

## 2.3.Project/Program Timing and Expenditure

a) Historical and Future Capital and Related O&M Expenditures

| | Historical Costs ($ '000) | | | | | Future Costs ($ '000) | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | **2013** | **2014** | **2015** | **2016** | **2017*** | **2018** | **2019** | **2020** | **2021** | **2022** |
| Capital (Gross) | 710 | 663 | 755 | 691 | 670 | 675 | 688 | 702 | 718 | 732 |
| Removals | (58) | (66) | (75) | - | (67) | (68) | (69) | (70) | (72) | (73) |
| **Net Capital** | **652** | **597** | **680** | **691** | **603** | **608** | **619** | **632** | **646** | **659** |
| O&M | - | - | - | - | - | - | - | - | - | - |

*includes 0 months of actual expenditures

b) Start Date
April 1, 2018

c) In-Service Date
November 30, 2018

d) 2018 Test Year Expenditure Timing

| | Forecast Costs ($ '000) | | | |
|---|---|---|---|---|
| | **Q1** | **Q2** | **Q3** | **Q4** |
| Capital (Gross) | - | 225 | 225 | 225 |
| O&M | - | - | - | - |

e) Comparative Expenditure Information

Comparative expenditures for engine overhauls over the historical period are shown in the table above. The budget is based on historical trends: the average gross spending over the historical period was $698k per year and the average gross spending over the forecast period is $703k per year. The number of generators overhauled depends on the cost – determined by the speed of the unit and its size (capacity).

## 2.4. Benefits

a) Operation Efficiency and Cost Effectiveness

When generators age, they become less fuel efficient. Engine overhauls renew or extend asset life, mitigating this loss of efficiency. This also prevents premature failure of the engine and defers the need for replacement. Engine replacements are substantially costlier than overhauls, so this procedure is cost-effective.

b) Customer

This investment improves system reliability for the customers in the relevant communities.

c) Safety

Proactive rebuilding of generators mitigates the risk of an unplanned generator failure, which may pose a safety concern.

d) Cyber-Security, Privacy

This investment pertains to the generators themselves and not to its controls or communication auxiliaries.

e) Co-ordination, Interoperability

Remotes coordinates with the Band Councils concerning new investments.

f) Economic Development

The majority of Remotes customers are First Nations and many of their suppliers and contractors are First Nation enterprises. Remotes frequently hires local station operators and provides extensive training. This investment is expected to maintain the reliability of the electrical systems and a reliable supply of electricity is good for economic growth.

g) Environment

As generators undergo operational wear-and-tear, their fuel efficiencies decrease. An engine overhaul improves the condition of the generator and mitigates the efficiency losses. Furthermore, this investment ensures the reliable operation of these generators, which ensures the PLCs can select the most fuel-efficient generators based on the load.

h) System Impacts

This investment helps maintain system performance.

# 3. Prioritization

## 3.1. Criteria for Prioritization

This program is measured against the following seven risk categories:

1. Customer/reliability
2. Regulatory relationship
3. Financial
4. Efficiency
5. Environment
6. Safety
7. Reputation

a) Customer/reliability

Based on manufacturer guidelines, the probability of increased maintenance and the risk of a catastrophic failure will increase without the planned project. Regular maintenance of the remaining generators would also be impacted, increasing the risk of community-wide outages as generators are taken out of service for maintenance. Depending on which unit failed and when a new unit could be procured and put into service, and on the season, rotating blackouts could be in place for a week or longer. Remotes does not have spare units on site in every community; therefore, the replacement unit would have to be procured and transported to the community. For the fly-in communities, this would represent an unacceptable risk to reliability as a replacement unit would need to be transported to the community. If a second unit were to fail, a community evacuation could potentially be required.

b) Regulatory

Without the planned program, safety and reliability may be compromised, which would constrain Remotes' regulatory relationship.

c) Financial

Without the planned program, additional oil changes, inspections and valve sets would still be done. Alternately, the engine may require replacement. The cost on average would be $600-$700k to replace, compared to an overhaul at approximately $200k. Any failure is treated as an emergency. Unplanned trips to the community would also be required. The remaining life of the generator would be lost and a new engine is about three (3) times more expensive than an overhaul.

d) Efficiency

Remotes' generating stations are typically designed with three generators, sized to meet load within communities. The two smaller units are normally capable of carrying the peak load in the community. This design allows for redundancy in the event of a failure. If a single generator were to fail, there would not be an outage in the community. However, there would be a loss of fuel efficiency, leading to higher volumes of fuel burnt, with higher costs and higher emissions. Depending on which generator is out of service, fuel efficiency would be affected (for example, the large unit is most efficient during peak load and is less efficient if run to meet lower loads). If Remotes' engines cannot follow load, diesel fuel consumption would increase by about 10%.

e) Environment

The reduction in generator efficiency without the engine overhaul program would increase the emissions intensity. In addition, an unplanned engine failure may create a hole in the engine block, which would leak coolant and fuel contaminants and increase the risk of fire.

f) Safety

Proper investment into diesel generators follow best practices recommended by manufacturers to ensure they operate safely. If someone is in the station when a unit fails, he or she could be struck by flying parts.

g) Reputation

Customers deserve and desire power that is good, safe, and reliable.

## 3.2. Consequences of Deferral

Remotes manages 57 engines. Reducing investment in engine overhauls would gradually lead to increased risk in terms of reliability, regulatory, financial, efficiency, environment, safety, and reputation.

## 3.3. Priority

Remotes prioritizes investments into generator overhauls based on the availability of resources. Trouble calls and operational defects always take priority over engine overhauls. This is a high priority program in the capital plan.

# 4. Execution Path

## 4.1. Implementation Plan

The work is performed between April and November to avoid a planned outage during peak load conditions in winter. The need to overhaul each unit is assessed based on the actual operating hours accrued. The timing of the overhaul is prioritized using available resources. Trouble calls and the repair of operational defects are prioritized before overhauls. Overhauls are completed by a dedicated station crew which is also responsible for the maintenance of Remotes' generators.

## 4.2. Risks and Risk Mitigation

Another risk to project completion is the availability of crew accommodation. Remotes only has lodgings for one crew in each community. Therefore, only one project can be implemented at a time in a community.

## 4.3.Timing Factors

The project plan is based on the forecast number of engine-hours for these units in 2017 and 2018, which will necessitate the overhaul. In case the actual engine-hours of the units were to differ significantly from the projection, then it may be necessary to alter the project plan in the 2018 Test Year to include generators that have reached the threshold number of engine-hours.

### 4.4. Cost Factors

The cost of a generator overhaul is largely based on the size of the generator. Although these costs are well understood and can be planned in accurately in advance, the units requiring an overhaul may change in accordance with the factors listed in Section 4.3 above, which may affect the final cost of the project.

Without the planned project, O&M costs would increase due to enhanced maintenance requirements and the increased likelihood of trouble calls to the generator.

### 4.5. Customer Preferences

In Remotes' latest customer survey in 2015, 65% stated that a reliable source of electricity is a key driver to their satisfaction. Overhauling generators as per manufacturer's recommendations is an important part of maintaining the reliability of the electricity systems.

### 4.6.Leave to Construct Approval

N/A

## 5. REG Investment Costs

N/A

# Diesel Plant Civil Improvements

## 1. Project/Program Description

### 1.1. Current Issue

Diesel plant civil improvements are required to maintain the safety and operability of the diesel generating stations. In the 2018 Test Year, improvements are planned at the diesel generating stations in Kingfisher Lake and Weagamow.

### 1.2. Project Scope

This investment includes improvements of the diesel plant in Kingfisher Lake and Weagamow. The work will include DGS siding, insulation, roofing, and concrete betterment. Diesel plant civil improvements are performed every year, and the community is chosen based on assessment of relative needs.

The diesel generator station facility located in Kingfisher Lake is a manufactured steel building. The roof structure consists of steel liner panels acting as the interior ceiling and doubling as the air/vapour barrier. The roof's thermal layer is composed of fiberglass batt insulation. The roof/ceiling support consists of horizontal steel with steel Z-girts running perpendicular to the horizontal structure to support the liner panel ceiling below. The proposed project would form a tempered air space above the existing panels. In addition, proper airflow from soffit to the ridge should also be created within the new tempered air space. By providing a tempered space above the existing steel roof, any heat loss which would occur at the eave location must now be transferred through the air space before transmitting heat to the new roof panels above. By enabling proper airflow into the air space by allowing fresh cold air in from the soffit and venting out at the ridge, heat transfer through the air space to the new steel roof panels can be significantly reduced.

Similarly, Weagamow's diesel generator station is a steel manufactured building. Roof construction consists of horizontal steel liner panel acting as the ceiling and as the air/vapour barrier for the roof. The insulation in the attic space is a single batt of fiberglass insulation. In addition to the ventilation issue identified at the Kingfisher diesel generator station, Weagamow has insufficient insulation within the attic space. As there is limited space within the existing attic for placement of additional batt insulation, the existing roof panels will be removed to facilitate additional fibreglass batt insulation and creation of a tempered air space.

### 1.3. Main and Secondary Drivers

The driver for investments in the system renewal category, as per Table 1-1 in Remotes' DSP, is that assets are at the end of their service life, resulting in substandard performance. In the case of civil improvements, this refers to the condition of the generating plant building itself. Poor condition of the diesel plant causes poor working conditions for Remotes' staff and can even threaten the health and safety of staff and the general public.

## 1.4. Performance Targets and Objectives

The proposed investment would improve daily working conditions of staff and operators in Kingfisher Lake and Weagamow, as well as mitigate safety hazards that would otherwise have to be mitigated through costly workarounds. As part of its metric tracking initiatives, Remotes tracks the number of lost time injuries and the total number of recordable injuries and upgrades to the diesel plants will assist in achieving the targets for these metrics. In accordance with Remotes' asset lifecycle optimization policies and practices, the capital upgrade is the more effective method of mitigating the risk compared to costly maintenance.

## 1.5. Condition of Assets

At Kingfisher Lake, the lack of ventilated airspace at the eaves is causing ice formation at the roof edge, leading to safety risks. To date, Remotes has worked around the issue by connecting temporary ice-stops to the light gauge roof panels, but the fasteners continually pull out of the light gauge material, requiring a great deal of maintenance and compromising the effectiveness of the steel roofing panels.

In Weagamow, ventilation in the attic space is insufficient and there is no air space at the exterior wall locations due to insufficient heel height on the roof trusses. In addition, the roof panels are beginning to show signs of deterioration on the exterior.

## 1.6. Customer Impact

a) Customer profile for the community:

| Customer Class | Non Std A – Res. | Non Std A – Seas. | Non Std A – GS 1P | Non Std A – GS 3P | Street Lightning | Std A – Res. – Air | Std A – GS – Air | Total |
|---|---|---|---|---|---|---|---|---|
| **Community** | **Number of Customers** | | | | | | | |
| **Kingfisher Lake** | 108 | - | 10 | 2 | - | 4 | 17 | **141** |
| **Weagamow** | 244 | - | 24 | 1 | 1 | 12 | 26 | **308** |

b) Customer impacts for each community:

The table below presents the customer impacts for each community. The value of customer impact is defined as follows:

- High – less than 10% seasonal customers.
- Medium – between 10 and 50% seasonal customers.
- Low – greater than 50% seasonal customers

| Community | Customer Count | Load at Risk (kW peak) | Value of Customer Impact |
|---|---|---|---|
| **Kingfisher Lake** | 141 | 649 | High |
| **Weagamow** | 308 | 1096 | High |

## 1.7. Supporting Documentation

The *Diesel Generator Station Roof Assessment Report* is attached as Appendix H to the DSP. Photos of the two stations with upgrades planned in 2018 are provided on the following pages, as excerpted from the report.

**Figure 1: Kingfisher Lake Diesel Generating Station (Exterior)**

**Figure 2: Existing Roof Insulation Thickness (Kingfisher Lake)**

**Figure 3: Roof Panel Mid-Span & Eave Support (Kingfisher Lake)**

**Figure 4: Roof Panel Peak Support (Kingfisher Lake)**

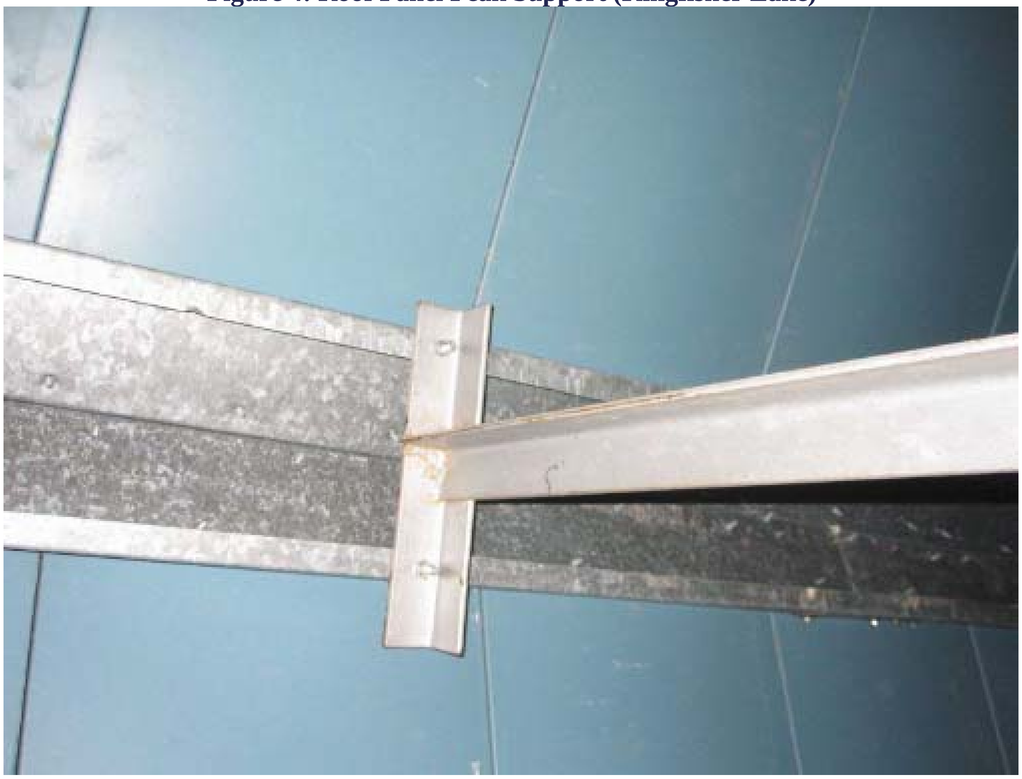

**Figure 5: Roof Panel Peak Support (Kingfisher Lake)**

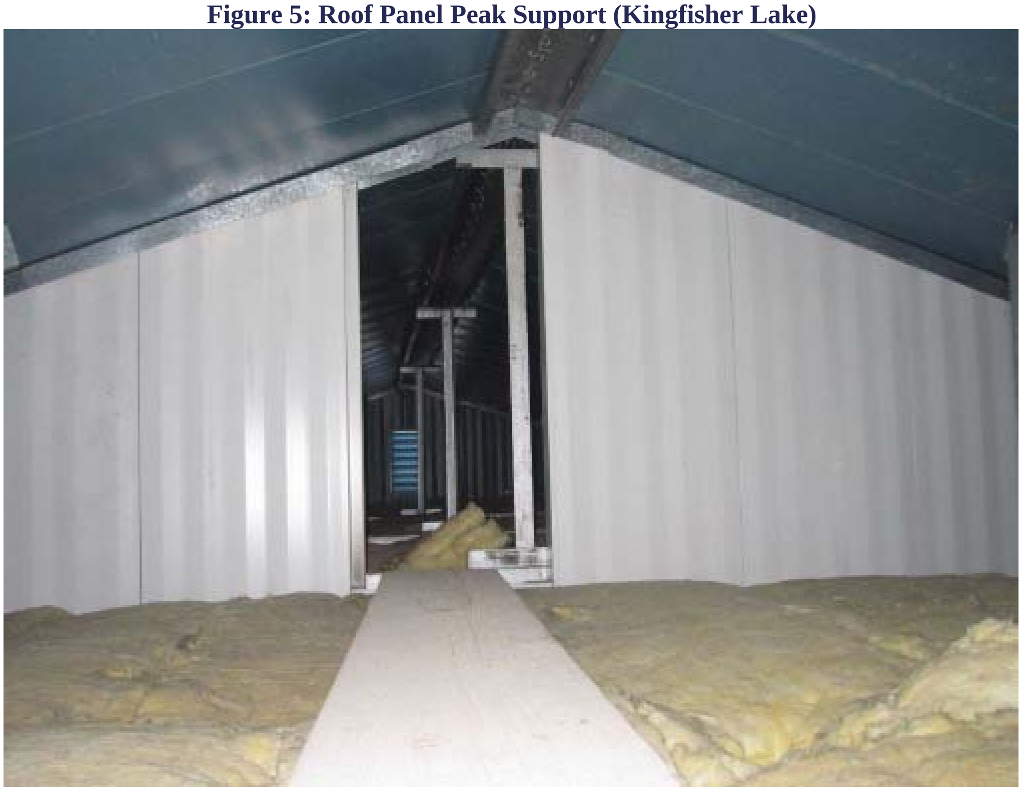

**Figure 6: Roof Framing (Weagamow)**

**Figure 7: CFC Purlins (Weagamow)**

**Figure 8: Insufficient Air Space (Weagamow)**

**Figure 9: Beginnings of Visible Ice Formation (Weagamow)**

**Figure 10: Exposed Fuel Line Tray & Visible Heat Loss (Weagamow)**

**Figure 11: Visible Heat Loss & Roof Panel Deterioration Signs (Weagamow)**

# 2. Project/Program Justification

## 2.1. Information Used to Justify the Investment

A report by FORM Architecture Engineering titled *Diesel Generator Station Roof Assessment Report & Recommendations* provides the justification for the investment. The report is included as Appendix H to the DSP.

## 2.2. Alternatives Evaluation

**Alternative 1: Do nothing**

The "do nothing" option considers no capital investment or preventative maintenance to the diesel generating stations. Staff and the operator would continue to work in the plant and the safety of these workers would be compromised.

**Alternative 2: Preventive maintenance**

The icing concerns can be temporarily mitigated using ice-stops connected to light gauge roof panels.

**Alternative 3: Build a new diesel generating station**

A new station is planned for the community; however, the timing and amount of available INAC funding is uncertain. The station must be in service and usable until a new modular unit is built. When the new station is completed, it is anticipated that most of the old plant will be used for storage. Therefore, the building will still be used and useful.

a) Comparison of Project Alternatives

In the case of the "do nothing" option, the ice formation would pose an unacceptable safety risk at the diesel generating stations. This is not a feasible alternative.

The fasteners installed as part of the preventative maintenance option continually pull out of the light gauge material. This requires costly maintenance to ensure performance. In addition, continual re-attachment of the temporary ice-stop material provides new penetrations through the roof panels and compromises the effectiveness of the roofing material. This is not the preferred alternative.

The alternative to build a new diesel generating station would mitigate the concerns of the existing station but would cost much more than the planned site upgrade. The condition of the remainder of the diesel generating station does not warrant a complete rebuild. This is not the preferred alternative.

The planned upgrades in Kingfisher Lake and Weagamow will mitigate the safety risk of ice formation without requiring costly and ongoing maintenance over the life of the building. The planned upgrade in Weagamow will also improve the insulation to reduce the heat loss from the building. This is the preferred option, as per the recommendations of the *Diesel Generator Station Roof Assessment Report*.

b) Comparison of Project Timing Alternatives

Deferral of the project would mean that the station roofs continue to deteriorate and ice build-up would continue to put staff and operators at risk. More important, the stations where roofs are planned are all old and, at some point, maintenance to keep the integrity of the building intact is required. Deferral of these investments could result in the need for further civil work as the building envelope could be compromised.

c) Analysis of Project Enhancements

Full details of the recommended upgrades planned under this project can be found in Appendix H.

## 2.3.Project/Program Timing and Expenditure

a) Historical and Future Capital and Related O&M Expenditures

| | Historical Costs ($ '000) | | | | | Future Costs ($ '000) | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | **2013** | **2014** | **2015** | **2016** | **2017** | **2018** | **2019** | **2020** | **2021** | **2022** |

b) Start Date
April/May 2018

c) In-Service Date
June 30 to July 30, 2018

d) Comparative Expenditure Information

| | Forecast Costs ($ '000) | | | |
|---|---|---|---|---|
| | **Q1** | **Q2** | **Q3** | **Q4** |
| Capital (Gross) | - | 173 | 173 | - |
| O&M | - | - | - | - |

e) Comparative Expenditure Information

Comparative information on expenditures for equivalent projects/activities can be found in Section 2.3(a) above. The cost of diesel plant civil improvements depends on the scope of work for each station.

## 2.4. Benefits

a) Operational Efficiency and Cost Effectiveness

As per the Comparison of Project Alternatives, the alternative to the capital upgrade is preventative maintenance to prevent ice formation at the diesel generating stations. The fasteners installed as part of the preventative maintenance option continually pull out of the light gauge material, therefore the maintenance must be performed continually. The continual reattachment of the temporary ice-stop material provides new penetrations through the roof panels and compromises the effectiveness of the roofing panels. The investment mitigates the structural compromise cost effectively without the need for continuous maintenance.

b) Customer

Customers benefits from the safety improvement in the communities. Since the investment is cost effective compared to continual maintenance over the life of the diesel generating station, ratepayers also benefit from the cost effectiveness of the investment.

c) Safety

The investment will mitigate a safety risk of ice formation at the diesel generating station.

d) Cyber-Security, Privacy

Not applicable to civil upgrades.

e) Co-ordination, Interoperability

This project applies recognized engineering principles based on a third-party report by FORM Architecture Engineering, stamped by a Professional Engineer registered in the Province of Ontario. The report has been included as Appendix H to the DSP. Remotes coordinates with the local Band Councils for upgrades in the communities.

The station in Weagamow is old and is not in good repair. INAC funding for a new plant may become available; however, the scope and timing of INAC funding is uncertain. Once funding is received it will be spread over multiple years for the entire station rebuild. In the interim, the community will continue to require reliable electricity and measures are required to mitigate the safety hazards.

f) Economic Development

The majority of Remotes customers are First Nations and many of their suppliers and contractors are First Nation enterprises. Remotes frequently hires local station operators and provides extensive training.

g) Environment

The additional fiberglass insulation at Weagamow diesel generating station will reduce the amount of energy lost to the environment.

h) System Impacts

Not applicable to civil upgrades.

# 3. Prioritization

## 3.1.Criteria for Prioritization

This program is measured against the following two risk categories:

1. Financial
2. Safety

a) Financial

Without the planned projects, ice barriers would need to be installed. This is a temporary fix necessitating frequent capital reinvestment. A new roof would eventually be required at Weagamow.

b) Safety

Falling ice is a serious safety risk for operators and staff entering or leaving the generation station.

### 3.2. Consequences of Deferral

If either project were deferred, falling ice would remain a safety hazard at these stations. Roofs would be subject to further deterioration. Maintenance work to install ice barriers in each of the communities would continue to be required.

### 3.3. Priority

Civil projects are a lower priority than those that affect community reliability. However, the safety of staff and station operators is also a priority.

## 4. Execution Path

### 4.1. Implementation Plan

The project includes insulation and roofing upgrades. The work will be done by experienced construction personnel familiar with building upgrades. The work will be coordinated with other work in the communities, including a planned capacity upgrade of the Weagamow generator. The generator will be procured in 2018 and installed in 2019, therefore the two projects will not interfere with one another.

### 4.2. Risks and Risk Mitigation

The biggest project risk is the use of in-house labour as the project is labor intensive. It will be managed through regular involvement and oversight by both the civil department and the project planner.

### 4.3. Timing Factors

The ability to safely fly in crews can affect the timing of this project.

### 4.4. Cost Factors

The project cost estimate is based on the expected labour hours and material costs, which can vary for civil upgrades in remote communities in northern Ontario. The net spending on the Weagamow generating station improvements depends on the capacity upgrade project in Weagamow. If the civil plant is replaced as part of the upgrade, then the cost would be recoverable through INAC.

### 4.5. Customer Preferences

Poor condition of the generating station can cause an increase in outages and reduce reliability.

### 4.6. Leave to Construct Approval

N/A

# 5. REG Investment Costs

N/A

# SCADA & PLC Replacements

## 1. Project/Program Description

### 1.1.Current Issue

This program seeks to upgrade the Supervisory Control and Data Acquisition ("**SCADA**") and Programmable Logic Controller ("**PLC**") systems deployed in the Remotes' generating stations along with telecommunications equipment used to monitor the operation of this equipment. The PLC and SCADA equipment currently in use are, on average, nearly 20 years old. New replacement parts to conduct repairs are no longer available given the models' obsolescence, while used parts are increasingly difficult to procure. Moreover, the Compact TSX PLC equipment is near its maximum memory storage capacity and lacks the spare input/output points that could enable temporary upgrades. Current site connectivity (required for remote monitoring and operation) is provided by obsolete dial-up modem technology, with significant speed and reliability implications.

### 1.2. Project Scope

The planned replacements, targeted for the 2018 Test Year include satellite or fibre optic communications equipment and SCADA upgrade at Armstrong, Gull Bay, Kingfisher Lake, Sachigo Lake, and Weagamow, along with the PLC unit upgrade at Armstrong.

### 1.3. Main and Secondary Drivers

As per Table 1-1 in Remotes' DSP, system reliability and operational efficiency are the main drivers for the planned communication, SCADA and PLC upgrades.

### 1.4. Performance Targets and Objectives

The PLC and SCADA systems are integral to efficient and reliable operation in the Remotes service territories – automation of Remotes generator equipment to follow communities' load profiles throughout the day has enabled the company to achieve a 10% improvement in fuel efficiency. Furthermore, real-time monitoring of generator station equipment permits Remotes to quickly identify station failures such as outages or fuel spills, resulting in better system reliability and environmental protection through faster issue identification and response, along with ensuing benefits to the related corporate performance measures.

### 1.5.Customer Impact

a) <u>Customer profile for the community:</u>

The following table showcases the number and rate classification of customers in the communities targeted for upgrades:

| Customer Class | Non Std A – Res. | Non Std A – Seas. | Non Std A – GS 1P | Non Std A – GS 3P | SL | Std A – Res. – Road | Std A – GS – Road | Std A – Res. – Air | Std A – GS – Air | Total |
|---|---|---|---|---|---|---|---|---|---|---|
| **Community** | | Number of Customers | | | | | | | | |
| **Armstrong** | 240 | 39 | 58 | 6 | 2 | 5 | 12 | - | - | **362** |
| **Gull Bay** | 86 | - | 8 | - | - | 3 | 9 | - | - | **106** |
| **Kingfisher Lake** | 108 | - | 10 | 2 | - | - | - | 4 | 17 | **141** |
| **Sachigo Lake** | 131 | - | 14 | 1 | 1 | - | - | 5 | 13 | **165** |
| **Weagamow** | 244 | - | 24 | 1 | 1 | - | - | 12 | 26 | **308** |

b) Customer impacts for each community:

The table below presents the customer impacts for each community, including the expected outage duration and frequency without the planned project. The value of customer impact is defined as follows:

- High – less than 10% seasonal customers.
- Medium – between 10 and 50% seasonal customers.
- Low – greater than 50 seasonal customers

| Community | Customer Count | Load at Risk (kW peak) | Value of Customer Impact |
|---|---|---|---|
| **Armstrong** | 362 | 1035 | Medium |
| **Gull Bay** | 106 | 334 | High |
| **Kingfisher Lake** | 141 | 649 | High |
| **Sachigo Lake** | 165 | 718 | High |
| **Weagamow** | 308 | 1096 | High |

## 1.6. Supporting Documentation

Remotes is in the process of equipping all of its generating stations towards a standard equipment set-up consisting of:

- Fiber or satellite telecommunications equipment.
- M340 – BMXP342020 or M580 PLC hardware with firmware version 10.0.
- Momentum – 171-CBU-980-90 PLC hardware with firmware version 10.0.
- Small PC – SDC170 touchscreen or desktop PC IFix hardware.
- Windows 7 Pro and IFix 5.8 software with Proficy Historian

Establishing a standard equipment complement in each community is expected to simplify the maintenance, repairs/replacements, and incident response efforts throughout the Remotes' service territory, thereby positively impacting the company's servicer levels while managing the aggregate costs.

The following table summarizes the existing equipment at each generating station. The existing solutions are over 10 years old. Remaining with the current configuration will increase risk due to the lack of replacement parts and outdated software.

# 2. Project/Program Justification

## 2.1. Information Used to Justify the Investment

Remotes' PLC and SCADA systems were originally installed between 1998 and 2000, and vendors no longer support the existing equipment and software. In the event of failure, the Remotes personnel rely on internal expertise and available spare equipment to rectify the issues as they arise. As the existing equipment continues to age, the probability of its failure (across a variety of potential causes) continues to increase, thereby increasing the risk to continuous system operations at an acceptable standard.

## 2.2. Alternatives Evaluation

**Alternative 1: Do nothing**

The "do nothing" alternative entails no SCADA or PLC upgrades, and the current configurations are used at Remotes' substations.

**Alternative 2: SCADA and PLC replacement at another station**

This alternative assumes that SCADA and PLC upgrades at other stations than those planned in the 2018 Test Year where these upgrades could ostensibly be justified.

a) Comparison of Project Alternatives

In the case of the "do nothing" option, functionality and system capability are expected to be significantly reduced going forward. This is not the preferred alternative.

To compare various stations for upgrades, the following metrics were considered:

- Remoteness: distance from the service centre (Thunder Bay).
- Population of the community.
- Availability of auxiliary power for the communication, SCADA, and PLC systems.
- Reliability of existing communication systems.

The annual project priorities are based on the worst performing station infrastructure. Each metric above was given a composite index rating on the basis of the above criteria. The outcome of the rankings was used to prioritize the stations. The following table summarizes the results of the analysis.

| Community | Remoteness | Population | Aux. Power | Comm. Reliability | Total |
|---|---|---|---|---|---|
| Big Trout | 17 | 19 | 0 | 2 | 38 |
| Sandy Lake | 15 | 20 | 1 | 1 | 37 |
| Fort Severn | 20 | 10 | 0 | 5 | 35 |
| Bearskin | 19 | 13 | 0 | 2 | 34 |
| Sachigo | 18 | 12 | 0 | 2 | 32 |
| Wapekeka | 16 | 11 | 0 | 5 | 32 |
| Deer Lake | 14 | 15 | 1 | 1 | 31 |
| Kasabonika | 13 | 16 | 0 | 2 | 31 |
| Weagamow | 12 | 17 | 0 | 2 | 31 |
| Deer Lake Hydel | 14 | 15 | 0 | 1 | 30 |
| Armstrong | 3 | 18 | 0 | 4 | 25 |
| Webequie | 10 | 14 | 0 | 1 | 25 |
| Kingfisher | 11 | 9 | 0 | 2 | 22 |
| Marten Falls | 8 | 8 | 1 | 1 | 18 |
| Lansdowne | 9 | 6 | 0 | 2 | 17 |
| Bisco | 7 | 5 | 0 | 2 | 14 |
| Sultan | 6 | 4 | 0 | 2 | 12 |
| Gull Bay | 2 | 7 | 0 | 2 | 11 |
| Hillsport | 4 | 3 | 0 | 2 | 9 |
| Oba | 5 | 2 | 0 | 2 | 9 |

b) Comparison of Technically-Feasible Alternatives

Communications infrastructure alternatives include fibre, satellite, and dial-up internet. Fibre is the most reliable and flexible technology, since it is available consistently and offers the most bandwidth. Satellite offers intermittent but successful communications. Dial-up is the least effective, since there is limited bandwidth and availability is affected by power outages in other communities. The preferred communications infrastructure was selected based on available technologies within the communities, with the elimination of dial-up considered the highest priority. In the fly-in communities, there is only a single provider of fibre infrastructure. Fibre infrastructure is installed where available, otherwise satellite communications is used. Canadian satellite communication providers are limited to a sole source tailoring to the industrial environment with a proven track record.

The SCADA and PLC technology was chosen for compatibility with existing systems to reduce training costs and changes to existing infrastructure.

## 2.3.Project/Program Timing and Expenditure

a) Historical and Future Capital and Related O&M Expenditures

| | Historical Costs ($ '000) | | | | | Future Costs ($ '000) | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | 2013 | 2014 | 2015 | 2016 | 2017* | 2018 | 2019 | 2020 | 2021 | 2022 |
| Capital (Gross) | - | - | - | - | 413 | 505 | 726 | 675 | 391 | 353 |
| Removals | - | - | - | - | - | - | - | - | - | - |
| **Net Capital** | **-** | **-** | **-** | **-** | **413** | **505** | **726** | **675** | **391** | **353** |
| O&M | - | - | - | - | - | - | - | - | - | - |

*0 months of actual expenditures included in 2017

b) Start Date
January 1, 2018

c) In-Service Date
December 31, 2018

d) 2018 Test Year Expenditure Timing

| | Forecast Costs ($ '000) | | | |
|---|---|---|---|---|
| | Q1 | Q2 | Q3 | Q4 |
| Capital (Gross) | 126.25 | 126.25 | 126.25 | 126.25 |
| O&M | - | - | - | - |

e) Comparative Expenditure Information

There are no equivalent historical projects of this nature.

## 2.4. Benefits

a) Operational Efficiency and Cost Effectiveness

The SCADA and PLC systems are key to ensuring the operational efficiency of the generators.

b) Customer

This investment affects system reliability, by allowing real-time monitoring of the station.

c) Safety

A functional and up-to-date SCADA system allows Remotes' personnel to accurately assess any issue which may arise, thus improving employee and public safety.

d) Cyber-Security, Privacy

In accordance with the NIST Guide to Industrial Control Systems Security, the planned upgrade includes restrictions of physical access to the station, PLC monitoring to detect security events, a demilitarized zone ("**DMZ**") network architecture, and restrictions of unauthorized remote access.

e) Co-ordination, Interoperability

Remotes coordinates with Band Councils concerning new investments. The investment enables future operational requirements at the generating stations in question.

Interoperability and compatibility are incorporated into the design.

f) Economic Development

Most of Remotes' customers are First Nations and many of their suppliers and contractors are First Nation enterprises. Remotes frequently hires local station operators and provides extensive training.

g) Environment

The SCADA and PLC upgrades are expected to improve the company's fuel efficiency and enhanced ability to quickly identify fuel spills.

# 3. Prioritization

## 3.1. Criteria for Prioritization

This program is measured against the following four risk categories:

1. Customer/reliability
2. Financial
3. Efficiency
4. Environment

a) Customer/reliability

Currently, a SCADA system breakdown requires manual agent operation of the generating equipment. Outage information is no longer available, leading to longer outages. SCADA information is necessary for troubleshooting the cause of generation station outages. When operator intervention is required, communication is improved with SCADA information.

Outages related to a PLC failure can normally be cleared in less than an hour. The frequency of outages increases due to PLC failures. Lack of connectivity reduces knowledge of outage cause, reducing ability to troubleshoot problems remotely. Also, customers may need to call before an outage is detected.

b) Financial

The PLC controls many plant interactions, including general selection and power output. Operators can run the plant manually; however, this is difficult and inefficient. Troubleshooting will likely be necessary to return the plant to operation. PLC troubleshooting would require a flight ($5000) and labour hours.

c) Efficiency

The estimated benefit of the overall SCADA and PLC system is a 10% increase in fuel efficiency. Fuel tanks are monitored via the SCADA system. Spill alarms are also connected to the SCADA system. Response to spill events could be delayed, increasing the scope and cost of rectification efforts.

d) Environment

Absent the planned program, generation emissions would be higher due to the reduced generator efficiency. A SCADA malfunction may results in a longer response time in case of a spill, which increases the risk of contaminants leaking into the environment.

### 3.2.Consequences of Deferral

Automation of the plants and an ability to monitor performance is critical to investigate the cause of outages. Without reliable communications, SCADA, and PLC systems, Remotes would be unable to perform preventative maintenance, troubleshooting, and rapid event notification. Furthermore, plant operation will change from automated to operator manual operation.

### 3.3. Priority

The project has been staged over several years. Improving the SCADA system provides necessary access to operational information to improve and maintain current operations. Failures of the PLC system require manual intervention, which can require flights and labour hours.

## 4. Execution Path

### 4.1. Implementation Plan

This investment consists of a three-part process:

1. Upgrade Communications

   Addition of satellite or fibre wide-network connectivity. Fibre is the preferred choice due to the speed and reliability advantage over satellite. Where fibre is not available, satellite can be incorporated.

2. Upgrade SCADA hardware and software

   To take full advantage of the upgraded communications, the SCADA systems need to handle the increased bandwidth. New hardware and software will be procured, configured, installed, and commissioned. Cyber-security, compatibility, and capacity will be incorporated in the design.

3. Upgrade PLC hardware and software

   To combat the memory capacity and the lack of input/output expandability as well as utilizing new Ethernet communication, PLC hardware replacement will occur. Each upgraded PLC will mirror the existing software.

The projects are also coordinated with other work planned at the generating stations. In 2018 civil plant upgrades are planned at the Weagamow and Kingfisher Lake diesel generating stations.

### 4.2.Risks and Risk Mitigation

The greatest risks to completing this program as planned relate to timing and cost factors, as described below.

### 4.3. Timing Factors

The ability to safely fly in crews are can affect the timing of this investment. To mitigate this risk, Remotes can work around the weather to complete the work earlier or later in the year.

### 4.4. Cost Factors

For complex system upgrades such as SCADA, PLC, and communication upgrades, the largest factor affecting the final cost of the project is cost of labour. The number of personnel depends upon the testing and commissioning requirements of each system to ensure compatibility among the various components. Since 2017 is the first year of this program, these costs are not well known. Controllable costs are minimized through extensive vendor participation prior to project rollout. By using similar systems for the different generating stations, Remotes also reduces the installation, testing, and commissioning costs.

### 4.5. Customer Preferences

In Remotes' latest customer survey in 2015, 65% of respondents stated that a reliable source of electricity is a key driver to their satisfaction. Modern engines have critical engine data available to be interfaced with the PLC and SCADA, providing the company with a better picture of the state of the plant. This information enables the maintenance staff to analyze and solve problems without undue delay, thereby managing the number of equipment interruptions.

Environmental protection is also important to Remotes' customers as identified in Remotes' 2016 Customer Workshop. This project improves diesel fuel efficiency, reducing the environmental impact of the diesel generation.

### 4.6.Regional Electricity Infrastructure Requirements

Given the nature of Remotes' operations, this project is not driven by any regional electricity infrastructure requirements. The 2016 Order-in-Council by the Minister of Energy identified 16 communities which are expected to be connected to new transmission lines passing through northern Ontario, including Sachigo Lake, Kingfisher Lake, and North Caribou Lake (Weagamow). The Remote Community Connection Plan is still in its draft form until further community consultation is performed and the anticipated connection date of this community is not known.

### 4.7.Incorporation of Advanced Technology

The project incorporates advanced SCADA, communications, and PLC technology.

### 4.8. Leave to Construct Approval

N/A

## 5. REG Investment Costs

# Big Trout Lake and Wapekeka Connection and Upgrade

## 1. Project/Program Description

### 1.1. Current Issue

The peak station load at Big Trout Lake reached 1395 kW in 2015, which exceeds the 1360-kW connection limit. The community of Wapekeka currently does not have new customer connection restrictions in place, but the peak load has reached 643 kW, which represents 74% of the station rating. Given that the Order-in-Council by the Minister of Energy has identified these two communities to be connected to new transmission lines at an undecided date in the future, Remotes' customers have requested funding through INAC to connect these two communities and perform upgrades at the generating stations to facilitate the connection, in the manner discussed in this document. The planned of the two communities is expected to increase the combined system capacity.

### 1.2. Project Scope

The scope of work includes an upgrade of the generation stations in Big Trout Lake and Wapekeka and a new 22-km, 25-kV overhead line linking the communities of Kitchenuhmaykoosib Inninuwug (Big Trout Lake) and Wapekeka First Nations, that is planned to address the load growth in both communities. Planning and design work for this project commenced in 2015.

The unit chosen to be replaced is the smallest generating unit in the combined generating station, namely the C unit in Wapekeka with 410 kW of capacity, as it will be too small to carry the lowest load level of the combined communities. It will be exchanged for a 1500-kW unit, increasing the combined station rating to 3765 kW. Upon replacement, the original generating unit would go back into inventory to be deployed in another community.

The planned scope of work would increase the station transformation capacity in each community to 3000 kW. Once construction is complete, this project would remove new customer connection restrictions in the Kitchenuhmaykoosib Inninuwug community, and enable unconstrained customer connections in both communities for five to ten years. The planned work is 100% recoverable through funding agreements with the First Nations and INAC.

The distribution system equipment in question was procured earlier in 2017. Generation equipment is planned to be purchased in 2018 and 2019. Modifications to the Wapekeka Generation Station are planned to commence in 2018. Big Trout Lake generating station modifications are planned for 2019. Testing and integration would ensue prior to putting the unit into service in 2020.

Additionally, 67.5 kW of community-owned solar, requested by customers and to be placed on related non-Standard A accounts, is planned as part of the project.

### 1.3. Main and Secondary Drivers

The driver for generator upgrade investments, as per Table 1-1 of Remotes' DSP, is system capacity constraints (i.e. expected changes in load that will constrain the ability to the system to provide consistent delivery). The peak load in Big Trout Lake has surpassed the connection limit (85% of the station rating) and should therefore be upgraded immediately.

Big Trout Lake and Wapekeka are 22 km apart and connected by a road. Connecting the two generating stations would decrease the combined peak load and thus result in a more efficient system. Furthermore, the connection between these two communities will be necessary once the new transmission lines reach the communities.

## 1.4. Performance Targets and Objectives

The investment affects a number of performance targets listed in Remotes' DSP. The connection of the two communities would improve the ability to supply power from either diesel generating station under contingency situations, reducing the frequency and duration of outages in both communities. As discussed in Section 2.3.1.1 of Remotes' DSP, system reliability is a key driver to customer satisfaction. The proposed upgrade of Wapekeka C would reduce the probability of its unplanned failure and thus improve reliability and generator availability. By connecting the two distribution systems, the load can be managed more efficiently using the Programmable Logic Controller (PLC) technology to improve diesel generation efficiency.

The proposed project is expected improve operational efficiency and cost effectiveness. For a project this size, 375,000 litres of additional fuel tanks would normally be required and purchased. In this case, only 150,000 litres of new fuel tanks are planned to be purchased in Wapekeka as part of this project. Both First Nations currently have fuel storage at their respective airports. To make up for the required fuel storage, each First Nation has agreed to sell fuel to Remotes and to dedicate a tank to Remotes.

A notable drawback of these improvements is an increase distribution losses are expected to increase with the addition of the new line (line losses are proportional to distance). However, the benefits associated with the improvements to system operability and reliability offered by the proposed investments exceed the impact of the associated increase in losses.

Remotes manages its diesel generating stations by limiting the peak load at the station to 85% of the station's rating (known as the connection limit). By connecting the two communities and upgrading unit C at Wapekeka, the system constraints will be removed and the planning objectives will be improved in both communities in the future.

## 1.5.Customer Impact

a) Customer profile for the community:

| Customer Class | Non Std A – Res. | Non Std A – Seas. | Non Std A – GS 1P | Non Std A – GS 3P | Street Lightning | Std A – Res. – Air | Std A – GS – Air | Total |
|---|---|---|---|---|---|---|---|---|
| **Community** | **Number of Customers** | | | | | | | |
| **Big Trout Lake** | 301 | - | 30 | 6 | - | 10 | 50 | **397** |
| **Wapekeka** | 114 | - | 10 | 1 | - | 5 | 20 | **150** |

b) Customer impacts for each community:

The table below presents the customer impacts for each community. The value of customer impact is defined as follows:

- High – less than 10% seasonal customers.
- Medium – between 10% and 50% seasonal customers.
- Low – greater than 50% seasonal customers

| Community | Customer Count | Load at Risk (kW peak) | Value of Customer Impact |
|---|---|---|---|
| **Big Trout Lake** | 397 | 1395 | High |
| **Wapekeka** | 150 | 643 | High |

# 2. Project/Program Justification

## 2.1. Information Used to Justify the Investment

To accommodate customer and load growth, Remotes schedules generator upgrades in communities where the load has surpassed 85% of the station rating. The forecast peak load in Big Trout Lake and Wapekeka for the years 2017 through 2022 are listed in kW in the table below. The forecast is based on the actual peak load observed in 2016.

| Community | Connection Limit (kW) | Peak Load Forecast (kW) | | | | | |
|---|---|---|---|---|---|---|---|
| | | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 |
| **Big Trout Lake** | 1360 | 1381 | 1436 | 1493 | 1553 | 1615 | 1680 |
| **Wapekeka** | 735 | 651 | 670 | 691 | 711 | 733 | 755 |
| **Combined** | N/A | **2032** | **2106** | **2184** | **2264** | **2348** | **2435** |

## 2.2. Alternatives Evaluation

**Alternative 1: Do nothing**

The “do nothing” option entails the case where no upgrades are made at either station and the new distribution line is not built.

**Alternative 2: Upgrade of both systems without new connection**

This option considers the ability to upgrade both systems individually

a) Comparison of Project Alternatives

In the case of the “do nothing” option, Remotes would have to ignore the request of its customers for this project to proceed, contrary to the company’s values and operating principles. Furthermore, under the “do nothing” scenario, connection restrictions would persist indefinitely in Big Trout Lake, and materialize in Wapekeka in the next five years. These considerations render the “do nothing” option suboptimal.

In the case of the second alternative – upgrading both systems individually without the new connection, the upgrade in Wapekeka could be deferred until 2022 or later based on the projected load growth in the community. Instead, the project would upgrade one of the generators in Big Trout Lake immediately, which would be costlier than upgrading the smaller generator in Wapekeka. The isolated systems are less robust when responding to contingency situations than a combined system. Furthermore, the new distribution line will be necessary once the anticipated new transmission connection project reaches the communities. Therefore, Alternative 2 is also suboptimal given its inferior cost effectiveness in light of the anticipated developments over the assets' lifetimes.

Accordingly, the proposed option represents an optimal trade-off between benefits and costs. The communities have the final say in the technical design of the project based on the feasible options outlined by Remotes, which is usually the most cost-effective option.

b) Comparison of Technically-Feasible Alternatives

The option to build an underground distribution line rather than the overhead distribution line connecting the two communities is a technically-feasible alternative to this project. The cost of construction for an underground distribution line in an area of mostly-frozen soil is much more expensive than an overhead build; therefore, an overhead line was planned.

For a project this size, 375,000 litres of additional fuel tanks would normally be required and purchased. In this case, only 150,000 litres of new fuel tanks are planned to be purchased in Wapekeka as part of this project. Both First Nations currently have fuel storage at their respective airports. To make up for the required fuel storage, each First Nation has agreed to sell fuel to Remotes and to dedicate a tank to Remotes.

## 2.3.Project/Program Timing and Expenditure

a) Historical and Future Capital and Related O&M Expenditures

| | Historical Costs ($ '000) | | | | | Future Costs ($ '000) | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | 2013 | 2014 | 2015 | 2016 | 2017* | 2018 | 2019 | 2020 | 2021 | 2022 |
| Capital (Gross) | - | - | 8 | 137 | 996 | 2,149 | 3,252 | 1,364 | - | - |
| Contributions | - | - | (8) | (123) | (896) | (1,934) | (2,927) | (1,228) | - | - |
| Removals | - | - | - | (14) | (100) | (215) | (325) | (136) | - | - |
| **Net Capital** | - | - | - | - | - | - | - | - | - | - |
| O&M | - | - | - | - | - | - | - | - | - | - |

*0 months of actual expenditures included in 2017

b) Start Date
Distribution material purchased in 2017
Generation purchases in 2018 and 2019

c) In-Service Date
June 2020

d) 2018 Test Year Expenditure Timing

| | Forecast Costs ($ '000) | | | |
|---|---|---|---|---|
| | Q1 | Q2 | Q3 | Q4 |
| Capital (Gross) | 537.25 | 537.25 | 537.25 | 537.25 |
| O&M | - | - | - | - |

e) Comparative Expenditure Information

Remotes has never previously tied stations together in the proposed manner – the project was conceived in response to limited availability of INAC funds and the goal of the communities to connect new customers in the near term.

## 2.4. Benefits

a) Operational Efficiency and Cost Effectiveness

By providing a solution that relieves connection constraints in Big Trout Lake and alleviates medium-term capacity concerns in Wapekeka without requiring a generator upgrade in Big Trout Lake, this project is expected to enhance the operational efficiency and cost effectiveness. Notwithstanding the near-term objectives, the proposed distribution line will be required once the communities are connected to the transmission system and, therefore, represents a cost-effective means of relieving the capacity issue and improving reliability of supply in both communities in the interim. The communities have the final say in the technical design of the project based on the feasible options outlined by Remotes.

b) Customer

This project was initiated by Remotes' customers, who benefit through relief of capacity constraints and the improved reliability of the new system. The First Nations will also benefit from increased economic activity associated with the sale of fuel to Remotes and from the installation of community-owned solar generation.

c) Safety

The investment is not expected to negatively impact health and safety protections and performance, as all applicable construction safety standards and operating clearance requirements will be met. The new distribution line will be constructed using Remotes' standards for distribution line construction, compliant with *O. Reg. 22/04*.

d) Cyber-Security, Privacy

In accordance with the NIST Guide to Industrial Control Systems Security, the planned upgrade includes restrictions of physical access to the station, PLC monitoring to detect security events, a demilitarized zone ("**DMZ**") network architecture, and restrictions of unauthorized remote access.

e) Co-ordination, Interoperability

As with all generation upgrade projects, Remotes is working closely with the First Nation communities through the funding allocation and design approval process. When a community's load levels begin to approach their connection limits, Remotes collaborates with the community to identify possible solutions to alleviate the capacity constraints. If a generator upgrade project is required, customers requests the project from Remotes, who works with the community to secure the requisite INAC funding. Under the terms of the electrification agreements, INAC is responsible for funding generation capital upgrades associated with load growth in First Nation communities served by Remotes. The funding must be requested by the communities, but Remotes also works closely with INAC in relation these projects. The communities have the final say in the technical design of the project based on the feasible options outlined by Remotes.

Kitchenuhmaykoosib Inninuwug and Wapekeka First Nations are both anticipating connection to new transmission lines that will reach the area. This has been coordinated into the project plan, since the new distribution line will be required once the transmission lines reach these communities.

f) Economic Development

Most of Remotes' customers are First Nations and many of their suppliers and contractors are First Nation enterprises. Remotes frequently hires local station operators and provides extensive training. This investment will relieve system capacity constraints in two communities and build a more robust electrical system for the communities, which is conducive to economic growth. The communities will also benefit from the ability to sell fuel and electricity to Remotes and from the ability to perform forestry work that will be required on the line.

g) Environment

Part of the project scope will replace a generator in Wapekeka and newer generators are more fuel efficient. The project will also upgrade the transformation at both diesel generating stations and the new transformers will meet the latest standards in energy efficiency. In addition, planned community-owned solar generation is expected to reduce environmental impacts.

# 3. Prioritization

This is a non-discretionary project, since it is requested by customers and funded by INAC. The project takes priority over discretionary projects/programs.

# 4. Execution Path

## 4.1. Implementation Plan

The program is planned to proceed over six years. It commenced in 2015 and will finish in 2020. Design and material procurement (poles, cable, station transformers, switchgear and building extension) of distribution and generation equipment will take place in 2018. Installation and commissioning of equipment will then be performed in 2019 and 2020. The generating station work will be done by a dedicated station crew, whereas line construction is expected to be tendered by the First Nation and INAC.

This project will be coordinated with other work planned in the communities, including generator replacements in Big Trout Lake from 2018 to 2020. Wherever possible, station crew utilization will be optimized between the two projects to reduce costs.

## 4.2. Risks and Risk Mitigation

The primary risk factor underlying this project and other generator upgrades is funding from INAC. On a number of past occasions, INAC was unable to support projects due to a lack of funds in light of competing priorities. Without the funding from INAC, Remotes does not have the means to recover the costs for this project and the project would not proceed. To mitigate this risk, Remotes works closely with the communities it serves and with INAC to ensure sufficient funds are available and approved to carry out the work.

Another risk to project completion is the ability to transport heavy electrical equipment to the sites, which requires use of winter roads. To mitigate this risk, the generator and transformers are procured in advance to prepare for transportation. In case an entire season passes without safe winter roads, the project may require deferral. Remotes has the option of hiring specialized aircraft to deliver the equipment if the risk of project deferral is greater than the increased transportation cost.

Remotes has lodgings for only one crew in each community. Therefore, a risk to project completion as planned includes the availability of accommodation for crews to perform work on the generation and distribution systems as part of this project, as well as emergency work that comes up throughout the year. Remotes mitigates this risk through careful project planning and execution. Remotes also has the option to locate crews in both communities (Big Trout Lake and Wapekeka) and to rent temporary accommodation if necessary.

Line construction is expected to be tendered by the First Nation and INAC and is, therefore, outside of Remotes' control.

## 4.3. Timing Factors

Winter road availability and the ability to safely fly in crews are factors that may affect the timing of this investment. Should this occur, the project may be deferred due to transportation or INAC funding delays, which Remotes attempts to are mitigate through project planning and coordination. Besides these factors, the project is customer-initiated and externally-funded and, therefore, takes priority over discretionary projects/programs.

## 4.4. Cost Factors

A large part of the final cost of this project will be transportation cost. The access to communities in question makes shipping both difficult to coordinate and expensive.

## 4.5.Customer Preferences

This project was initiated by Remotes' customers. As identified in Section 2.2.1.1 of Remotes' DSP, customers prioritize renewable energy. As such, the customer-requested scope includes 67.5 kW of community-owned solar generation.

## 4.6.Regional Electricity Infrastructure Requirements

The 2016 Order-in-Council by the Minister of Energy identified 16 communities which will be connected to new transmission lines passing through northern Ontario, including Kitchenuhmaykoosib Inninuwug (Big Trout Lake) and Wapekeka. The Remote Community Connection Plan is still in its draft form until further community consultation is performed and the anticipated connection dates of these communities are not known. In anticipation of the new transmission lines, the new distribution line is being constructed as an integrated, cost-effective approach to increase the capacity of both communities, as well as improving the robustness of the electricity supply. The new distribution line will be required to connect the communities to the new transmission line

# Sandy Lake Upgrade

## 1. Project/Program Description

### 1.1. Current Issue

The peak station load at Sandy Lake reached 2576 kW in 2013, nearing its connection limit of 2593 kW or 85% of the station capacity (3050 kW). Based on the current loading levels, the peak load is forecast to exceed the connection limit by 2018. Therefore, Remotes' customers have requested funding through INAC to upgrade the generating station capacity in Sandy Lake. The timing of the generation investment depends on INAC approval for the capital dollars that is presently outstanding. For planning purposes, Remotes' anticipates that the required INAC investment will be made in time to enable continued community growth (that is, 2018). Given that the investment constitutes contributed capital, there is no impact to Remotes' rate base.

### 1.2. Project Scope

There are currently four low-speed (1200-rpm) diesel generators in Sandy Lake. G1 and G2 each have a rated capacity of 1250 kW, G3 is rated 1500 kW, and G4 is rated 1000 kW. The G1, G2, and G4 units have all been in service since 2008, whereas G3 was installed in 2013. For the upgrade, the unit with the lowest capacity, namely G4, was chosen to be exchanged for a 1500 kW unit, increasing the station's aggregate rating to 3300 kW. The chosen generator has operated for the most engine-hours of the four generators.

The existing transformation capacity is sufficient to serve the load. The existing station building and generator rooms were designed to accommodate incremental community load growth and, as such, do not require any facilities expansion investments accommodate the new generator. Some modifications to the controls may be required as part of this project.

### 1.3. Main and Secondary Drivers

The driver for generator upgrade investments, as per Table 1-1 in the DSP, is system capacity constraints (i.e. expected changes in load that will constrain the ability to the system to provide consistent delivery). Sandy Lake's peak load is forecast to exceed the station's connection limit in 2018 and as such, requires an upgrade to enable continued load growth. This forecast is based on historical data that has determined the future annual load increase in Sandy Lake to be around 2.5%.

### 1.4. Performance Targets and Objectives

Remotes manages its diesel generating stations by limiting the peak load at the station to 85% of the station's rating before commencing the analytical work and engagements underlying potential expansion planning. By upgrading the G4 unit at Sandy Lake, the system constraints would be relieved.

The proposed investment would also positively affect several performance targets listed in Remotes' DSP. The upgrade of Sandy Lake G4 would reduce the probability of its unplanned failure and thus improve reliability and generator availability. By replacing the old generator with a new one that meets the latest energy efficiency standards, both diesel generation efficiency and carbon emission intensity would be positively affected.

## 1.5. Customer Impact

a) Customer profile for the community:

| Customer Class | Non Std A – Res. | Non Std A – Seas. | Non Std A – GS 1P | Non Std A – GS 3P | Street Lightning | Std A – Res. – Air | Std A – GS – Air | Total |
|---|---|---|---|---|---|---|---|---|
| **Community** | **Number of Customers** | | | | | | | |
| **Sandy Lake** | 440 | - | 29 | 3 | 1 | 21 | 26 | **520** |

b) Customer impacts for the community:

The table below presents the customer impacts in Sandy Lake. The value of customer impact is defined as follows:

- High – less than 10% seasonal customers.
- Medium – between 10 and 50% seasonal customers.
- Low – greater than 50% seasonal customers

| Community | Customer Count | Load at Risk (kW peak) | Value of Customer Impact |
|---|---|---|---|
| **Sandy Lake** | 520 | 2576 | High |

# 2. Project/Program Justification

## 2.1. Information Used to Justify the Investment

To accommodate customer and load growth, Remotes schedules generator upgrades in communities where the load has surpassed 85% of the station rating. The forecast peak load in Sandy Lake for the years 2017 through 2022 is shown below in kW. The forecast is based on the 2016 actual peak load.

| Community | Connection Limit (kW) | Peak Load Forecast (kW) | | | | | |
|---|---|---|---|---|---|---|---|
| | | **2017** | **2018** | **2019** | **2020** | **2021** | **2022** |
| **Sandy Lake** | 2593 | 2535 | 2598 | 2663 | 2730 | 2798 | 2868 |

Since the load is anticipated to reach the connection limit in 2018, the station should be upgraded around that time to avoid connection restrictions.

## 2.2. Alternatives Evaluation

**Alternative 1: Do nothing**

Given the nature of the Remotes' service territory and the ensuing mode of operation, the "do nothing" option considers the case where no upgrade is made at the station.

**Alternative 2: New hydroelectric generation**

This alternative considers the option of the Sandy Lake First Nation developing a new hydro-electric generating facility (the "**Duck River Dam**") to relieve system capacity.

a) Comparison of Project Alternatives

In the case of the "do nothing" option, Remotes would have to de-prioritize the request from its customers for this project to proceed (at least for a certain period of time), contrary to Remotes' values. Furthermore, connection restrictions are expected to occur in Sandy Lake in the next two years. This is not the preferred option.

The Sandy Lake First Nation is interested in developing the Duck River Dam; however, they have not yet been able to secure approvals from the province or the federal government to develop this project and are not expecting to resolve this issue within the timeline when the anticipated connection constraints would materialize. Accordingly, the project timelines would not address the short-term supply needs of the community. This is not the preferred alternative

The proposed project is the preferred alternative. The communities have the final say in the technical design of the project based on the feasible options outlined by Remotes, which is usually the most cost-effective option.

b) Comparison of Technically-Feasible Alternatives

The generator selected for the upgrade at Sandy Lake is both the smallest and has run for the most hours. Therefore, the upgrade of this particular unit is optimal from within the range of available options of proactively addressing the impending capacity shortages. The existing transformation at the generating station is sufficient to meet the capacity needs. Some modifications to the controls may be required as part of this project.

Rather than requesting an increase to tank storage, Remotes expects to purchase more fuel from the Sandy Lake Tank Farm.

## 2.3.Project/Program Timing and Expenditure

a) Historical and Future Capital and Related O&M Expenditures

| | Historical Costs ($ '000) | | | | | Future Costs ($ '000) | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | **2013** | **2014** | **2015** | **2016** | **2017*** | **2018** | **2019** | **2020** | **2021** | **2022** |
| Capital | - | - | - | - | - | 367 | 881 | 1,311 | - | - |
| Contributions | - | - | - | - | - | (330) | (793) | (1,180) | - | - |
| Removals | - | - | - | - | - | (37) | (88) | (131) | - | - |
| **Net Capital** | - | - | - | - | - | - | - | - | - | - |
| O&M | - | - | - | - | - | - | - | - | - | - |

*0 months of actual expenditures included in 2017

b) Start Date
Design in Q3 of 2018
Purchase engine in 2019
Transport by winter road in March 2020

c) In-Service Date
July 31, 2020

d) 2018 Test Year Expenditure Timing

| | Forecast Costs ($ '000) | | | |
|---|---|---|---|---|
| | Q1 | Q2 | Q3 | Q4 |
| Capital (Gross) | - | - | 183.5 | 183.5 |
| O&M | - | - | - | - |

e) Comparative Expenditure Information

The planned total cost of this investment is $2,559,000, spread over three years. In order to compare the cost to other station upgrade investments, cost per kW has to be considered. The new unit has 1500 kW capacity, rendering the cost per kW at $1,706.

A station upgrade was done in Deer Lake in 2016, where a new 1200-rpm generator unit with capacity 1500 kW was installed at the total cost of $2,306,368 and per-kW cost of was $1,536. The expenditures for this investment are generally consistent to the investment in Deer Lake. The observed cost differences can mostly be attributed to transportation and labour costs. Some of the First Nation communities are less accessible than others due to isolation and lack of year-round roads.

## 2.4. Benefits

a) Operation Efficiency and Cost Effectiveness

The communities have the final say in the technical design of the project based on the feasible options outlined by Remotes, which is usually the most cost-effective option.

b) Customer

This project was initiated by Remotes' customers, who benefit through relief of capacity constraints.

c) Safety

The investment will replace an old generator, which will reduce the probability of an unplanned failure.

d) Cyber-Security, Privacy

All upgrades to generator PLCs and related infrastructure meet the latest cyber-security standards.

e) Co-ordination, Interoperability

As with all generation upgrade projects, Remotes is working closely with the First Nation communities through the funding and approval process. When a community's loading levels begin to approach its rated connection limits, Remotes collaborates with the community to identify possible solutions to alleviate the capacity constraints. If a generator upgrade project is determined required, the customer requests the company to undertake the work, and Remotes works with the community to secure INAC funding for the project. Under the terms of the electrification agreements, INAC is responsible for funding generation capital upgrades associated with load growth in First Nation communities served by Remotes. The communities have the final say in the technical design of the project based on the feasible options outlined by Remotes.

The community of Sandy Lake is anticipating connection to new transmission lines that will reach the community at an undetermined date. The Remote Community Connection Plan is still in its draft form until further community consultations are completed. Since connection constraints are anticipated beginning in 2018, the upgrade project is proposed to proceed.

f) Economic Development

The majority of Remotes customers are First Nations and many of their suppliers and contractors are First Nation enterprises. Remotes frequently hires local station operators and provides extensive training. This investment will relieve system capacity constraints in Sandy Lake, which is conducive to economic growth.

g) Environment

The new generator unit will meet the latest standards in emissions and fuel efficiency.

# 3. Prioritization

This is a non-discretionary project, since it is requested by customers and funded by INAC. The project takes priority over discretionary projects/programs.

# 4. Execution Path

## 4.1. Implementation Plan

The project is planned over a three-year period. Design of upgrade will take place in 2018, procurement and installation in 2019, and completion of construction and commissioning in 2020. The work will be done by a dedicated station crew. This project will be coordinated with other work planned in Sandy Lake.

## 4.2. Risks and Risk Mitigation

The primary concern for this project and other generator upgrades is funding from INAC. In the past, INAC was unable to consistently support projects due to funding constraints in certain years. Absent the funding from INAC, Remotes does not have the means to recover the costs for this project and the project can not proceed until the situation is resolved. To mitigate this risk, Remotes works closely with the communities it serves and INAC to ensure sufficient funds are available and approved to carry out the work.

Another risk to project completion is the ability to transport heavy electrical equipment to the sites, which requires winter road access. To mitigate this risk, the generator is procured in advance to be ready for transportation in short order when the suitable weather conditions materialize. In case of an entire season passing without safe winter road conditions, the project may need to be deferred. Remotes has the option to hire a specialized aircraft to deliver the equipment if the risk of project deferral is greater than the increased transportation cost.

Finally, Remotes has lodgings for only one crew in each community. Therefore, a risk to the completion of the project as planned is the availability of accommodation for crews to perform work on the generating station as part of this project and emergency work that comes up throughout the year. Remotes mitigates this risk through careful project planning and execution. Remotes also can rent temporary accommodation in necessary.

### 4.3. Timing Factors

Winter road availability and the ability to safely fly in crews are factors that can affect the timing of this investment. This project may be deferred due to transportation or INAC funding delays, which are mitigated through project planning and coordination. Besides these factors, the project is customer-initiated, non-discretionary and externally-funded, and therefore takes priority over discretionary projects/programs.

### 4.4. Cost Factors

A large part of the final cost of this project will be transportation cost. The inaccessibility of the First Nation communities makes shipping both unreliable and expensive. Another important factor that may affect the final cost of the project is labour cost. Controllable costs are minimized by using experienced station crews and selecting the most cost-effective transportation option.

### 4.5. Customer Preferences

This project was initiated by Remotes' customers.

### 4.6.Regional Electricity Infrastructure Requirements

This project does not directly arise from Regional Electricity Infrastructure Requirements. The 2016 Order-in-Council by the Minister of Energy identified 16 communities which will be connected to new transmission lines passing through northern Ontario, including Sandy Lake. The Remote Community Connection Plan is still in its draft form until further community consultation is performed and a federal/provincial funding agreement is in place. The anticipated connection dates of these communities are not known. The peak load in Sandy Lake is forecast to reach the connection limit in 2018; therefore, the project is proposed to move ahead subject to the availability of INAC funding.

# Weagamow DGS Upgrade

## 1. Project/Program Description

### 1.1. Current Issue

The peak load in North Caribou First Nation (Weagamow) reached 1096 kW in 2013, which is over ninety percent (90%) the station's connection limit of 1211 kW. An interim station upgrade was performed in 2016 to help address capacity constraints in the short term. However, the peak load is forecast to reach the technical connection limit in 2019, necessitating a larger upgrade to ensure connection capacity availability over the longer term. Accordingly, Remotes' customers have requested funding through INAC to upgrade the generating station capacity in Weagamow.

### 1.2. Project Scope

Subject to the availability and amount of INAC funding approved, the Weagamow upgrade would replace all four generators comprising the community's current generating station. Weagamow unit A was installed in 1996 and is rated 600 kW. Unit B was upgraded in 2016 from 250 kW to 725 kW capacity. Unit C was installed in 2008 with 400 kW capacity. The 1-MW D unit is owned by the North Caribou First Nation. The three units owned by Remotes are all medium speed (1800 rpm). The unit owned by the North Caribou First Nation is low speed (1200 rpm). The four units would be replaced with four units with an upgraded total station capacity of 2 MW. The existing generators owned by Remotes will be returned to inventory.

The proposed upgrade also includes construction of a larger facility to host the generating equipment, to address the spatial restrictions that characterizing the current facility, which complicate the tasks of generator maintenance and introduce potential safety risks for the company's staff.

### 1.3. Main and Secondary Drivers

As per Table 1-1 in the DSP, the key driver for the proposed generator upgrade investments is addressing System Capacity constraints (i.e. expected changes in load that will constrain the ability of the system to provide requisite output under peak conditions). Weagamow's peak load is forecast to exceed the station's connection limit in 2019, necessitating the upgrade work.

The condition of the station and reliability concerns are the secondary drivers for the upgrade. The existing building is too small to house all the generators creating restricted workspaces when engine repair or maintenance is required. Meanwhile, the condition of the D unit places reliability within the community at risk since the unit has experienced several prolonged outages in the past and is operated by the North Caribou Lake First Nations on a run-to-failure basis.

### 1.4. Performance Targets and Objectives

Remotes manages its diesel generating station by limiting the peak load at the station 85% of the station's rating. This threshold allows for consumption growth as existing customers connect more devices to the grid without compromising the ability to supply power during peak load. The proposed generator upgrade at Weagamow would relieve the system constraints.

The investment would also affect several performance targets listed in Remotes' DSP. The upgrade of the generator would reduce the probability of its unplanned failure, thereby improving reliability and generator availability. Based on Remotes' customer engagement efforts described in Section 2.3.1.1 of the DSP, reliability is a key driver for customer satisfaction. By replacing old generators with new ones that meet the latest energy efficiency standards, both diesel generation efficiency and carbon emission intensity would be improved. New generators are approximately 10% more efficient than in-service units.

## 1.5. Customer Impact

a) Customer profile for the community:

| Customer Class | Non Std A – Res. | Non Std A – Seas. | Non Std A – GS 1P | Non Std A – GS 3P | Street Lightning | Std A – Res. – Air | Std A – GS – Air | Total |
|---|---|---|---|---|---|---|---|---|
| **Community** | **Number of Customers** | | | | | | | |
| **Weagamow** | 244 | - | 24 | 1 | 1 | 12 | 26 | 308 |

b) Customer impacts for the community:

The table below presents the customer impacts for North Caribou Lake (Weagamow). The value of customer impact is defined as follows:

- High – less than 10% seasonal customers.
- Medium – between 10% and 50% seasonal customers.
- Low – greater than 50% seasonal customers

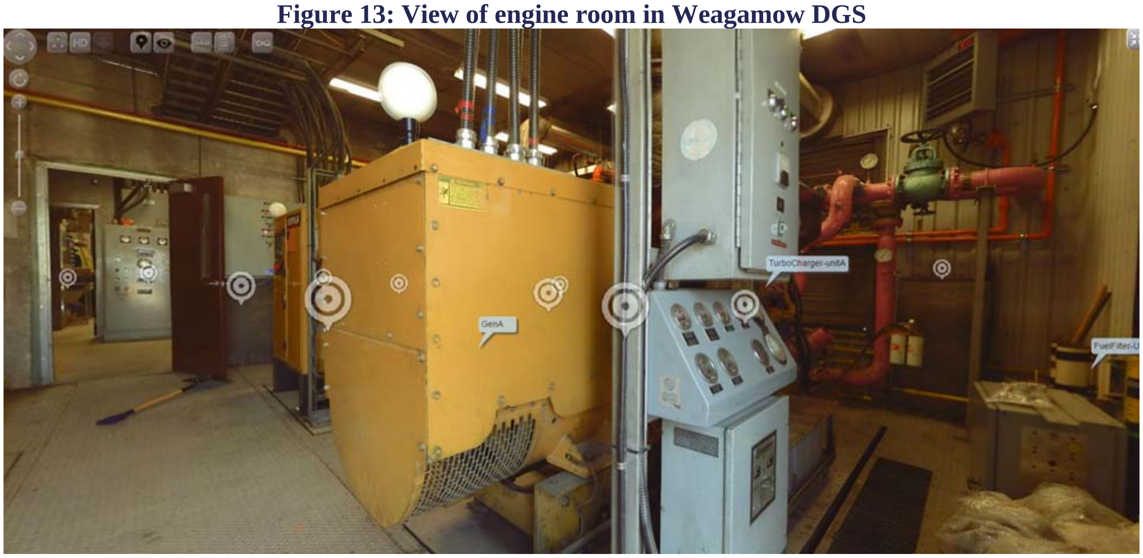
| Community | Customer Count | Load at Risk (kW peak) | Value of Customer Impact |
|---|---|---|---|
| **Weagamow** | 308 | 1096 | High |

## 1.6. Supporting Documentation

Figures 1 and 2 depict the generator rooms in Weagamow DGS. As can be seen from the pictures, the facility's size relative to the size and configuration of the generator equipment it hosts, results in significant spatial restrictions that complicate the task of servicing the equipment. The 725-kW B unit was put into service in 2013 in response to reliability concerns of the D unit and the First Nation would not permit expansion of the existing site, resulting in the present-day constraints.

**Figure 12: Close-up of engine in Weagamow DGS**

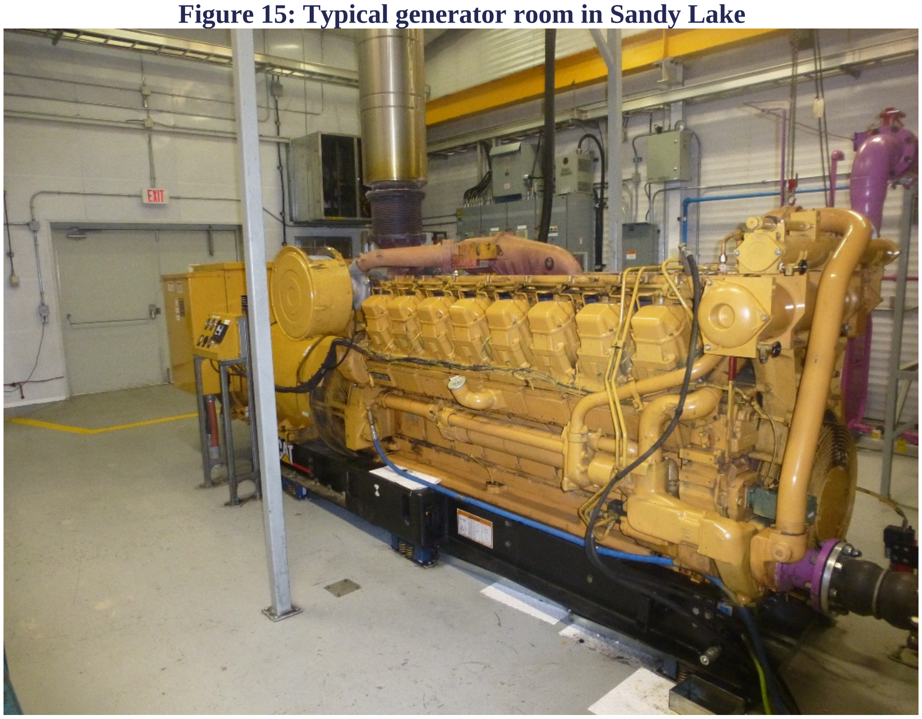
**Figure 13: View of engine room in Weagamow DGS**



For comparison, Figures 3 and 4 depict the generator rooms in Deer Lake and Sandy Lake, which are of standard sizes and each contain just one (1) engine, providing sufficient space for servicing the equipment.

**Figure 14: Typical generator room in Deer Lake**

**Figure 15: Typical generator room in Sandy Lake**



# 2. Project/Program Justification

## 2.1. Information Used to Justify the Investment

To accommodate customer and load growth, Remotes schedules generator upgrades in communities where the load surpasses 85% of the station rating. Since Weagamow's load is anticipated to reach the connection limit in 2019, the station upgrade is being proposed to avoid any connection restrictions. The forecast peak load in Weagamow for the years 2017 through 2022 is shown below. This forecast is based on historical data that has determined the future annual load increase in Weagamow to be around three per cent. Beyond the community's internal growth projections, the magnitude of the forecast load growth is also a function of a planned completion of an all-season road to the community in 2017.

| Community | Connection Limit (kW) | Peak Load Forecast (kW) | | | | | |
|---|---|---|---|---|---|---|---|
| | | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 |
| **Weagamow** | 1105 | 1062 | 1094 | 1127 | 1160 | 1195 | 1231 |

The spatial restrictions and condition of the station facility itself are also significant drivers for the project. The existing building is too small to house all the generators. In stations where engines are larger than 200 kW, each engine is normally located in a separate room so that work can be done without the risk of permanent hearing damage to operators. In Weagamow, the 600-kW and 400-kW units are housed in the same room (see Figure 2) creating significant spatial restrictions that affect the manner in which work has to be performed (by extension, affecting execution efficiency and employee safety). Presently, spare engine parts must be moved to a temporary location to enable work. Moreover, the 600-kW unit is old and cannot be replaced if it were to fail, since new 600-kW units are too large to fit into the existing room in the station. Furthermore, the station has a wood floor, presenting an unacceptable environmental risk in the event of a fuel spill.

The D unit is stored in a trailer on the property that has reached end-of-life and is too small for maintenance on the unit to be conducted safely. The D unit is operated by Remotes and integrated into the supply needs of the community, but maintenance is paid for under an agreement with the unit's owner – the North Caribou First Nation. Under the terms of the agreement, maintenance by Remotes on the D unit is limited to oil changes and visual inspections. Consequently, the D unit's condition is not maintained with the same rigour as assets subject to Remotes' regular asset management process.

The condition of the D unit puts reliability in the community at risk as the unit is run to failure. For example, in September 2012, the D unit failed. While INAC and the First Nation worked to replace the D unit with a temporary unit, electricity was supplied by the 600-kW engine, along with one of the smaller engines. In November of that year, rotating blackouts were required due to failures of both smaller engines. Both smaller units were returned to service in late December. In January 2013, the 600-kW unit, which had been operating throughout the previous year's emergency conditions, failed. Rotating blackouts were avoided due to the community's conservation efforts while the 600-kW unit was out of service and being repaired. The community secured a 725-kW unit which was put into service in January 2013 until the equipment supplier could complete a major overhaul on the D unit. The temporary 725-kW unit was put into service as the B unit in 2016. Once the D unit is replaced, it will be owned and operated by Remotes and will be maintained as a normal part of Remotes' business. INAC has not yet approved funding for the project.

## 2.2. Alternatives Evaluation

**Alternative 1: Do nothing**

The "do nothing" option entails the case where no upgrade is made at the station.

a) Comparison of Project Alternatives

In the case of the "do nothing" option, Remotes would have to defer addressing the request of its customers for this project to proceed, which is contrary to Remotes' values, and would create connection capacity restrictions within the next three years. This is not the preferred option.

The proposed facility rebuilds and generator replacement project is the preferred alternative. Generally, upgrades are required as community demand increases to ensure Remotes has enough capacity to reliably meet the needs of its customers.

b) Comparison of Technically-Feasible Alternatives

The preferred alternative is to design and build a modular station building that would house four generators. The modular units would be constructed off site. A larger modular unit assembled off site and transported to the community would house each of the units into a larger station. The existing 725-kW generating units will be repurposed, but the existing 600-V alternator will be replaced with a 4160-V alternator. Three new 4160-V generating units will be procured, including two units rated 1500 kW each and one unit other rated 725 kW. As station capacity increases, the size of the 600-V switchgear and cabling becomes too large to accommodate. The 4160-V switchgear bus and cabling is much smaller. The community is expected to be connected to an all-season road by the fall of 2017; therefore, additional on-site fuel storage is not required or requested as part of this project.

Given the uncertainty of INAC funding, Remotes must consider alternatives to downscale the project while addressing the key drivers. Accordingly, Remotes has considered a partial upgrade, including a new standalone trailer to house the First Nation-owned generator if the desired level of funding is not available. The priority will be to replace the First Nations' unit first, based on its condition, followed by the 600-kW unit, and then the 400-kW unit.

Remotes also considered a more conventional station building upgrade, where the First Nation manages the project and the station construction work is contracted out to a third party. Conventional upgrades, wherein most of the construction is completed on site, are costlier than using modular units. As the community is planning an all-season road that is expected to be in place by the fall of 2017, a modular design with completed manufacturing off-site is possible, less costly, and more time efficient. As such, it is a practical alternative given that INAC has limited funds.

The communities have the final say in the technical design of the project based on the feasible options outlined by Remotes.

## 2.3.Project/Program Timing and Expenditure

a) Historical and Future Capital and Related O&M Expenditures

| | Historical Costs ($ '000) | | | | | Future Costs ($ '000) | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | 2013 | 2014 | 2015 | 2016 | 2017* | 2018 | 2019 | 2020 | 2021 | 2022 |
| Capital (Gross) | - | - | 14 | 1,816 | 1,485 | 2,832 | 1,993 | - | - | - |
| Contributions | - | - | (13) | (1,634) | (1,336) | (2,549) | (1,794) | - | - | - |
| Removals | - | - | (1) | (182) | (149) | (283) | (199) | - | - | - |
| **Net Capital** | - | - | - | - | - | - | - | - | - | - |
| O&M | - | - | - | - | - | - | - | - | - | - |

b) Start Date

Procurement in 2018
Construction in 2019

c) In-Service Date

Fall 2019

d) 2018 Test Year Expenditure Timing

| | Forecast Costs ($ '000) | | | |
|---|---|---|---|---|
| | Q1 | Q2 | Q3 | Q4 |
| Capital (Gross) | 708 | 708 | 708 | 708 |
| O&M | - | - | - | - |

e) Comparative Expenditure Information

The plant in Webequie, which includes three generators and a combined station capacity of one MW, was built by a third-party contractor in 2008, at an estimated cost of approximately $16M. The proposal in Weagamow is to design and build a modular 2-MW plant at a cost of under $10M.

## 2.4. Benefits

a) Operation Efficiency and Cost Effectiveness

The communities have the final say in the technical design of the project based on the feasible options outlined by Remotes, which is usually the most cost-effective option. The proposed modular design is more cost-effective than a traditional substation rebuild. The existing generators will be returned to inventory.

b) Customer

This project was initiated by Remotes' customers. The project simultaneously addresses forecast connection constraints in the community and historical reliability concerns of the D unit. Customers benefit from improved electricity availability.

c) Safety

Alleviating the spatial restrictions of the generator building would enable Remotes staff to conduct regular wok activities in a safer manner.

d) Cyber-Security, Privacy

In accordance with the NIST Guide to Industrial Control Systems Security, the planned upgrade includes restrictions of physical access to the station, PLC monitoring to detect security events, a demilitarized zone ("**DMZ**") network architecture, and restrictions of unauthorized remote access.

e) Co-ordination, Interoperability

As with all generation upgrade projects, Remotes is working closely with the First Nation communities through the funding and approval process. When a community's load begins to approach its connection limit, Remotes collaborates with the community to identify possible solutions to alleviate the capacity constraints. If a generator upgrade project is determined to be required, the customer formally requests Remotes to undertake the project, and Remotes works with the community to secure INAC funding for the project. Under the terms of the electrification agreements, INAC is responsible for funding generation capital upgrades associated with load growth in First Nation communities served by Remotes. The communities have the final say in the technical design of the project based on the feasible options outlined by Remotes.

The community of Weagamow is anticipating connection to new transmission lines that will reach the community at an undetermined date. The Remote Community Connection Plan is still in its draft form until further community consultations are completed. The likely timeline for grid connection is between 2027 and 2037. Since connection constraints are anticipated beginning in 2018, the upgrade project will proceed.

f) Economic Development

Most of Remotes' customers are First Nations, and many of their suppliers and contractors are First Nation enterprises. Remotes frequently hires local station operators and provides extensive training. This investment will relieve system capacity constraints in Weagamow, which is conducive to economic growth.

g) Environment

The new generator unit will meet the latest standards in emissions and fuel efficiency.

# 3. Prioritization

This is a non-discretionary project, since it is requested by customers and funded by INAC. The project takes priority over discretionary projects/programs.

# 4. Execution Path

## 4.1. Implementation Plan

Procurement of generators, building, and transportation of generators to Weagamow is planned to take place in 2018. Assembly of the building modules and installation of the generators would then be completed in 2019. The work will be done by a dedicated station crew. This project will be coordinated with other work planned in Weagamow, including a civil plant improvement (a separate project) in 2018.

## 4.2. Risks and Risk Mitigation

The primary risk factor for this project and other generator upgrades is funding from INAC, the levels of which have fluctuated in the past, depending on considerations outside of Remote's control. Absent the funding from INAC, Remotes does not have the means to recover the costs for this project and the project would not proceed. To mitigate this risk, Remotes works closely with the communities it serves and with INAC to ensure sufficient funds are available and approved to carry out the work. Based on the approved funding levels, the scope of work may change. The proposed modular station design is the optimal investment plan, but a partial rebuild can be completed to meet the supply needs of the community with limited funding.

Another risk to project completion is the ability to transport heavy electrical equipment to the sites, which requires the completion of an all-season road. Remotes expects the all-season road to this community to be completed in 2017. If this is not the case, then the costs and timing of the project will change.

Remotes has lodgings for only one crew in each community. Therefore, a risk to the completion of the project as planned is the availability of accommodation for crews to perform work on the generating station as part of this project, relative to emergency work that comes up throughout the year. Remotes mitigates this risk through careful project planning and execution. Remotes also can rent temporary accommodation if necessary.

## 4.3. Timing Factors

If the completion of an all-season road to the community is delayed, then the construction of a modular station would be delayed. This project may be deferred due to transportation or INAC funding delays, which are mitigated through project planning and coordination. Besides these factors, the project is customer-initiated and externally-funded and, therefore, takes priority over discretionary projects/programs.

## 4.4. Cost Factors

A large part of the final cost of this project will be transportation cost. The remoteness of the First Nation communities makes crew transportation expensive. Another important factor that may affect the final cost of the project is labour cost. Controllable costs are minimized by using experienced station crews and selecting the most cost-effective transportation option.

## 4.5. Customer Preferences

This project was initiated by Remotes' customers, the North Caribou Lake First Nation, who will have the final say in the technical design of the project.

## 4.6.Regional Electricity Infrastructure Requirements

This project does not directly arise from Regional Electricity Infrastructure Requirements. The 2016 Order-in-Council by the Minister of Energy identified 16 communities which will be connected to new transmission lines passing through northern Ontario, including North Caribou Lake

(Weagamow). The Remote Community Connection Plan is still in its draft form until further community consultation is performed and the anticipated connection dates of these communities are not known. The peak load in Weagamow is forecast to reach the connection limit in 2019; therefore, the project will proceed. The project plan accounts for the anticipated future connection in this community and tank storage upgrades have been foregone as a more near-term approach due to the long-term uncertainties.

Part of the Northwest Ontario Planning Region | January 27, 2015

ieso
Independent Electri i

**Explanatory Note Regarding January 1, 2015 OPA-IESO Merger**

On January 1, 2015, the Ontario Power Authority (OPA) merged with the Independent Electricity System Operator (IESO) to create a new organization that will combine the OPA and IESO mandates. The new organization is called the Independent Electricity System Operator.

This report was largely completed prior to January 1, 2015. Any mention of the activities performed by the former OPA or the former IESO in this report refers collectively to the new IESO.

## Contents

## Table of Figures

**Summary of Plan Highlights**

- Drivers for increased electricity demand in the areas surrounding Red Lake, Pickle Lake and Ring of Fire include *connecting remote First Nation communities and growth in the mining sector*.

- The OPA recommends a new single-circuit 230 kV line from Dryden/Ignace to Pickle Lake and upgrades to existing lines between Dryden and Red Lake for immediate implementation to address near- and medium- term needs for the Pickle Lake and Red Lake areas.

- Incremental longer term solutions to supply Ring of Fire and Red Lake are not required at this time. Longer term options will be re-evaluated in the next planning cycle (1-5 years).

- Options to supply the Ring of Fire include transmission utilizing an East-West or North South corridor, or on-site generation. East-West and North-South transmission options are comparable in cost under the high demand scenario and the potential need for a transmission line should be considered in the planning of a common infrastructure corridor to the Ring of Fire.

- Long-term options for the Red Lake area include local gas generation or new transmission.

## Summary of Updates from August 2013 draft IRRP

- Revised demand forecast used different methodology, includes updated data and is represented by three scenarios – reference, high and low; August 2013 draft included high and low scenarios, but did not include a reference scenario.
- Revised demand forecast indicates relatively higher forecasted demand in the Pickle Lake subsystem, and relatively lower forecasted demand in the Red Lake subsystem than in the August 2013 draft.
- Recommendation is for new 230 kV line to Pickle Lake in this version; voltage recommendation was not specified in the August 2013 draft.
- Recommended line upgrades from Dryden to Red Lake are expected to be sufficient to the end of the planning period for the reference and low forecast scenarios, and to 2030 for the high forecast scenario. The August 2013 draft indicated that the upgrades may be insufficient in the medium-term for the high scenario.
- Recommendation to discuss reactive services of Manitou Falls GS with OPG, as per OPG's written submission.
- Revised economic analysis methodology – refer to Appendices 10.6, 10.7, and 10.8 for details.

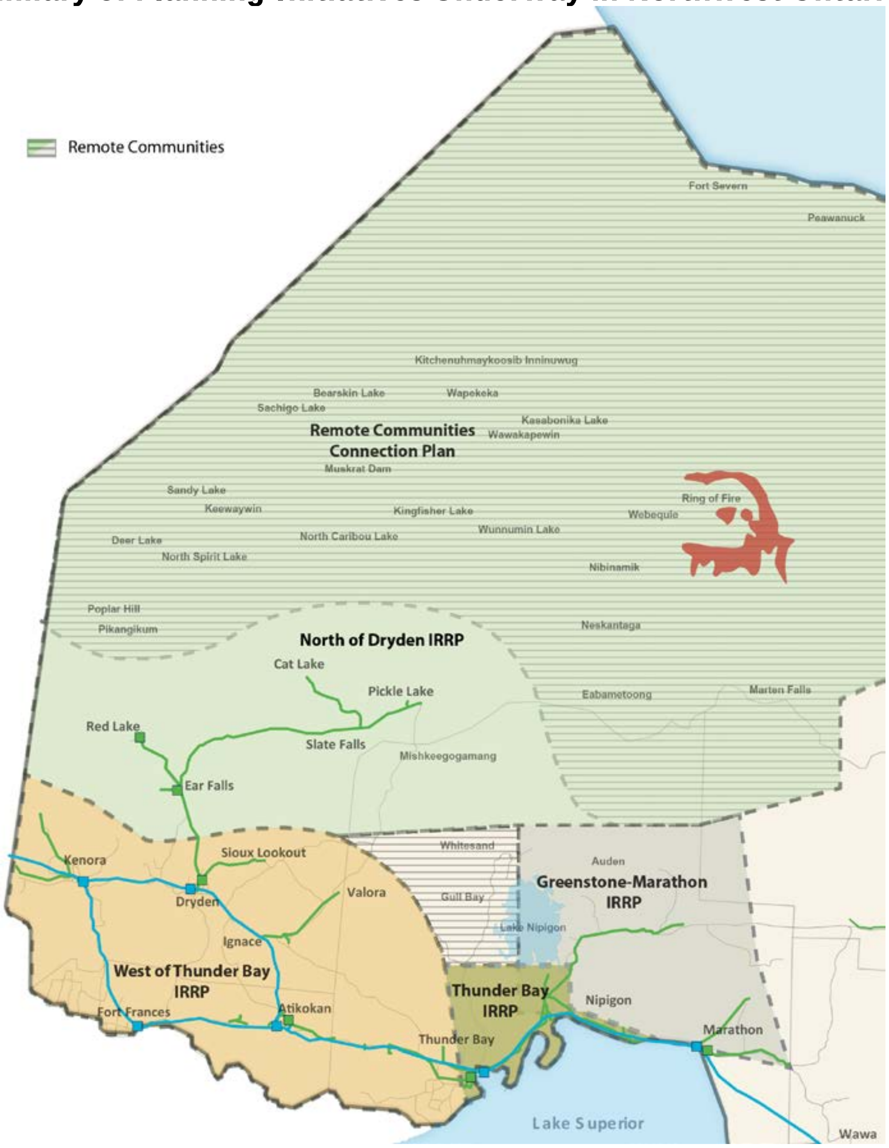
# 1 EXECUTIVE SUMMARY

## Context and Purpose

The purpose of the North of Dryden Integrated Regional Resource Plan (“regional plan”, “North of Dryden IRRP”, or “IRRP”) is to identify the near-term and medium- to long-term electricity supply needs of the area and assess options that are available to address the needs in a timely, reliable and cost-effective manner. The IRRP is intended to provide the overall planning context to address regional supply adequacy and reliability needs.

The North of Dryden IRRP is one of several electricity planning initiatives that the the Ontario Power Authority (“OPA”) is undertaking for the Northwest Ontario region. Figure 1 identifies the IRRP initiatives currently being undertaken by OPA in the Northwest Ontario region. The North of Dryden IRRP accounts for the demand requirements in the North of Dryden sub-region. This includes requirements at Pickle Lake and Red Lake related to the connection of the 21 remote First Nation communities (“remote communities”) that are economic to connect, as outlined in the Remote Community Connection Plan as well as new mining developments forecasted in the area. It also coordinates with the West of Thunder Bay IRRP, ensuring that the West of Thunder Bay transmission system is able to accommodate the expected growth north of Dryden. The North of Dryden IRRP will also coordinate options related to supply to the Ring of Fire with the Greenstone-Marathon IRRP.

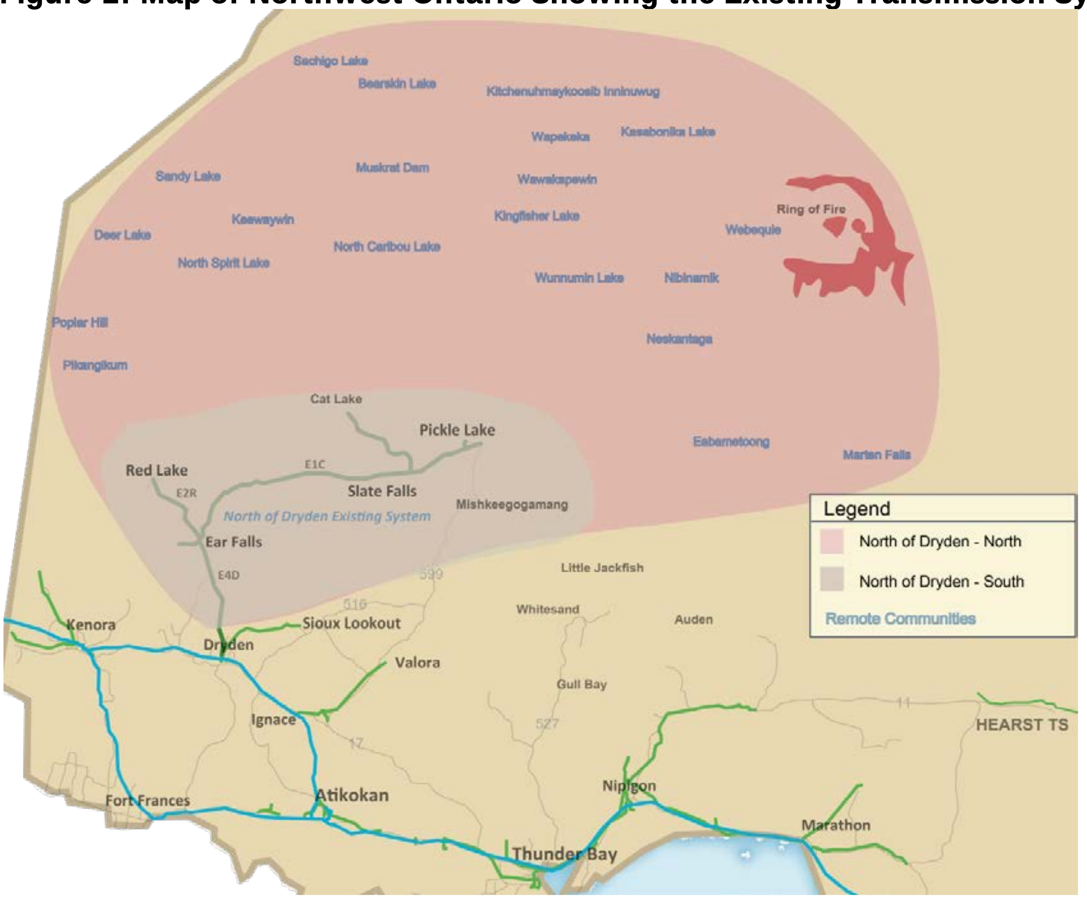
**Figure 1: Summary of Planning Initiatives Underway in Northwest Ontario**



The North of Dryden sub-region is contained within First Nation Treaty areas 3, 5, 9 and the Robinson-Superior Treaty area. It also includes portions of Region 1 and Region 2 of the Métis Nation of Ontario ("MNO"). The southern portion of the sub-region (shown in Figure 2) is currently served by Ontario's transmission grid and is bounded by Dryden to the southwest, Red Lake to the northwest and Pickle Lake to the northeast. Existing mining activity is primarily located in this southern portion of the North of Dryden sub-region and is largely focused around the towns of Ear Falls, Red Lake and Pickle Lake. The northern portion of the North of Dryden sub-region (shown in Figure 2) contains the

21 remote First Nation communities which are economic to connect, one operating mine, and the mine development area known as the Ring of Fire. At present, only one mine north of Pickle Lake is connected to the transmission grid through a privately owned transmission line.

**Figure 2: Map of Northwest Ontario Showing the Existing Transmission System**



The North of Dryden sub-region is forecast to experience some of the highest growth in electrical demand in Ontario. Currently the electricity transmission system serving the area is at capacity and is unable to accommodate demand growth.

Mining sector expansion is the primary driver of electricity demand growth in the area; through the expansion of existing mines and the development of new mines, as well as growth in the industries and communities that support the mining sector. Remote communities in the North of Dryden sub-region are currently supplied by diesel generation, however the draft Remote Community Connection Plan[1] developed jointly by the remote communities and the OPA indicates that there is an economic case for connecting the majority of these communities to Ontario's transmission system. The Remote Community Connection Plan is the OPA's primary planning document for these communities, however, the connection would put additional demand requirements on the local transmission system in the areas of Red Lake and Pickle Lake, which is considered in this IRRP.

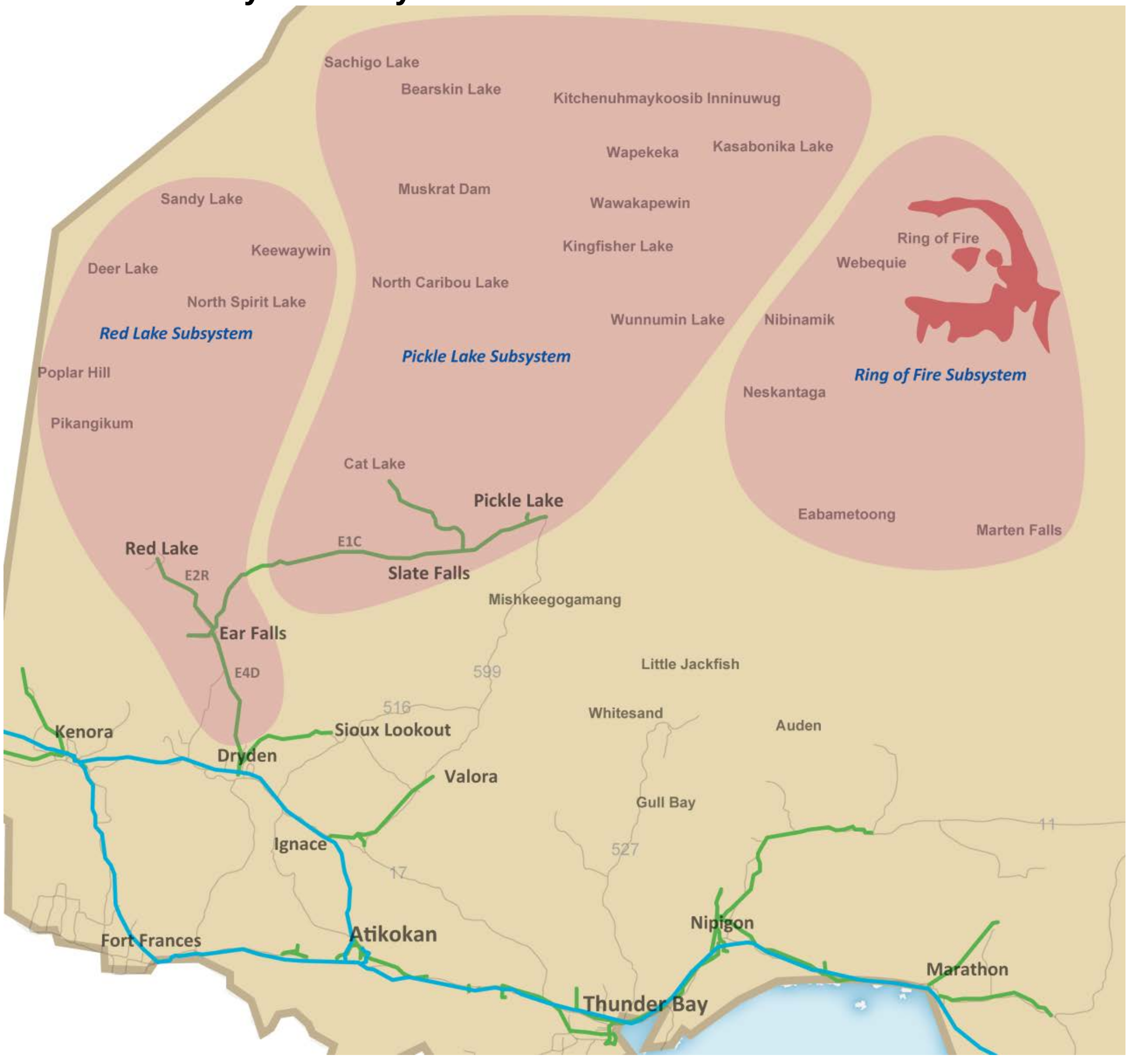
**Need Identification**

Over the past decade, the annual electricity demand growth in the North of Dryden sub-region has averaged about 1.9%. Growth plans of existing and future customers that are expected to be supplied from the local transmission system indicate that there will be a significant increase in electricity demand over the next 20 or more years.

For study purposes, the area has been segmented into three subsystems generally surrounding Red Lake, Pickle Lake and the Ring of Fire.

[1] A report entitled "Technical Report and Business Case for the Connection of Remote First Nation Communities in Northwest Ontario" was developed by the Northwest Ontario First Nations Transmission Planning Committee and the OPA. The document can be found at this website: http://www.powerauthority.on.ca/sites/default/files/planning/OPA-technical-report-2014-08-21.pdf

**Figure 3: North of Dryden Subsystems**



Where growth in electricity demand identified in these subsystems cannot be met by the existing system, technically feasible conservation, local generation, and transmission options are identified and compared based on their ability to cost effectively meet the needs.

The OPA produced high and low forecast scenarios to capture the range of variability in future electrical demand and a reference forecast to reflect a likely scenario of future demand based on the information available at the time.

This regional plan has identified that there is a near-term (2014 to 2018) need for additional Load Meeting Capability[2] ("LMC") in the transmission system currently serving the Red Lake and Pickle Lake subsystems. The regional plan has also identified that the majority of the forecasted growth is expected to occur during the medium term between 2019 and 2023. This is the period when remote communities and new mines are expected to develop and connect to the transmission system. The long term is characterized by steadily increasing demand over the remainder of the planning period (to 2033). The need for incremental LMC by subsystem is summarized in Table 1 below.

**Table 1: Incremental Capacity Needs by Subsystem**

| **Sub-system** | **Near-term Capacity Needs (Present to 2018 in MW)** | | | **Medium-term Capacity Needs (2019-2023 in MW)** | | | **Long-term Capacity Needs (2024-2033 in MW)** | | |
|---|---|---|---|---|---|---|---|---|---|
| | High | Reference | Low | High | Reference | Low | High | Reference | Low |
| Pickle Lake | 20 | 18 | 15 | 36 | 28 | 17 | 59 | 47 | 11 |
| Red Lake | 30 | 30 | 30 | 62 | 44 | 36 | 75 | 48 | 39 |
| Ring of Fire | 22 | 22 | 4 | 67 | 27 | 5 | 73 | 29 | 7 |

Given the magnitude of the increase in electrical demand associated with expanding an existing mine or opening a new mine, as well as growth in electricity demand from growing communities, the area is currently deficient in supply capacity and is expected to become increasingly deficient over the near, medium, and long term.

### Options Analysis

The technically feasible options available to meet needs in the Red Lake, Pickle Lake and Ring of Fire subsystems and their implementation timing are outlined in Table 2 below. All costs are net present cost in 2014 dollars, unless stated otherwise (a detailed description of costing methodology can be found in Appendices 10.6, 10.7, and 10.8):

[2] Existing system is thermally limited.

**Table 2: Summary of Options**

| Implementation Timing | Pickle Lake Subsystem | Red Lake Subsystem | Ring of Fire Subsystem |
|---|---|---|---|
| **Conservation and DG Options** | | | |
| Near term and medium to long term (2014-2033) | Customers may investigate opportunities for additional conservation beyond targets and DG resources to suit their own electrical requirements; Industrial Accelerator Program ("IAP"), Aboriginal Conservation Program, Aboriginal Community Energy Plans Program, remote renewable opportunities after grid expanded to supply remote First Nation communities. | | |
| **Transmission Options** | | | |
| Near term (2014-2018) | Build a new 115 kV<br>OR<br>230 kV transmission line from the Dryden/Ignace area to Pickle Lake<br>**Cost: $80 M - $114 M** | Upgrade existing transmission lines serving Red Lake (E4D and E2R)<br>**Cost: $11 M** | East-West Corridor Option:<br>Build a new 115 kV transmission line from Pickle Lake to Ring of Fire for demand up to 67 MW, or build a new 230 kV line if greater than 67 MW.<br>**Cost: $106 M - $156 M**<br>OR<br>North-South Corridor Option:<br>Build a new 230 kV transmission line from either Marathon or a point east of Nipigon to Ring of Fire<br>**Cost: $175 M** |
| Medium to long term (2019-2033) | | If load in the Red Lake subsystem exceeds 109 MW:<br>Install additional voltage support<br>**Cost: $1 M**<br>If load in the Red Lake subsystem exceeds 130 MW:<br>Build a new 115 kV or 230 kV transmission line between Dryden and Ear Falls<br>**Capital Cost: $91 M - $132 M**[3] | |
| **Generation Options** | | | |
| Near term (2014-2018) | Gas-fired generator at Pickle Lake fuelled by compressed natural gas, sized and expanded to meet demand growth of up to 31 MW in medium term and up to 76 MW in long | Gas fired generator utilizing up to 30 MW of available gas pipeline capacity at Red Lake<br>**Cost: $51 M** | On-site generation fuelled by compressed natural gas or diesel,<br>**Cost: $209 M - $946 M**[4]<br>Separately connect remote communities |
| Medium to long term (2019-2033) | | Gas-fired generator utilizing up to 30 MW of available gas pipeline | |

[3] For comparison with other options, the long-term Red Lake options are presented as capital costs. The NPV of transmission in the long term is $10-15 M. This number is low as the majority of costs are not incurred in the 20 year planning period of this IRRP and the NPV is expressed in 2014 dollars (multiple years of discounting). A fuller description of costing methodology can be found in Appendices 10.6, 10.7, and10.8.

[4] Range indicates variation in cost of diesel and compressed natural gas as well as sizing of the generation facility to accommodate the low, reference or high forecast scenarios.

| | | | |
|---|---|---|---|
| | term<br>**Cost: $158 M - $317 M** | capacity at Red Lake, followed by additional 30 MW at Ear Falls if a new gas pipeline is built<br>**Capital Cost: $95 M - $ 153 M**[5] | **Cost: $ 62 M**<br>**Total Cost: $ 272 M - $1,009 M** |
| | | | |

This regional plan considers overall societal costs[6] in determining the least-cost options for supplying the study area. The analysis in this regional plan does not consider the allocation of costs that are attributable to individual customers in the area or how this may affect individual customer decisions on pursuing the societal least-cost options. The final determination of cost allocation between parties will be made through the applicable regulatory process and/or through commercial agreements. For example, cost allocation of transmission and distribution infrastructure is made by the Ontario Energy Board ("OEB"), benefitting customers, and/or transmitters and distributors in the area in accordance with rules set out in the Transmission System Code ("TSC") and Distribution System Code ("DSC").

**Summary of Aboriginal, Stakeholder, and Public Feedback**

*Aboriginal Consultation*

The Ministry of Energy delegated the procedural aspects of consultation to the OPA and identified 44 First Nation communities and four Métis communities to be consulted on

[5] For comparison with other options, the long-term Red Lake options are presented as capital costs. The NPV of generation in the long term is $6-8 M. This number is low as the majority of costs are not incurred in the 20 year planning period of this IRRP and the NPV is expressed in 2014 dollars (multiple years of discounting). A fuller description of costing methodology can be found in Appendices 10.6, 10.7, and10.8.

[6] Societal costs include direct electricity project costs associated with real incremental goods and services (capital cost of engineering, equipment, operations and maintenance, fuel, etc.) but excludes the cost of land, taxes and potential impact benefit agreements that may be reached with affected First Nations, which proponents may be required to pay. Governments (and their agencies) undertake projects of infrastructural, environmental or health and safety enhancements in the wider public interest, assessing project merits in terms of the long-term return to current and future generations of society as a whole, using a social discount rate ("SDR"). The OPA uses a four-percent SDR to determine the present value of options over the planning period.

the Draft North of Dryden IRRP. The OPA and Ministry of Energy provided written notice to each community. The OPA also followed up by telephone to each community and sent all presentation material to each community in advance of the sessions.

The OPA held consultation sessions for the First Nation communities in Thunder Bay on June 18, 2014, June 25, 2014, and October 16, 2014, and in Dryden on June 26, 2014. The OPA met with Red Sky Métis Independent Nation on June 19, 2014 at Red Sky's office in Thunder Bay.

The OPA was in contact with the Métis Nation of Ontario ("MNO") on a number of occasions via telephone and email to set up appropriate times for regional consultation meetings with MNO's member communities. The OPA endeavoured to meet with the MNO and its chartered communities and remains open to such meetings.

To date there have not been any specific concerns expressed regarding potential impacts of the regional plan on any Aboriginal or treaty rights.

*Municipal Engagement*

The OPA met with municipal representatives in person to solicit feedback on the Draft North of Dryden IRRP to be incorporated into the North of Dryden IRRP. The OPA met with municipal representatives from Pickle Lake, Greenstone, Red Lake, Sioux Lookout, Marathon, Dryden and Ignace in December 2013 and February 2014.

Following the municipal engagement meetings, several common themes emerged from the various municipalities and mainly centered on option preference, cost responsibility, and urgency for development.

*Written Feedback*

Since the posting of the Draft North of Dryden IRRP, the OPA has received written feedback and has followed up with those who contributed written submissions. Written feedback was submitted from the Common Voice Northwest Energy Task Force

("CVNW"), the township of Pickle Lake, Imperium Energy on behalf of the municipality of Greenstone, the Ontario Waterpower Association, Ontario Power Generation ("OPG"), Gold Canyon Resources Inc., Energy Acuity, and an independently represented stakeholder.

In general, written submissions asked clarifying questions regarding the content in the draft report. It should be noted that CVNW submitted a 51-page report of comment covering topics across the entire Northwest. The OPA has considered the input in this report, has met with CVNW since publishing the draft report, and will continue to consider their feedback for regional planning initiatives across northwestern Ontario.

Based on written feedback provided by OPG on the Draft North of Dryden IRRP, submitted November 8th, 2013, OPG identified that Manitou Falls units G1, G2, and G3 all have condense features which could be contracted to provide reactive power during drought conditions. The contracting of these units could avoid some of the station investments at Ear Falls Switching Station ("SS") associated with the installation of voltage control devices. The OPA has considered this feedback in finalizing the plan.

*Webinar*

The first draft of the North of Dryden IRRP was posted to the OPA's website in August 2013 and a webinar was held on November 21, 2013 to present the draft IRRP and solicit feedback. Main points of feedback were consistent with that received in written submissions and engagement and consultation meetings.

**Recommended Solutions/Actions to be initiated in the near term**

The OPA recommends the following solutions for implementation as soon as possible:

1. Building a new single circuit 230 kV transmission line from the Dryden/Ignace area to Pickle Lake (for the Pickle Lake subsystem), installing a new 230/115 kV autotransformer, related switching facilities, and the necessary voltage control

devices at Pickle Lake, and transferring the existing load on the line between Ear Falls and Pickle Lake (E1C) to be supplied by this new line;

2. Upgrading the existing 115 kV lines from Dryden to Ear Falls (E4D) and from Ear Falls to Red Lake (E2R) (for the Red Lake subsystem) and install the necessary voltage control devices; and

3. Having the Independent Electricity System Operator ("IESO")/OPA initiate discussions with OPG for new reactive power services provided by Manitou Falls Generating Station ("GS") if it is confirmed to be beneficial to the ratepayer.

These recommendations are the most cost-effective options that can be implemented in a timely manner and provide flexibility for meeting a broad range of long-term forecast scenarios.

The estimated combined present value cost of recommendations (1) and (2) during the planning period is about $124 million[7]. Recommendation (3) may reduce the estimated cost further. Together these projects increase the LMC of the Pickle Lake subsystem from 24 MW to 160 MW, and increase the LMC of the Red Lake subsystem from 61 MW to 130 MW.

The OPA understands that near-term actions for implementing a new line to Pickle Lake have been initiated by two proponents. Additionally, the OPA understands that Hydro One and various customers in the Red Lake area have initiated discussions to implement the upgrades from Dryden to Red Lake. Implementation of the new 230 kV line to Pickle Lake and the 115 kV line upgrades from Dryden to Red Lake continue to be supported by the OPA.

[7] The August 2013 draft identified this cost as $234-271 million. This change in cost is due to a change in methodology for the NPV economic analysis – treating avoided system generation as a benefit of generation options, rather than a cost to transmission options (as in the 2013 draft). NPV economic analysis is an analysis tool to compare costs over a time horizon, and is not the same as the total project cost for the option being investigated.

**Options for the medium to long term period**

*Pickle Lake Subsystem*

The recommendation to build a new single-circuit 230 kV line from Dryden/Ignace to Pickle Lake in the near term would be sufficient under all forecast scenarios for the medium to long term.

*Red Lake Subsystem*

Following the completion of the near-term recommendations, the 130 MW LMC is expected to be sufficient beyond the planning period for the low and reference forecast scenarios, and until 2030 for the high scenario as shown in Table 1. Therefore, the near-term recommendations are expected to be sufficient to meet the needs of the Red Lake subsystem for the long term.

As shown in Table 2, two options have been investigated for the Red Lake subsystem to address any forecasted load in excess of 130 MW. The OPA recommends that these options, incremental natural gas-fired generation at Red Lake and a new transmission line, be retained as viable long term options and re-evaluated in the next planning cycle (1-5 years) for this IRRP. Re-evaluating plans up to every 5 years is consistent with OEB requirements in the TSC, DSC and the OPA license.

*Ring of Fire Subsystem*

There are several options for supplying the Ring of Fire subsystem depending on the load growth scenario. The analysis indicates that the Ring of Fire subsystem can be cost-effectively served by a 115 kV transmission connection from Pickle Lake (serving five remote communities and mines at the Ring of Fire), if demand over the long term is 67 MW or less. If demand is reasonably certain to exceed 67 MW in the subsystem, a 230 kV transmission line utilizing an East-West corridor from Pickle Lake, or a 230 kV transmission line utilizing a North-South corridor from either Marathon or east of Lake Nipigon would be required, where these alternatives have approximately equal cost.

The 230 kV transmission options are also expected to be more cost-effective from a societal perspective than the combined cost of developing local generation to serve the total mining load and separately connecting remote communities to Pickle Lake.

The OPA is aware of ongoing work for infrastructure development for the Ring of Fire. Common infrastructure corridors serving multiple uses provide synergies for cost and environmental approvals, and may reduce environmental impacts. The OPA therefore recommends that development of an infrastructure corridor to the Ring of Fire should consider the potential need for a transmission line.

**Conservation Options**

Recently, the OPA has received new direction[8] from the Minister of Energy pertaining to the framework for conservation programs moving forward. Directives from the Minister of Energy set conservation targets, which Local Distribution Companies ("LDC") will plan to meet through the development of conservation plans and programs for their service area. The spirit of this new direction is to provide more opportunity for LDCs, communities, and industry to participate in conservation initiatives so a broader scope of programs is expected to be tailored to the local needs of the region. For remote communities, conservation opportunities are considered in the Remote Community Connection Plan.

Furthermore, the following programs are available through the OPA to Aboriginal Communities:

- Aboriginal Conservation Program, with the aim to provide customized conservation services designed to help First Nation communities, including remote and northern communities, reduce their electricity use in residential housing, and in commercial and institutional buildings, like stores, schools and

[8] *2015-2020 Conservation First Framework (March 31, 2014), Continuance of the OPA's Demand Response Program under IESO management (March 31, 2014), and Industrial Accelerator Program (July 25, 2014).*

band offices. This program will be offered for one additional year (ending December 31, 2015) until such time as LDCs are able to develop a CDM program which recognizes the specific requirements of on-reserve First Nation communities as per the 2015-2020 Conservation First Framework Directive.

- Aboriginal Community Energy Plans program to support Aboriginal participation in Ontario's energy sector by providing up to $90,000 per community in funding to First Nation or Métis communities for local energy planning activities, with remote communities being eligible for an additional $5,000.

Electricity demand of the industrial sector is quite significant in this area. The Industrial Accelerator Program ("IAP") is available to industrial customers as a means of achieving conservation savings with financial assistance from the OPA.

Given the large component of industrial demand and number of First Nation and Métis communities in the area, the above mentioned programs should be pursued.

**Generation Options for the Medium- to Long-term Period**

On May 30, 2014, the OPA closed submissions for the Northwest Ontario Request for Information ("NW RFI"). The purpose of the NW RFI was to gather information on the potential availability of diverse resource options in northwestern Ontario, with particular focus on the interim period to 2020. As part of the NW RFI, the OPA received submissions totaling over 4000 MW for the entire Northwest region. Of the over 4000 MW, a few potential projects were identified in the North of Dryden sub-region and were consistent with the generation options investigated as part of this IRRP.

Procurement of generation is not recommended to be pursued at this time for meeting needs in the North of Dryden sub-region. However, if a generation solution is required for other areas of the Northwest, local benefits of these options to the North of Dryden sub-region will be re-evaluated.

# 2 INTRODUCTION

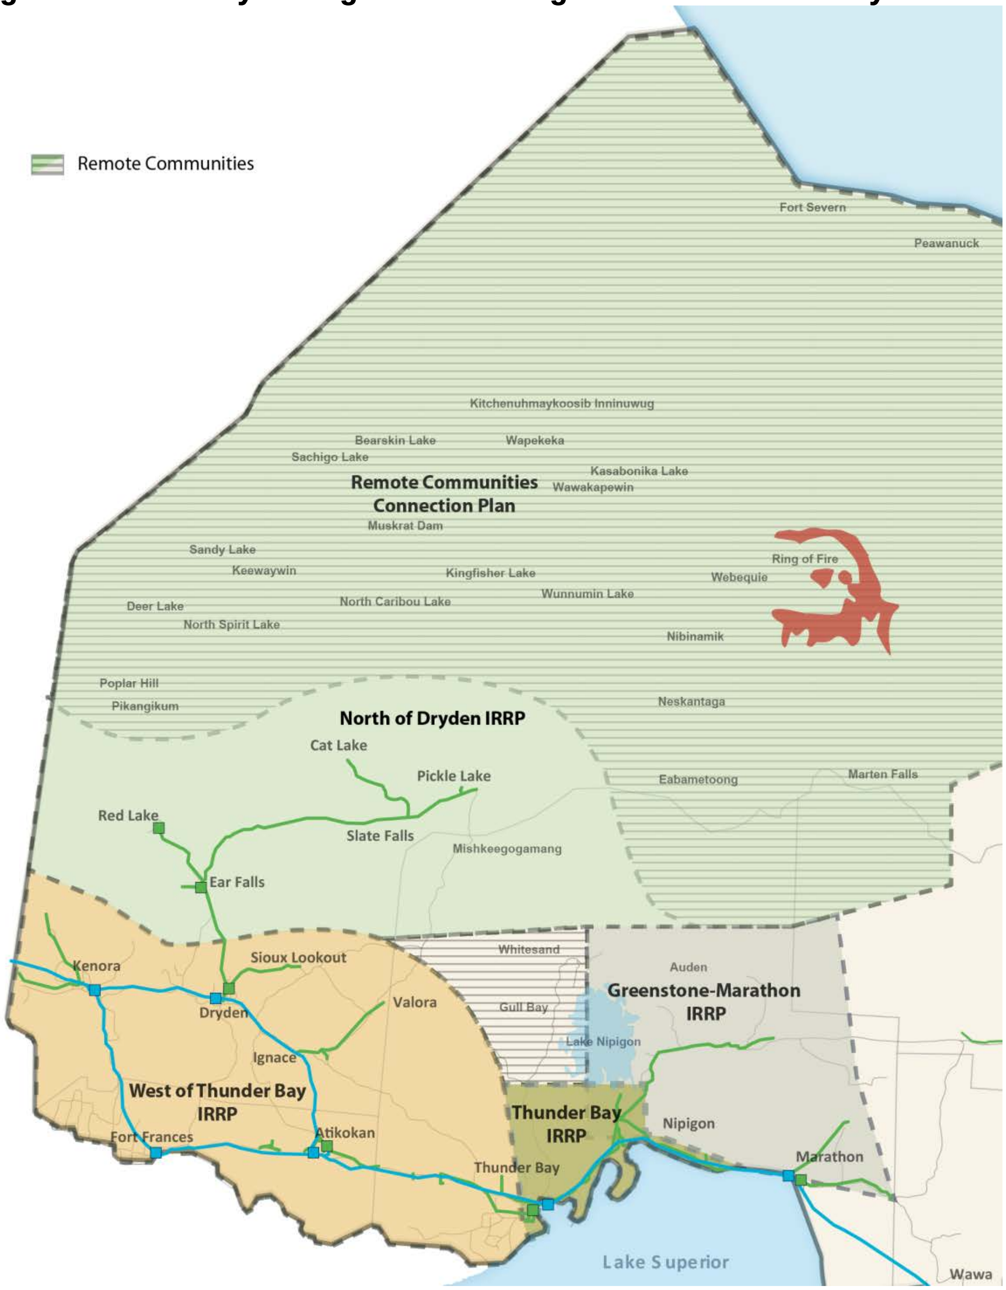
## 2.1 The North of Dryden Sub-Region

The North of Dryden Integrated Regional Resource Plan (“IRRP”) is one of several electricity planning initiatives that the Ontario Power Authority (“OPA”) is undertaking for the Northwest Ontario region. Figure 4 identifies the IRRP initiatives currently being undertaken by the OPA in the Northwest Ontario region. The North of Dryden IRRP accounts for the demand requirements in the North of Dryden sub-region.

The Thunder Bay IRRP, West of Thunder Bay IRRP and Greenstone-Marathon IRRP were initiated fall 2014. A Scoping Outcome Assessment Outcome Report for northwestern Ontario, which includes the Terms of Reference for three new IRRPs, is available on the OPA’s website, consistent with Ontario Energy Board (“OEB”) requirements. The Terms of Reference for the West of Thunder Bay IRRP and the Greenstone-Marathon IRRP include considerations for relationships with the North of Dryden IRRP.

The North of Dryden sub-region is a natural resource rich area in northwestern Ontario, with existing mining, forestry, and hydroelectric generation operations, as well as potential for substantial new resource development. Mining sector expansion, including expansion of existing mines as well as the development of new mines, is a major driver for electricity demand growth in the area, both at mine sites and through growth in industries that support the mining sector. Another major driver for electricity demand growth in the area is the economic connection of remote First Nations communities (“remote communities”) to the provincial transmission grid, which are currently served by isolated diesel generation systems.

**Figure 4: Summary of Regional Planning Initiatives Underway in Northwest Ontario**



The transmission system supplying the North of Dryden sub-region is currently at capacity. This IRRP recommends options to provide new high voltage electrical capacity to meet near-term growth, while providing options to meet future growth as it becomes more certain. These near-term recommendations are presented as action items for immediate or early deployment. Options to address potential longer-term needs are also

24

identified, but the OPA does not make a recommendation on a preferred option at this time, as the longer term still remains uncertain and adequate time is available to continue to monitor the situation closely. The OPA will continue to monitor demand growth and reevaluate longer-term options in future planning cycles for the North of Dryden sub-region. When a decision for the longer-term is required, the OPA will make a recommendation for solutions to be implemented.

The North of Dryden sub-region (shown in more detail in Figure 5) is contained within First Nation Treaty areas 3, 5, 9 and the Robinson-Superior Treaty area. It also includes portions of Region 1 and Region 2 of the Métis Nation of Ontario ("MNO"). The southern portion of the area (as shown in Figure 5) is currently served by Ontario's transmission grid and is bounded by Dryden to the southwest, Red Lake to the northwest, and Pickle Lake to the northeast. Current mining activity is mostly contained in this portion of the area, and broadly focused around the Towns of Ear Falls, Red Lake and Pickle Lake.

The northern portion of the North of Dryden sub-region (as shown in Figure 5) is comprised of 21 remote communities, one operating mine and the mine development area in the Hudson Bay lowlands known as the Ring of Fire. At present, the mine north of Pickle Lake is connected to the transmission grid by a privately owned transmission line. There are 25 remote First Nations communities that are distant from the existing provincial transmission system and are currently supplied electricity by local diesel generation facilities. On August 21, 2014, an updated draft Remote Community Connection Plan was made available on the OPA website.[9] The Remote Community Connection Plan demonstrates a business case to connect 21 of 25 remote communities that currently rely on diesel generation, to the provincial transmission grid. The business case is based on the avoided cost of diesel fuel. For the purpose of this regional plan, 21 of the 25 communities are assumed to connect to Ontario's transmission system as per the OPA's Remote Community Connection Plan. Communities are expected to begin connecting in the early 2020s.

[9] http://www.powerauthority.on.ca/sites/default/files/planning/OPA-technical-report-2014-08-21.pdf

**Figure 5: Map of Northwest Ontario Showing the Existing Transmission System**

Distribution connected customers in the North of Dryden sub-region are served by Hydro One's distribution system. There are also a number of large industrial customers that are connected directly to the transmission system in the area and served by Hydro One's transmission system.

## 2.2 Purpose and Scope of the IRRP

This regional plan assesses the near-term and medium- to long-term electricity supply needs of the North of Dryden sub-region and identifies the options which are available to address these needs in a cost-effective, reliable, and timely manner. The regional plan is intended to identify alternatives and recommended options to local customers, proponents, and local government so development work may proceed. Proponents may also choose to use this regional plan to support the regulatory proceedings they will undertake to seek approval for their projects.

Regional planning for the North of Dryden sub-region began before the OEB's formalized regional planning process was developed as part of the Renewed Regulatory Framework for Electricity ("RRFE"). Consequentially the North of Dryden IRRP does not have a corresponding Scoping Assessment Outcome Report. The North of Dryden IRRP is considered a "transition plan" as per the Planning Process Working Group ("PPWG") report on Regional Planning to the OEB. This version of the North of Dryden IRRP has transitioned and aligned with OEB requirements for the IRRPs as per the OPA's license.

In 2010, the OPA, Hydro One and the Independent Electricity System Operator ("IESO") began working together to assess the ability of the electricity system in the North of Dryden sub-region to meet forecast growth over the near, medium and long term, and to develop integrated plans to address needs that have been identified. Since beginning this planning work, the OPA has engaged existing and potential customers in the area to identify the size and scope of their future electricity needs in the North of Dryden sub-region. The IESO has also completed a number of System Impact Assessments ("SIAs") and feasibility studies for customers requesting additional capacity.

In addition to the regional planning requirements outlined by the OEB, the Minister of Energy identified in the 2010 Long-Term Energy Plan ("LTEP") that the OPA would develop plans to enable the connection of remote First Nations communities, and identified the development of a new transmission line to Pickle Lake to be a priority transmission project, with the scope and timing to be determined by OPA. In February 2011, the OPA received an updated Supply Mix Directive ("SMD") from the Minister of Energy. The updated SMD requires that the OPA develop a plan to connect remote First Nation communities north of Pickle Lake. In December 2013, the Ministry of

Energy released the second LTEP which reiterated that connecting remote First Nation communities in northwestern Ontario is a priority.

Since 2009, the OPA has been working with remote First Nations communities through the Northwestern Ontario First Nation Transmission Planning Committee ("NWOFNTPC") to identify communities that are economic to connect to the provincial transmission system. Through this partnership, planning is underway for connecting most of these communities to the grid and for developing local solutions for the remaining communities to cost-effectively reduce their reliance on diesel fueled generation.

The North of Dryden IRRP is affected by connection of remote communities in two primary ways:

1. The transmission facilities serving the area must be capable of supplying the electrical demand resulting from the connection of these remote communities; and

2. Options for coordinating connection with mining developments, especially in the Ring of Fire area, must be investigated in accordance with assumptions in the Remote Community Connection Plan.

As new information on the connection of the remote communities becomes available, the North of Dryden IRRP will be updated accordingly and consistent with the regional planning process and PPWG report.

It should also be noted that regional plans consider overall societal costs[10] in determining the least cost options for supplying a study area. This analysis does not

[10]Societal costs include direct electricity project costs associated with real incremental goods and services (capital cost of engineering, equipment etc, operating and maintenance, fuel etc.), but excludes the cost of land, taxes, and potential Impact Benefit Agreements that may be reached with affected First Nations, which proponents may be required to pay. cont'd...

consider how the allocation of costs attributable to individual customers in the area may affect their decision to pursue the societal least cost options. The final determination of cost allocation between parties will be determined by the appropriate regulatory process or commercial agreement. For example, cost allocation of transmission and distribution infrastructure is made by the OEB, benefitting customers, and/or transmitters and distributors in the area in accordance with the rules set out in the Transmission System Code ("TSC") and Distribution System Code ("DSC").

Other planning activities for the region will consider supply needs to the Dryden area for supply of expected load growth in the North of Dryden sub-region. Some of the planning and development work that is underway to ensure an adequate supply is available in the overall Northwest region includes development work being undertaken by NextBridge Infrastructure for an expanded East-West Tie ("EWT"), the May 30, 2014 Northwest Request for Information ("NW-RFI"), and the regional planning initiatives summarized in Figure 4.

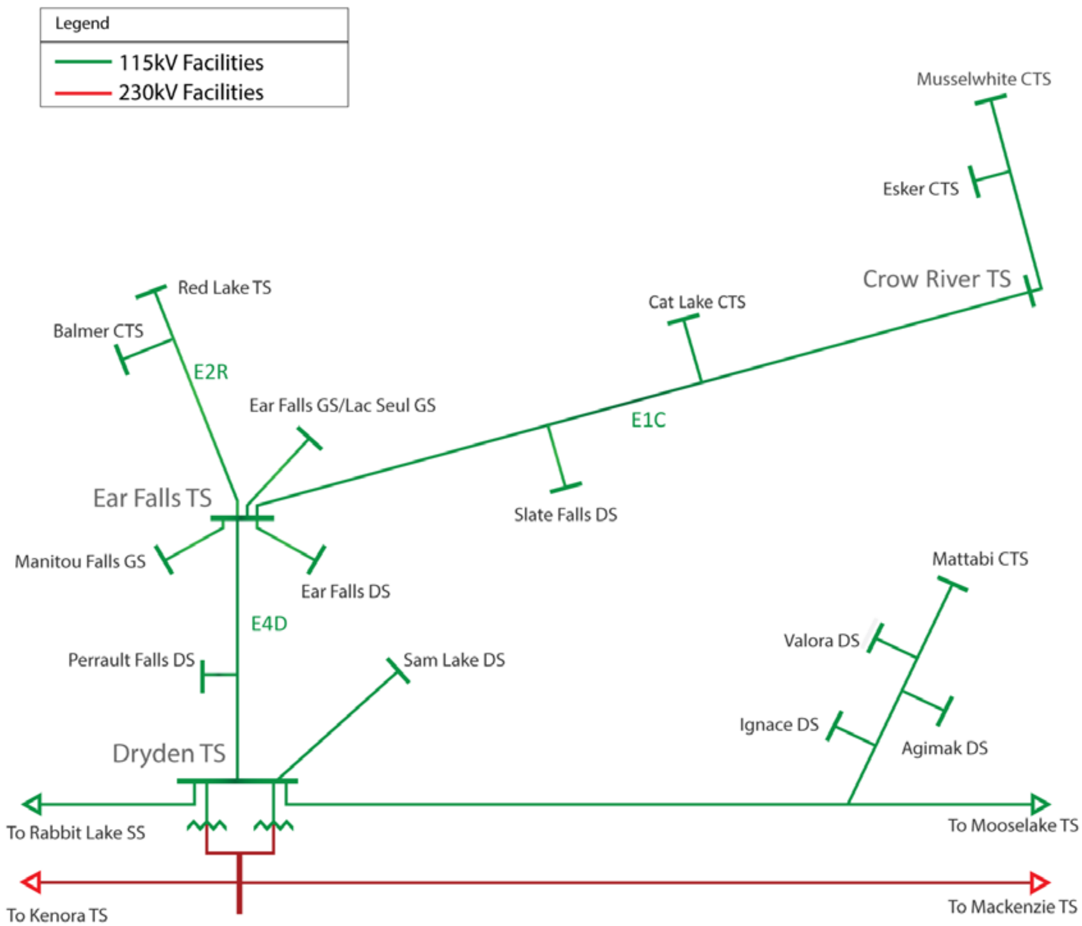
---

...Governments (and their agencies) undertake (or mandate) projects of infrastructural, environmental, or health and safety enhancement in the wider public interest, assessing project merit in terms of the long-term return to current and future generations of society as a whole, using a Real Social Discount Rate (Real "SDR"). The OPA uses a 4% Real Social Discount Rate for determining the present value of options over the planning period.

# 3 NORTH OF DRYDEN TRANSMISSION AND GENERATION FACILITIES

Currently, electricity customers in the North of Dryden sub-region are supplied by a single-circuit 115 kV radial transmission line (“E4D”) emanating from Dryden TS and by local hydroelectric generation. Dryden TS is a major supply station for this area, where the voltage is stepped down from the regional 230 kV system to 115 kV to serve local community and industrial customers as shown in Figure 6 below.

**Figure 6 Existing North of Dryden Transmission System**



30

At Ear Falls TS, the 115 kV supply branches to the north, east, and west to supply customers and incorporate generation in the area. Hydroelectric generation is connected to the transmission system at Ear Falls generating station (“GS”) (17 MW Ear Falls + 12.1 MW Lac Seul) and at Manitou Falls GS (73.1 MW). To the north of Ear Falls, the E2R transmission line (“E2R”) supplies Red Lake area mining and community customers. East of Ear Falls, the E1C transmission line (“E1C”) supplies the Town of Pickle Lake, Cat Lake First Nation, Slate Falls First Nation, Mishkeegogamang First Nation, as well as a mine via a privately-owned 115 kV transmission line (“M1M”).

For the purposes of this regional plan, the North of Dryden sub-region is divided into three main subsystems, as shown in Figure 7, the Pickle Lake subsystem, the Red Lake subsystem, and the Ring of Fire subsystem. At present, the Ring of Fire subsystem has no transmission infrastructure and is not connected to the provincial transmission grid, and the Pickle Lake subsystem is supplied downstream of the Red Lake subsystem from Ear Falls via E1C.

The Pickle Lake subsystem includes all demand planned to be served by E1C at Cat Lake CTS, Slate Falls DS, Crow River DS, as well as a mine north of Pickle Lake and any new customers that may connect in the Pickle Lake area in the future. The Pickle Lake subsystem also includes 10 remote communities north of Pickle Lake that are identified to connect to Pickle Lake in the 2014 Remote Community Connection Plan.

The Red Lake subsystem includes all load and generation connected and planned to be served by E4D and E2R, at Perrault Falls DS, Ear Falls TS, Red Lake TS, Balmer CTS, and the six remote communities north of Red Lake that are identified as being economic to connect to Red Lake TS in the 2014 Remote Community Connection Plan. As mentioned previously, there is 102.2 MW of hydroelectric generation at Ear Falls GS and Manitou Falls GS.

**Figure 7: North of Dryden Subsystems**

The Ring of Fire subsystem does not include any existing transmission facilities. The subsystem includes five remote communities that are identified for connection in the 2014 Remote Community Connection Plan as well as potential future industrial customers at the Ring of Fire mine development area.

Due to the current system configuration, when a transmission line in the North of Dryden sub-region is forced out of service all load connected to it is lost. In the event that E4D is removed from service, some of the North of Dryden system can be restored

32

by islanded[11] hydroelectric generation in the Ear Falls area until E4D is returned to service. While the area is islanded from the system and supplied by local generation, the amount of load that can supplied is limited to the available generation output.

Historically, the reliability of electricity supply to some customers in the North of Dryden sub-region has been worse than the average for other customers in northwestern Ontario. Specifically, customers in the Pickle Lake subsystem (currently supplied by E1C) have experienced, on average, 14 unplanned outages per year over the past 10 years.[12] This compares to an average of about three unplanned outages per year for customers served by the other 115 kV lines in northwestern Ontario.[13] Planning for the north of Dryden system includes consideration of this historical performance.

---

[11] Islanded: when one part of the system is disconnected and operated separately from the rest of the Ontario electricity system.

[13] Hydro One Networks Inc. through correspondence.

# 4 HISTORICAL ELECTRICITY DEMAND

## 4.1 Historical Electricity Demand

Demand for electricity in the North of Dryden sub-region is driven by a number of factors including mining and forestry activity, as well as local community growth. Mining sector expansion is the primary driver of growth in electricity demand in the area. The north of Dryden area is currently winter-peaking. As shown in Figure 8, peak demand in the North of Dryden sub-region has been growing by approximately 1.9% since 2004. Historical demand includes only the Pickle Lake and Red Lake subsystems, since the Ring of Fire subsystem has not yet developed beyond the five remote communities located east of Pickle Lake. Historical demand figures also do not include remote community demand, since they are not currently connected to the provincial transmission system.

**Figure 8: North of Dryden Historical Transmission Connected Demand**

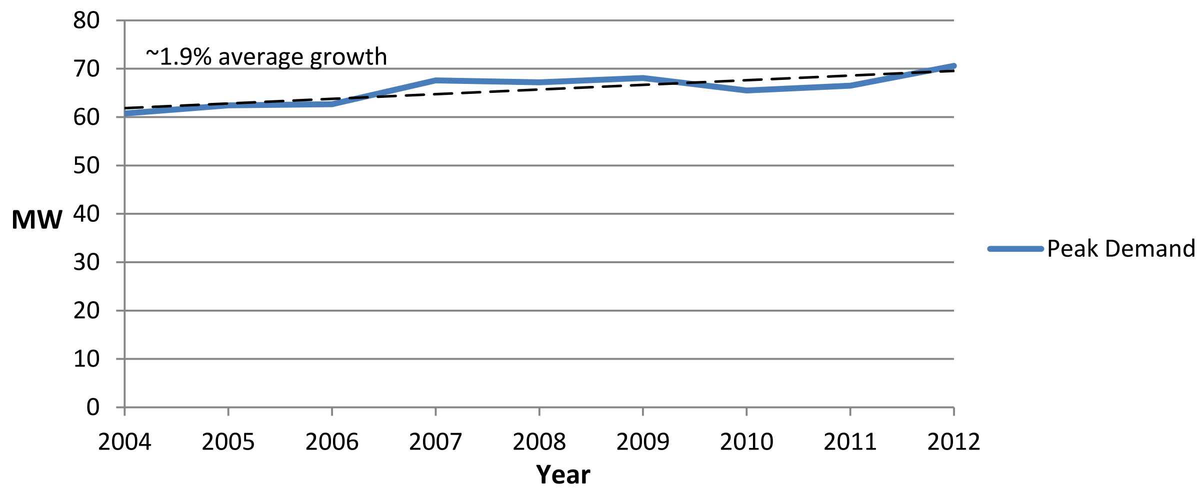

Figure 9 shows that growth in electricity demand has also varied between the Red Lake and Pickle Lake subsystems, with annual growth in electricity demand averaging 1.6% in the Red Lake subsystem and 2.6% in the Pickle Lake subsystem between 2004 and 2012.

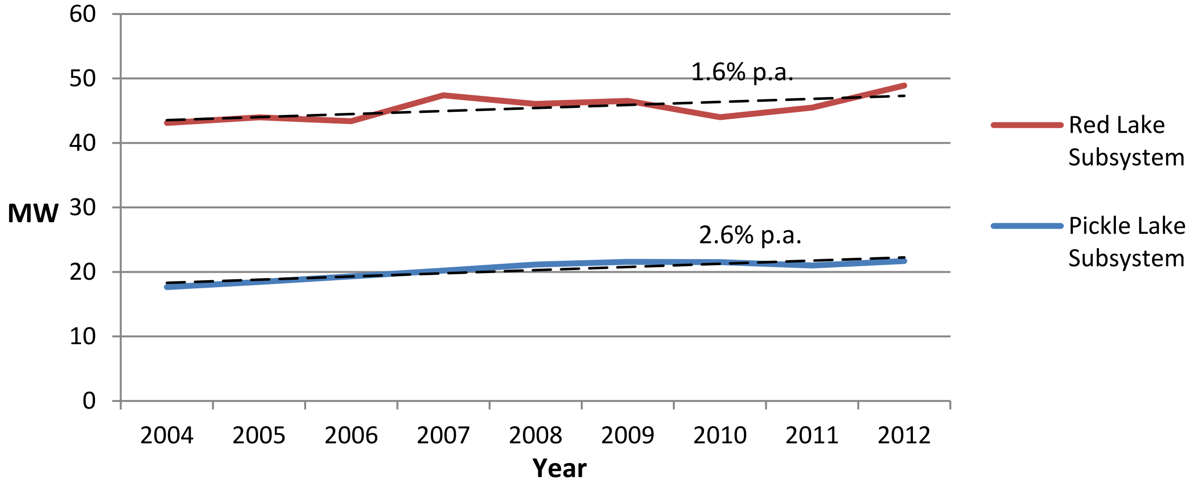
**Figure 9: North of Dryden Historical Demand by Subsystem**



In 2012, 61 MW of capacity was allocated to customers in the Red Lake subsystem, while 24 MW of capacity was allocated to customers supplied in the Pickle Lake subsystem. When the load of the remote communities in each subsystem are added to the connected load, the total load in 2012 increases to 67 MW in the Red Lake subsystem and 31 MW in the Pickle Lake subsystem. At present, no customers in the Ring of Fire subsystem are connected to the provincial grid; however, the combined demand of the five remote communities in the subsystem was about 3 MW in 2012.

## 4.2 Existing Distributed Generation Resources

Distributed generation is small-scale generation sited close to load centers; it helps supply local energy needs while at the same time contributing to meeting provincial demand. Along with other OPA procurement processes, the introduction of the *Green Energy and Green Economy Act, 2009* and the associated development of the Feed-in Tariff ("FIT") program have encouraged the development of distributed generation resources in Ontario. These procurements take into consideration the system need for generation as well as cost.

Presently, there are five contracted microFIT projects, and one contracted FIT project in the North of Dryden sub-region. All of these projects are located in the Red Lake subsystem. Of these projects, four microFIT solar projects are located in Red Lake with a total contract capacity of 39.3 kW and one microFIT solar project is in Ear Falls with a contract capacity of 10 kW. Analysis of the ability of solar resources in the North of Dryden sub-region to contribute to meeting local demand during the fall months has been estimated to be 5% of contract capacity. Therefore, these units are expected to contribute 2.5 kW to the LMC of the Red Lake subsystem. The FIT project is the Trout Lake River FIT small hydro project, a run of river hydroelectric project near Ear Falls, with a contract capacity of 3.75 MW[14]. The dependable generation level for this project (see Appendix 10.3.2) and its contribution to the LMC of the Red Lake subsystem is assumed to be 0 MW.[15] In total, the contribution of these DG units to the LMC of the Red Lake subsystem is expected to be 2.5 kW (0.0025 MW).

Currently, there are a number of diesel generators that provide backup/emergency supply at mine sites, which are required for health and safety purposes. Generally, these units are not configured for grid connection and thus are not currently available to supply the system. Even if they were configured to connect to the grid, there may be other limitations on their ability to reliably supply load customers on a regular basis including: their age, efficiency, level of emissions, prescribed limits in their operating approvals and their operating and maintenance costs. These units may have some potential to operate as short-term demand management resources, but given the available information they cannot be relied upon to provide the capacity and energy required to meet the needs of the North of Dryden sub-region. Therefore, they have not been considered further in this regional plan.

The Request for Information for Electricity Resources in Northwestern Ontario ("NW-RFI") was issued to better understand the availability of all potential resources in northwest Ontario including the North of Dryden sub-region, with particular focus on the

[14] Trout Lake River GS, is a contracted FIT small hydro project currently under development, with an expected commercial operation date of Q1 2015.
[15] The performance of the facility during drought conditions has not yet been determined, however, the anticipated contribution based on similar facilities in the area, is much less than the tolerance of the modelling software used for this study.

interim period to 2020. The OPA has received submissions to the NW-RFI. Generation options in this plan have considered the relevant NW-RFI submissions. Should new information become available it will be included at the next update of this regional plan.

# 5 FORECAST ELECTRICITY DEMAND

To develop the demand forecast the OPA worked with Hydro One (the transmitter and local distribution company serving the North of Dryden sub-region), existing and potential transmission connected industrial customers around Ear Falls, Red Lake, and Pickle Lake[16] and the Ring of Fire, municipalities, business associations, as well as remote First Nations communities in northwest Ontario.

## 5.1 New Demand from Connection of Remote First Nation Communities

The findings of the Remote Community Connection Plan indicate that due to the high and growing cost of diesel fuel as well as the high cost of operating and maintaining remote diesel generation systems, transmission connection of up to 21 remote communities can avoid substantial future costs of about $1 billion over 40 years and therefore economically justifies the connection of the corresponding 21 remote communities to the provincial transmission grid. For the purposes of this IRRP, it has been assumed that these communities will pursue a connection and therefore includes the demand of the corresponding remote communities in the North of Dryden IRRP forecast. The Remote Community Connection Plan indicates that communities may begin connecting between 2018 and 2020, following the development of required capacity in the North of Dryden sub-region transmission system.

## 5.2 Residential and Commercial Forecasted Demand

The OPA worked with Hydro One to establish the Residential and Commercial component of the demand forecast in the North of Dryden sub-region. The OPA then removed the industrial component of the load that is connected to the distribution system to determine the forecasted residential and commercial forecasted demand. Hydro One Distribution supplies electricity to customers at the following transformer

[16] The load growth is based on information provided to the OPA by Hydro One Networks Inc. and industrial customers in the North of Dryden sub-region. Hydro One provided information relating to existing distribution facilities North of Dryden; this includes existing community loads and some industrial loads. The OPA worked with existing and potential industrial customers to determine their expected near and long-term electricity needs. The forecast has been shared with Common Voice Northwest's Energy Task Force among other interested stakeholders.

stations: Perrault Falls DS, Ear Falls DS, Red Lake TS, Crow River DS, and Slate Falls DS. Cat Lake CTS is owned by Cat Lake Power Utility Ltd., and is supplied by Hydro One's transmission system from circuit E1C.

## 5.3 New and Expanding Mining Projects

The majority of forecasted demand growth in the North of Dryden sub-region is anticipated to be primarily driven by the mining sector.

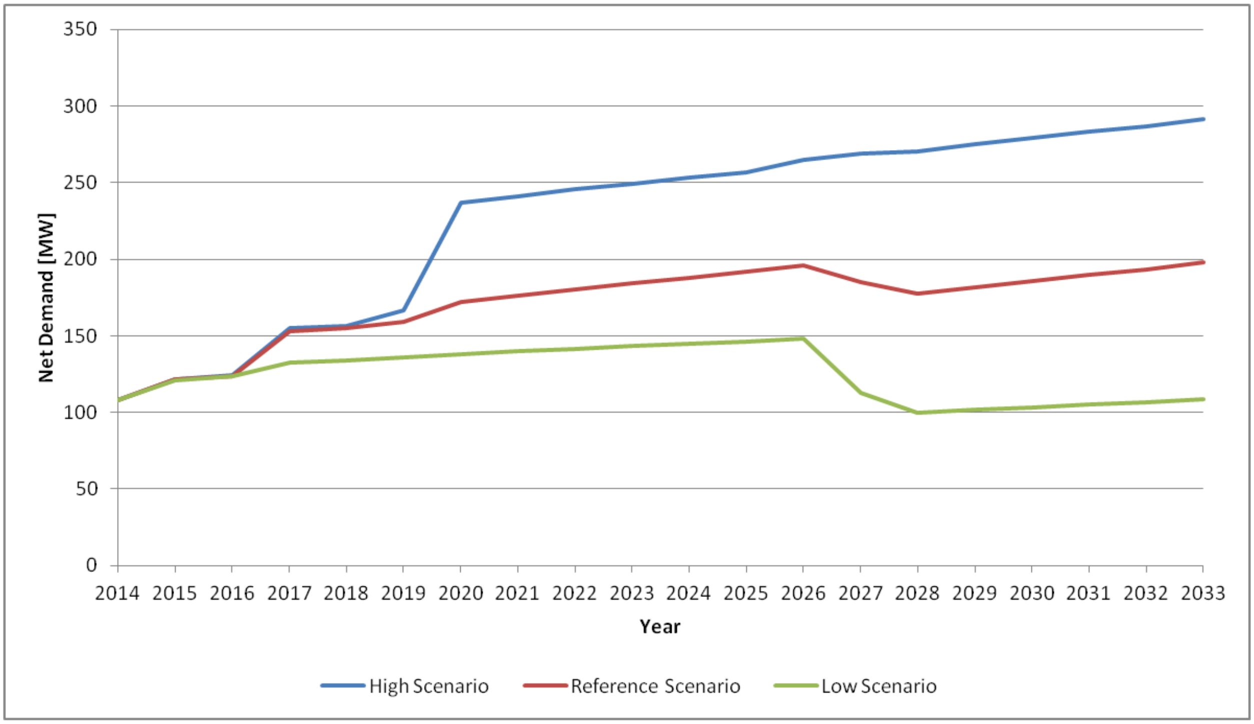
Numerous projects have been proposed in the region, representing a variety of mineral resources, stages of feasibility and development and potential environmental impacts. As mining is a commodity-based industry, there is uncertainty with the timing of mining projects, especially those that are in the relatively early stages of development. This corresponds to uncertainty in the forecasted electrical demand for the area. Recognizing the risk associated with uncertainty in the forecasted demand, the OPA produced three load scenarios. The OPA produced high and low forecast scenarios to capture the range of variability in future electrical demand and a reference forecast to reflect a likely scenario of future demand based on the information presently available.

Through engagement with the mining companies, mining associations and other stakeholders in the region, and by reviewing available technical documents produced by the mining companies regarding their proposed projects, the OPA categorized projects according to the likelihood that they will be developed within their proposed timelines. The projects have been categorized based on several factors, including:

- Stage of development (e.g. under construction, undergoing an Environmental Assessment ("EA"), still in exploration, etc.)
- Financial feasibility (e.g. results of publically available economic assessments)
- Potential environmental impacts
- Existing infrastructure and accessibility
- Global markets (e.g. commodity prices, customers and demand)

Figure 10 shows the forecast range over the planning period.

**Figure 10: North of Dryden sub-region Net Demand Forecast**

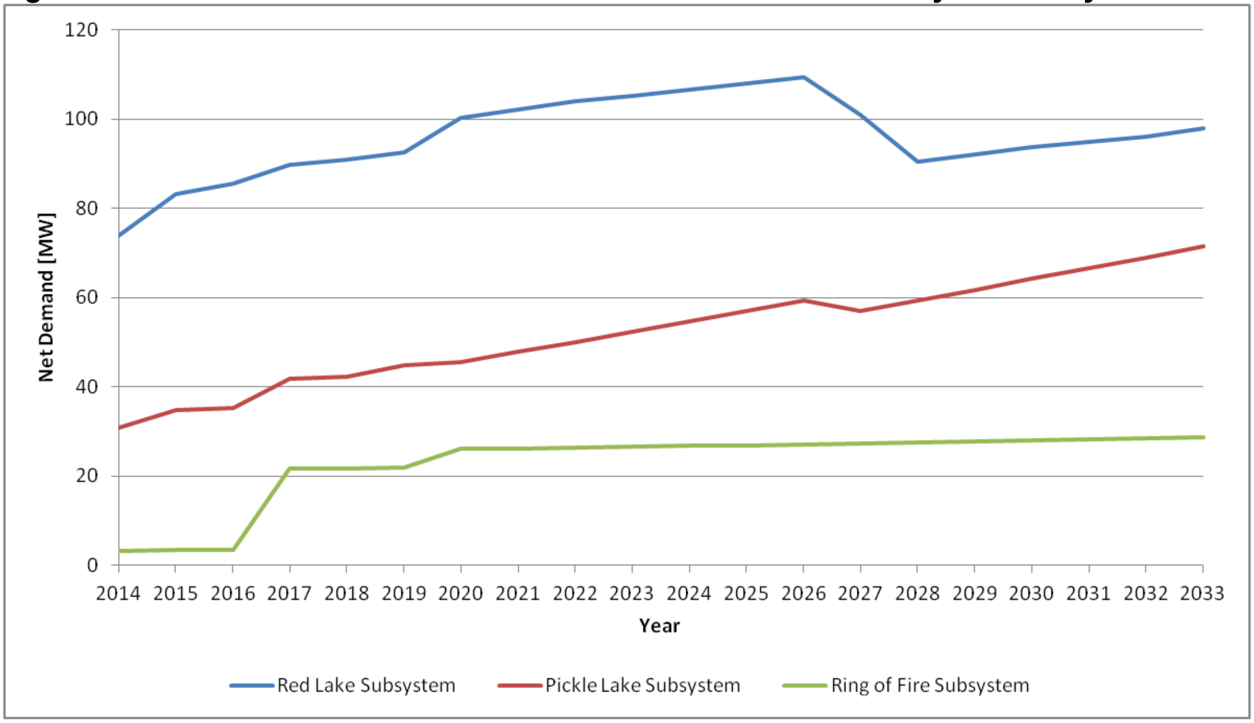


The following descriptions provide the scope of regional activity under the three scenarios.

## 5.4 Reference Scenario Demand Forecast

Under this scenario, it is assumed that projects currently under construction will be completed and commissioned on schedule. It is assumed that projects with high grade mineral deposits and positive economic assessments will be developed by the timelines specified in their project descriptions with relatively high probability. Projects with potential for extensive environmental impacts are assumed to be unlikely to proceed in the near term as well as projects which are still in the exploration phase. Furthermore, the reference scenario assumes that modest electrical demand driven by the mining sector in the Ring of Fire area is likely to appear before 2024.

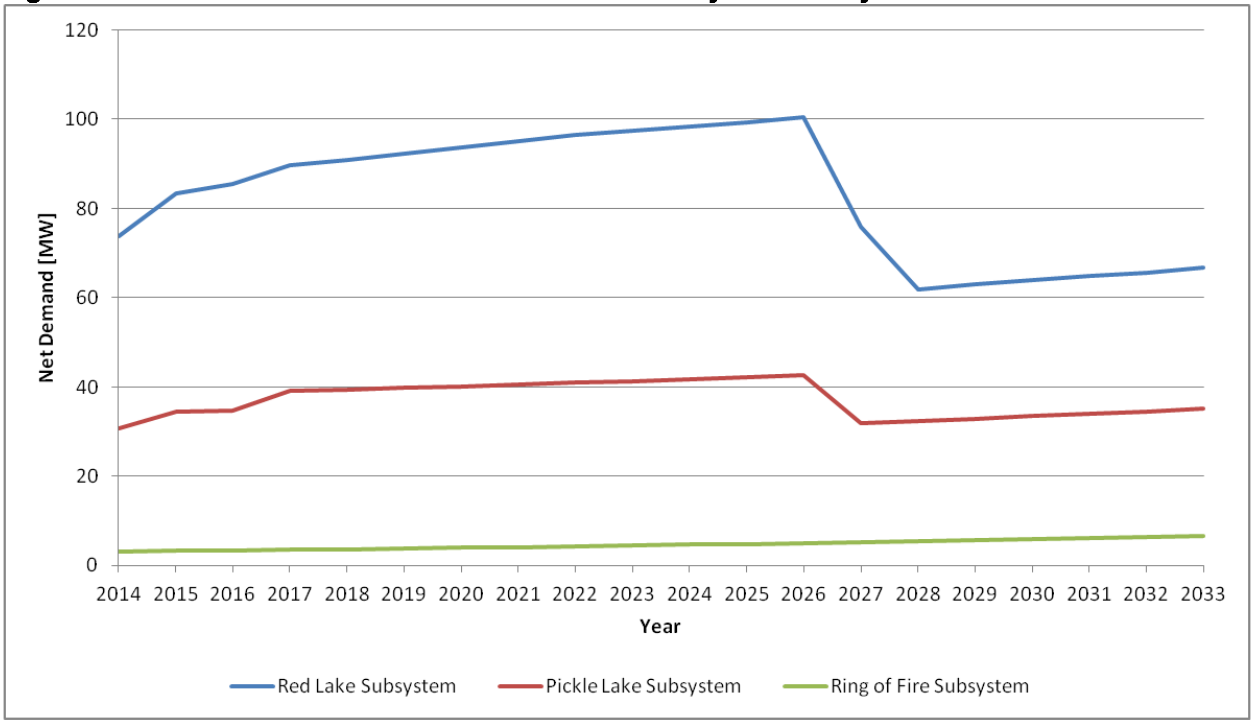
**Figure 11: Reference Scenario Demand Forecast for North of Dryden Subsystems**



## 5.5 Low Scenario Demand Forecast

This scenario assumes only the most mature and developed projects (e.g. currently under construction or applying for a leave to construct) are likely to be developed before 2024. It is assumed that other projects with a positive economic assessment will be fully developed with a 50% probability. Early stage exploration projects and projects with marginal economics or environmental, infrastructure and/or accessibility hurdles are assumed to not be developed. This scenario also assumes the Ring of Fire will not be developed before 2034.

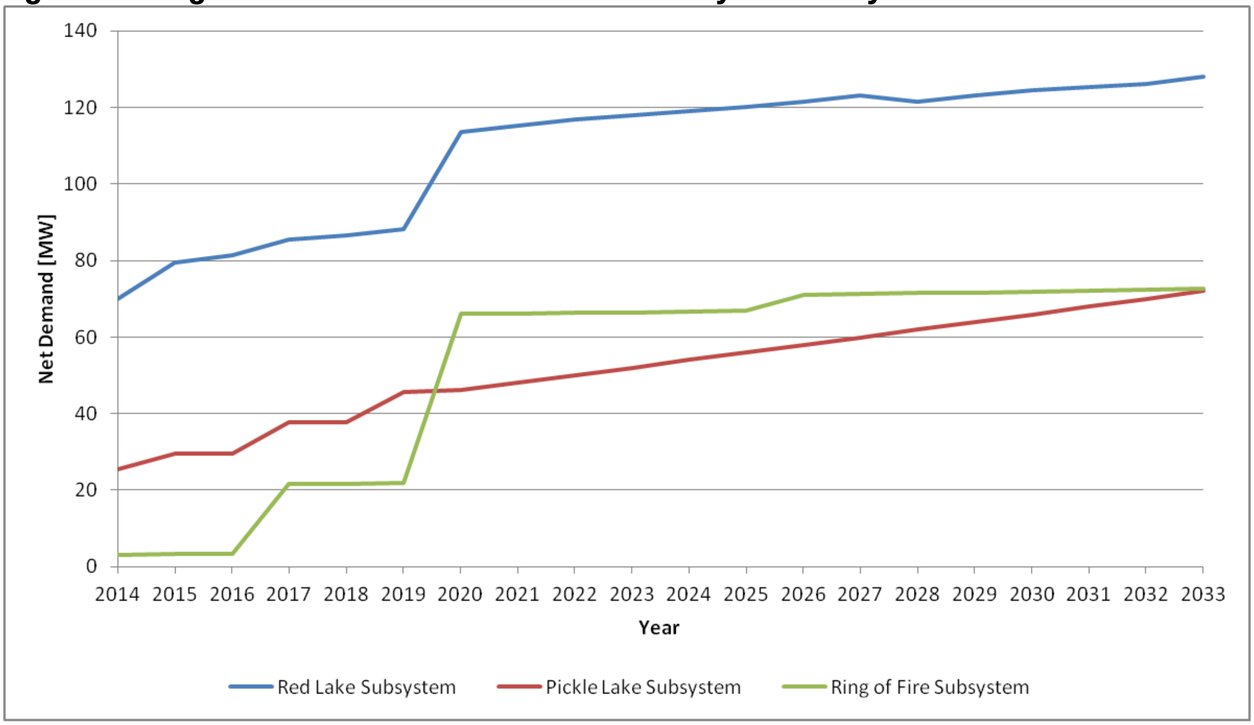
**Figure 12: Low Demand Forecast for North of Dryden Subsystems**



## 5.6 High Scenario Demand Forecast

Under the high scenario, most proposed projects are considered likely to be developed and commissioned in the near term. This scenario assumes sufficiently high commodity prices will provide financial feasibility to many projects that may otherwise be considered marginal or uneconomic. The high scenario also assumes an extensive, near- to medium-term build out of the Ring of Fire area, and that multiple mines will be operating in the region by 2020. The expansion of the mining sector is assumed to result in additional expansion of the residential sector in the region, which is also captured in this scenario.

**Figure 13: High Demand Forecast for North of Dryden Subsystems**



The OPA will continue to monitor electricity demand growth and work with existing and potential customers to maintain up to date electrical demand forecasts for the area. This information will be used to develop regular updates to the North of Dryden IRRP as per the formalized OEB Regional Planning Process.

## 5.7 North of Dryden Sub-Region Net Electricity Demand

A summary of the net demand forecast scenarios for the North of Dryden sub-region is presented in Table 3.

## Table 3: Detailed Net Demand Forecast[17]

**NET FORECAST [MW]**

| Red Lake Subsystem | 2014 | 2015 | 2016 | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | 2023 | 2024 | 2025 | 2026 | 2027 | 2028 | 2029 | 2030 | 2031 | 2032 | 2033 |

# 6 NEEDS IN THE NORTH OF DRYDEN SUB-REGION

Planning for the reliable supply of electricity requires anticipating potential equipment outages before they occur and designing a power system that limits the impacts to consumers, based on good utility practices as outlined in the OEB's TSC. This is accomplished through the application of planning criteria. In Ontario, the criteria for planning the transmission system are specified in the IESO's Ontario Resource and Transmission Assessment Criteria ("ORTAC")[18].

In accordance with ORTAC, the transmission system shall have sufficient capability under peak demand conditions to withstand specific outages while keeping voltages, and equipment loading within applicable limits. The maximum demand that can be supplied by an electricity system in a defined area is known as the load meeting capability ("LMC") of that area. Where an area is served by a single transmission line and local generation, the LMC is determined as the capability of the transmission line during normal operation, with the dependable level of local generation respecting the loss of the largest generating unit. If the area is served by a single transmission line without local generation, the LMC is determined as the capability of the transmission line during normal operation since the loss of the single line will result in the total loss of all connected load. The following factors are considered when determining the LMC of a transmission system serving an area:

- the configuration of the system;
- the capabilities of individual elements comprising the system, for the north of Dryden system, this includes the limits of the transmission lines and the dependable levels of hydroelectric generation;[19] and

[18] http://www.ieso.ca/imoweb/pubs/marketadmin/imo_req_0041_transmissionassessmentcriteria.pdf
[19] the dependable level of the existing run of river hydroelectric generation (that is available during drought water flow conditions) is assumed to be available. Details regarding the method for determining the dependable level of hydroelectric and other renewable generation resources for the IRRP are provided in Appendix 10.3.2. Drought conditions are expected to occur about one year in every 10 years and can persist for several months at a time, when watersheds are at their lowest levels in the late summer, fall and early winter months.

- the distribution of demand in the area being supplied.

In general, the greater the distance a given electrical load is located from the inter-regional transmission system (bulk system) supply point (Dryden and/or Marathon or east of Nipigon), the lower the LMC of the system will be. This is due to losses and the need to maintain system voltages within criteria.

## 6.1 Capability of the Existing North of Dryden System to Supply Forecast Electricity Demand

At present the entire North of Dryden system is supplied from Dryden TS (via E4D) and supported by hydroelectric generation at Ear Falls. The application of ORTAC to the 115 kV transmission system serving the North of Dryden results in an LMC of 85 MW, based on the current line ratings and available dependable hydroelectric generation resources in the Ear Falls area. Existing customers have been allocated 85 MW of capacity on the system and thus the area has reached its capacity limit or LMC. Of this LMC, 24 MW is allocated to the Pickle Lake subsystem and the remaining 61 MW serves the Red Lake subsystem. Mining load in the Ring of Fire subsystem has yet to develop, and the five remote communities in the subsystem are currently supplied by isolated diesel generation. Since the Remote Community Connection Plan identifies that it is economic to connect these communities and there is currently no transmission system serving the Ring of Fire subsystem, the corresponding LMC of the existing provincial power system is 0 MW.

For new customer load to be connected and served in any of the subsystems, additional supply capacity is required. The new capacity needed in order to meet forecast demand growth as provided by Hydro One Distribution, existing and future industrial customers, and the Remote Community Connection Plan (net of planned conservation), is summarized in Table 4 below.

## Table 4: Summary of Capacity Needs to Meet the Net Demand Forecast for each Subsystem

There is a near-term (present to 2018) need for additional capacity (incremental LMC) in each subsystem. The summary of capacity needs indicates that there will be need for 18 MW and up to 20 MW in the Pickle Lake subsystem, 30 MW in the Red Lake subsystem and 22 MW in the Ring of Fire subsystem in the near term.

The majority of forecast demand growth for the North of Dryden sub-region is expected to occur in the medium-term period between 2019 and 2023. This is the period when remote communities and most new mines are expected to connect their load to the system. The long term is characterized by steadily increasing demand over the remainder of the forecast period (2024 to 2033).

In the medium term, capacity needs in the Pickle Lake subsystem are forecast to be 28 MW and up to 36 MW, and up to 59 MW by the end of the planning period in 2033. In the Red Lake subsystem needs are forecast to be 44 MW and up to 62 MW in the medium term, and up to 75 MW by the end of the planning period in 2033.

The capacity need for the Ring of Fire subsystem, which includes potential mines at the Ring of Fire and the connection of five remote communities east of Pickle Lake, is driven by when and if mines connect to the transmission system. If the mines do not connect, then only the demand of the five remote communities will need to be supplied by the system. This is forecast to be 4 MW at the time of connection and up to 7 MW by the end of the planning period in 2033. If the potential Ring of Fire area mines that are considered in the load forecast develop, the capacity need for the Ring of Fire subsystem is forecast to be up to 73 MW by the end of the planning period.

The near-, medium- and long-term capacity needs of each subsystem are summarized in Table 5 below.

**Table 5: Summary of Incremental Capacity Needs by Subsystem**[20]

| Subsystem | Near-term Capacity Needs (Present to 2018 in MW) | | | Medium-term Capacity Needs (2019-2023 in MW) | | | Long-term Capacity Needs (2024-2033 in MW) | | |
|---|---|---|---|---|---|---|---|---|---|
| | High | Reference | Low | High | Reference | Low | High | Reference | Low |
| Pickle Lake | 20 | 18 | 15 | 36 | 28 | 17 | 59 | 47 | 11 |
| Red Lake | 30 | 30 | 30 | 62 | 44 | 36 | 75 | 48 | 39 |
| Ring of Fire | 22 | 22 | 4 | 67 | 27 | 5 | 73 | 29 | 7 |

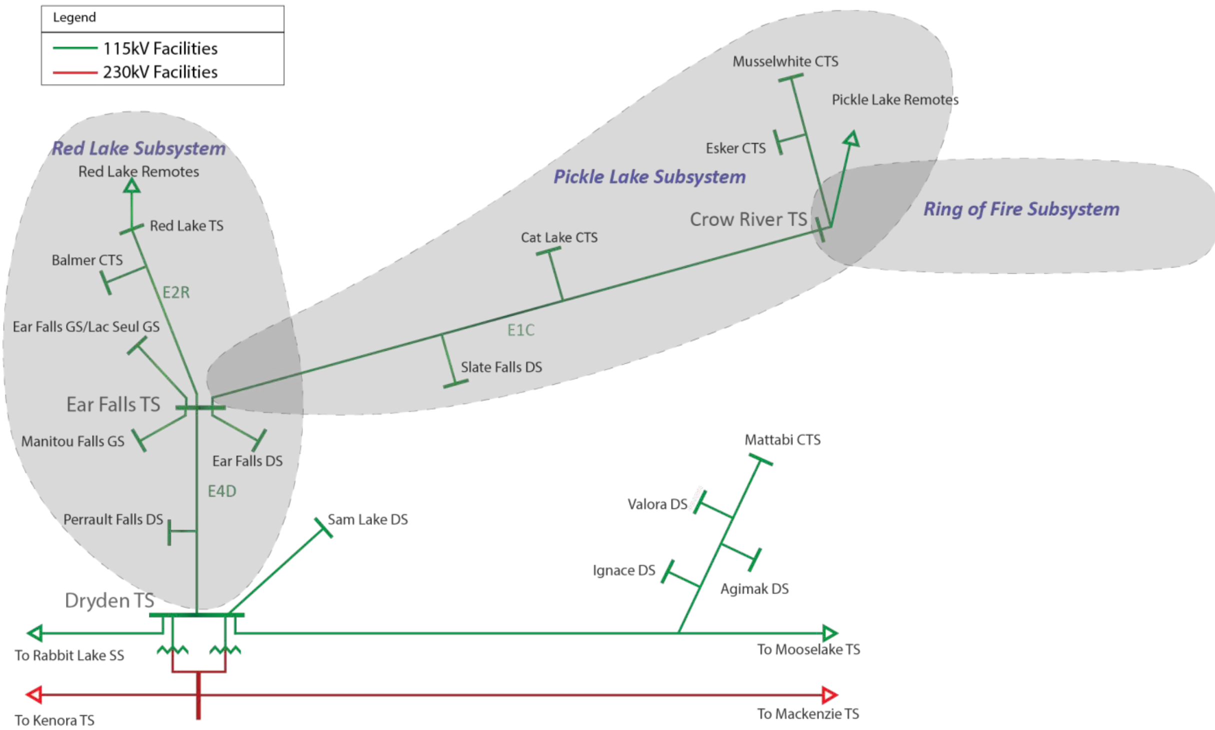
[20] Includes LMC required to supply remote communities that are economic to connect.

## 6.2 Interdependence between Subsystems

Due to the existing connection of the Pickle Lake subsystem to the Red Lake subsystem at Ear Falls, there is an existing interdependency between these subsystems. Identifying the interrelationships between subsystems is necessary because the supplying subsystem will need to have sufficient capacity to serve the needs of both subsystems. If the Pickle Lake subsystem is supplied completely by a new dedicated transmission connection, then it would be possible (and advantageous during drought conditions) to open the connection between Pickle Lake and Ear Falls (on E1C) and remove this interdependency.

Further, if the Pickle Lake subsystem has sufficient capacity in the future and the Ring of Fire subsystem is connected to Pickle Lake, then a new interdependency between the Pickle Lake and Ring of Fire subsystems would be created. These relationships are highlighted on the map below in Figure 14, which shows the amount of load in the dependent subsystem that is or would be served from the supplying subsystem. The ultimate capacity needed in the Red Lake and Pickle Lake subsystems will depend on the how the Pickle Lake and Ring of Fire subsystems are supplied in the future.

**Figure 14: North of Dryden Subsystems and Points of Intersection**



51

# 7 OPTIONS AND ALTERNATIVE DEVELOPMENT

This section identifies and evaluates options for developing integrated solutions that meet the needs identified in Section 6. Options applicable for all subsystems are described first, subsystem-specific options are then discussed. The options for the Pickle Lake subsystem are then evaluated,[21] followed by those of the Red Lake subsystem and the Ring of Fire subsystem. The options for addressing the needs of the North of Dryden sub-region are divided into those that can meet near-term needs (present-2018) and those which can meet the medium- and long-term needs (2019-2033) for each subsystem. Technically viable options are identified and evaluated in the context of their ability to meet the needs of each subsystem based on cost,[22] ability to meet reliability criteria, incremental capacity enabled, and in-service date.

## 7.1 Conservation, Renewable and Distributed Generation

### *Opportunities for Further Cost Effective Conservation in the North of Dryden sub-region*

Conservation is important in managing the demand in the North of Dryden sub-region. However, the high levels of load growth anticipated for the sub-region, resulting from connection of new industrial customers and the remote communities require the incorporation of supply-side solutions such as new transmission, distribution and/or generation facilities in the near term. New industrial facilities are assumed to install relatively efficient equipment from the beginning given the inherent economic benefits and the improved codes and standards.

[21] The Pickle Lake subsystem is assessed first because of its interdependence with both Red Lake and Ring of Fire subsystems. Decisions for serving the Pickle Lake subsystem will impact the capacity needs for the Red Lake subsystem and available options for the Ring of Fire subsystem.

[22] The costs represented in this report are incremental to costs that would have otherwise been incurred for the overall Ontario power system generation capacity needs. The Ontario electricity system will require incremental generation capacity to reliably serve all Ontario customers during peak demand periods by about 2018. Generation resources developed in the North of Dryden sub-region would contribute to meeting this provincial need. Cost for generation in the North of Dryden area is represented as the incremental cost above the least-cost generation option for Ontario. Details of costing methodology can be found in Appendix 10.4.

The OPA evaluates, measures and verifies (“EM&V”) conservation program savings. Moving forward, the OPA will continue to monitor conservation achievement in the North of Dryden sub-region and look for opportunities for further cost effective conservation to address supply capacity needs of the area over the medium and long term.

In Achieving Balance: Ontario’s Long-Term Energy Plan (“LTEP 2013”), the government established a provincial Conservation and Demand Management (“CDM”) target of 30 TWh in 2032. To assist the government in achieving this target, LTEP 2013 also committed to establishing a new six-year Conservation First Framework beginning in January 2015. Meeting these targets was included in establishing the needs described in Section 6. These targets apply to currently grid-connected communities and customers. The Conservation included in the net demand forecast for each subsystem is provided in Table 6 below. For remote communities, conservation opportunities are considered in more detail in the Remote Community Connection Plan.

**Table 6: Forecasted Conservation Savings in North of Dryden Sub-Region**

| | **2014** | **2019** | **2024** | **2029** | **2033** |
|---|---|---|---|---|---|
| **Pickle Lake Subsystem** | 0.1 MW | 0.5 MW | 1.2 MW | 2.0 MW | 2.6 MW |
| **Red Lake Subsystem** | 0.2 MW | 1.1 MW | 2.6 MW | 4.0 MW | 5.3 MW |
| **Ring of Fire Subsystem** | 0.0 MW | 0.2 MW | 0.4 MW | 0.7 MW | 0.9 MW |

It is anticipated that the energy efficiency savings identified in Table 6 above will be achieved mainly through measures aimed at the current load base and the load added through connection of the remote communities. The 9 MW in reduced peak demand represents about a 7% reduction of load in this area. The additional mining load is expected to be built using current codes and standards and will be operating at better energy efficiency compared to older facilities. Thus it is not anticipated that the new mining load will be able to contribute much more to energy efficiency programs. Conservation forecast in the region is derived from the provincial target and is consistent with LTEP 2013.

Given the anticipated electricity demand growth, there are opportunities in the medium to long term for proponents to pursue conservation savings. The following tools and programs could be used to achieve conservation savings in the sub-region.

Recently, the OPA has received direction from the Minister of Energy pertaining to the framework for Conservation programs[23] moving forward:

1. *2015-2020 Conservation First Framework (March 31, 2014):* To remain on track to achieve Ontario's 2013 LTEP CDM target, it is forecasted that 7 TWh needs to be achieved between 2015 and 2020 through Distributor CDM programs enabled by the Conservation First Framework. In addition, transmission-connected customers will continue to have access to OPA CDM programs. The OPA is directed to coordinate, support and fund the delivery of CDM programs through Distributors to achieve a total of 7 TWh of reductions in electricity consumption between January 1, 2015 and December 31, 2020.

2. *Continuance of the OPA's Demand Response Program under IESO management (March 31, 2014):* In LTEP 2013, Ontario signaled that responsibility for existing demand response ("DR") initiatives and introduction of new DR initiatives will be transferred from the OPA to the IESO.

3. *Industrial Accelerator Program (July 25, 2014):* The 5-year Industrial Accelerator Program ("IAP") established through the March 4, 2010 ministerial direction, will conclude on June 23, 2015. The Minister has directed the OPA to deliver the IAP for the period commencing June 23, 2015 through December 31, 2020, with a CDM target of 1.7 TWh for the period.

The spirit of the directive is to provide more opportunity for Local Distribution Companies ("LDCs"), industry, and communities to participate in conservation initiatives

[23] The current framework for Conservation programs does not apply to remote communities. These communities are anticipated for connection post-2020, which is the end of the existing framework.

so a broader scope of programs is expected to be tailored to the local needs of the region.

Each LDC will develop their conservation plans and programs to demonstrate. In assisting LDCs, the OPA has launched an online Tool Kit to provide LDCs with the information and planning resources needed to design an effective CDM plan to serve their customers. One of these resources is the Regional Achievable Potential Calculator which assists the utilities in estimating potential Conservation savings in their service regions. Use of this tool can also achieve an understanding of the potential for further conservation specific to the North of Dryden sub-region.

The IAP is available to industrial customers as a means of achieving conservation savings with financial assistance from the OPA. Given that electricity demand of the industrial sector is significant in the area, this could be a good opportunity for conservation in the sub-region. Also, the IAP program expanded the eligibility to allow commercial and institutional customers. These customers can be directly connected to the grid or connected via an LDC.

Furthermore, the following programs are available to Aboriginal Communities:

- Aboriginal Conservation Program, with the aim to provide customized conservation services designed to help First Nation communities, including remote and northern communities, reduce their electricity use in residential housing, and in commercial and institutional buildings, like stores, schools and band offices. This program will be offered for one additional year (ending December 31, 2015) until such time as LDCs are able to develop a CDM program which recognizes the specific requirements of on-reserve First Nation communities as per the 2015-2020 Conservation First Framework Directive.

- Aboriginal Community Energy Plans program to support Aboriginal participation in Ontario’s energy sector by providing up to $90,000 per community in funding to First Nation or Métis communities for local energy planning activities, with remote communities being eligible for an additional $5,000.

### *Opportunities for Renewable and Distributed Generation in the North of Dryden sub-region*

A high level assessment of the cost of renewable and distributed generation resources to meet the capacity needs of the North of Dryden sub-region was completed, estimating the dependable capacity of hydroelectric (run of river), wind, and solar resources. Dependable capacity refers to the portion of the total installed capacity that can be relied upon to meet local or system peak capacity needs. This refers to 98-percentile output. Based on the dependable capacity, costs were developed for these renewable resources. Based on the cost of other local generation and transmission options that are discussed in the following sub-sections, run of river hydroelectric, wind, and solar are not cost effective solutions for meeting the needs of the North of Dryden sub-region in the near and medium-term periods.

Details of these alternative generation resources are provided in Appendix 10.3.2 and summarized below in Table 7.

**Table 7: Summary of Alternative Generation Options**

| Resource Type | Dependable Capacity | Capital Cost per MW of Dependable Capacity | Levelized Unit Energy Cost[24] | Development Duration |
|---|---|---|---|---|
| Hydroelectric (Run of River) | 15-30% | $16 M-$66 M /MW | $60-$110/MWh | 5 to 10 Years |
| Intermittent Renewables | 5-28% | $7.5 M -$100M /MW | $80-$400/MWh | 3 Years |

While run of river hydroelectric or renewable resources are not cost-effective to meet the North of Dryden sub-region peak capacity needs, there may be opportunity for proponents to develop such projects for broader Ontario supply needs in accordance

[24] Levelized Unit Energy Cost (LUEC) is a method to compare electricity system resources on a $/MWh basis, considering the costs incurred (capital, fixed, variable, fuel, etc.) and the production of energy over the lifetime of the resource, discounted appropriately. LUEC assumes that all energy generated can be delivered without transmission constraints.

with renewable policy objectives for the provincial supply mix as set in the 2013 LTEP. Additionally, the connection of remote communities may provide the opportunity to explore development opportunities in the far north, in the longer term.

The remainder of Section 7 will assess the generation and transmission options that can cost effectively meet the identified capacity needs of the North of Dryden sub-region.

## 7.2 Summary of Recommended and Assessed Options for Meeting Pickle Lake Subsystem Needs

Based on the following analysis, the OPA recommends that a new 230 kV single circuit line to Pickle Lake be built as soon as possible in order to meet the needs of the Pickle Lake subsystem. Building the new line to 230 kV standards is the most economic option to meet the reference forecast scenario, which is regarded as the most-likely scenario. A line built to 230 kV standards also mitigates the long-term risk associated with higher forecasted demand scenarios and maintains the flexibility to supply the Ring of Fire mining development from Pickle Lake. The OPA also recommends that circuit E1C be opened at Ear Falls as an operational measure when the local system is capacity constrained. This operational measure maximizes the capability of the transmission system in the area, resulting in incremental LMC to the Red Lake subsystem. The capacity constraint is expected to occur during high demand periods coincident with drought hydroelectric conditions.

The following section summarizes the analysis and comparison of options.

Within the context of the North of Dryden IRRP, the Pickle Lake subsystem is assessed first because of its interdependence with both the Red Lake subsystem and the Ring of Fire subsystem as discussed in Section 5.2. Decisions made for serving the Pickle Lake subsystem will impact the capacity needs for the Red Lake subsystem at Ear Falls TS and the options for serving the Ring of Fire subsystem.

As mentioned previously, the Pickle Lake subsystem is currently supplied by the 115 kV line E1C from Ear Falls TS and the subsystem has reached its LMC. The forecasted near-term growth and medium- to long-term growth cannot be met by the existing system and other supply options are required. Identified needs for the Pickle Lake subsystem are summarized in Table 8, below.

**Table 8: Needs for Pickle Lake Subsystem**

| Timing | Needs | Required Load Meeting Capability [MW] | | |
|---|---|---|---|---|
| | | Low | Reference | High |
| Near term (Present-2018) | ***Near term Total 1:*** *Supply Mining and Community Demand in the Pickle Lake Subsystem, and Supply the 5 Communities in the Ring of Fire Subsystem* | ***43*** | ***46*** | ***48*** |
| Near term (Present-2018) | ***Near term Total 2:*** *Supply Mining and Community Demand in the Pickle Lake Subsystem and in the Ring of Fire Subsystem* | ***43*** | ***64*** | ***66*** |
| Medium and long term (2019-2033) | ***Medium and long term Total 1:*** *Supply Mining and Community Demand in the Pickle Lake Subsystem, and Supply the 5 Communities in the Ring of Fire Subsystem* | ***48*** | ***78*** | ***90*** |
| Medium and long term (2019-2033) | ***Medium and long term Total 2:*** *Supply Mining and Community Demand in the Pickle Lake Subsystem and in the Ring of Fire Subsystem* | ***48*** | ***100*** | ***156*** |

The following generation and transmission options have been identified to fully or partially meet these needs.

**Table 9: Summary of Options to Meet the Needs for Pickle Lake Subsystem**[25]

| Options | Capital Cost | PV Option Cost | Incremental Load Meeting Capability [MW] | PV Unit Cost of Utilized Capacity |
|---|---|---|---|---|
| CNG Generation at Pickle Lake[26,27] | $132 M | $294 M | 54 | $5.44 M/MW |
| 115 kV line to Pickle Lake[28] | $126 M | $80 M | 18 + 35 | $1.31 M/MW |
| 230 kV line to Pickle Lake[18] | $167 M | $106 M | 54 + 35[29] | $1.07 M/MW |
| Pre-build 230 kV line to Pickle Lake,<br>Stage 1: operate at 115 kV[18]<br>Stage 2: upgrade to 230 kV | $155 M<br>$14 M | $98 M<br>$5 M | 46 + 35<br>114 | $1.08 M/MW<br>$0.63 M/MW |

The 115 kV transmission line option would not be adequate to meet the needs of the Pickle Lake subsystem, with or without the Ring of Fire mining load supplied from Pickle Lake under the reference scenario forecasted load. The reference scenario forecast is considered the most likely scenario. The only scenario assessed that the 115 kV transmission line option would be adequate for the long term is the low scenario. The reference and high scenarios with and without the Ring of Fire mining load supplied from Pickle Lake would require a new 230 kV line.

Based on the following factors, the OPA recommends that a single circuit 230 kV line be developed as soon as possible:

- There is currently insufficient capacity to supply existing electrical demand; and
- A 115 kV line is insufficient to meet the reference scenario forecast demand, which is considered most likely, and therefore there is material risk in not meeting the long-term demand of the Pickle Lake subsystem with a 115 kV line; and

[25] Description of the method for calculating costs is provided in Appendix 10.7.1 and 0. Note all costs include reactive compensation required to meet stated LMC.
[26] Requires continued supply of 24 MW of load via E1C from Ear Falls TS
[27] Generation could be developed in 2-3 years
[28] Transmission options cannot be developed before 2016
[29] 35 MW are in the Red Lake subsystem. System is voltage limited and can reach a higher LMC with additional reactive compensation. Costing does not include reactive compensation required to supply Ring of Fire.

- A 230 kV line to Pickle Lake is required to preserve the option of supplying the Ring of Fire utilizing an East-West corridor; and
- An East-West infrastructure corridor to the Ring of Fire continues to be a viable option being considered by mining developers.

Decisions made regarding a common infrastructure corridor (e.g. transportation, etc.) to the Ring of Fire should be monitored and reflected in updates to this IRRP.

#### 7.2.1 Discussion of Options to Meet the Needs of the Pickle Lake Subsystem

Both generation and transmission options are considered for meeting the needs of the Pickle Lake subsystem. In developing these options, the economic connection of remote communities and maintaining supply options to the Ring of Fire are key planning factors.

The five remote communities in the Ring of Fire subsystem have been determined to be economic to connect in accordance with the conclusions of the Remote Community Connection Plan. The lowest cost transmission connection option for the five remote communities in the Ring of Fire subsystem, independent of the Ring of Fire mines, is to connect to Pickle Lake. Therefore, for the purposes of the IRRP, sufficient capacity would need to be made available in the Pickle Lake subsystem to connect up to five remote communities in the Ring of Fire subsystem as a minimum. Given the uncertainty around other infrastructure development plans for the Ring of Fire area, there is also long-term value in maintaining the option for Ring of Fire mines to connect at Pickle Lake. This connection could be realized utilizing an East-West multi-use corridor, which is being promoted by some mining developers in the area. Details are discussed in the following sections.

##### 7.2.1.1 Reference Scenario Options Analysis for Pickle Lake Subsystem and Connection of Communities in the Ring of Fire Subsystem

From Table 8, this scenario requires an LMC of 46 MW for the near term, and 78 MW for the medium and long term.

### *Generation Options*

There is no existing supply of natural gas in the Pickle Lake subsystem and the OPA is not aware of any plan to expand natural gas pipeline service to Pickle Lake. However, generators fueled by Compressed Natural Gas ("CNG") could be developed in the Pickle Lake area, as CNG could be produced and transported from the TransCanada Pipelines Limited ("TCPL" or "TransCanada") mainline near Ignace to Pickle Lake along Highway 599 and beyond as needed. The cost of developing a CNG production facility at Ignace and transporting CNG from Ignace to Pickle Lake is significant and results in a much higher delivered cost of natural gas than in areas that are served by natural gas pipelines, such as Red Lake. To minimize generation costs in this option, it is assumed that the Pickle Lake subsystem will remain connected to Ear Falls TS and 24 MW of load in the Pickle Lake subsystem will continue to be served from Ear Falls TS.

The remaining 22 MW of LMC for the near term and 54 MW of LMC for the medium and long term (which includes the remote communities in the Ring of Fire subsystem), would be served by CNG fueled generation at Pickle Lake.

To make available 22 MW of incremental LMC in the Pickle Lake subsystem with local generation, a total installed generation capacity of 47.5 MW would be required with a maximum unit size of 9.5 MW (i.e. 5x9.5 MW). Similarly, to make available 54 MW of incremental LMC in the Pickle Lake subsystem with local generation, a total installed generation capacity of 76 MW would be required with a maximum unit size of 9.5 MW (i.e. 8x9.5 MW).

This arrangement of units would ensure that load could be supplied with up to two units unavailable by either forced or planned outages, while maintaining flows on E1C and at Ear Falls TS within thermal and voltage limits consistent with requirements outlined in ORTAC. Table 10 summarizes the gas generation capacity required and the increase in the Pickle Lake LMC it will provide.

**Table 10: Capacity of Generation Option**

| Option | Incremental LMC [MW] | Pickle Lake Subsystem LMC [MW] | Near term Reference Forecast Demand[30] [MW] | Medium and Long term Reference Forecast Demand[20] [MW] |
|---|---|---|---|---|
| Near term: 47.5 MW CNG Generation at Pickle Lake[31] | 28.5 | 52.5 | 46 | 78 |
| Medium and Long term 76 MW CNG Generation at Pickle Lake[21] | 57 | 81 | 46 | 78 |

The cost (summarized in Table 11) of supplying the growth needs of the Pickle Lake subsystem with CNG fueled generation includes any additional required voltage control devices at Pickle Lake.

**Table 11: Costs and Timing for Generation Option**

| Option | Time to Complete | Capital Cost | Total PV During Planning Period | PV Unit Cost of Utilized Capacity |
|---|---|---|---|---|
| 47.5 MW CNG Generation at Pickle Lake | 1-2 Years | $75 M | $158 M | $6.59 M/MW |
| 76 MW CNG Generation at Pickle Lake[32] | 1-2 Years | $132 M | $294 M | $5.44 M/MW |

Generation resources in the Pickle Lake subsystem would be operated to serve local demand in the Pickle Lake subsystem in the event that load exceeds 24 MW and would likely not be dispatched in the Ontario market for supplying provincial system load due to relatively high cost of operation. At present the Ontario system has sufficient generation capacity to meet system peak and energy needs; however, by 2018 a need for additional peak capacity is forecasted. Local generation at Pickle Lake would serve demand that would otherwise be served by generation somewhere else in the system and would help to offset some of this Ontario system need.

### *Transmission Options*

[30] Includes demand for Ring of Fire remote communities (7 MW).
[31] Requires continued supply of 24 MW of load via E1C from Ear Falls TS.
[32] Size is cumulative.

The OPA has identified three transmission options for reinforcing the supply to the Pickle Lake area.

The transmission options are:

1. A new 115 kV single circuit line tapping the 115 kV line 29M1 near Valora with an in-line breaker on the tap line and terminating at Crow River DS in Pickle Lake.

2. A new 230 kV single circuit line tapping D26A east of Dryden with an in-line breaker on the tap line and running to Pickle Lake terminating at Crow River DS or a new TS in the Pickle Lake area with a new 230/115 kV autotransformer.

3. A new single circuit line pre-built to 230 kV standards (230 kV structures, and hardware) and initially operated at 115 kV by connecting it to M2D on the 115 kV system near Dryden with an in-line breaker on the tap line. When additional capacity is required the line would be operated at 230 kV by re-terminating on the 230 kV system near Dryden (D26A) and a 230/115 kV autotransformer would be installed at Pickle Lake.

The 230 kV line options, Options 2 or 3, are capable of supplying the reference scenario forecasted demand for the Pickle Lake subsystem including the five remote communities in the Ring of Fire subsystem until the end of the planning period.

The 115 kV line option is capable of supplying the Pickle Lake subsystem, including the five remote communities in the Ring of Fire subsystem up to a demand of 70 MW, which is the LMC of the option. This corresponds to year 2030 for the reference scenario forecasted demand.

By opening E1C at Ear Falls TS, the Red Lake subsystem no longer supplies the Pickle Lake subsystem. Under this arrangement the capacity that was allocated to the Pickle Lake subsystem (24 MW, which corresponds to 35 MW at Ear Falls due to losses), is offloaded. In other words, a new line to Pickle Lake also provides 35 MW of incremental LMC to the Red Lake subsystem. This occurs because the new line would serve the entire load along E1C. This benefit must be accounted for in the analysis.

Details of these options have been summarized in Table 12 and Table 13 below.

**Table 12: Capacity of Transmission Options**

| Transmission Options | Incremental LMC for Pickle Lake Subsystem [MW] | Incremental LMC for Red Lake Subsystem [MW] | Total Incremental LMC for Option [MW] | Pickle Lake Subsystem Load Meeting Capability [MW] | Pickle Lake Subsystem Near term Reference Forecast Demand[33] [MW] | Pickle Lake Subsystem Medium and Long term Reference Forecast Demand[33] [MW] |
|---|---|---|---|---|---|---|
| 115 kV line to Pickle Lake[34] | 46 | 35 | 81 | 70 | 46 | 78 |
| 230 kV line to Pickle Lake[35] | 136 | 35 | 171 | 160 | 46 | 78 |
| Pre-build 230 kV line to Pickle Lake[35]<br>Stage 1: operate at 115 kV<br>Stage 2: upgrade to 230 kV[35] | <br>46<br>136 | <br>35<br>35 | <br>81<br>171 | <br>70<br>160 | 46 | 78 |

[33] Includes demand for Ring of Fire remote communities (7 MW).
[34] Transmission options cannot be developed before 2016.
[35] Upgrade completed in 2023 when three Ring of Fire mines are forecast to be operating

To serve the forecasted electrical demand of the reference scenario to the end of the planning period, without any additional investments, transmission options 2 or 3, a new 230 kV single circuit line to Pickle Lake would be required.

Transmission Option 1, a 115 kV single circuit line to Pickle Lake is insufficient to meet the identified needs of the Pickle Lake subsystem, including connection of up to five remote communities in the Ring of Fire subsystem, for the reference forecast scenario beyond 2030. The reference forecast scenario load exceeds the LMC of a 115 kV single circuit line by 8 MW at the end of the planning period, in 2033.

The OPA recommends that the new line be operated at 230 kV from the onset. Deferring 230 kV operation to when the incremental capacity is required for load supply is not expected to incur any cost savings relative to initially operating at 230 kV. This is due to the fact that some additional voltage control equipment required for 115 kV operation would no longer be required after converting the line to 230 kV operation. This results in a stranded cost which is approximately equal to the deferral value.

Transmission Option 3 is the development of a 230 kV line that is staged to provide additional capacity with deferral of some capital cost to when and if the capacity is needed. This would be done by pre-building the line to 230 kV specifications but initially operating it at 115 kV. When additional capacity is required the line would be reterminated on the bulk 230 kV system on circuit D26A and a 230/115 kV autotransformer would be installed either at Crow River DS or at a new TS in Pickle Lake. As indicated above, this option is not expected to result in any relative savings compared to Transmission Option 2.

In order to properly compare costs of transmission options (which also provide incremental capacity to the Red Lake subsystem) to generation options (which do not provide incremental capacity to the Red Lake subsystem) the unit costs consider the total incremental LMC for both the Pickle Lake and Red Lake subsystems that is made available by the option. Table 13 provides a summary of costs and timing for these options.

**Table 13: Costs and Timing of Transmission Options**

| | Time to Complete | Capital Cost | Total PV During Planning Period | PV Unit Cost of Utilized Capacity |
|---|---|---|---|---|
| 115 kV line to Pickle Lake | Not technically feasible | | | |
| 230 kV line to Pickle Lake | 3-5 Years | $167 M | $106 M | $1.07 M/MW |
| Pre-build 230 kV line to Pickle Lake<br>Stage 1: operate at 115 kV<br>Stage 2: upgrade to 230 kV[36] | <br><br>3-5 Years<br>1-2 Years | <br><br>$155 M<br>$14 M | <br><br>$98 M<br>$5 M | <br><br>$1.08 M/MW<br>$0.63 M/MW |

From the above tables, the following conclusions can be made for the forecasted load under the reference scenario *with the Ring of Fire subsystem communities supplied from Pickle Lake*:

1. A line built to 115 kV standards would be insufficient to meet the medium- and long-term need.
2. A line pre-built to 230 kV standards with staged 115 kV and 230 kV operation is approximately as cost effective as initially operating at 230 kV. While cost is the same, initially operating at 115 kV will require the installation of voltage control devices that will no longer be useful when the line operates at 230 kV.
3. A line built and initially operated at 230 kV is also a cost effective option that meets the medium- and long-term need, and will not result in stranding of transmission devices. This is the recommended solution option.

#### 7.2.1.2 Reference Scenario Options Analysis for Pickle Lake Subsystem and Connection of Mines and Communities in the Ring of Fire Subsystem to Pickle Lake

The Ring of Fire subsystem reference forecasted load from mines and communities is 22 MW in the near term and 29 MW in the medium and long term. Options to supply the Ring of Fire subsystem mines include on-site generation consistent with the Environmental Assessment cases for the mining developments, as well as building a new transmission line utilizing a North-South corridor and originating from either

[36] Upgrade assumed to be completed in 2023 when three Ring of Fire mines are forecast to be operating.

Marathon or east of Nipigon, or utilizing an East-West corridor originating from Pickle Lake. Detailed analysis of these options is included in 7.4. As indicated in 6.2, if the Ring of Fire subsystem is supplied from Pickle Lake utilizing an East-West corridor, interdependency between the Pickle Lake subsystem and the Ring of Fire subsystem is introduced.

The following assesses the requirements for supply to the Pickle Lake subsystem under the reference forecast scenario if the mines and communities in the Ring of Fire subsystem are supplied from Pickle Lake. The corresponding LMC required for the Pickle Lake subsystem under this reference scenario is 64 MW in the near term and 100 MW in the medium and long term as indicated by the reference scenario "*Total 2*" in Table 8.

### *Generation Options*

Generation options from the Pickle Lake subsystem to supply Ring of Fire mining load were screened out as they are less cost effective than self-generation options at the mining sites within the Ring of Fire subsystem to supply Ring of Fire mining load (which is investigated in 7.4). Therefore, only transmission options are investigated for this scenario.

### *Transmission Options*

The LMC and costs for the respective transmission options are repeated below:

**Table 14: Capacity of Transmission Options**

| Option | Incremental LMC for Pickle Lake Subsystem[1] [MW] | Incremental LMC for Red Lake Subsystem [MW] | Total Incremental LMC for Option [MW] | Pickle Lake Subsystem Load Meeting Capability[37] [MW] | Pickle Lake Subsystem Near term Reference Forecast Demand[27] [MW] | Pickle Lake Subsystem Medium and Long term Reference Forecast Demand[27] [MW] |
|---|---|---|---|---|---|---|
| 115 kV line to Pickle Lake[38] | 46 | 35 | 81 | 70 | 64 | 100 |
| 230 kV line to Pickle Lake[28] | 136 | 35 | 171 | 160 | 64 | 100 |
| Pre-build 230 kV line to Pickle Lake[28]<br>Stage 1: operate at 115 kV<br>Stage 2: upgrade to 230 kV[39] | 46<br>136 | 35<br>35 | 81<br>171 | 70<br>160 | 64 | 100 |

[37] Includes Ring of Fire subsystem.
[38] Transmission options cannot be developed before 2016.
[39] Upgrade assumed to be completed in 2023 when three Ring of Fire mines are forecast to be operating.

**Table 15: Costs and Timing of Transmission Options**

| Option | Time to Complete | Capital Cost | Total PV During Planning Period | PV Unit Cost of Utilized Capacity |
|---|---|---|---|---|
| 115 kV line to Pickle Lake[40] | Not technically feasible | | | |
| 230 kV line to Pickle Lake | 3-5 Years | $167 M | $106 M | $1.07 M/MW |
| Pre-build 230 kV line to Pickle Lake<br>Stage 1: operate at 115 kV<br>Stage 2: upgrade to 230 kV[41] | <br>3-5 Years<br>1-2 Years | <br>$155 M<br>$14 M | <br>$98 M<br>$5 M | <br>$1.08 M/MW<br>$0.63 M/MW |

From the above tables, and consistent with the analysis in 7.2.1.1, the following conclusions can be made for the forecasted load under the reference scenario *with the Ring of Fire subsystem supplied from Pickle Lake*, including the community and mining load:

1. A line built to 115 kV standards would be insufficient to meet the medium- and long-term need.
2. A line pre-built to 230 kV standards with staged 115 kV and 230 kV operation is the approximately as cost effective as initially operating at 230 kV. While cost is the same, initially operating at 115 kV will require the installation of voltage control devices that will no longer be useful when the line operates at 230 kV.
3. A line built and initially operated at 230 kV is also a cost effective option that meets the medium- and long-term need, and will not result in stranding of transmission devices. This is the recommended solution.

This analysis reinforces the need to build a new 230 kV line to Pickle Lake, rather than a new 115 kV line.

#### 7.2.1.3 Low Scenario Options Analysis for Pickle Lake Subsystem and Connection of Communities in the Ring of Fire Subsystem

Under the low scenario forecasted load, the LMC required is 43 MW for the near term, and 48 MW for the medium and long term as indicated by the low scenario "*Total 1*" in Table 8.

---

[40] Sufficient for near term, insufficient for medium to long term.
[41] Upgrade assumed to be completed in 2023 when three Ring of Fire mines are forecast to be operating.

### *Sensitivity Analysis for Generation Options*

Similarly to what was done with the Reference Scenario analysis, in order to minimize generation cost, it is assumed that 24 MW of load in the Pickle Lake subsystem will continue to be served by the Red Lake subsystem from Ear Falls TS via the circuit E1C.

The remaining 19 MW of LMC for the near term and 24 MW of LMC for the medium and long term (which includes the remote communities in the Ring of Fire subsystem), would be served by CNG fueled generation at Pickle Lake.

To make available 19 MW or 24 MW of incremental LMC in the Pickle Lake subsystem with local generation, a total generation capacity of 38 MW and 47.5 MW would be required, respectively, with a maximum unit size of 9.5 MW (i.e. 4x9.5 MW and 5x9.5 MW).

**Table 16: Capacity of Generation Option**

| Option | Incremental LMC [MW] | Pickle Lake Subsystem LMC [MW] | Near term Low Forecast Demand[42] [MW] | Medium and Long term Low Forecast Demand[32] [MW] |
|---|---|---|---|---|
| Near term: 38 MW CNG Generation at Pickle Lake[43] | 19 | 43 | 43 | 48 |
| Medium and Long term 47.5 MW CNG Generation at Pickle Lake[33] | 28.5 | 52.5 | 43 | 48 |

**Table 17: Costs and Timing for Generation Option**

| Option | Time to Complete | Capital Cost | Total PV During Planning Period | PV Unit Cost of Utilized Capacity |
|---|---|---|---|---|
| 38 MW CNG Generation at Pickle Lake | 1-2 Years | $57 M | $131 M | $6.89 M/MW |
| 47.5 MW CNG Generation at Pickle Lake | 1-2 Years | $75 M | $158 M | $6.59 M/MW |

[42] Includes demand for Ring of Fire remote communities (7 MW).
[43] Requires continued supply of 24 MW of load via E1C from Ear Falls TS.

Based on the low forecast demand scenario, the initial near-term generation option does not change. However, less capacity is needed to meet the medium- and long-term needs compared to the reference scenario.

### *Sensitivity Analysis for Transmission Options*

Under the low forecast scenario, the LMC required for the Pickle Lake subsystem is 43 MW in the near term and 48 MW for the medium and long term. Consistent with the reference scenario, building a new line to Pickle Lake allows for a capacity increase to the Red Lake subsystem of 35 MW by opening circuit E1C from Ear Falls during capacity-constrained conditions, where peak demand is coincident with drought hydroelectric generation output.

In order to supply 43 MW in the near term and 48 MW in the medium and long term, a new line to Pickle Lake at 115 kV would be required as a minimum and would be the most economic. It should be noted that the low scenario forecast is the only scenario that the 115 kV line option is feasible; the 115 kV line option is not feasible for all other demand scenarios.

**Table 18: Capacity of Transmission Options**

| Option | Incremental LMC for Pickle Lake Subsystem [MW] | Incremental LMC for Red Lake Subsystem [MW] | Total Incremental LMC for Option [MW] | Pickle Lake Subsystem Load Meeting Capability [MW] | Pickle Lake Subsystem Near term Low Forecast Demand[44] [MW] | Pickle Lake Subsystem Medium and Long term Low Forecast Demand[34] [MW] |
| --- | --- | --- | --- | --- | --- | --- |
| 115 kV line to Pickle Lake[45] | 46 | 35 | 81 | 70 | 37 | 41 |
| 230 kV line to Pickle Lake[35] | 136 | 35 | 171 | 160 | 37 | 41 |
| Pre-build 230 kV line to Pickle Lake[35]<br>Stage 1: operate at 115 kV<br>Stage 2: upgrade to 230 kV[46] | 46<br>136 | 35<br>35 | 81<br>171 | 70<br>160 | 37 | 41 |

[44] Includes demand for Ring of Fire remote communities (7 MW).
[45] Transmission options cannot be developed before 2016.
[46] Upgrade assumed to be completed in 2023 when three Ring of Fire mines are forecast to be operating.

**Table 19: Costs and Timing of Transmission Options**

| Option | Time to Complete | Capital Cost | Total PV During Planning Period | PV Unit Cost of Utilized Capacity |
|---|---|---|---|---|
| 115 kV line to Pickle Lake | 3-5 Years | $126 M | $80 M | $1.31 M/MW |
| 230 kV line to Pickle Lake | 3-5 Years | $167 M | $106 M | $2.12 M/MW |
| Pre-build 230 kV line to Pickle Lake<br>Stage 1: operate at 115 kV[47] | 3-5 Years | $155 M | $98 M | $1.85 M/MW |

#### 7.2.1.4 Low Scenario Options Analysis for Pickle Lake Subsystem and Connection of Mines and Communities in the Ring of Fire Subsystem to Pickle Lake

The low scenario does not include any additional load within the planning period from the Ring of Fire area mines compared to 7.2.1.3 and therefore this scenario is identical to 7.2.1.3 and not considered further.

#### 7.2.1.5 High Scenario Options Analysis for Pickle Lake Subsystem and Connection of Communities in the Ring of Fire Subsystem

Under the high scenario forecasted load, the LMC required is 48 MW for the near term, and 90 MW for the medium and long term as indicated by the high scenario "*Total 1*" in Table 8.

*Sensitivity Analysis for Generation Options*

Similarly to what was done with the Reference Scenario analysis, in order to minimize generation cost, it is assumed that 24 MW of load in the Pickle Lake subsystem will continue to be served by the Red Lake subsystem from Ear Falls TS via the circuit E1C.

[47] Stage 2 would not be required for the low forecast scenario without the Ring of Fire

The remaining 24 MW of LMC for the near term and 66 MW of LMC for the medium and long term (which includes the remote communities in the Ring of Fire subsystem), would be served by CNG fueled generation at Pickle Lake.

To make available 24 MW of incremental LMC in the Pickle Lake subsystem with local generation, a total generation capacity of 47.5 MW would be required in the near term with a maximum unit size of 9.5 MW (i.e. 5x9.5 MW). To make available 66 MW of incremental LMC in the Pickle Lake subsystem with local generation, a total generation capacity of 85.5 MW would be required in the near term with a maximum unit size of 9.5 MW (i.e. 9x9.5 MW).

**Table 20: Capacity of Generation Option**

| Option | Incremental LMC [MW] | Pickle Lake Subsystem LMC [MW] | Near term High Forecast Demand[48] [MW] | Medium and Long term High Forecast Demand[38] [MW] |
|---|---|---|---|---|
| Near term: 47.5 MW CNG Generation at Pickle Lake[49] | 28.5 | 52.5 | 48 | 90 |
| Medium and Long term: 85.5 MW CNG Generation at Pickle Lake[39] | 66.5 | 90.5 | 48 | 90 |

**Table 21: Costs and Timing for Generation Option**

| Option | Time to Complete | Capital Cost | Total PV During Planning Period | PV Unit Cost of Utilized Capacity |
|---|---|---|---|---|
| 47.5 MW CNG Generation at Pickle Lake | 1-2 Years | $75 M | $158 M | $6.59 M/MW |
| 85.5 MW CNG Generation at Pickle Lake | 1-2 Years | $140 M | $317 M | $4.80 M/MW |

[48] Includes demand for Ring of Fire remote communities (7 MW).
[49] Requires continued supply of 24 MW of load via E1C from Ear Falls TS.

### *Sensitivity Analysis for Transmission Options*

Under the high forecast scenario, the LMC required for the Pickle Lake subsystem is 48 MW in the near term and 90 MW for the medium and long term. Consistent with the reference scenario, building a new line to Pickle Lake allows for a capacity increase to the Red Lake subsystem of 35 MW by opening circuit E1C from Ear Falls during capacity-constrained conditions, where peak demand is coincident with drought hydroelectric generation output.

In order to supply 48 MW in the near term and 90 MW in the medium and long term, a new line to Pickle Lake built to 230 kV standards would be required.

**Table 22: Capacity of Transmission Options**

| Option | Incremental LMC for Pickle Lake Subsystem [MW] | Incremental LMC for Red Lake Subsystem [MW] | Total Incremental LMC for Option [MW] | Pickle Lake Subsystem Load Meeting Capability [MW] | Pickle Lake Subsystem Near term High Forecast Demand[50] [MW] | Pickle Lake Subsystem Medium and Long term High Forecast Demand[1] [MW] |
|---|---|---|---|---|---|---|
| 115 kV line to Pickle Lake[51] | 46 | 35 | 81 | 70 | 48 | 90 |
| 230 kV line to Pickle Lake[41] | 136 | 35 | 171 | 160 | 48 | 90 |
| Pre-build 230 kV line to Pickle Lake[41]<br>Stage 1: operate at 115 kV<br>Stage 2: upgrade to 230 kV[52] | 46<br>136 | 35<br>35 | 81<br>171 | 70<br>160 | 48 | 90 |

[50] Includes 7 MW of forecast demand for the remote communities in the Ring of Fire subsystem

[51] Transmission options cannot be developed before 2016

[52] Upgrade completed in 2023, when 3 Ring of Fire mines are forecast to be operating

**Table 23: Costs and Timing of Transmission Options**

| Option | Time to Complete | Capital Cost | Total PV During Planning Period | PV Unit Cost of Utilized Capacity |
|---|---|---|---|---|
| 115 kV line to Pickle Lake | Not technically feasible | | | |
| 230 kV line to Pickle Lake | 3-5 Years | $180 M | $114 M | $1.20 M/MW |
| Pre-build 230 kV line to Pickle Lake<br>Stage 1: operate at 115 kV<br>Stage 2: upgrade to 230 kV[53] | <br>3-5 Years<br>1-2 Years | <br>$155 M<br>$14 M | <br>$98 M<br>$5 M | <br>$1.29 M/MW<br>$0.25 M/MW |

From the above tables, and consistent with the analysis for the reference scenario, the following conclusions can be made for the forecasted load under the high scenario *with the Ring of Fire subsystem communities supplied from Pickle Lake*:

1. A line built to 115 kV standards would be insufficient to meet the medium- and long-term need.
2. A line pre-built to 230 kV standards with staged 115 kV and 230 kV operation is approximately as cost effective as initially operating at 230 kV. While cost is about the same, initially operating at 115 kV will require the installation of voltage control devices that will no longer be useful when the line operates at 230 kV.
3. A line built and initially operated at 230 kV is also a cost effective option that meets the medium- and long-term need, and will not result in stranding of transmission devices. This is the recommended solution option.

#### 7.2.1.6 High Scenario Options Analysis for Pickle Lake Subsystem and Connection of Mines and Communities in the Ring of Fire Subsystem to Pickle Lake

Under the high scenario forecasted load, the LMC required is 66 MW for the near term, and 156 MW for the medium and long term as indicated by the high scenario "*Total 2*" in Table 8.

[53] Upgrade completed in 2023, when 3 Ring of Fire mines are forecast to be operating

### *Sensitivity Analysis for Generation Options*

Consistent with the reference scenario analysis, generation options from the Pickle Lake subsystem to supply Ring of Fire mining load were screened out as they are less cost effective than generation options from the Ring of Fire subsystem to supply Ring of Fire mining load (which is investigated in 7.4). Therefore, only transmission options are investigated for this scenario.

### *Sensitivity Analysis for Transmission Options*

In order to supply 66 MW in the near term and 156 MW in the medium and long term, a new line to Pickle Lake built to 230 kV standards would be required. This may be achieved by either Transmission Option 2 or Option 3.

**Table 24: Capacity of Transmission Options**

| Option | Incremental LMC for Pickle Lake Subsystem [MW] | Incremental LMC for Red Lake Subsystem [MW] | Total Incremental LMC for Option [MW] | Pickle Lake Subsystem Load Meeting Capability [MW] | Pickle Lake Subsystem Near term High Forecast Demand[1] [MW] | Pickle Lake Subsystem Medium and Long term High Forecast Demand[1] [MW] |
|---|---|---|---|---|---|---|
| 115 kV line to Pickle Lake[2] | 46 | 35 | 81 | 70 | 66 | 156 |
| 230 kV line to Pickle Lake[2] | 136 | 35 | 171 | 160 | 66 | 156 |
| Pre-build 230 kV line to Pickle Lake[2]<br>Stage 1: operate at 115 kV<br>Stage 2: upgrade to 230 kV[3] | 46<br>136 | 35<br>35 | 81<br>171 | 70<br>160 | 66 | 156 |

(1) Includes 7 MW of forecast demand for the remote communities in the Ring of Fire subsystem
(2) Transmission options cannot be developed before 2016
(3) Upgrade completed in 2023, when 3 Ring of Fire mines are forecast to be operating

**Table 25: Costs and Timing of Transmission Options**

| Options | Time to Complete | Capital Cost | Total PV During Planning Period | PV Unit Cost of Utilized Capacity |
|---|---|---|---|---|
| 115 kV line to Pickle Lake | Not technically feasible | | | |
| 230 kV line to Pickle Lake | 3-5 Years | $180 M | $114 M | $1.20 M/MW |
| Pre-build 230 kV line to Pickle Lake<br>Stage 1: operate at 115 kV<br>Stage 2: upgrade to 230 kV[54] | <br><br>3-5 Years<br>1-2 Years | <br><br>$155 M<br>$14 M | <br><br>$98 M<br>$5 M | <br><br>$1.29 M/MW<br>$0.25 M/MW |

From the above tables, and consistent with the analysis for the reference scenario, the following conclusions can be made for the forecasted load under the high scenario *with the Ring of Fire subsystem supplied from Pickle Lake*, including the community and mining load:

1. A line built to 115 kV standards would be insufficient to meet the medium- and long-term need, and is only marginally sufficient to meet the near term need.
2. A line pre-built to 230 kV standards with staged 115 kV and 230 kV operation is approximately as cost effective as initially operating at 230 kV. While cost is the same, initially operating at 115 kV will require the installation of voltage control devices that will no longer be useful when the line operates at 230 kV.
3. A line built and initially operated at 230 kV is also a cost effective option that meets the medium-and long-term need, and will not result in stranding of transmission devices. This is the recommended solution option.

### 7.2.2 **Pickle Lake Subsystem Recommended Solutions**

The OPA recommends that a new 230 kV single circuit line to Pickle Lake be built as soon as possible in order to meet the needs of the Pickle Lake subsystem. Building the new line to 230 kV standards is the most economic option to meet the reference forecast scenario, which is regarded as the most-likely scenario, and mitigates the long-term risk associated with higher forecasted demand scenarios and maintains the flexibility to supply the Ring of Fire mining development from Pickle Lake. The OPA also recommends that circuit E1C be opened at Ear Falls as an operational measure when

54 Upgrade completed in 2023, when 3 Ring of Fire mines are forecast to be operating

the local system is capacity-constrained. This operational measure maximizes the capability of the transmission system in the area, resulting in incremental LMC to the Red Lake subsystem. The capacity constraint is expected to occur during high demand coincident with drought hydroelectric conditions.

It is recommended that development work on a new 230 kV single circuit line to Pickle Lake is completed as soon as possible. The OPA understands that preliminary development work has been started by two First Nations-owned transmission development companies. This work was initiated after the project was identified as a priority transmission project in the Government of Ontario's 2010 and 2013 Long-Term Energy Plans, and was identified for inclusion in future power system plans in the Minister of Energy's 2011 SMD to the OPA.

Implementation of the new line to Pickle Lake continues to be supported by the OPA. The OPA is following the development process for the two development companies closely. The OPA expresses urgency in the need for a new 230 kV single circuit line to Pickle Lake and will support this project to obtain the necessary approvals as soon as possible.

## 7.3 Summary of Recommended and Assessed Options for Meeting Red Lake Subsystem Needs

The OPA recommends the upgrading of circuits E4D and E2R from a summer ampacity of 470 A to 660 A and 420 A to 610 A, respectively. The upgrading of E4D and E2R, in addition to a new line to Pickle Lake coupled with operating circuit E1C open at Ear Falls would provide an additional 70 MW of LMC, bringing the LMC for the Red Lake subsystem to 130 MW. The LMC of 130 MW meets the needs of the Red Lake subsystem for the long term for all the OPA's forecast scenarios, beyond the planning period for the low scenario and reference scenario (which is considered the most likely), and until 2030 for the high scenario.

In addition, the OPA recommends that the IESO and Ontario Power Generation ("OPG"), with assistance from the OPA, negotiate a new contract for amended reactive services contract for Manitou Falls GS if it is beneficial to the rate payer. Based on information provided by OPG on the Draft North of Dryden IRRP, submitted November 8th, 2013, the Manitou Falls units G1, G2, and G3 all have condense features which could be contracted to provide reactive power during drought conditions. The contracting of these units could avoid some of the station investments at Ear Falls SS associated with the installation of voltage control devices. Table 62 in Appendix 10.6 outlines the cash-flows associated with the circuit upgrades including the station costs being referred to above.

The OPA also recommends that the potential long-term options of incremental natural gas-fired generation at Red Lake or a new transmission line be re-evaluated in the next planning cycle (1-5 years) for the North of Dryden sub-region of the Northwest region. This analysis will consider an updated forecast. The economics of additional gas-fired generation compared to a new transmission line will depend on the amount of load that materializes – gas generation is scalable, while transmission has greater economies of scale if enough demand is present for a sufficient level of utilization. Re-evaluating options in future planning cycles is consistent with OEB requirements in the Transmission System Code, Distribution System Code and the OPA license.

The following section summarizes the analysis and comparison of options.

As mentioned previously, the Red Lake subsystem is currently supplied by the 115 kV line E4D from Dryden TS as well as local run of river hydroelectric generation around Ear Falls. At present the subsystem has reached its LMC. Therefore, forecasted near term growth and medium and long term growth cannot be met by the existing system and other supply options are required. Identified needs for the Red Lake subsystem are summarized in Table 26, below.

**Table 26: Needs for Red Lake Subsystem**

| Timing | Needs | Required Load Meeting Capability [MW] | | |
|---|---|---|---|---|
| | | Low | Reference | High |
| Near term (2014-2018) | • Supply of mining and community demand in the Red Lake subsystem | 91 | 91 | 91 |
| | ***Total Near term*** | ***91*** | ***91*** | ***91*** |
| Medium and long term (2019-2033) | • Supply of mining and community demand in the Red Lake subsystem | 100 | 109 | 136 |
| | ***Total Medium and Long term*** | ***100*** | ***109*** | ***136*** |

The following near term generation and transmission options have been identified for meeting these needs.

**Table 27: Summary of Options to Meet the Near-term Needs of the Red Lake Subsystem**

| Options to Meet Near-term Needs | Capital Cost | PV Cost | Incremental Load Meeting Capability | PV Unit Cost of Utilized Capacity |
|---|---|---|---|---|
| Red Lake Gas Generation (30 MW) | $89 M | $51 M | 30 MW | $1.94 M/MW |
| Off Load E1C to New Line to Pickle Lake[55] | $66 M | $42 M | 35 MW | |
| Upgrade E4D and E2R | $16 M | $11 M | 34 MW | $1.11 M/MW[56] |
| Off Load E1C to New Line to Pickle Lake | $66 M | $42 M | 35 MW | |

The OPA recommends upgrading E4D and E2R, as this option has the lowest NPV cost for meeting the near-term needs of the Red Lake subsystem. This option also has the shortest lead time and the highest incremental capacity.

[55] Costs assumed for transfer of E1C load to new line to Pickle Lake are pro-rated based on LMC for Red Lake subsystem and the LMC for Red Lake subsystem plus the LMC for Pickle Lake subsystem.
[56] Note that utilized capacity is 30 MW in the near term.

**Table 28: Summary of Options to Meet the Medium- and Long-Term Needs of the Red Lake Subsystem**

| Options to Meet Medium- and Long-Term Needs | Capital Cost | PV Cost[57] | Incremental Load Meeting Capability | PV Unit Cost of Utilized Capacity |
|---|---|---|---|---|
| Red Lake Gas Generation (30 MW)[58] | \$95 M | \$6 M | 30 MW | \$0.20 M/MW |
| Ear Falls and Red Lake Gas Generation (60 MW) | \$153 M | \$8 M | 60 MW | \$0.13 M/MW |
| Install Voltage Compensation at Ear Falls and Red Lake (130 MW) | \$9 M | \$1 M | 21 MW | \$0.05 M/MW |
| New 115 kV line to Ear Falls (160 MW) | \$91 M | \$10 M | 30 MW | \$0.34 M/MW |
| New 115 kV line to Ear Falls (190 MW) | \$108 M | \$12 M | 60 MW | \$0.20 M/MW |
| New 230 kV line to Ear Falls (190 MW) | \$132 M | \$15 M | 60 MW | \$0.25 M/MW |

Once the upgrades to E4D and E2R are complete and the new line to Pickle Lake is in service, the Red Lake subsystem will have an LMC of 130 MW, which is sufficient to meet the supply needs of the Red Lake subsystem for the long term.

Costs do not need to be incurred at this time for additional enhancements for the Red Lake subsystem beyond E4D and E2R upgrades. Under the low scenario and reference scenario (which is considered most likely) no incremental LMC is required beyond 130 MW. Only under the high scenario is incremental LMC forecasted to be required in 2030. The lead times for the long-term incremental options allow for re-evaluation of the demand forecast and options in future planning cycles. Future planning cycles will contain more certainty in the demand forecast as mines and related development materialize. The next planning cycle for the North of Dryden sub-region is between 1-5

[57] Present Value costs for long-term options consider only the costs incurred within the 20 year planning horizon. These numbers appear low because costs are assumed to be incurred when a need is forecasted. Costs are not expected to need to be incurred until about 2030 at earliest, and therefore only 3 years of costs discounted over 17 years are included. Present Value costs are a method of comparison and should not be misinterpreted as total project costs.

[58] Same as the near term option, with install date of 2030 and therefore cannot be combined with the near term option.

years, as per the OEB-sanctioned regional planning process. The prudent course of action for the long term is monitoring load growth and re-evaluating in a timely manner.

### 7.3.1 Discussion of Options to Meet the Needs of the Red Lake Subsystem

Both generation and transmission options are considered for meeting the needs of the Red Lake subsystem.

The following sub-sections will outline the evaluation of various integrated options to meet the near-term and medium-to long-term needs of the Red Lake subsystem for the reference, low, and high load forecast scenarios.

#### 7.3.1.1 Reference Scenario Options Analysis for Red Lake Subsystem

Under the reference scenario, the LMC required is 91 MW for the near term, and 109 MW for the medium and long term as indicated by the reference scenario in Table 26. The existing LMC for the Red Lake subsystem is 61 MW, which is not sufficient.

In establishing the need for incremental LMC for the Red Lake subsystem, it is assumed that, consistent with the recommendations for addressing supply needs for the Pickle Lake subsystem, a new line to Pickle Lake will be implemented and circuit E1C will be operated open at Ear Falls SS. Opening circuit E1C from Ear Falls SS relieves circuit E4D of 35 MW.

*Generation Options*

At Red Lake, there is a limited supply of natural gas on the existing Union Gas pipeline. This pipeline was extended to serve the needs of an industrial customer at Red Lake and the Town of Red Lake. Based on information provided by the industrial customer, there is sufficient pipeline capacity to increase the LMC by 30 MW from gas-fired generation at Red Lake.

The OPA studied the costs and benefits of implementing gas fired generation to provide incremental LMC in the Red Lake subsystem. The generators could operate both as a local area resource and as a system resource to support growth in northwest Ontario, by reducing loading on the bulk transmission system at Dryden TS. Gas generators in the Red Lake subsystem would be expected to operate for local area needs primarily during periods when run of river hydroelectric generation near Ear Falls is low and when the demand in the area is high.

Due to the availability of gas on the pipeline and the distribution of load in the Red Lake subsystem, gas generation at Red Lake would increase the LMC of the Red Lake subsystem by 30 MW. Table 29 summarizes the capability and Table 30 summarizes the cost and timing associated with the gas generation option.

**Table 29: Capacity for Generation Options**

| Option | Incremental LMC [MW] | Red Lake Subsystem LMC [MW] | Near term Reference Forecast Demand [MW] | Medium and Long term Reference Forecast Demand [MW] |
|---|---|---|---|---|
| Red Lake Gas Generation (30 MW) and Transfer of Pickle Lake load to new line to Pickle Lake | 30 MW | 91 MW | 91 | 109 |
| | 35 MW | 126 MW | | |

**Table 30: Costs and Timing for Generation Options**

| Option | Time to Complete | Capital Cost | Total PV During Planning Period | PV Unit Cost of Utilized Capacity |
|---|---|---|---|---|
| Red Lake Gas Generation (30 MW) | 2 Years | $89 M | $51 M | $1.94 M/MW |
| Transfer of E1C load to new line to Pickle Lake[59] | 3-5 Years | $66 M | $42 M | |

It is important to note that the transfer of Pickle Lake load from E1C to relieve the Red Lake subsystem can be made once a new line to Pickle Lake is in service. This again

[59] Costs assumed for transfer of E1C load to new line to Pickle Lake are pro-rated based on LMC for Red Lake subsystem and the LMC for Red Lake subsystem plus the LMC for Pickle Lake subsystem.

emphasizes the urgent need to implement the new line to Pickle Lake, as it has broader benefits for incremental LMC for the Red Lake subsystem.

### *Transmission Options*

Hydro One Networks Inc. owns and operates transmission lines E4D and E2R and has confirmed that they can be upgraded from a summer ampacity of 470 A to 660 A and 420 A to 610 A, respectively. This upgrade increases the LMC of the Red Lake subsystem by 34 MW. To enable this higher transmission capability, additional voltage control would also be required at Ear Falls TS. Hydro One has indicated that upgrading E4D and E2R and the installation of the required voltage control devices would take two years and could be completed within the near-term period.

**Table 31: Capacity of Transmission Option**

| Option | Incremental LMC [MW] | Red Lake Subsystem LMC [MW] | Near term Reference Forecast Demand [MW] | Medium and Long term Reference Forecast Demand [MW] |
|---|---|---|---|---|
| Near-term Option | | | | |
| Upgrade E4D and E2R | 34 | 95 | 91 | 109 |
| and Transfer of Pickle Lake load to new line to Pickle Lake | 35 | 130 | | |

Upgrading the transfer capability of E4D and E2R and installation of the required amount of voltage control is the recommended solution for the Red Lake subsystem. This option satisfies the reference scenario forecasted demand at the least cost. When E4D and E2R are upgraded and the required amount of voltage control is installed at Ear Falls TS, there will be 95 MW of capacity at Ear Falls TS to serve load in the Red Lake subsystem and 35 MW available to continue to serve the Pickle Lake subsystem. Once a new line to Pickle Lake is implemented and circuit E1C is operated open at Ear Falls SS, an additional 35 MW of LMC is provided to the Red Lake subsystem because currently the Pickle Lake subsystem currently requires 35 MW of supply from Ear Falls to serve 24 MW of load (due to losses). This brings the total LMC for the Red Lake subsystem to 130 MW. The combination of the line upgrades to E4D and E2R as well as a new line to Pickle Lake is expected provide enough LMC for the Red Lake subsystem until the end of the study horizon for the reference forecast scenario.

It should be noted that the incremental LMC of 35 MW provided to the Red Lake subsystem from transferring E1C load to the new line to Pickle Lake requires the E4D and E2R upgrades to be completed. Without the upgrades, E2R would limit the supply into Red Lake because E2R is not relieved from transferring E1C load (E1C transfer only relieves E4D).

This again emphasizes the urgent need to implement both the upgrades to circuits E4D and E2R, as well as the new line to Pickle Lake, as combined these solutions provide a significant increase in LMC for the Red Lake subsystem.

**Table 32: Cost and Timing of Transmission Option**

<table>
<tr><th>Options</th><th>Time to Complete</th><th>Capital Cost[60]</th><th>PV During Planning Period</th><th>PV Unit Cost of Utilized Capacity</th></tr>
<tr><td>Upgrade of E4D and E2R</td><td>1-2 years</td><td>$16 M</td><td>$11 M</td><td rowspan="2">$1.11 M/MW</td></tr>
<tr><td>Transfer of E1C load to new line to Pickle Lake[61]</td><td>3-5 years</td><td>$66 M</td><td>$42 M</td></tr>
</table>

Based on the above analysis of Generation and Transmission Options for the reference scenario, the upgrading of circuits E4D and E2R in combination with the relief provided by transferring E1C demand to a new line to Pickle Lake is the most economic solution to meet the needs of the Red Lake area. This solution would be sufficient to meet the electrical demand in the Red Lake subsystem until beyond the planning period.

[60] Capital cost does not include the capital cost for new system generation
[61] Costs assumed for transfer of E1C load to new line to Pickle Lake are pro-rated based on LMC for Red Lake subsystem and the LMC for Red Lake subsystem plus the LMC for Pickle Lake subsystem.

The IESO recently completed SIAs for three customers in the Red Lake subsystem that are interested in increasing their demand on the system. Upgrading of E4D and E2R was also identified by the IESO as the preferred solution to meet the load increase requests. The IESO's analysis is consistent with the OPA's findings.

#### 7.3.1.2 Low Scenario Options Analysis for Red Lake Subsystem

Under the low scenario, the LMC required is 91 MW for the near term, and 100 MW for the medium and long term as indicated by the low scenario in Table 26.

Consistent with the analysis performed for the reference scenario, it is assumed that a new line to Pickle Lake will be implemented and circuit E1C is operated open at Ear Falls SS, which relieves circuit E4D of 35 MW.

*Sensitivity Analysis for Generation Options*

In order to meet the required LMC for the Red Lake subsystem under the low scenario, the generation option assessed for the reference scenario remains unchanged and is therefore not sensitive to the low scenario demand. A summary of capacity and costs are repeated in the following tables for convenience:

**Table 33: Capacity for Generation Options**

| Option | Incremental LMC [MW] | Red Lake Subsystem LMC [MW] | Near term Low Forecast Demand [MW] | Medium and Long term Low Forecast Demand [MW] |
|---|---|---|---|---|
| Red Lake Gas Generation (30 MW)<br>and<br>Transfer of Pickle Lake load to new line to Pickle Lake | 30 MW | 91 MW | 91 | 100 |
| | 35 MW | 126 MW | | |

**Table 34: Costs and Timing for Generation Options**

| Option | Time to Complete | Capital Cost | Total PV During Planning Period | PV Unit Cost of Utilized Capacity |
|---|---|---|---|---|
| Red Lake Gas Generation (30 MW) | 2 Years | $89 M | $51 M | $2.38 M/MW |
| Transfer of E1C load to new line to Pickle Lake[62] | 3-5 Years | $66 M | $42 M | |

### *Sensitivity Analysis for Transmission Options*

In order to meet the required LMC for the Red Lake subsystem under the low scenario, the transmission options assessed for the reference scenario remain unchanged and are therefore not sensitive to the low scenario demand. A summary of capacity and costs are repeated in the following tables for convenience:

**Table 35: Capacity of Transmission Option**

| Option | Incremental LMC [MW] | Red Lake Subsystem LMC [MW] | Near term Low Forecast Demand [MW] | Medium and Long term Low Forecast Demand [MW] |
|---|---|---|---|---|
| Near-term Option | | | | |
| Upgrade E4D and E2R and Transfer of Pickle Lake load to new line to Pickle Lake | 34 | 95 | 91 | 100 |
| | 35 | 130 | | |

**Table 36: Cost and Timing of Transmission Option**

| Options | Time to Complete | Capital Cost[63] | PV During Planning Period | PV Unit Cost of Utilized Capacity |
|---|---|---|---|---|
| Upgrade of E4D and E2R | 1-2 years | $16 M | $11 M | $1.36 M/MW |
| Transfer of E1C load to new line to Pickle Lake[64] | 3-5 years | $66 M | $42 M | |

[62] Costs assumed for transfer of E1C load to new line to Pickle Lake are pro-rated based on LMC for Red Lake subsystem and the LMC for Red Lake subsystem plus the LMC for Pickle Lake subsystem.
[63] Capital cost does not include the capital cost for new system generation
[64] Costs assumed for transfer of E1C load to new line to Pickle Lake are pro-rated based on LMC for Red Lake subsystem and the LMC for Red Lake subsystem plus the LMC for Pickle Lake subsystem.

### 7.3.1.3 High Scenario Options Analysis for Red Lake Subsystem

Under the high scenario, the LMC required is 91 MW for the near term, and 136 MW for the medium and long term as indicated by the high scenario in Table 26.

Consistent with the analysis performed for the reference scenario, it is assumed that a new line to Pickle Lake will be implemented and circuit E1C is operated open at Ear Falls SS, which relieves circuit E4D of 35 MW.

#### *Sensitivity Analysis for Generation Options*

In order to meet the required LMC for the Red Lake subsystem under the high scenario, additional gas generation at Ear Falls or Red Lake would be required in the long term compared to the reference scenario. However, it should be noted that based on information from the existing industrial customer gas pipeline capacity is not available to support gas-fired generation beyond 30 MW.

The option of incremental gas generation has been assessed assuming that industrial customers may require additional natural gas supply to serve their industrial processes.

A summary of capacity and costs are summarized in the following tables:

**Table 37: Capacity for Generation Options**

<table>
<tr><th>Option</th><th>Incremental LMC [MW]</th><th>Red Lake Subsystem LMC [MW]</th><th>Near term High Forecast Demand [MW]</th><th>Medium and Long term High Forecast Demand [MW]</th></tr>
<tr><td rowspan="2">Red Lake Gas Generation (30 MW)<br><br>and<br><br>Transfer of Pickle Lake load to new line to Pickle Lake</td><td>30</td><td>91</td><td rowspan="2">91</td><td rowspan="2">136</td></tr>
<tr><td>35</td><td>126</td></tr>
<tr><td colspan="5">Incremental Long term Options</td></tr>
</table>

| | | | | |
|---|---|---|---|---|
| Incremental Potential Gas Generation at Red Lake or Ear Falls (30 MW)[65] | 30 | 156 | 91 | 136 |

**Table 38: Costs and Timing for Generation Options**

| Option | Time to Complete | Capital Cost | Total PV During Planning Period | PV Unit Cost of Utilized Capacity |
|---|---|---|---|---|
| Red Lake Gas Generation (30 MW) | 2 Years | $89 M | $51 M | $1.36 M/MW |
| Transfer of E1C load to new line to Pickle Lake[66] | 3-5 Years | $66 M | $42 M | |
| Incremental Potential Gas Generation at Red Lake or Ear Falls (30 MW)[67] | TBD[1] | $95 M[68] | $6 M[69] | $1.00 M/MW |

From the above, the option of 30 MW of gas-fired generation at Red Lake using existing pipeline capacity in combination with relieving circuit E4D of the E1C load following the installation of a new line to Pickle Lake would result in an LMC of 126 MW for the Red Lake subsystem. This LMC would be forecasted to be exceeded by 2027 under the high scenario.

The sensitivity analysis does not impact the decisions that are required during this planning cycle. Demand forecasts and long term options will be re-evaluated in the next planning cycle (1-5 years) for the North of Dryden sub-region of the Northwest region.

### *Sensitivity Analysis for Transmission Options*

In order to meet the required LMC for the Red Lake subsystem under the high scenario, the transmission options assessed for the reference scenario remain unchanged and

---

[65] Contingent on new gas pipeline to serve new electricity and gas customers
[66] Costs assumed for transfer of E1C load to new line to Pickle Lake are pro-rated based on LMC for Red Lake subsystem and the LMC for Red Lake subsystem plus the LMC for Pickle Lake subsystem.
[67] Contingent on new gas pipeline to serve new electricity and gas customers
[68] Capital Cost does not include pipeline costs. It is assumed that if the pipeline was needed anyway, there would be no incremental pipeline costs to incorporate generation
[69] Present Value costs for long-term options consider only the costs incurred within the 20 year planning horizon. These numbers appear low because costs are assumed to be incurred when a need is forecasted. Costs are not expected to need to be incurred until 2026 at earliest, and therefore only 3 years of costs discounted over 13 years are included. Present Value costs are a method of comparison and should not be misinterpreted as total project costs.

are therefore not sensitive to the high scenario demand. A summary of capacity and costs are repeated in the following tables:

**Table 39: Capacity of Transmission Option**

| Option | Incremental LMC [MW] | Red Lake Subsystem LMC [MW] | Near term High Forecast Demand [MW] | Medium and Long term High Forecast Demand [MW] |
|---|---|---|---|---|
| Near-term Option | | | | |
| Upgrade E4D and E2R | 34 | 95 | 91 | 136 |
| and Transfer of Pickle Lake load to new line to Pickle Lake | 35 | 130 | | |
| Incremental Long-term Options | | | | |
| New 115 kV line to Ear Falls (160 MW LMC) | 30 | 160 | 91 | 136 |
| New 115 kV line to Ear Falls (190 MW LMC) | 60 | 190 | 91 | 136 |
| New 230 kV line to Ear Falls (190 MW LMC) | 60 | 190 | 91 | 136 |

**Table 40: Cost and Timing of Transmission Option**

| Options | Time to Complete | Capital Cost[70] | PV During Planning Period[71] | PV Unit Cost of Utilized Capacity |
|---|---|---|---|---|
| Upgrade of E4D and E2R | 1-2 years | $16 M | $11 M | $0.78 M/MW |
| Transfer of Pickle Lake load to new Line at Pickle Lake[72] | 3-5 years | $66 M | $42 M | |
| New 115 kV line to Ear Falls (160 MW LMC) | 4-7 years | $91 M | $10 M | $1.72 M/MW |
| New 115 kV line to Ear Falls (190 MW LMC) | 4-7 years | $108 M | $12 M | $2.04 M/MW |
| New 230 kV line to Ear Falls (190 MW LMC) | 4-7 years | $132 M | $15 M | $2.5 M/MW |

[70] Capital cost does not include the capital cost for new system generation

[71] Present Value costs for long-term options (i.e. all except E4D and E2R upgrades, and Transfer of Pickle Lake load to new Line at Pickle Lake) consider only the costs incurred within the 20 year planning horizon. These numbers appear low because costs are assumed to be incurred when a need is forecasted. Costs are not expected to need to be incurred until 2030 at earliest, and therefore only 3 years of costs discounted over 17 years are included. Present Value costs are a method of comparison and should not be misinterpreted as total project costs.

[72] Costs assumed for transfer of E1C load to new line to Pickle Lake are pro-rated based on LMC for Red Lake subsystem and the LMC for Red Lake subsystem plus the LMC for Pickle Lake subsystem.

From the above, upgrading lines E4D and E2R (Dryden to Red Lake) in combination with relieving circuit E4D of the E1C load following the installation of a new line to Pickle Lake, an LMC of 130 MW would result for the Red Lake subsystem. This LMC would be forecasted to be exceeded by 2030 under the high scenario forecasted demand, but not under the reference scenario (which is considered most likely). Incremental transmission options are available if forecasted demand consistent with, or greater than, the high scenario is realized. This is not expected to occur until 2030 under the high scenario and beyond the planning period for the reference scenario. A recommendation for incremental enhancements in addition to the line upgrades and the new line to Pickle Lake does not need to be made at this time. Demand forecasts and long-term options will be re-evaluated in the next planning cycle (1-5 years) for the North of Dryden sub-region of the Northwest region.

### 7.3.2 **Cost Saving Opportunities Utilizing Existing Facilities**

OPG provided information to the OPA on voltage control capabilities of the generating units at Manitou Falls as part of their comments on the Draft North of Dryden IRRP. This information was submitted in writing on November 8th, 2013. Part of this submission indicated that the Manitou Falls units G1, G2, and G3 all have condense features which could be contracted to provide reactive power for voltage control during drought conditions. The contracting of these units could avoid some of the station investments at Ear Falls SS associated with the installation of voltage control devices. Total station costs for upgrading E4D and E2R are referenced in Table 62 of Appendix 10.6.

OPA recommends that the IESO and OPG, with assistance from the OPA, negotiate a new contract or amended reactive services contract for Manitou Falls GS if it is of benefit to the rate payer.

### 7.3.3 **Red Lake Subsystem Recommended Solutions**

The OPA recommends the upgrading of circuits E4D and E2R from a summer ampacity of 470 A to 660 A and 420 A to 610 A, respectively. The upgrading of E4D and E2R, in addition to a new line to Pickle Lake coupled with operating circuit E1C normally open at

Ear Falls would provide an additional 70 MW of LMC, bringing the LMC for the Red Lake subsystem to 130 MW. The LMC of 130 MW meets the needs of the Red Lake subsystem for the long term for all the OPA's forecast scenarios; beyond the planning period for the low scenario and reference scenario (which is considered the most likely), and until 2030 for the high scenario.

In addition, the OPA recommends that the IESO and OPG, with assistance from the OPA, negotiate a new contract or amended reactive services contract for Manitou Falls GS if it is beneficial to the rate payer. Based on information provided by OPG on the Draft North of Dryden IRRP, submitted November 8th, 2013, the Manitou Falls units G1, G2, and G3 all have condense features which could be contracted to provide reactive power during drought conditions. The contracting of these units could avoid some of the station investments at Ear Falls SS associated with the installation of voltage control devices.

The OPA also recommends that the potential long-term options of incremental natural gas-fired generation at Red Lake or a new transmission line be re-evaluated in the next planning cycle (1-5 years) for the North of Dryden sub-region of the Northwest region. This is consistent with OEB requirements in the Transmission System Code, Distribution System Code and the OPA license.

## 7.4 Summary of Options to Meet Ring of Fire Subsystem Needs

The Ring of Fire subsystem is a large geographic area on the edge of the Hudson Bay Lowlands approximately 350 km north of Long Lac and approximately 300 km east of Pickle Lake. There are five remote First Nations ("FN") communities in the area (Eabametoong FN, Neskantaga FN, Marten Falls FN, Nibinamik FN and Webequie FN) and a proposed mine development area called the Ring of Fire, where a number of companies are developing mining claims. At present the five remote First Nations communities are supplied electricity by local diesel generators.

The OPA recommends that electricity infrastructure to supply the Ring of Fire subsystem, including the connection of the remote communities, be coordinated with other infrastructure being investigated or planned, such as transportation corridors to the communities and potential mining development. Mining development companies have indicated different transportation corridor preferences for the Ring of Fire. The OPA understands that a transportation corridor may be developed in an East-West orientation from the Pickle Lake area, or in a North-South orientation from the Nakina area. Transmission options may also utilize either an East-West corridor (originating from Pickle Lake) or a North-South corridor (originating from either Marathon or a point east of Nipigon). The OPA therefore recommends that development of an infrastructure corridor to the Ring of Fire should consider the potential need for a transmission line.

The OPA has included transmission supply options for the Ring of Fire subsystem that are consistent with these general corridor orientations identified by mining proponents. A shared East-West or North-South transmission corridor, in alignment with a transportation corridor, could be a way to reduce overall cost and environmental impact. Mining development companies have also indicated self-generation as their electrical supply base case in their EA documentation. Consistent with the EA documentation of mining development companies, the OPA has considered self-generation as a possible option for the forecasted mining load in the Ring of Fire subsystem. The decision as to whether the mining load in the Ring of Fire subsystem is supplied by transmission or generation will ultimately lie with the mining companies as they will be the beneficiaries of a direct transmission supply. The OPA has already indicated in the Remote Community Connection plan that there is a business case for connecting the five remote communities in the vicinity of the Ring of Fire on their own merit, without the connection of the mining development. The connection of the mining development with the five remote communities creates a stronger business case for the connection of the remote communities. The OPA will continue to support the economic connection of remote communities.

The relative economics of generation versus transmission to supply mining load in the Ring of Fire subsystem depends on the amount of electrical demand that materializes. The reason for this is because transmission is generally more economic for relatively large electrical demand, while generation is scalable and generally more economic for lower levels of electrical demand. Details of the various options are explained further later in this section.

The OPA also recognizes that there may be potential for further utilization of a North-South transmission supply to the Ring of Fire subsystem through integration with supplying new growth in the Greenstone area. The detailed needs and supply options specific for new growth in the Greenstone area will be assessed as part of the Greenstone-Marathon IRRP, which may be used to supplement the findings in this IRRP.

The needs identified for the Ring of Fire subsystem are to connect the five remote communities to the provincial transmission system and to supply the potential future mines. The connection of the five remote communities cannot be completed until at least 2018, as indicated in the Remote Community Connection Report. Also, mines at the Ring of Fire are not expected to start up until 2017 at the earliest. A summary of the needs is provided in Table 41.

**Table 41: Needs for the Ring of Fire Subsystem**

| Timing | Needs | Required Load Meeting Capability [MW] | | |
|---|---|---|---|---|
| | | **Low** | **Reference** | **High** |
| Near term (2014-2018) | • Connect 5 remote communities and supply mining demand in the Ring of Fire subsystems | 4 | 22 | 22 |
| | ***Total Near term*** | ***4*** | ***22*** | ***22*** |
| Medium and long term (2019-2033) | • Connect 5 remote communities and supply mining demand in the Ring of Fire subsystems | 7 | 29 | 73 |
| | ***Total Medium and Long term*** | ***7*** | ***29*** | ***73*** |

An assessment developed for the Remote Community Connection Plan determined that up to five remote First Nation communities in the subsystem are economic to connect to the grid (see Appendices 11.2 and 11.4). As a result, all options identified for this subsystem include the connection of the five remote communities included in this subsystem.

Options to meet these requirements include:

- Connection of mines and remote communities to the transmission system; or
- Connection of the remote communities and on-site generation fueled by diesel or natural gas for the mines.

Transmission supply options being considered for the Ring of Fire subsystem include a new supply from Pickle Lake, a point east of Nipigon, or Marathon. These options were developed with the understanding that both East-West and North-South transportation corridors are being considered and linear corridor planning with electricity may provide greater economic efficiencies and reduce environmental impacts. It should also be noted that 230 kV supply to Pickle Lake is the minimum technical requirement for connecting any mining load at the Ring of Fire to Pickle Lake.

Options for supply to the Ring of Fire subsystem are summarized in Table 42 below.

**Table 42: Summary of Options to Meet the Medium- and Long-Term Needs of the Ring of Fire Subsystem[73]**

| | Capital Cost[74] | PV Cost | Utilized Capacity | PV Unit Cost of Utilized Capacity |
|---|---|---|---|---|
| Diesel Generation + Remote Connection | Low: $186 M<br>High: $277 M | Low: $456 M<br>High:$1,009 M | 29 MW<br>73 MW | $15.7 M/MW<br>$13.8 M/MW |
| CNG Generation + Remote Connection | Low: $240 M<br>High: $421 M | Low: $272 M<br>High: $480 M | 29 MW<br>73 MW | $9.37 M/MW<br>$6.58 M/MW |

[73] Transmission options routed from Pickle Lake include a prorated portion (based on the relative amount of load that would be supplied to each party) of the cost for a new 230 kV transmission line to Pickle Lake.
[74] Description of capital costs can be found in the following tables: Generation, Table 26; Transmission, Table 27

| | | | | |
|---|---|---|---|---|
| 115 kV Line from Pickle Lake to Ring of Fire | $189 M | $106 M | 29 MW | $3.64 M/MW |
| 230 kV Line from Pickle Lake to Ring of Fire | $277 M | $156 M | 73 MW | $2.14 M/MW |
| 230 kV Line from Marathon to Ring of Fire | $327 M | $175 M | 73 MW | $2.40 M/MW |
| 230 kV Line from east of Nipigon to Ring of Fire | $327 M | $175 M | 73 MW | $2.40 M/MW |

Options that are developed for the scenario that the Ring of Fire subsystem mining developments and remote communities are supplied from a transmission connection to the provincial power system assumes the cost for the transmission option with road access. The option for connecting only the remote communities from a transmission connection to the provincial power system assumes the cost for the transmission option without road access. Road access may be provided from the development of a multi-use corridor.

### 7.4.1 **Discussion of Options to Meet the Needs of the Ring of Fire Subsystem**

Currently, the electric supply of the five remote communities in the Ring of Fire subsystem is provided by local diesel generators. As discussed previously, up to five of these communities have been shown to be economic to connect to the transmission system in the Remote Community Connection Plan. Hence, for the purpose of the North of Dryden IRRP, these five communities are assumed to connect to the transmission system.

Given the timelines required to obtain approvals and to design and construct transmission facilities of this scale, the OPA has assumed that transmission options for serving remote communities would not be in service until 2018 at the earliest.

#### 7.4.1.1 Reference Scenario Options Analysis for Ring of Fire Subsystem

Under the reference scenario electrical demand forecast, the LMC required is 22 MW for the near term, and 29 MW for the medium and long term as indicated in Table 41. The existing LMC for the Ring of Fire subsystem is 0 MW, as it is currently not connected to the provincial power system.

### *Generation Options*

Two Environmental Assessment Terms of Reference published by mining developers in the Ring of Fire have included electricity supply options for on-site generation for their particular mining projects. They have identified that diesel or CNG fueled generation plants can provide sufficient capacity and energy to reliably meet their needs and can be brought into service within their mine development timelines. Assuming that a proposed all-season road would connect the Ring of Fire to the provincial highway system, the transportation of the large volumes of fuel required to operate on-site generation of this scale would be enabled.

As mentioned earlier, the five remote communities in the Ring of Fire subsystem have been identified as economic to connect to the transmission system at Pickle Lake. Should the Ring of Fire mines choose the self–generation option for their electricity needs, it is assumed that the remote communities will connect to Pickle Lake through a separate remote community connection project. This option is discussed in detail in the Remote Community Connection Plan. The cost of serving the remote communities by transmission and the Ring of Fire area mines with on-site generation are considered together as an integrated option for serving the Ring of Fire subsystem.

The OPA evaluated the feasibility and relative economics of various on-site generation options to supply the mining load. Findings indicated that reciprocating engines fueled either by diesel or natural gas could power future mines at the Ring of Fire, which is consistent with the respective EA Terms of Reference of developers. These units are available in a large range of sizes which allows for capacity to be scaled to meet a wide range of needs for individual mines initially and over time. Mine developers at the Ring of Fire have plans for transportation systems that would connect the Ring of Fire to the provincial transportation network, by either road or rail. One of these options is an all-season road from the Ring of Fire to the railway near Nakina. In order to develop cost estimates for this regional plan it is assumed that fuel would be transported to the Ring of Fire via the provincial road network to Nakina and then from Nakina to the Ring of Fire via the proposed all-season road[75].

Supplying diesel fuel to mine sites for power generators is common practice. Diesel fuel can be purchased at a number of bulk storage facilities in northwest Ontario and transported to mine sites. CNG also appears to be feasible though there are no direct examples that the OPA could reference for remote mining applications. The OPA has leveraged available public information and worked with industry to establish a reasonable set of assumptions and inputs that were used to develop cost models for both remote diesel and CNG fueled DG. The cost of fuel transportation infrastructure (trucks and trailers) required to transport both diesel and CNG to the mine sites has been included in the cost analysis.

The infrastructure required to fuel a natural gas generation facility at the Ring of Fire would include a compression station located along the TCPL mainline with road access to the proposed all-season road to the Ring of Fire beginning near Nakina. Due to the complexities and permitting required to build a CNG storage facility at the mine site, the OPA understands that no CNG storage facilities are planned for the mine sites and that fuel would be delivered on a just in time basis, with allowance for only a few trailers to be kept on site. Each trailer stores approximately 2 hours supply of fuel.

While the process is not substantially different from the transport and use of diesel, there are more steps and facilities required to compress, transport and decompress the gas before it can be used. Without significant on-site storage facilities, natural gas transportation logistics will be more challenging particularly during inclement weather when the all-season road may be closed for extended periods. To account for such challenges, it is likely that the generators will have to be capable of using both diesel and natural gas. Mines will have large scale diesel storage on site to fuel their vehicles and heavy equipment which could be used to fuel the generators when natural gas

[75] The OPA does not have expertise in transportation planning; this assumption is solely for developing cost estimates for generation OM&A and does not indicate a preference of the OPA.

supply is interrupted. The OPA has also discussed the results of its CNG cost model with industry to ensure the findings are reasonable.

Liquefied natural gas ("LNG") may also be a feasible option to fuel generators. However, it is not clear what minimum production volume is required to establish a natural gas liquefaction facility in northwest Ontario or what the economics of such facilities would be. As a result, the OPA does not have sufficient information to assess either the feasibility or the economics of LNG at this time.

**Table 43: Generation Options at the Ring of Fire Mines**

| Options for Mining Load | Mining Generation [MW] | Near term Reference Forecast Demand (Mines Only) [MW] | Medium and Long term Reference Forecast Demand (Mines Only) [MW] |
|---|---|---|---|
| Diesel Generation | 22 | 18 | 22 |
| CNG Generation | 22 | | |

From the above, in order to meet the reference scenario demand for the Ring of Fire mining load, up to 22 MW of diesel or CNG generation are considered.

The costs for supplying the forecasted Ring of Fire subsystem mining load by either 22 MW of diesel or CNG generation at the Ring of Fire mines are summarized in Table 44.

**Table 44: Generation Options at the Ring of Fire Mines**

| Options for Mining Load | Mining Generation [MW] | Initial Capital Cost | Average Annual Fuel and O&M | Total PV |
|---|---|---|---|---|
| Diesel Generation | 22 | $72 M | $39 M | $393 M |
| CNG Generation | 22 | $127 M | $20 M | $209 M |

As discussed above, the integrated options for serving the needs of the remote communities and the mines in the Ring of Fire subsystem includes a transmission connection option to serve the five remote communities from Pickle Lake in the case where the Ring of Fire mines opt for self-generation. This option would consist of a 115 kV transmission line from Pickle Lake to an end point near Webequie FN, passing near Neskantaga FN. Transformer stations to serve the communities would be sited near Neskantaga FN and at the end of the line near Webequie FN. Neskantaga FN, Eabametoong FN and Marten Falls FN would be connected via distribution lines and stations to the transformer station near Neskantaga FN, while Webequie FN and Nibinamik FN would be connected by distribution lines and stations to the transformer station near Webequie FN. Figure 36 in Appendix 11.4 shows this planned connection system for the five remote communities.

The OPA has estimated the cost of connecting the five remote communities in this subsystem to be $64 million, consistent with the 2014 Remote Community Connection Plan. The costs of the integrated options for mine site generation and transmission connection of remote communities are summarized in Table 45.

**Table 45 Integrated Options for the Ring of Fire Subsystem: Mine Generation and Remote Community Connection to Pickle Lake**

| Integrated Options | PV of Mine Site Generation | PV Remote Connection | Total PV of Integrated Option |
|---|---|---|---|
| Diesel Generation + Remote Connection | $393 M | $62 M | $456M |
| CNG Generation + Remote Connection | $209 M | $62 M | $272 M |

Therefore, in order to supply the entire need for the Ring of Fire subsystem – connection of remote communities and generation supply to mines – a new 115 kV connection for remote communities and 22 MW of generation would be required and would total $273-$457 M, depending on fuel.

### *Transmission Options*

Transmission options for supplying the five remote communities and mining load at the Ring of Fire together include the following:

1. East-West corridor

    a. A new 115 kV single circuit line from Crow River DS or a new station at Pickle Lake to the Ring of Fire

    b. A new 230 kV single circuit line from a new 230/115 kV station at Pickle Lake to the Ring of Fire, and new 230/115 kV TS near Neskantaga FN

2. North-South corridor

    a. A 230 kV single circuit line from Marathon TS to a new transformer station at the Ring of Fire and a new 230/115 kV station near Marten Falls FN

    b. A 230 kV single circuit line from east of Nipigon to a new transformer station at the Ring of Fire and a new 230/115 kV station near Marten Falls FN

The LMC of these options are summarized in Table 46 below

**Table 46: Capacity of Transmission Options**

| Options | Ring of Fire Subsystem Load Meeting Capability [MW] | Ring of Fire Subsystem Near term Reference Forecast Demand [MW] | Ring of Fire Subsystem Medium and Long term Reference Forecast Demand [MW] |
|---|---|---|---|
| *East-West corridor* | | | |
| 115 kV line from Pickle Lake | 67 | 22 | 29 |
| 230 kV line from Pickle Lake | 78 | 22 | 29 |
| *North-South corridor* | | | |

| | | | |
|---|---|---|---|
| 230 kV line from Marathon TS | 78 | 22 | 29 |
| 230 kV line from east of Nipigon | 78 | 22 | 29 |

Power flow studies show that a single circuit 115 kV line from Pickle Lake could supply up to 67 MW of load at the Ring of Fire (60 MW of mining load plus 7 MW of remote community load). Figure 36 in Appendix 11.4 shows a potential configuration of the North of Dryden system with a 115 kV connection to the Ring of Fire from Pickle Lake. This would be sufficient and would be the least-cost option to supply the reference scenario forecasted demand.

It is not economic under the reference scenario forecasted demand to supply the Ring of Fire subsystem by a 230 kV transmission line.

If mining and remote community load exceeds 67 MW a new 115 kV supply would no longer be sufficient and a 230 kV connection to the Ontario transmission system is required for the Ring of Fire subsystem.

The North-South options will be assessed in further detail in the Greenstone-Marathon IRRP by considering possible economic synergies with potential load growth in the Greenstone area.

As mentioned in Section 7.4.1, the five remote communities in the Ring of Fire subsystem have been identified in the Remote Community Connection Plan as being economic to connect on their own. It is therefore assumed that if the Ring of Fire mines do not connect to the grid, then the five remote communities will continue to pursue a connection to the transmission system at Pickle Lake. The lowest cost transmission connection for these communities is a single circuit 115 kV line from Pickle Lake to a new 115/44 kV transformer station near Webequie FN.

A summary of the cost and capabilities of these options is provided in Table 47.

**Table 47: Capacity and Costs of Transmission Options**

| Options | Capital Cost | Prorated Capital of Line to Pickle Lake | Total Capital | Total PV During Planning Period |
|---|---|---|---|---|
| Remote Community Only Connection from Pickle Lake (115 kV) | $101 M | $13 M | $114 M | $62 M |
| New 115 kV line from Pickle Lake to Ring of Fire | $146 M | $44 M | $189 M | $106 M |
| New 230 kV line from Pickle Lake to Ring of Fire | $196 M | $35 M | $231 M | $127 M |
| New 230 kV Line from Marathon to Ring of Fire | $327 M | N/A | $327 M | $175 M |
| New 230 kV Line from east of Nipigon to Ring of Fire | $327 M | N/A | $327 M | $175 M |

The cost responsibility for the new line to Pickle Lake and any connection line to the Ring of Fire shared by mines and remote communities would be determined through commercial agreements and/or through the OEB's Leave to Construct application process.

### 7.4.1.2 Low Scenario Options Analysis for Ring of Fire Subsystem

Under the low scenario forecasted load, the LMC required is 4 MW for the near term, and 7 MW for the medium and long term as indicated by the low scenario in Table 41. This scenario corresponds to the load associated with only the five remote communities in the Ring of Fire subsystem.

Therefore, under this scenario, only the connection of the five remote communities is considered. As indicated in the previous section, the lowest cost transmission connection for these communities is a single circuit 115 kV line from Pickle Lake to a new 115/44 kV transformer station near Webequie FN. This is expected to cost $115 M net-present value over the planning period.

Details are included in the Remote Community Connection Report. This scenario does not require any additional consideration.

### 7.4.1.3 High Scenario Options Analysis for Ring of Fire Subsystem

Under the high scenario forecasted load, the LMC required is 22 MW for the near term, and 73 MW for the medium and long term as indicated by the high scenario in Table 41. Of the 73 MW, 66 MW is mining load and 7 MW is community load. The existing LMC for the Ring of Fire subsystem is 0 MW, as it is currently not connected to the provincial power system.

*Sensitivity Analysis for Generation Options*

In order to meet the required LMC for the Ring of Fire subsystem under the high scenario, the high generation option would be required. The tables outlining the generation options are repeated for convenience:

**Table 48: Generation Options at the Ring of Fire**

| Options for Mining Load | Mining Generation [MW] | Initial Capital Cost | Average Annual Fuel and O&M | Total PV |
|---|---|---|---|---|
| Diesel Generation | 71 | $163 M | $102 M | $946 M |
| CNG Generation | 71 | $307 M | $46 M | $418 M |

**Table 49: Integrated Option for the Ring of Fire Subsystem: Mine Generation and Remote Community Connection to Pickle Lake**

| Integrated Options | PV of Mine Site Generation | PV Remote Connection | Total PV of Integrated Option |
|---|---|---|---|
| Diesel Generation + Remote Connection | $946 M | $62 M | $1,009 M |
| CNG Generation + Remote Connection | $393 M | $62 M | $456 M |

*Sensitivity Analysis for Transmission Options*

In order to meet the required LMC for the Ring of Fire subsystem under the high scenario, the transmission options assessed for the reference scenario remain unchanged. A summary of capacity and costs are repeated in the following tables for convenience:

**Table 50: Capacity of Transmission Options**

| Options | Ring of Fire Subsystem Load Meeting Capability [MW] | Ring of Fire Subsystem Near term High Forecast Demand [MW] | Ring of Fire Subsystem Medium and Long term High Forecast Demand [MW] |
|---|---|---|---|
| *East-West corridor* | | | |
| 115 kV line from Pickle Lake | 67 | 22 | 73 |
| 230 kV line from Pickle Lake | 78 | 22 | 73 |
| *North-South corridor* | | | |
| 230 kV line from Marathon TS | 78 | 22 | 73 |
| 230 kV line from east of Nipigon | 78 | 22 | 73 |

**Table 51: Capacity and Costs of Transmission Options**

| Options | Capital Cost | Prorated Capital of Line to Pickle Lake | Total Capital | Total PV During Planning Period |
|---|---|---|---|---|
| Remote Community Only Connection from Pickle Lake (115 kV) | $101 M | $13 M | $114 M | $62 M |
| New 115 kV line from Pickle Lake to Ring of Fire | Not Technically Feasible for medium to long term | | | |
| New 230 kV line from Pickle Lake to Ring of Fire | $196 M | $35 M | $231 M | $127 M |
| New 230 kV Line from Marathon to Ring of Fire | $327 M | N/A | $327 M | $175 M |
| New 230 kV Line from east of Nipigon to Ring of Fire | $327 M | N/A | $327 M | $175 M |

As indicated previously, a 115 kV line to the Ring of Fire subsystem could supply up to 67 MW, and a 230 kV line would be required to serve demand greater than 67 MW.

Based on the high demand scenario, a 230 kV supply to the Ring of Fire subsystem would be required. A recommendation for a specific solution is not required at this time. The magnitude and timing of the potential mining load is still very uncertain, and decisions regarding transportation infrastructure to the Ring of Fire have not yet been made. A common corridor to the Ring of Fire should consider the potential need for a transmission line.

### 7.4.2 **Ring of Fire Subsystem Recommendations**

The OPA recommends that electricity infrastructure to supply the Ring of Fire subsystem is coordinated with other infrastructure being investigated, such as transportation. Transmission may also utilize either an East-West corridor (originating from Pickle Lake) or a North-South corridor (originating from either Marathon or east of Nipigon). The OPA therefore recommends that development of an infrastructure corridor to the Ring of Fire should consider the potential need for a transmission line.

The lowest cost option for meeting the medium- and long-term identified needs is a transmission connection from either Pickle Lake, Marathon, or east of Nipigon to the Ring of Fire. The incremental cost of developing a transmission connection capable of serving mines and remote communities is substantially lower than the cost of generation to serve mines and separately connect the remote communities.

# 8 FEEDBACK FROM ENGAGEMENT AND CONSULTATION

## 8.1 Aboriginal Consultation

The OPA recognizes the importance of engaging with First Nation and Métis communities and carrying out the procedural aspects of Aboriginal consultation where delegated by the Crown.

The Ministry of Energy delegated the procedural aspects of consultation to the OPA and identified 44 First Nation communities and four Métis communities to be consulted on the Draft North of Dryden IRRP. The Ministry of Energy wrote to each community on the consultation list by letter dated April 25, 2014 to provide notice of the consultation and the delegation of the OPA's role as a delegate of the Crown. The OPA then wrote to each community by letter dated May 26, 2014 to provide the dates and locations of the consultation sessions scheduled for June 2014. The letters included the OPA's commitment to cover the cost of travel and accommodation expenses associated with attending a consultation session. OPA staff then phoned each community to follow up and to answer questions about the North of Dryden IRRP consultation and provided presentation materials in advance of all sessions. The OPA sent additional invitation letters by registered mail on September 26, 2014 for the consultation session that occurred on October 16, 2014. The OPA followed up by phoning each community to ensure that leadership and/or band staff were aware of the North of Dryden consultation.

The OPA held consultation sessions for the First Nation communities in Thunder Bay on June 18, 2014, June 25, 2014, and October 16, 2014, and in Dryden on June 26, 2014. Representatives from 15 communities attended the sessions. Two communities informed the OPA that the North of Dryden IRRP is outside their area of interest. Representatives from the Chiefs of Ontario, Grand Council Treaty 3, and Nishnawbe Aski Nation also attended the sessions but did so for informational purposes only. Notes of these sessions were prepared by the OPA and posted in the regional planning section of the OPA's website.

The OPA was in contact with the Métis Nation of Ontario ("MNO") on a number of occasions via telephone and email to set up appropriate times for regional consultation meetings with MNO's member communities. The OPA endeavoured to meet with the MNO and its chartered communities and remains open to such meetings.

The OPA met with Red Sky Métis Independent Nation on June 19 at Red Sky's office in Thunder Bay. OPA staff delivered a presentation on the North of Dryden IRRP and answered questions posed by Red Sky's representatives.

To date there have not been any specific concerns expressed regarding potential impacts of the regional plan on any Aboriginal or treaty rights. Some clarifying questions were asked during the sessions, and there were some non-consultation related questions regarding electricity rates following the connection of the remote communities identified in the Remote Community Connection Plan. At this point in time, it is not yet known how the distribution service would be structured and therefore it is not possible to determine the impact to rates in a detailed manner. Rates similar to other rural distribution customers in northwestern Ontario are believed to be expected. Other general comments included:

- the need for capacity building in communities to facilitate greater participation in consultation sessions
- some communities wish to focus on project-level consultation with proponents due to the more immediate potential impacts.

## 8.2 Municipal Engagement

Following the publication of the Draft North of Dryden IRRP, the OPA travelled across the northwest to meet with various municipal representatives from affected municipalities. The following summarizes these meetings:

**Table 52: Municipal Engagement Summary**

| Meeting Date | Municipality |
|---|---|
| December 10, 2013 | Pickle Lake |
| December 10, 2013 | Greenstone |
| December 12, 2013 | Red Lake |
| December 12, 2013 | Sioux Lookout |
| December 13, 2013 | Marathon |
| February 12, 2014 | Dryden |
| February 13, 2014 | Ignace |

Following the municipal engagement meetings, several themes emerged as common feedback from the various municipalities and mainly centered on option preference, cost responsibility, and urgency for development.

Various municipal representatives provided input that any new transmission being contemplated in northwestern Ontario should be built to 230 kV standards in order to accommodate potentially high growth and encourage economic development. In general, the OPA agrees with this philosophy if there is sufficient justification to spend the incremental cost associated with a more expensive 230 kV option compared to a less expensive 115 kV option.

The OPA considered this feedback in updating the Draft North of Dryden IRRP that was released on August 16th, 2013. In the draft IRRP, the OPA indicated that it had no preference to the voltage for the recommended new line to Pickle Lake. In this version of the IRRP, the OPA was able to find sufficient justification for initially building and operating the recommended new line to Pickle Lake to 230 kV. The justification is based on the fact that the reference scenario forecast exceeds the capability of a 115 kV line in the longer term, and the provision of option flexibility for supplying the Ring of Fire as described in Section 7.2.

Cost responsibility was another common point of feedback. Generally the municipal representatives communicated that the infrastructure being contemplated in the North of Dryden IRRP is to enable economic development. Economic development was said to provide broader benefits than the local customers and costs should therefore be shared more broadly. Cost responsibility for new transmission and distribution infrastructure will be determined by the OEB during the appropriate regulatory process. For example for applicable transmission lines, cost responsibility would be determined during the leave to construct application.

Another common theme communicated by municipal representatives was the sense of urgency to develop the near term recommendations of a new line to Pickle Lake and the line upgrades from Dryden to Red Lake. The OPA agrees that the recommendation of building a new 230 kV single circuit line to Pickle Lake and upgrading the lines between Dryden and Red Lake are required as soon as possible, and will continue to support their development within the capacity of the OPA.

## 8.3 Other Engagement Activities

Prior to the publication of the Draft North of Dryden IRRP, the OPA engaged with remote communities, municipalities, stakeholder groups and industry to better understand the needs of the North of Dryden sub-region and communicate options that the OPA was considering for the North of Dryden IRRP. Presentations were made to the following groups and events:

- Ontario Mining Conference – June, 2013
- Common Voice Northwest – May, 2013
- Kenora District Municipal Association AGM – February, 2013
- Central Corridor Energy Group/Wataynikaneyap Power – various meetings 2011-2014
- Sagatay Transmission L.P. – various meetings 2012-2014

- Sioux Lookout Aboriginal Advisory Management Board - Trades Conference Fall 2012
- Aboriginal Energy Forum – December 2012
- Keewaytinook Okimakanak Chiefs Annual Meeting – December 2012
- Red Lake Mining Forum – October 2012
- NWOFNTPC - various meetings 2011-2012

With the release of draft IRRP in August 2013, the OPA hosted a webinar on November 21, 2013 to provide a high-level overview of the plan and to start the dialogue on further developing and refining the plan. An archive of the webinar was posted to the OPA website for stakeholders and communities who were not able to participate.

The OPA also established a dedicated email address – northofdryden@powerauthority.on.ca – to receive written feedback on the draft IRRP and for correspondence about the plan.

# 9 SUMMARY OF RECOMMENDATIONS

The existing North of Dryden sub-region has met its load meeting capability. In order to accommodate the economic connection of remote First Nation communities and to enable forecasted growth in the mining sector, it is prudent to develop and implement the following recommended solutions as soon as possible:

1. Building a new single circuit 230 kV transmission line from the Dryden/Ignace area to Pickle Lake (for the Pickle Lake subsystem) and installing a new 230/115 kV autotransformer, related switching facilities, and the necessary voltage control devices at Pickle Lake;

2. Upgrading the existing 115 kV lines from Dryden to Ear Falls (E4D) and from Ear Falls to Red Lake (E2R) (for the Red Lake subsystem) and install the necessary voltage control devices; and

3. IESO/OPA to initiate discussions with OPG for new reactive power services provided by Manitou Falls GS if it is confirmed to be beneficial to the ratepayer

These recommendations are the most cost-effective options that can be implemented in a timely manner and provide flexibility for meeting a broad range of long term forecast scenarios.

The estimated combined cost of recommendations (1) and (2) during the planning period is about $124 million (net present value). Recommendation (3) may reduce the estimated cost further. Together these projects increase the LMC of the Pickle Lake subsystem from 24 MW to 160 MW, and increase the LMC of the Red Lake subsystem from 61 MW to 130 MW.

Based on the reference scenario forecast, the recommended solutions are expected to satisfy the forecasted demand requirements for the Pickle Lake and Red Lake subsystem until beyond the end of the planning period. The high scenario forecast indicates that additional investments for the Red Lake subsystem may be required by

2030. The transmission and generation options available have relatively short lead times compared to the 2030 need date, based on the high scenario forecast. As a result, no further action needs to be taken at this time.

The OPA has also shown that under all forecast scenarios assessed in this version of the North of Dryden IRRP, transmission supply options to supply the Ring of Fire subsystem are more economic than remote generation options. The OPA therefore recommends that common infrastructure corridor planning to the Ring of Fire should include the consideration of the potential need for a transmission line to ensure economic and regulatory efficiencies. The OPA will monitor developments in the Ring of Fire subsystem to ensure potential customers, stakeholders and Aboriginal groups are aware of these findings.

The OPA will continue to monitor developments in the North of Dryden sub-region, such as: progress on the recommendations in this version of the plan, demand growth, conservation activities, and progress on developments at the Ring of Fire.

As developments in the North of Dryden sub-region reach new milestones, a new planning cycle for the sub-region will be initiated. The next planning cycle will take place within the next 1-5 years, consistent with the TSC, DSC, and the OPA's license, depending on if and when currently uncertain developments take place.

When the long-term needs for the Red Lake and Ring of Fire subsystems become more certain, reinforcement projects can be triggered in the next planning cycle with appropriate lead times to ensure that the needs will be met.

Some projects may require funding by customers, in accordance with the TSC. In these cases the projects cannot proceed until customers have committed the required resources and funding for development work to be completed. Therefore, the timing of these facilities may be dependent on when customers can identify their needs and provide commitment to the project.

Additionally, conservation and distributed generation resources are important contributors to the integrated solution for addressing the needs of the North of Dryden sub-region. The OPA has and will continue to actively work with existing and future customers in the North of Dryden sub-region to pursue conservation and DG. The OPA will continue to work with interested customers to understand the availability of potential resources including conservation and customer based DG in the North of Dryden sub-region.

The recommended solutions in the North of Dryden sub-region are consistent with the broader planning and development work that is underway to ensure an adequate supply is available in the Northwest as a whole.

## 10.3 Study Methodologies

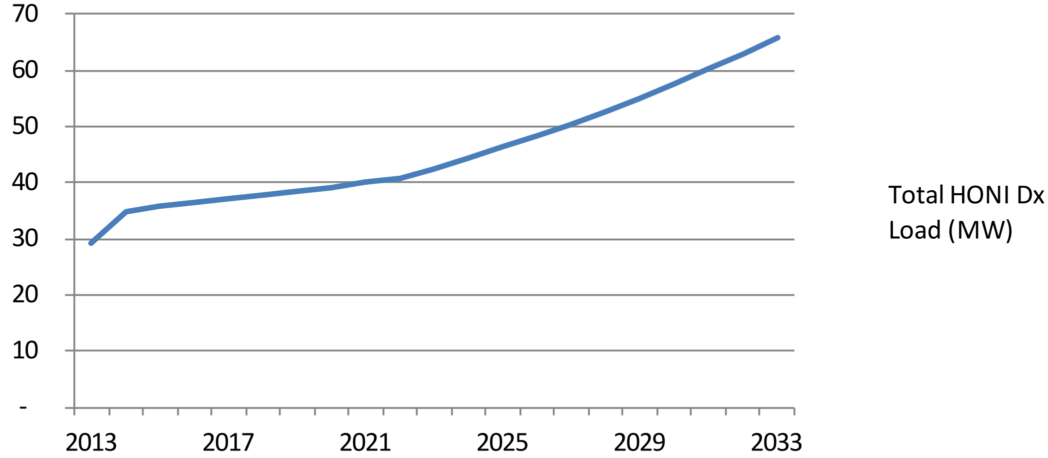
### 10.3.1 Hydro One Distribution - Reference Demand Forecast Methodology

Hydro One Distribution services the North of Dryden sub-region via six step-down stations:

- 115/12.5 kV Perrault Falls DS supplied by circuit E4D
- 115/44 kV Ear Falls TS supplied by 115 kV circuit E4D
- 115/44 kV Red Lake TS supplied by 115 kV circuit E2R
- 115/24.9 kV Cat Lake CTS supplied by 115 kV circuit E1C
- 115/24.9 kV Slate Falls DS supplied by 115 kV circuit E1C
- 115/27.6 kV Crow River DS supplied by 115 kV circuit E1C

The Hydro One reference demand forecast was developed using macro-economic analysis, which takes into account the growth of demographic and economic factors. Thus historical relationships between actual load growth and economic/demographic factors were utilized in preparing the forecast. In addition, local knowledge, as well as information regarding the loading in the area within the next two to three years, is utilized to make minor adjustments to the forecast. The forecast is net of the load impact of conservation so that it is consistent with actual load for the base-year and expected load in the future in a manner consistent with the on-going provincial conservation efforts. It also reflects the expected weather impact on peak load under average peak-time weather conditions, known as weather-normal. Furthermore, the forecast is unbiased such that there is an equal chance of the actual peak load being above or below the forecast.

**Figure 15: North of Dryden sub-region Reference Distribution Demand Forecast (Net of Conservation)**



### 10.3.2 **Methodology for Dependable Renewable Generation Assumptions**

*Determining Dependable Wind and Solar Generation*

For planning purposes, the dependable capacity of generation is the prorated amount of installed generation capacity that can be relied on to meet demand during peak need hours. Since each type of distributed generation exhibits unique behavior, specific capacity contribution assumptions were used for wind and solar to determine the dependable capacity of these resource types in the North of Dryden sub-region.

**Table 53: Capacity Contributions from Wind and Solar**

| Resource Type | Capacity Contribution | Data Source |
|---|---|---|
| Wind | 30% | Wind Profiles from AWS Truepower |
| Solar | 5% | Solar Profiles from AWS Truepower |

The capacity contribution of solar generation depends on both random and predictable elements, such as weather conditions, latitude, and sunrise/sunset times. The capacity contribution of wind generation depends on weather conditions and can vary significantly. To achieve an accurate representation of these resources, hourly solar and wind profiles for the Northwest zone were estimated by AWS Truepower for the years between 2004 and 2008.

The fall period is typically the most constrained supply period for the North of Dryden sub-region as it is when hydroelectric generation in the Ear Falls area is at its lowest. To calculate the expected solar and wind output in the area, hourly capacity factors from the AWS data corresponding to the top 10% of historical demand hours during October and November were averaged. This result provides a dependable level of output that can be reasonably expected from solar and wind resources in the North of Dryden sub-region during the period of peak need.

### *Determining Dependable Hydroelectric Generation*

The hydroelectric generators located in the North of Dryden sub-region are listed below in Table 54. Lac Seul GS is an expansion of the Ear Falls GS that was undertaken by OPG with the Lac Seul First Nation.

**Table 54: Existing and Contracted Hydroelectric Generation**

| Name | Owner | No. Unit (Total) | Unit Size (MW) | Circuit |
|---|---|---|---|---|
| Manitou Falls GS | Ontario Power Generation | 5 | 4x14.9 + 1x13.5 | M3E |
| Ear Falls GS | Ontario Power Generation | 4 | 2x5.4 + 2x3.1 | Ear Falls TS bus |
| Lac Seul GS | Ontario Power Generation | 1 | 12.1 | Ear Falls TS bus |
| Trout Lake River GS | Horizon Hydro Inc. | 1 | 3.75 | E1C |

Northern hydroelectric generation is an energy limited resource known to have significantly reduced output and availability during drought conditions of the river system supplying these generating units. Neither Manitou Falls nor Ear Falls/Lac Seul are currently configured to condense. The OPA has met with OPG and are aware that configuring some select units for condense mode under drought conditions may be a low cost option to provide voltage support.

Dependable generation is defined in ORTAC as the level of generation that is available for at least 98% of hours during the evaluation period. At Manitou Falls GS, output has been at least 14.4 MW 98% of the time, while at Ear Falls GS output has been at least 6.7 MW, 98% of the time.

At Manitou Falls GS, four of the five units are connected on the secondary of one step up transformer (T1), with the fifth unit having its own transformer (T2). Because of this configuration, if T1 is unavailable, only one Manitou Falls GS unit (G5) can remain operational during the duration of the outage of T1.

The units at Manitou Falls GS units are also much larger (13.5 MW and 14.9 MW) than the Ear Falls GS units (3.1 MW and 5.4 MW), therefore the presence of one additional Ear Falls GS unit (assuming sufficient water is available during the outage of Manitou Falls T1) does not significantly improve the transfer limits in the subsystem. The single Lac Seul unit is of a similar size to the Manitou Falls GS units and its operation does significantly improve the transfer capability of the Red Lake subsystem, when it is available.

However, the performance of the Lac Seul unit and the future Trout Lake River GS during drought conditions is not yet known. Until drought condition performance is determined at these units they are assumed to be unavailable during drought conditions. The dependable generation assumptions for hydroelectric units in the Ear Falls area that have been used in this plan are summarized in Table 55.

**Table 55: Existing and Contracted Hydroelectric Generation**

| Name | No. Units (Total) | Unit Size (MW) | Dependable Output (MW) |
|---|---|---|---|
| Manitou Falls GS | 5 | 4x14.9 + 1x13.5 | 14.4 |
| Ear Falls GS | 4 | 2x5.4 + 2x3.1 | 6.7 |
| Lac Seul GS | 1 | 12.1 | 0 |
| Trout Lake River GS | 1 | 3.75 | 0 |

### *High Level Cost Assessment of Renewable Generation*

The seasonal and annual variations of run of river hydroelectric generation and the intermittent output of potential wind and solar resources in the North of Dryden sub-region lead to dependable capacities for these resources that are between 5% and 30% of their nameplate capacity, as described above. If these types of resources were used to meet capacity needs for the North of Dryden sub-region, then their dependable capacity would be used to assess their contribution to meeting peak demand. To be an alternative to other generation resources or transmission reinforcements, the nameplate capacity of these renewable resources would have to be built to a level substantially greater than the capacity required for the subsystem. Furthermore, because of this over-sizing, during times of high renewable output, these resources may be partially constrained by limited existing transmission capability connecting them to the rest of the Ontario system.

Developing these resources to serve capacity needs would require between 3 MW and 20 MW of nameplate capacity to dependably supply 1 MW of load.

It is estimated that the capital cost of dependable run of river hydroelectric capacity ranges from $15 million to $65 million per MW, while wind and solar range from $15 million to $100 million per MW. The curtailment of generation would have an associated cost, or alternatively, new implementation of transmission to deliver excess energy would also have societal costs and is an alternative to renewable generation for meeting the needs of the North of Dryden sub-region. Neither of these additional costs were considered in this high level cost analysis. A summary of the results of this cost analysis is in Table 56, below.

**Table 56: Summary of Renewable Generation Options**

| Resource Type | Firm Capacity | Capital Cost per MW of Firm Capacity | Levelized Unit Energy Cost[76] | Development Duration |
|---|---|---|---|---|
| Hydroelectric (Run of River) | 15-30% | $16 M - $66 M /MW | $60-$110/MWh | 5 to 10 Years |
| Intermittent Renewables | 5-28% | $7.5 M - $100M /MW | $80-$400/MWh | 3 Years |

## 10.4 Technical Studies and Analysis Methodologies

The following section outlines the assumptions and methodology used for performing the technical analysis for determining the load meeting capability of the existing system, and the options being considered. The load meeting capability for options being considered are mostly limited by acceptable voltage performances. Consequently, a significant portion of the costs for options being considered is for the installation of voltage control devices. When developing cost estimates, planning level unit costs were used, which typically have an accuracy of +/-50%.

### 10.4.1 Base Case Setup and Assumptions

The system studies for this plan were conducted using PSS/E Power System Simulation software. The reference PSS/E case was adapted from the base case that was produced by the IESO for the 2012 North of Dryden Feasibility Study.

*Bulk System Assumptions*

The North of Dryden sub-region is connected to the bulk transmission system at Dryden TS. The forecasted capacity requirements for the North of Dryden sub-region are coordinated with the West of Thunder Bay IRRP. Therefore, for the purpose of this assessment, it is assumed that the bulk system supply to the North of Dryden sub-

[76] Levelized Unit Energy Cost (LUEC) is a method to compare electricity system resources on a $/MWh basis, considering the costs incurred (capital, fixed, variable, fuel, etc.) and the production of energy over the lifetime of the resource, discounted appropriately. LUEC assumes that all energy generated can be delivered without transmission constraints.
.

region will be stable. A healthy supply voltage from the bulk 230 kV (nominal) system of 245 kV has been assumed.

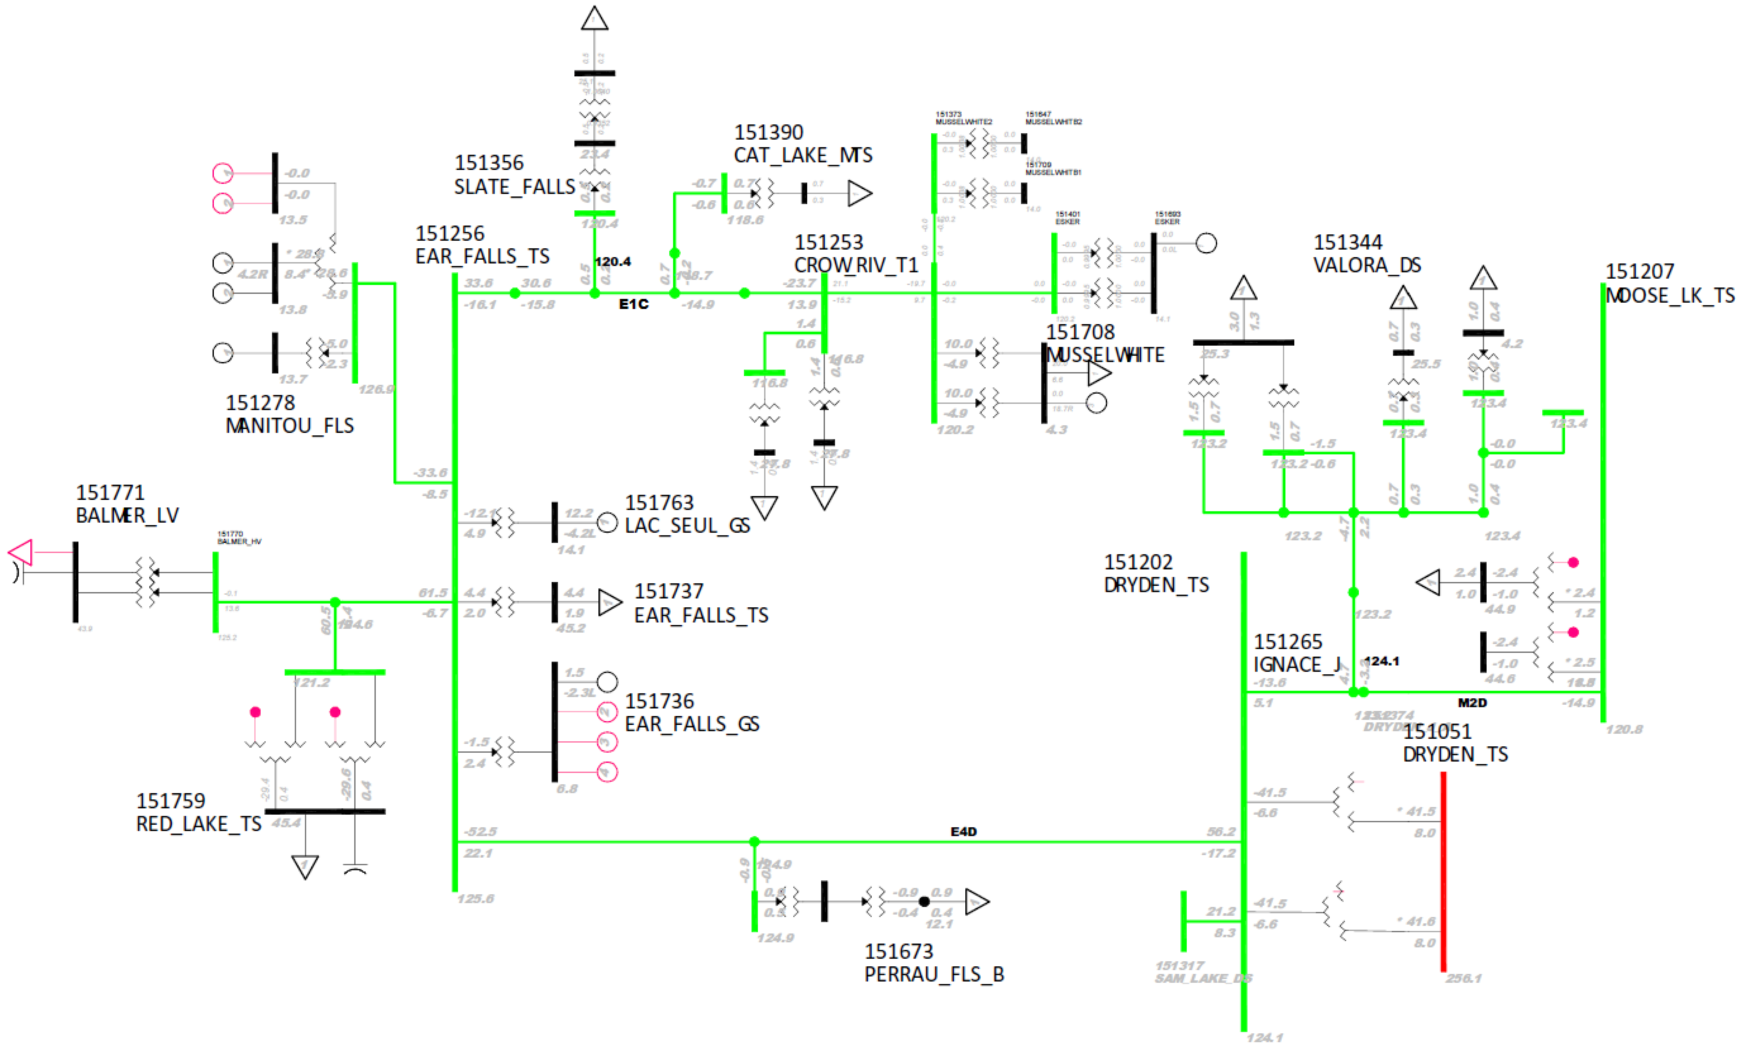
### *Local Area Assumptions*

These load flow cases include the following assumptions:

- Dependable (drought) level hydroelectric generation, which totals 21.1 MW in the Ear Falls area (Manitou Falls GS (14.4 MW), Ear Falls GS (6.7 MW))
- Summer ambient temperature of 30°C and 0-4 km/hr wind for ampacity of overhead transmission circuits
- Peak forecasted load corresponding to the reference, high, and low scenarios for the near term and medium to long term
- All proposed 115 kV circuits had line characteristics equivalent to that of a 477 kcmil ACSR conductor (similar to existing M2D), and all proposed 230 kV circuits had line characteristics equivalent to that of a 795 kcmil ACSR conductor (similar to existing circuit D26A)
- The 115 kV step-down transformers at Mc Faulds (Ring of Fire mines) were assumed to be similar to the existing transformers at Red Lake TS. Other 115 kV step-down transformers were assumed to be similar to the existing transformers at Crow River DS for loads greater than 3 MVA, or the Slate Falls transformer for loads smaller than 3 MVA. The Pickle Lake 230/115 kV autotransformer was assumed to be similar to the existing Lakehead autotransformers.
- Dependable capacity at Trout Lake River GS is assumed to be 0 MW
- 5% of installed solar capacity is assumed to be dependable. This includes four microFIT projects in Red Lake providing capacity of 39.3 kW and one microFIT project in Ear Falls with an capacity of 10 kW, providing a 2.5 kW of dependable output
- For steady state and voltage assessment, the loads are modeled as constant megavolt-ampere (MVA)
- All new voltage control devices are assumed to be Static Var Compensation (SVC) devices

- It was assumed that the loss of voltage control devices connected at load stations (McFaulds, Esker, Musselwhite, Red Lake, Balmer, Sandy Lake, Pickle Lake area Mine) would also result in the loss of the associated load.

**Figure 16: North of Dryden 2012 Peak Load Flow Case**



130

### 10.4.2 **Application of IESO Planning Criteria**

In Ontario, the criteria for planning the transmission system are specified in the IESO's Ontario Resource and Transmission Assessment Criteria (ORTAC)[77]. In accordance with ORTAC, the transmission system supplying a local area shall have sufficient capability under peak demand conditions to withstand specific outages prescribed by ORTAC while keeping voltages, line and equipment loading within applicable limits. In determining the load meeting capability for each subsystem, ORTAC requires certain conditions to be respected. The supply options that are discussed for the North of Dryden sub-region assume that where new lines are built parallel to existing lines, some or all of the incremental load that is enabled for connection to the system, may be curtailed in the event of a forced outage of either line. This following is an excerpt from Section 7.1 of ORTAC which states:

> "The *transmission system* must be planned to satisfy *demand* levels up to the extreme weather, median-economic forecast for an extended period with any one transmission element out of service. The *transmission system* must exhibit acceptable performance, as described below, following the design criteria contingencies defined in sections 2.7.1 and 2.7.2. For the purposes of this section, an element is comprised of a single zone of protection.
>
> With all transmission *facilities* in service, equipment loading must be within continuous ratings, voltages must be within normal ranges and transfers must be within applicable normal condition stability limits. This must be satisfied coincident with an outage to the largest local generation unit.
>
> With any one element out of service3, equipment loading must be within applicable long-term *emergency* ratings, voltages must be within applicable *emergency* ranges, and transfers must be within applicable normal condition stability limits. Planned load *curtailment* or load rejection, excluding voluntary *demand* management, is permissible only to account for local generation outages. Not more than 150MW of load may be interrupted by configuration and by planned load *curtailment* or load rejection, excluding voluntary *demand* management. The 150MW load interruption limit reflects past planning practices in Ontario."

Additionally, the following were assumed in this study to comply with ORTAC:

- Run of river hydroelectric generation should be assumed at a level that is available 98% of the time (ORTAC Section 2.6);

---

[77] http://www.ieso.ca/imoweb/pubs/marketadmin/imo_req_0041_transmissionassessmentcriteria.pdf

- Load power factors is assumed to be 0.95 at the low voltage busbar to comply with the Market Rule of 0.9 at the defined meter point at the HV busbar (ORTAC Section 2.4);
- Voltage operating range of 113 kV to 132 kV for the 115 kV nominal system, and 220 kV to 250 kV for the 230 kV nominal system (ORTAC Section 2.4);
- Pre-contingency voltage maintained to the greater of (ORTAC Section 4.2):
    - At least 10% margin above the instability point
    - Minimum continuous voltage pre-contingency: 113 kV for 115 kV nominal system, and 220 kV for 230 kV nominal system
    - That which results in a post-contingency voltage of at least 108 kV for 115 kV nominal system, and 207 kV for 230 kV nominal system
- All line and equipment loading is within the continuous ratings with all elements in service and within their long-term emergency ratings with any one element out of service (ORTAC Section 4.7.2 and 7.1); and
- If the subsystem has transmission connected generation, the largest generator unit is assumed to be on outage pre-contingency and not available post-contingency.

The load meeting capability for each subsystem and each option are determined with the aid of PSS/E simulation, which represents a full model of the system, accounting for active and reactive power flows, losses, voltage drops, etc.

**Table 57: Conditions for Determining Subsystem LMC**

| Local Area Supply | Conditions for LMC |
|---|---|
| Single Radial Line | Limit of the line during normal operating conditions. |
| Single Radial Line + Local Generation | Limit of the line during normal conditions; and<br>Loss of the largest generating unit. |

### 10.4.3 Technical Study Procedures

Once the needs for the subsystems were determined based on an assessment of the existing system and forecast net demand growth, the technical study identified how various options could meet the identified needs. From these needs, a range of generation and transmission options were developed that are capable of partially or fully meeting the identified needs. The capability of the options to serve the needs including the amount of voltage control required to meet the required LMC was determined.

#### *Contingencies Considered in Option Assessment*

A detailed list of the contingencies considered for the North of Dryden sub-region is outlined below in Table 58. All contingencies are limited to the loss of a single element (N-1) considering pre-contingency outage conditions consistent with ORTAC.

**Table 58: Contingencies Considered in the Technical Study**

| Subsystem | Supply Option | Contingencies |
|---|---|---|
| Pickle Lake | CNG generation at Pickle Lake | Loss of single generating unit (10 MW) at Pickle Lake |
| | | Loss of Manitou Falls GS |
| | New Line to Pickle Lake | N/A |
| Red Lake | NG generation at Red Lake | Loss of single generating unit (10 MW) at Red Lake |
| | | Loss of Manitou Falls GS |
| | New Line to Ear Falls | Loss of New Line |
| | | Loss of Manitou Falls GS |
| Ring of Fire | All | N/A |

#### *Determining Voltage Control Requirements*

For each option in each subsystem, base cases were developed for both peak and light load conditions. Each subsystem was considered independently, and the effects of each option on the bulk system around Dryden TS and/or at Marathon TS were included.

Location and size of the voltage control devices for each test case was determined under the following load scenarios to satisfy the assumptions listed above.

1. Peak load conditions, all elements in service: This test determined the voltage control devices are required to ensure sufficient margin from the voltage collapse point. Voltage control devices were used to maintain the voltage within the ranges stated in the assumptions.

2. Zero load conditions: This test determined the amount of voltage control required to manage high voltages.

3. Light load conditions, all elements in service: This test was used to determine the required switching size and range of the voltage control devices.

4. Peak load conditions, largest local element out of service: In areas where contingencies were tested, voltage control device requirements before tap changing were determined.

### *Determining Load Meeting Capability of Options*

This study uses the base cases that were developed for the peak load scenario in determining voltage control requirements, as stated above. For each subsystem, the LMC of the option following the installation of all facilities and voltage control devices that are required to meet the peak load forecast was determined for each option for each forecast scenario.

The LMCs for each option were determined using the following procedure:

1. The range of voltage control that was determined in the previous analysis was assumed to be available.

2. Peak load was assumed as a base. Thermal loading of transmission equipment was assessed.

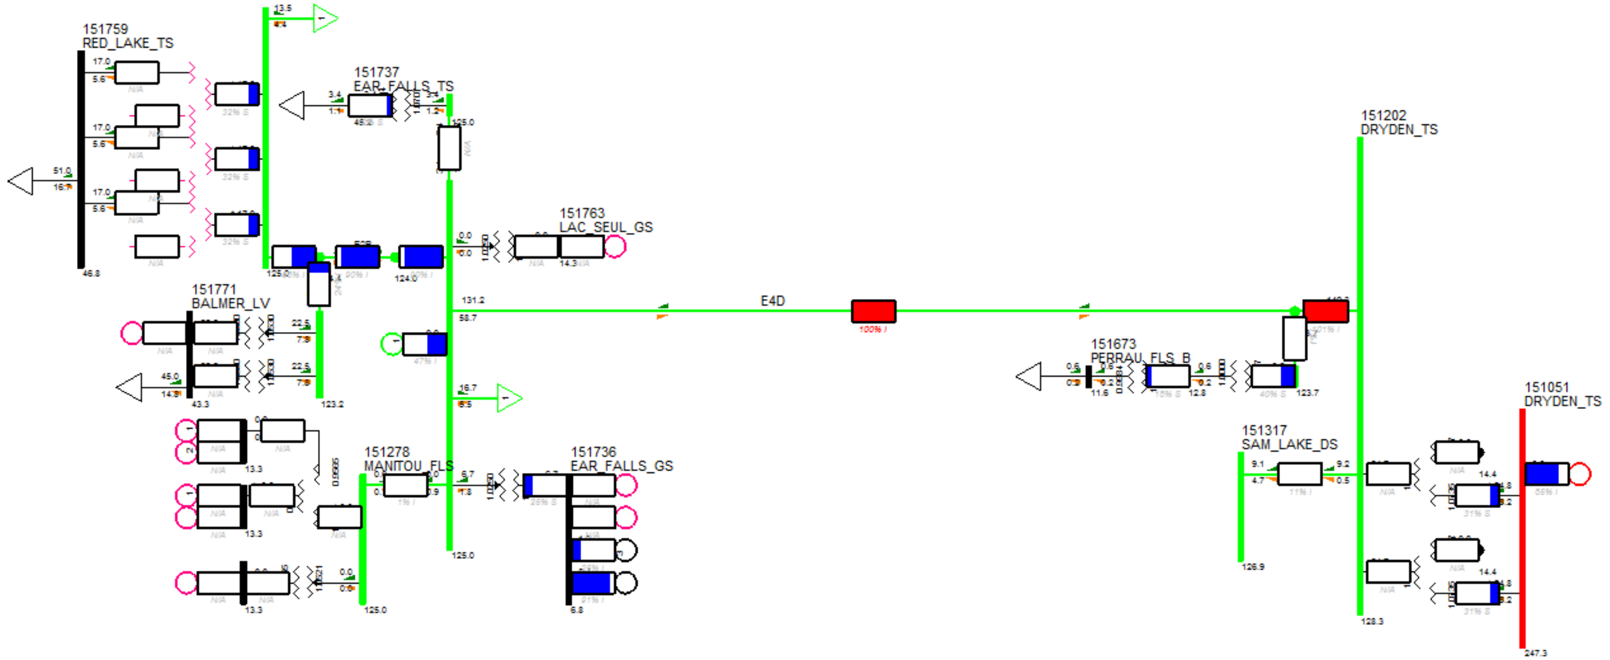
3. Where there was existing thermal capacity on transmission equipment, load was increased and new voltage control requirements were established, to determine the LMC. Load was increased at a central system bus within the subsystem (Pickle Lake area TS for the Pickle Lake subsystem, Ear Falls TS for the Red Lake subsystem, Mc Faulds TS for the Ring of Fire subsystem).

4. Following this, the system was tested allowing voltage control requirements to increase within reasonable limits.

More detailed studies for particular reinforcements may determine that voltage control devices can be located in alternative places closer to large loads, which may be found to optimize their value and reduce the overall cost. Specific connection requirements for individual customers, including requirements for additional voltage control devices will be identified by the IESO in future System Impact Assessments (“SIA”).

A sample load flow case that was used to determine the LMC of the Red Lake subsystem after the upgrade of E4D and E2R is provided in Figure 17 below. In this case, the LMC for subsystem is 130 MW.

**Figure 17: Sample of Methodology – Determining Post-Upgrade LMC of E4D and E2R Upgrade**

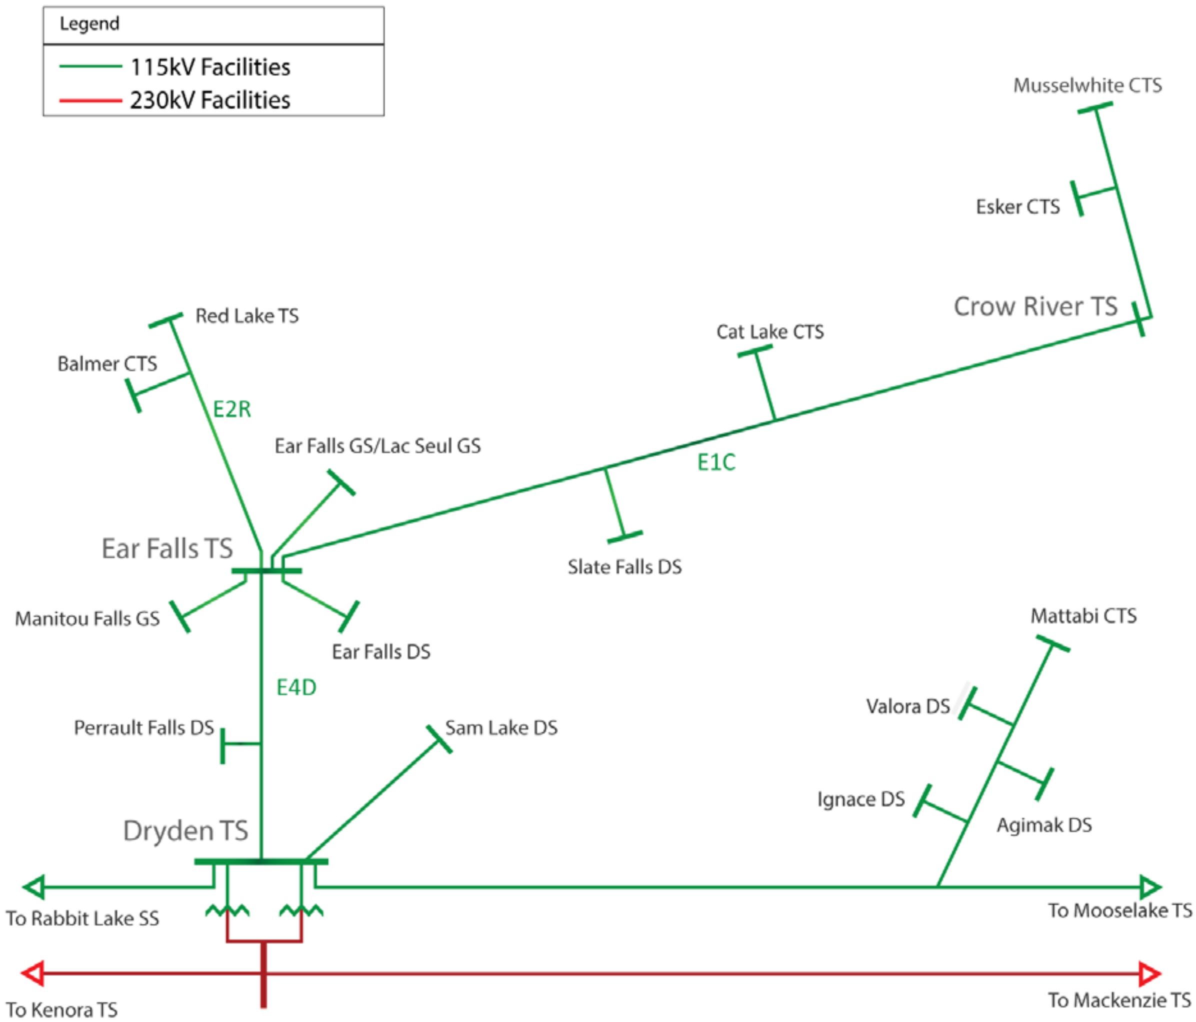


136

## 10.5 Existing System Description and Load Meeting Capability

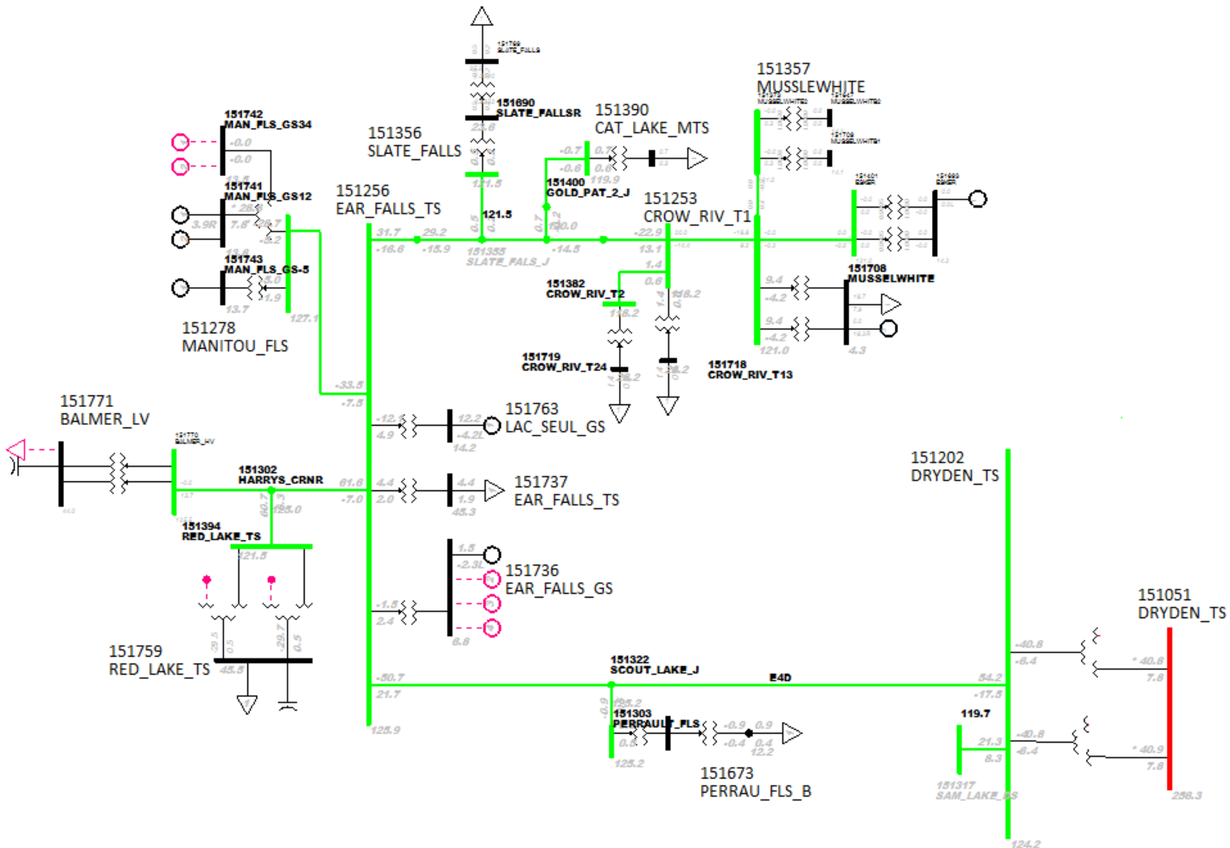
The North of Dryden electricity system is shown in Figure 18.

**Figure 18: Existing North of Dryden Transmission System**



137

**Figure 19: Existing North of Dryden Transmission System Load Flow Plot**



## *Pickle Lake Subsystem*

The Pickle Lake subsystem includes all load currently and planned to be served by E1C at Cat Lake CTS, Slate Falls DS, Crow River DS, as well as Musselwhite mine. The Pickle Lake subsystem also includes 10 remote communities north of Pickle Lake that are planned to connect to Pickle Lake via a transmission line to Crow River DS.

Currently, the Pickle Lake subsystem has an LMC of 24 MW. Due to losses on the line E1C, supply of close to 35 MW is required from Ear Falls TS to serve this load along the line and at Pickle Lake. The LMC for the Pickle Lake subsystem is determined by the load that can be met during normal operating conditions.

### *Red Lake Subsystem*

The Red Lake subsystem includes all load and generation connected and planned to be served by E4D and E2R, at Perrault Falls DS, Ear Falls TS, Red Lake TS, Balmer CTS, and the six remote communities that lie north of Red Lake that are planned to connect to Red Lake TS. There is 102.2 MW of hydroelectric generation at Ear Falls/Lac Seul GS and at Manitou Falls GS.

Currently, the E4D and Ear Falls area generation is capable of supplying 85 MW from Ear Falls TS, which includes 61 MW in the Red Lake subsystem and 24 MW in the Pickle Lake subsystem.

### *Ring of Fire Subsystem*

The Ring of Fire subsystem includes five remote communities that are planned for connection to the provincial transmission system as well as potential future industrial customers at the Ring of Fire. This subsystem may be connected to the provincial transmission system either at Pickle Lake, Marathon TS, or east of Nipigon.

The Ring of Fire subsystem is not currently supplied from the IESO-controlled grid and thus has a load meeting capability of 0 MW. However the 5 remote communities are currently served by local diesel generation in their communities.

## 10.6 Analysis of Recommended Options

As indicated in Section 0, the recommended options for the North of Dryden sub-region are:

1. Building a new single circuit 230 kV transmission line from the Dryden/Ignace area to Pickle Lake (for the Pickle Lake subsystem) and installing a new 230/115 kV autotransformer, related switching facilities, and the necessary voltage control devices at Pickle Lake;

2. Upgrading the existing 115 kV lines from Dryden to Ear Falls (E4D) and from Ear Falls to Red Lake (E2R) (for the Red Lake subsystem) and install the necessary voltage control devices; and

3. IESO/OPA to initiate discussions with OPG for new reactive power services provided by Manitou Falls GS if it is confirmed to be beneficial to the ratepayer

   For the list of assumptions and procedure pertaining to the assessment of generation options, refer to Section 10.7. For a list of assumptions and procedure pertaining in the assessment of transmission options, refer to Section 10.8

### *Recommendation 1: New single circuit 230 kV line to Pickle Lake and supporting facilities*

The following table outlines the load meeting capability provided by the option and the long-term forecasted load.

**Table 59: Summary of Load Meeting Capability of Recommendation**

| Recommendation | Incremental Capacity | Load Meeting Capability | Low Forecast Demand | Reference Forecast Demand | High Forecast Demand |
|---|---|---|---|---|---|
| 230 kV line to Pickle Lake | 136 MW | 160 MW | 48 MW | 78 MW (100 MW) | 90 MW (156 MW) |

Table 60 outlines the cash flows used for the net present value economic analysis. Figure 20 and Figure 21 illustrate the single line diagram of the option and the power flow simulation for the reference scenario.

**Table 60: Summary of Cashflow for New Line to Pickle Lake at 230 kV**[78]

**Figure 22: E4D and E2R Upgrade Diagram**

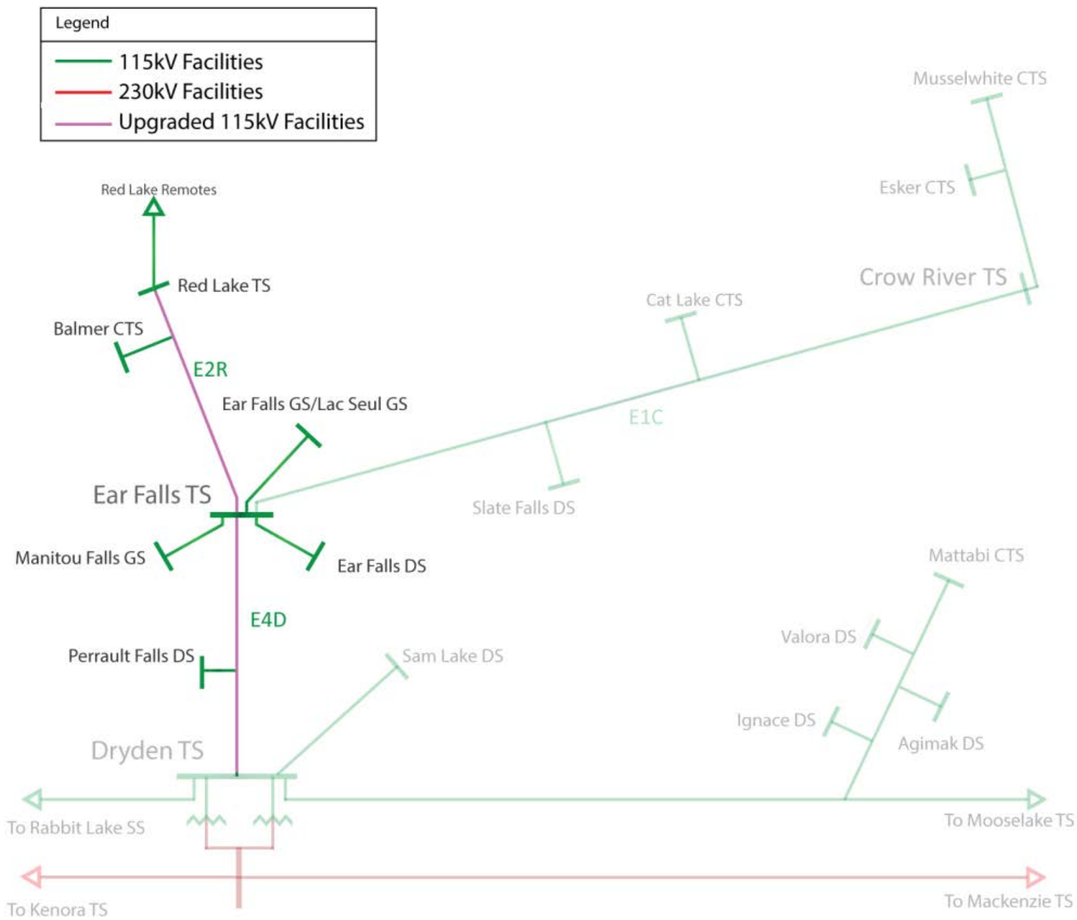

**Figure 23: E4D and E2R Upgrade Red Lake Subsystem Configuration**

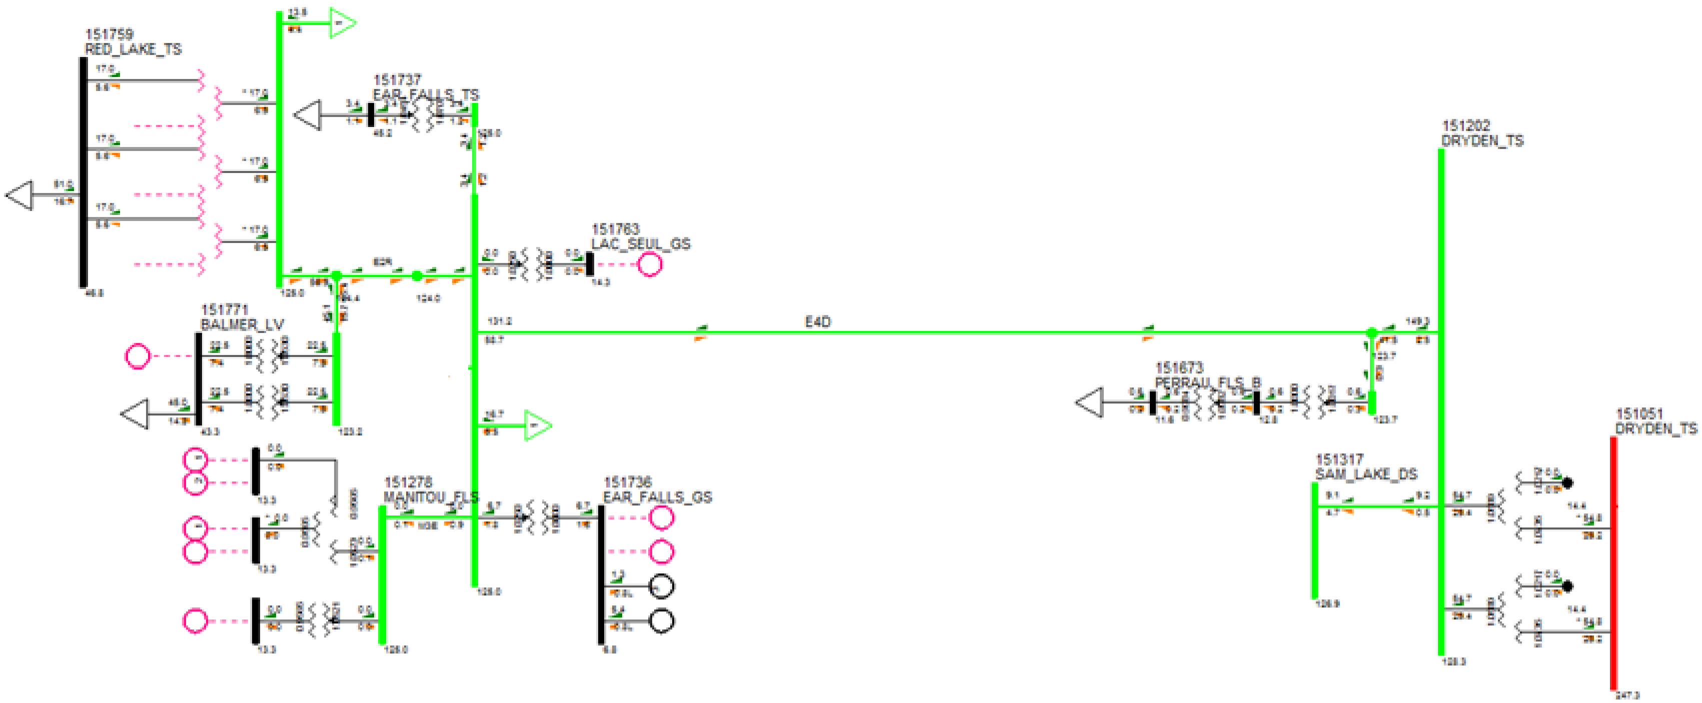

*Recommendation 3: Manitou Falls condense operation during drought conditions*

In order to accommodate future growth in the Red Lake subsystem, new voltage control devices would need to be installed in the Ear Falls and Red Lake areas. New voltage control devices would be required in order to release the thermal capability provided to the Red Lake subsystem from the system upgrades being recommended.

OPG has informed the OPA that Manitou Falls units G1, G2, and G3 could be made to condense with minor maintenance work. Units G1, G2, and G3 would have a capability of approximately +/-14 MVar each, for a total of +/- 42 MVar. The OPA anticipates that the NPV cost associated with enabling and operating the condense features over the planning period is likely to be significantly less than the NPV cost of installing new voltage control devices.

## 10.7 Generation Options

For each of the three subsystems, at least one generation option was studied in detail. However, due to the different nature of each system, and thus the differing needs, each system was approached with a unique methodology to ensure that the generation option/s studied reflect the need of the subsystem.

The assumptions and methodologies used for developing the generation options are described below.

### 10.7.1 Pickle Lake Subsystem

*Assumptions*

The following assumptions were used to estimate the cost of CNG electricity generation in the Pickle Lake subsystem:

- Pickle Lake subsystem will remain connected to Ear Falls TS and 24 MW of load in the Pickle Lake subsystem will be served from Ear Falls TS

- Forecasted demand greater than 24 MW in the Pickle Lake subsystem (including remote communities in the Ring of Fire subsystem connecting at Pickle Lake) would be served by CNG fueled generation at Pickle Lake
- Generators will be dual fuel CNG/Diesel reciprocating engines. Engines will be capable of running predominantly on CNG, but can run on pure diesel as needed
- Generation would be fueled mainly by CNG, which would be compressed and transported from TCPL pipeline in the Ignace area via Highway 599
- Decanting stations would be required to decompress the natural gas for use
- CNG fuel delivery would be on a just in time basis due to challenges with large scale on-site CNG storage
- If CNG is unavailable generators will run on diesel, cost of supplying diesel and storage has not been included
- A sufficient number of trailers would be required to transport CNG as well as provide for some limited on-site storage to ensure a stable flow of fuel
- A Special Protection System triggered by the loss of more than one generator in the new facility, may be required to automatically shed load sufficient to maintain operation of E1C within appropriate limits
- Discrete generator unit sizes of 9.5 MW

### *Study Procedure*

To determine the feasibility and estimate the cost of implementing a CNG generation facility in the Pickle Lake subsystem, the following procedure was undertaken:

1. Load flow assessment in PSS/E (provided in this Section) was done to find the installed generation capacity at Pickle Lake that would be required to meet the peak forecast demand of the subsystem.
2. Using established transmission limits, hydroelectric generation profiles and load profiles for the subsystem, the capacity and energy that would need to be served by new CNG generation resources was estimated.
3. Using energy requirements estimate number of trucks and trailers (size of fleet) required to transport fuel based on a) trailer volume assumptions, b) fuel requirements and c) one day round trip;

4. Using generator capacity, number of trailers and annual energy requirements, capital, operations and maintenance, and fuel costs of the system were calculated.
5. These capital, operations and maintenance costs, were levelized over the project life and the present value over the planning period (2013-2033) was calculated.

### *Planning Level Assessment*

A summary of the technical capability of the generation options that were considered for the Pickle Lake subsystem is summarized below.

**Table 63: Summary of Capacity for Gas Generation at Pickle Lake**

| Option | Incremental Capacity | Load Meeting Capability | Low Forecast Demand | Reference Forecast Demand | High Forecast Demand |
|---|---|---|---|---|---|
| CNG Generation at Pickle Lake (38 MW) | 19 MW | 43 MW | 41 MW | 78 MW | 90 MW |
| CNG Generation at Pickle Lake (47.5 MW) | 23.5 MW | 47.5 MW | | | |
| CNG Generation at Pickle Lake (76 MW) | 57 MW | 81 MW | | | |
| CNG Generation at Pickle Lake (85.5 MW) | 66.5 MW | 90.5 MW | | | |

*Requires continued supply of 24 MW of load via E1C from Ear Falls

**Includes demand for Ring of Fire remote communities (7 MW)

The cost of supplying the growth needs of the Pickle Lake subsystem with CNG fueled generation are shown in Table 64 through Table 69. Figure 24 shows operation of the Pickle Lake subsystem with this option in the peak load case. Voltage profiles throughout the subsystem remain healthy in the general range of 118 kV to 125 kV. The installation of generation at Pickle Lake also provides some voltage control to the Pickle Lake subsystem.

150

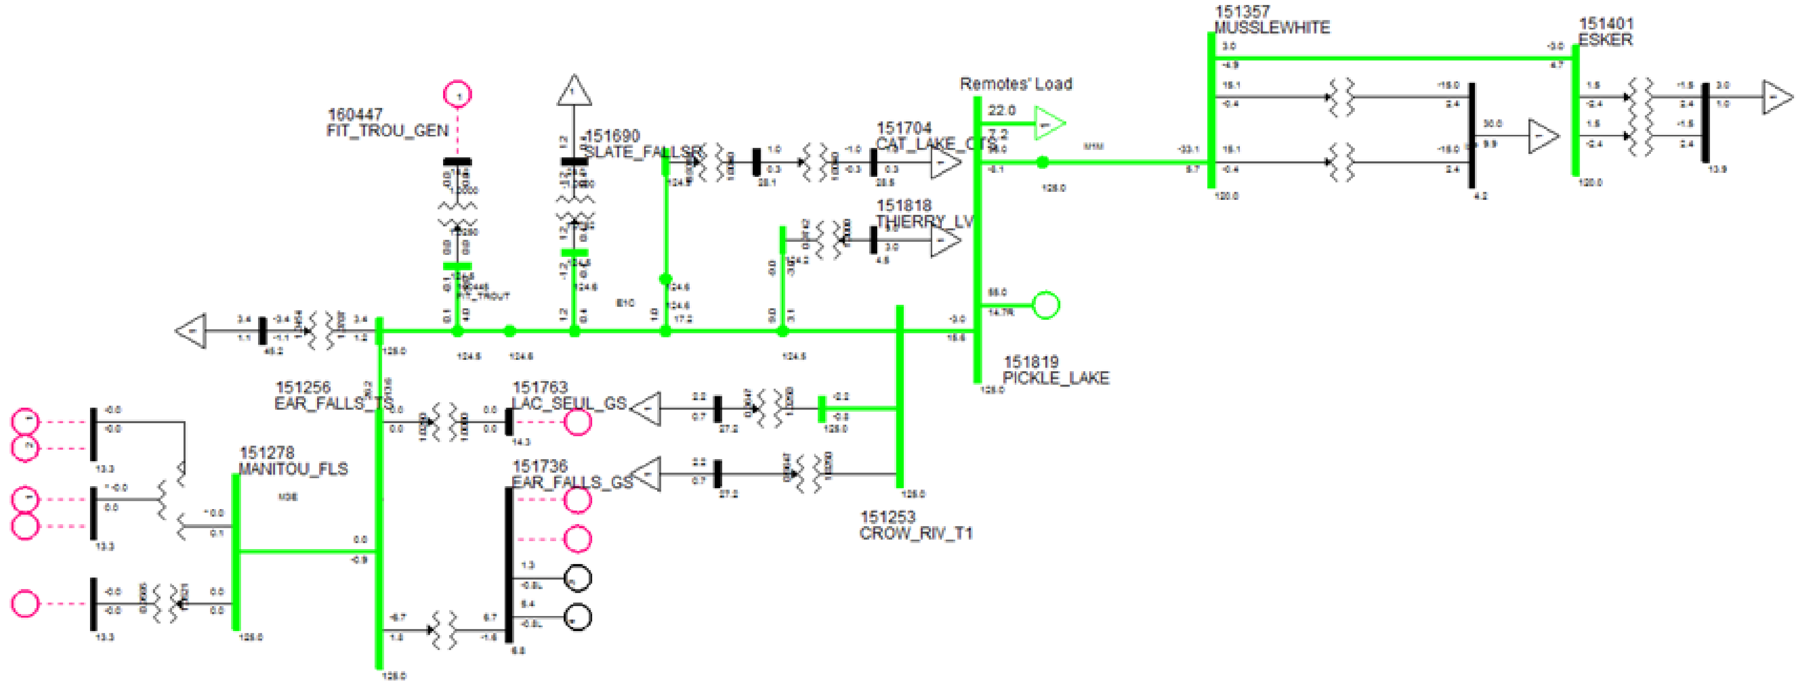
**Figure 24: Generation Option Pickle Lake Subsystem Configuration**



### 10.7.2 **Red Lake Subsystem Generation Options**

#### *Assumptions*

The following assumptions were used to estimate the cost of natural gas electricity generation in the Red Lake subsystem:

- Natural gas would be supplied via the existing Union Gas pipeline in the Red Lake area for 30 MW generation (near-term) option;
- Natural gas would be supplied via the existing Union Gas pipeline in the Red Lake area and a new gas pipeline to future customer(s) for the 60 MW (long-term) option;
- Pipelines are assumed to be available and associated costs are not included in this analysis (except gas management charges). New pipeline capacity required for the second 30 MW of gas generation at Ear Falls is assumed to be linked to a future potential load customer, therefore if the incremental gas capacity is not developed neither will the load be present in the subsystem; and
- Discrete generator unit sizes of 9.5 MW.

#### *Study Procedure*

To estimate the cost of implementing natural gas generation in the Red Lake subsystem, the following procedure was taken:

1. Load flow assessment in PSS/E (provided in this Section) was done to find the installed generation capacity required to meet the need of the Red Lake subsystem;
2. Using established transmission limits, hydroelectric generation profiles and the identified need for the subsystem, determine the capacity and energy that new generation resources would need to served;
3. Using established unit costs, capital, operations and maintenance, and fuel costs of the new generation resources were calculated;
4. Using capacity size, gas management charges for a peaking facility in the area were estimated; and
5. These capital, operations and maintenance costs, were levelized over the project life and the present value over the planning period (2014-2033) was calculated.

### *Planning Assessment of Near-Term Option*

Table 70 summarizes the incremental capacity provided by this option as well as the total LMC of the Red Lake subsystem with this option, while Table 71 summarizes the cost of the option in the Red Lake subsystem.

**Table 70: Capacity and LMC Summary for Generation Options at Red Lake**

| Option | Incremental Capacity | Load Meeting Capability | Low Forecast Near-term Demand | Reference Forecast Near-term Demand | High Forecast Near-term Demand |
|---|---|---|---|---|---|
| NG Generation at Ear Falls (30 MW) | 30 MW | 91 MW | 91 MW | 91 MW | 91 MW |

Figure 25 illustrates the system state of the Red Lake subsystem with this option.

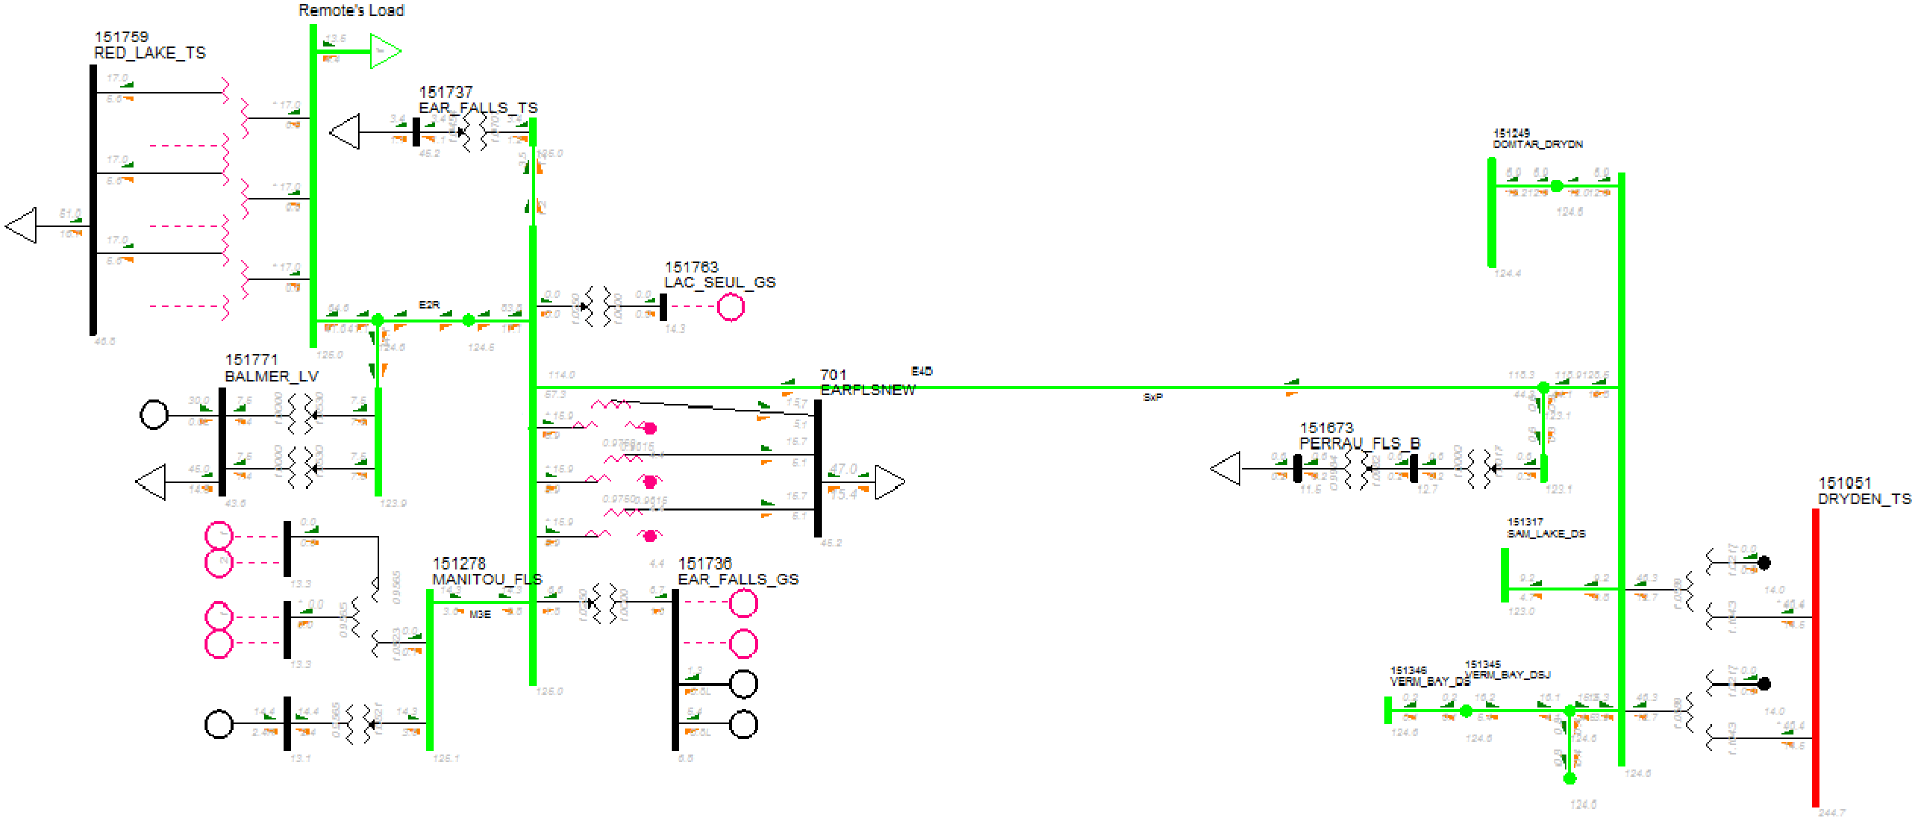
## Figure 25: 30 MW Generation Option Red Lake Subsystem Configuration



157

Given the existing opportunity for 30 MW of gas generation at Red Lake, a second gas generator at Ear Falls could be sized to serve the remaining capacity needs of the Red Lake subsystem. With a total of 60 MW of gas generation in the Red Lake subsystem, the LMC of the subsystem would increase by 60 MW to 190 MW (assuming all Pickle Lake subsystem load on E1C is transferred to the new line to Pickle Lake). Table 73 summarizes the capacity provided by a single 30 MW facility at Red Lake as well as two facilities in the subsystem.

**Table 73: Summary of Incremental Capacity and LMC**

| Option | Incremental Capacity | Load Meeting Capability* | Low Forecast Long-term Demand | Reference Forecast Long-term Demand | High Forecast Long-term Demand |
|---|---|---|---|---|---|
| NG Generation at Ear Falls (30 MW) | 30 MW | 160 MW | 100 MW | 109 MW | 136 MW |
| NG Generation at Ear Falls (60 MW) | 60 MW | 190 MW | | | |

*Includes the capability of E4D and E2R after upgrading

Figure 25 and Figure 26, show the state of the Red Lake subsystem with each of these options implemented, while Table 74 to Table 77, provide a detailed summary of the costs for each option. The generators at Red Lake and/or Ear Falls help to maintain the voltages at those buses to a healthy range of 120 kV to 125 kV.

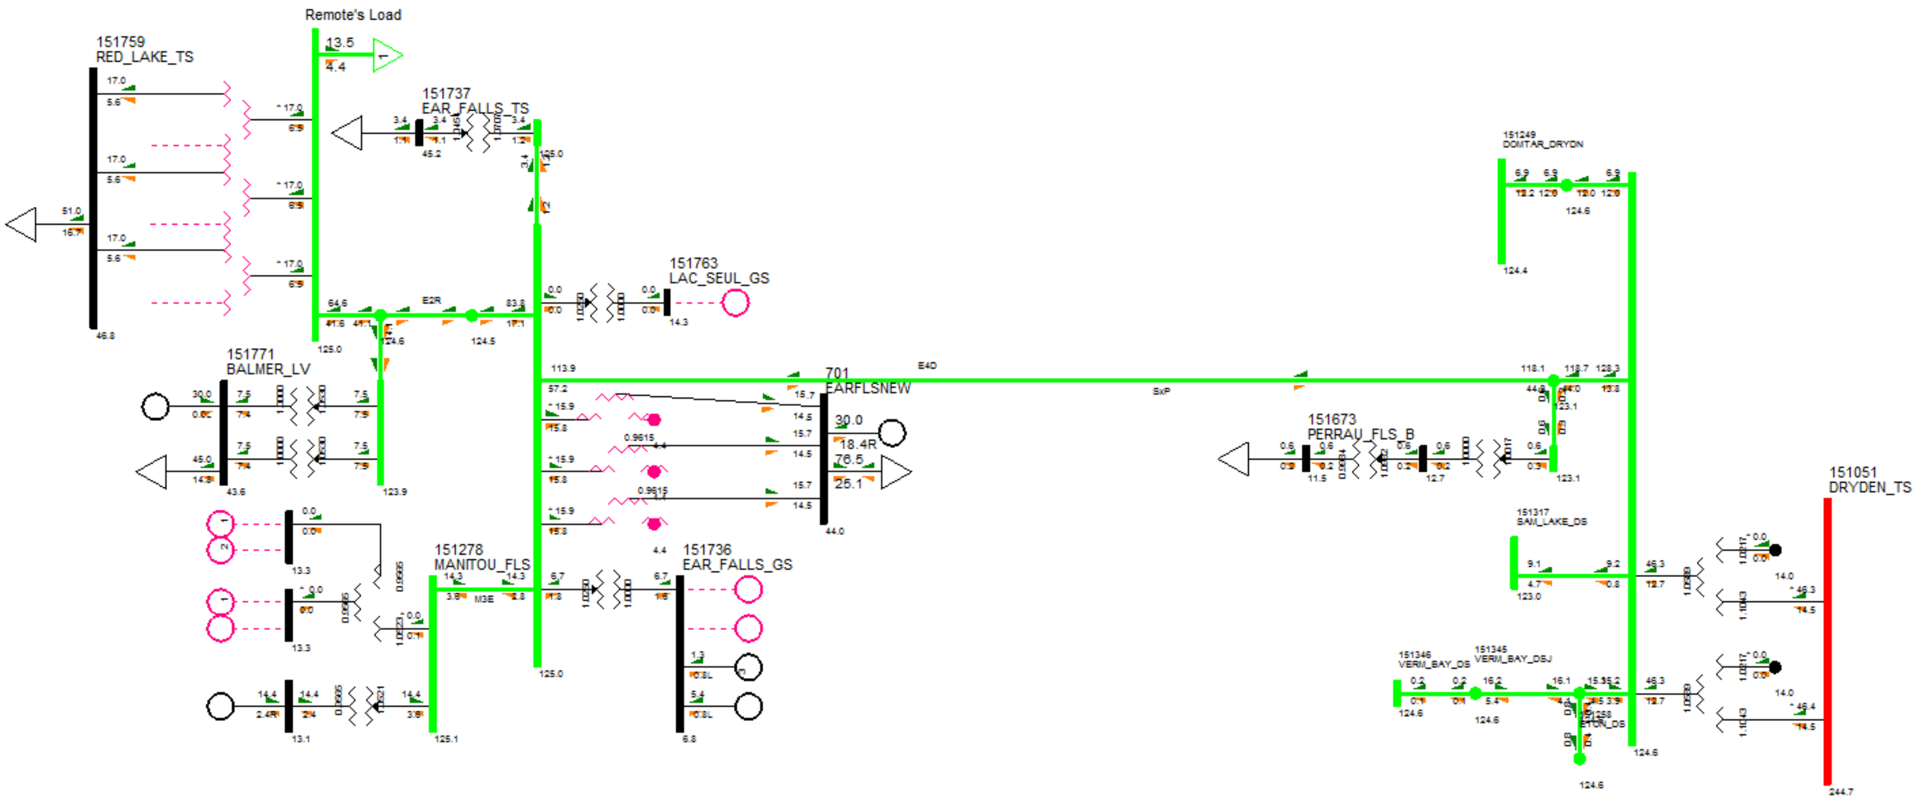
### Figure 26: 60 MW Generation Option Red Lake Subsystem Configuration



160

### 10.7.3 Ring of Fire Subsystem Options

#### *Assumptions*

The following assumptions were made to determine the infrastructure required to implement diesel and CNG fueled generation at the mine-sites and its costs. Based on the infrastructure requirements, costs for capital, operating and maintenance and capital sustainment were estimated to determine the total cost of generating electricity at Ring of Fire mine-sites. For both fuel options, generators are assumed to not be connected to the Ontario electricity system.

Assumptions for CNG Fueled Mine-site Generation:

- Generators will be dual fuel CNG/Diesel reciprocating engines. Engines will be capable of running predominantly on CNG, but can run on pure diesel as needed;
- CNG would be compressed at a new compressor station in the Nakina area and transported on specialized high pressure transport trailers via the proposed road to the mine-sites;
- Decanting stations near the generators would be required to decompress the natural gas for use;
- CNG fuel delivery would be on a just in time basis due to challenges and additional cost of large scale on-site CNG storage;
- If CNG is unavailable generators will run on diesel;
- A sufficient number of trailers would be required to both transport fuel as well as provide for some limited on-site storage to ensure a stable flow of fuel; and
- Discrete generator unit sizes of 9.5 MW.

Assumptions for Diesel Fueled Mine-site Generation:

- Generators will be diesel fueled reciprocating engines;

- Diesel would be supplied from the Thunder Bay area and transported to the mine-sites via the proposed all-weather road, stored on site and used for in-mine equipment as well as for electricity generation;
- On-site diesel storage is available due to the variety of uses for diesel at the mine-sites, therefore timing and logistic challenges with fuel transport and delivery will not be as significant as for CNG; and
- Discrete generator unit sizes of 9.5 MW.

### *Study Procedure*

To estimate the cost of implementing a CNG or diesel electricity generation facility at the Ring of Fire mine-sites, the following procedure was undertaken:

1. Determine forecast peak load for the Ring of Fire mines based on the demand forecast;

2. Determine the required amount of generation capacity based on peak load;

3. Calculate the energy requirements (total kWh per year) by applying a estimated load factor to the peak load;

4. Calculate fuel required daily based on energy requirements;

5. Estimate number of trucks and trailers (size of fleet) required to transport fuel based on a) trailer volume assumptions, b) fuel requirements and c) one day round trip;

6. (CNG option only) Determine number of compressor and decanting stations based on amount of fuel required per day; and

7. Use the calculated values (generator capacity, number of trucks, annual fuel requirements, and decanting/compressing stations) to calculate initial capital costs, refurbishment costs, operation and maintenance costs, and fuel costs of the system.

8. These capital, operations and maintenance costs, were amortized over the project life and the present value over the planning period (2013-2033) was calculated.

### *Planning Level Assessment*

The generation options considered for supplying the Ring of Fire subsystem would only supply the mining load. The five remote communities in the Ring of Fire subsystem have been determined to be economic to connect as per the findings of the Remote Community Connection Plan. Backup generation capacity is considered to use consistent reliability criteria specified under ORTAC. Table 78 outlines the generation solution options considered for the Ring of Fire subsystem mining demand.

**Table 78: Summary of Incremental Capacity and LMC**

| Option | Incremental Capacity | Load Meeting Capability for Mining | Low Forecast Long-term Mining Demand | Reference Forecast Long-term Mining Demand | High Forecast Long-term Mining Demand |
|---|---|---|---|---|---|
| 38 MW of CNG | 22 MW | 22 MW | 0 MW | 22 MW | 66 MW |
| 38 MW of Diesel | 22 MW | 22 MW | | | |
| 57 MW of CNG | 44 MW | 44 MW | | | |
| 57 MW of Diesel | 44 MW | 44 MW | | | |
| 85.5 MW of CNG | 71 MW | 71 MW | | | |
| 85.5 MW of Diesel | 71 MW | 71 MW | | | |

Table 79 through Table 83 below summarize the cost profiles for each option.

## 10.8 Transmission Options

### *Assumptions*

In determining the cost of transmission options, the following were assumed:

- Unit cost estimates for new facilities were provided by a study conducted for the OPA by SNC Lavalin T&D. The report has been included in Section 11.3;
- Operations and maintenance costs were estimated as a percentage of the capital cost of the project, and would be incurred every year from the in-service date to the end of the projects useful life;
- Land cost was not included. Land costs are difficult to determine given the types of land and the variety of land holders that certain options described in this report may occupy; and
- Impact Benefit Agreements that may be negotiated between future projects proponents and impacted First Nations have not been estimated or included in the costs of options.

### *Procedure*

To estimate the cost of transmission options to supply the North of Dryden sub-region, the following procedure was taken:

1. Load flow assessment in PSS/E (provided in this Section) was done to determine the capability of each option and the amount of capability of voltage control devices required to achieve the LMC;
2. Using unit costs for lines and stations, line lengths, number and types of new stations and/or station upgrades and voltage control requirements, capital, operations and maintenance costs of the system were calculated;
3. The amount of system generation that could be displaced after 2018, by associated local generation options for the subsystem was calculated; and
4. These capital, operations and maintenance costs and attributed costs for incremental system generation beginning in 2018, were levelized over the project life and the present value over the planning period (2013-2033) was calculated.

### 10.8.1 **Red Lake Subsystem Transmission Options**

#### *Near-term Option - Upgrade of E4D and E2R*

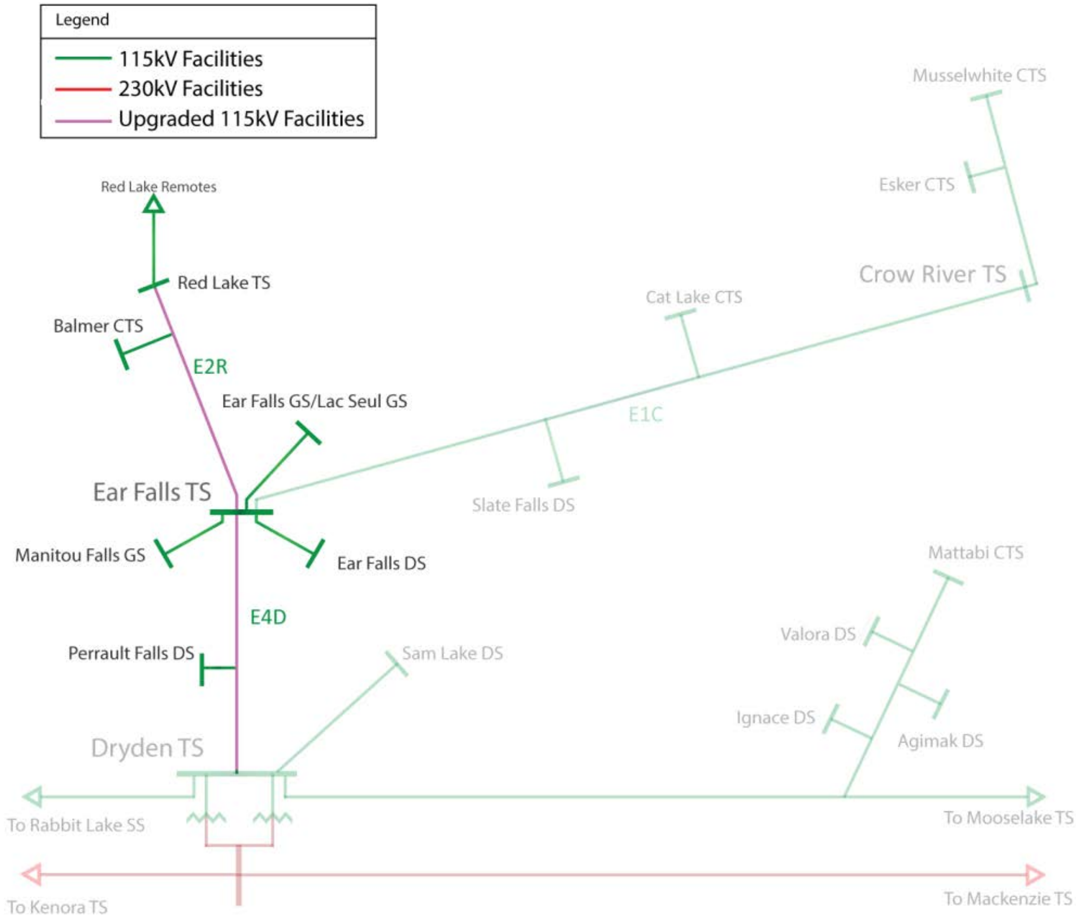
The existing lines serving the Red Lake subsystem are E4D, from Dryden to Ear Falls, and E2R, from Ear Falls to Red Lake. E4D has a thermal rating of 470 amps, and a transfer capability of 100 MVA (at 125 kV nominal voltage), while E2R a thermal rating of 420 amps, and a transfer capability of 91 MVA (125 kV nominal voltage). Based on dependable hydroelectric generation at Manitou Falls GS, Ear Falls GS and Lac Seul GS, and the current summer transmission line ratings, 85 MW of load can be served from Ear Falls TS. The Red Lake subsystem has an LMC of 61 MW, while the Pickle Lake subsystem has an LMC of 24 MW.

Hydro One has identified that E4D can be upgraded to a thermal rating of 670 amps, while E2R can be upgraded to 620 amps. After these line upgrades and the installation of an appropriate amount of voltage control at Ear Falls TS the Red Lake subsystem LMC will rise to 95 MW, assuming the Pickle Lake subsystem continues to be supplied solely from Ear Falls via circuit E1C and the LMC remains at 24 MW. A diagram of the upgrade of E4D and E2R is provided in Figure 27.

**Table 85: Summary of Load Meeting Capability**

| Option | Incremental Capacity | Load Meeting Capability | Low Forecast Demand | Reference Forecast Demand | High Forecast Demand |
|---|---|---|---|---|---|
| Upgrade E4D and E2R | 34 MW | 95 MW | 100 MW | 109 MW | 136 MW |
| and Transfer of Pickle Lake load to new line to Pickle Lake | 35 MW | 130 MW | | | |

**Figure 27: E4D and E2R Upgrade Diagram**



Hydro One has indicated that upgrading these lines as well as the installation of required voltage control devices could be completed within the near-term period. Table 86 below shows the cost breakdown of the upgrade option which includes the required voltage control devices. Figure 28 shows the load flow case during peak load. Ear Falls TS and Red Lake TS voltage is maintained in a healthy range of 120 kV to 125 kV.

### Table 86: E4D and E2R Upgrade Cost Summary

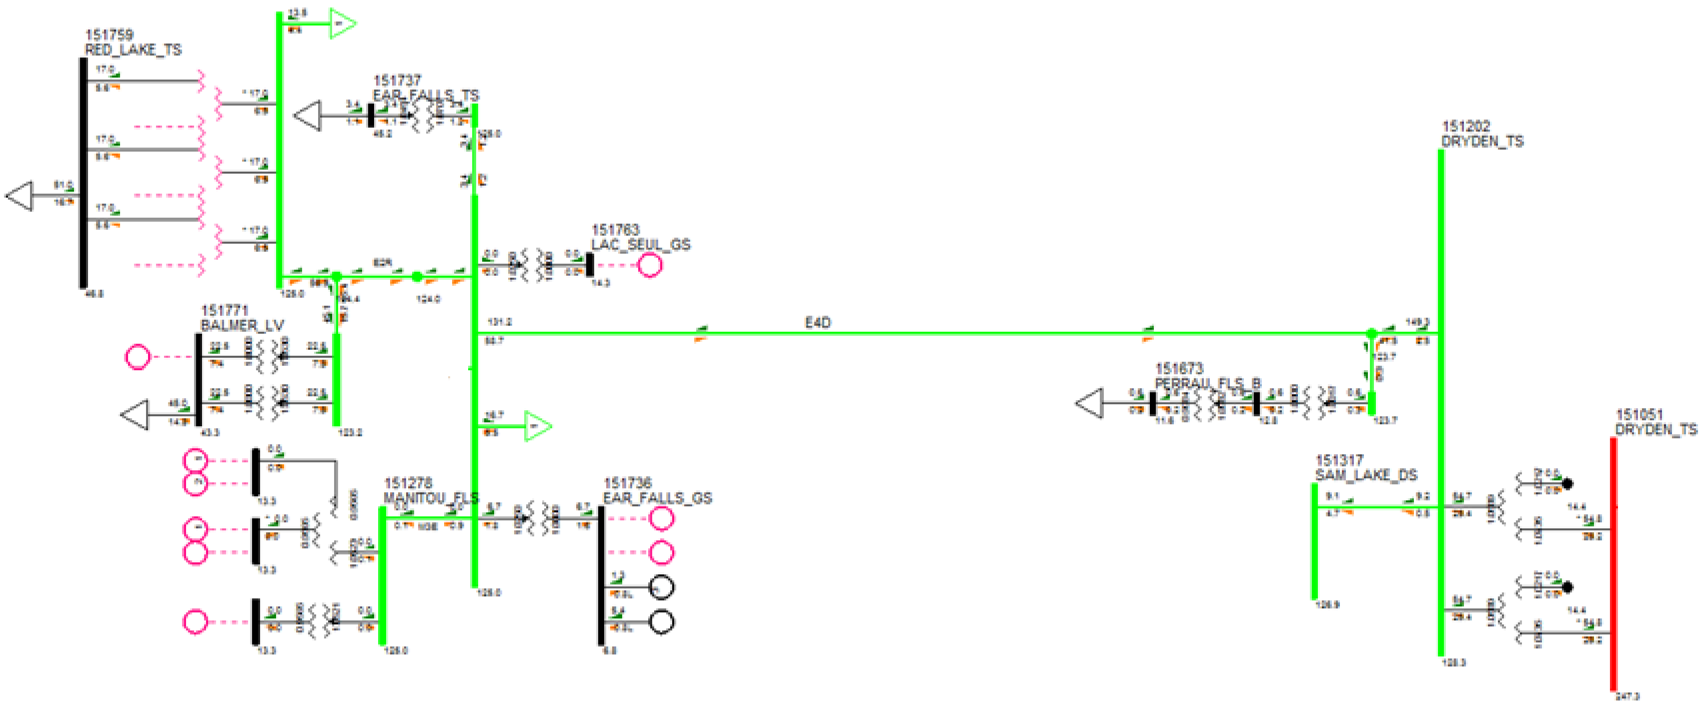
### Figure 28: E4D and E2R Upgrade Red Lake Subsystem Configuration



### *Medium- and Long-term Option - 115 kV Line from Dryden TS to Ear Falls TS*

This option is to build a new 115 kV single circuit line connecting at Dryden TS running to Ear Falls TS. A diagram of this option is provided in Figure 29. Because there are two local generation options for the Red Lake subsystem (30 MW, 60 MW), the 115 kV transmission option has been developed for an LMC of 160 MW and 190 MW. The option designed to have an LMC of 160 MW is comparable to the capability of the 30 MW Red Lake generation option and 190 MW LMC option is comparable to the 60 MW gas generation option, which meets the needs of the high scenario demand forecast. This difference in transmission LMC is determined by the voltage control requirements at Ear Falls TS.

**Table 87: Summary of Load Meeting Capability**

| Option | Incremental Capacity | Load Meeting Capability | Low Forecast Demand | Reference Forecast Demand | High Forecast Demand |
|---|---|---|---|---|---|
| New 115 kV line from Dryden to Ear Falls with less compensation (160 MW) | 30 MW | 160 MW | 100 MW | 109 MW | 136 MW |
| New 115 kV line from Dryden to Ear Falls with more compensation (190 MW) | 60 MW | 190 MW | | | |

**Figure 29: New 115 kV line to Ear Falls Diagram**

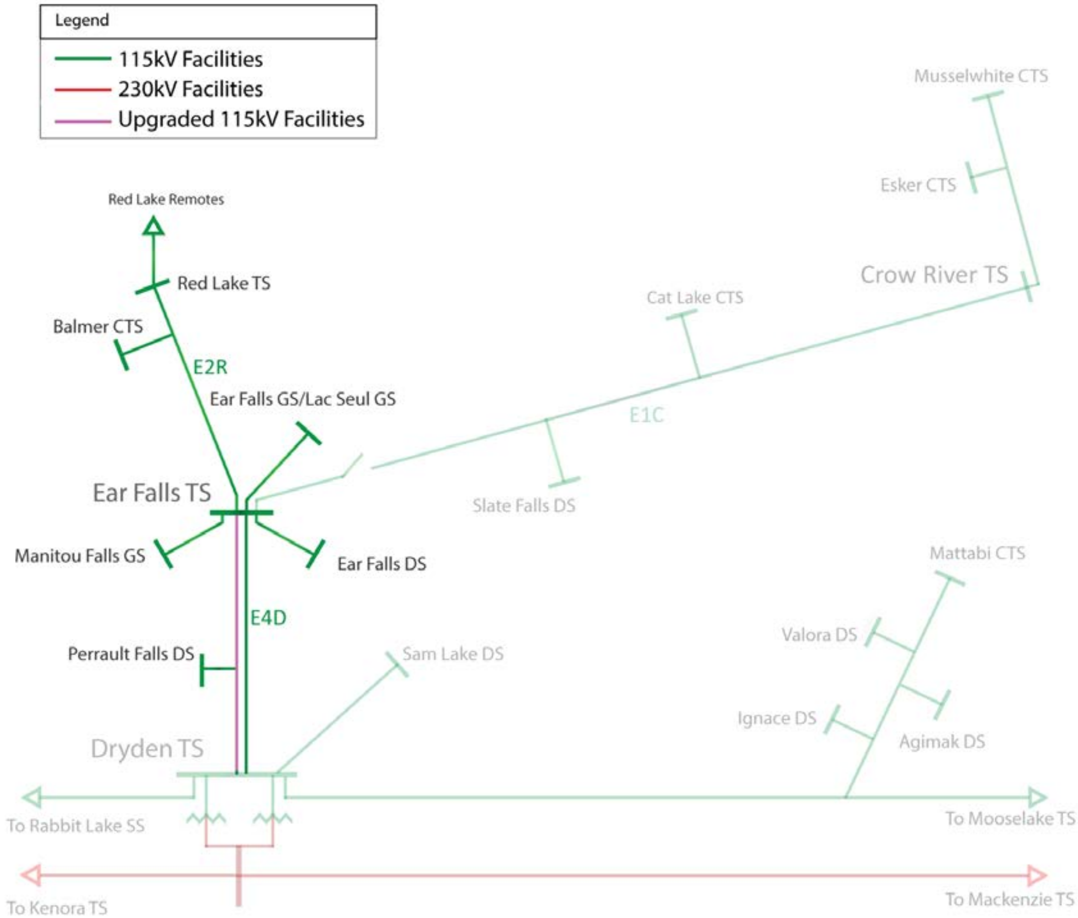


Figure 30, shows the peak load flow case for this option. Voltage at Ear Falls TS is maintained within a healthy range of 120 kV to 125 kV.

Table 88 and Table 89 summarize the annual cashflows and cumulative NPV cost for the options.

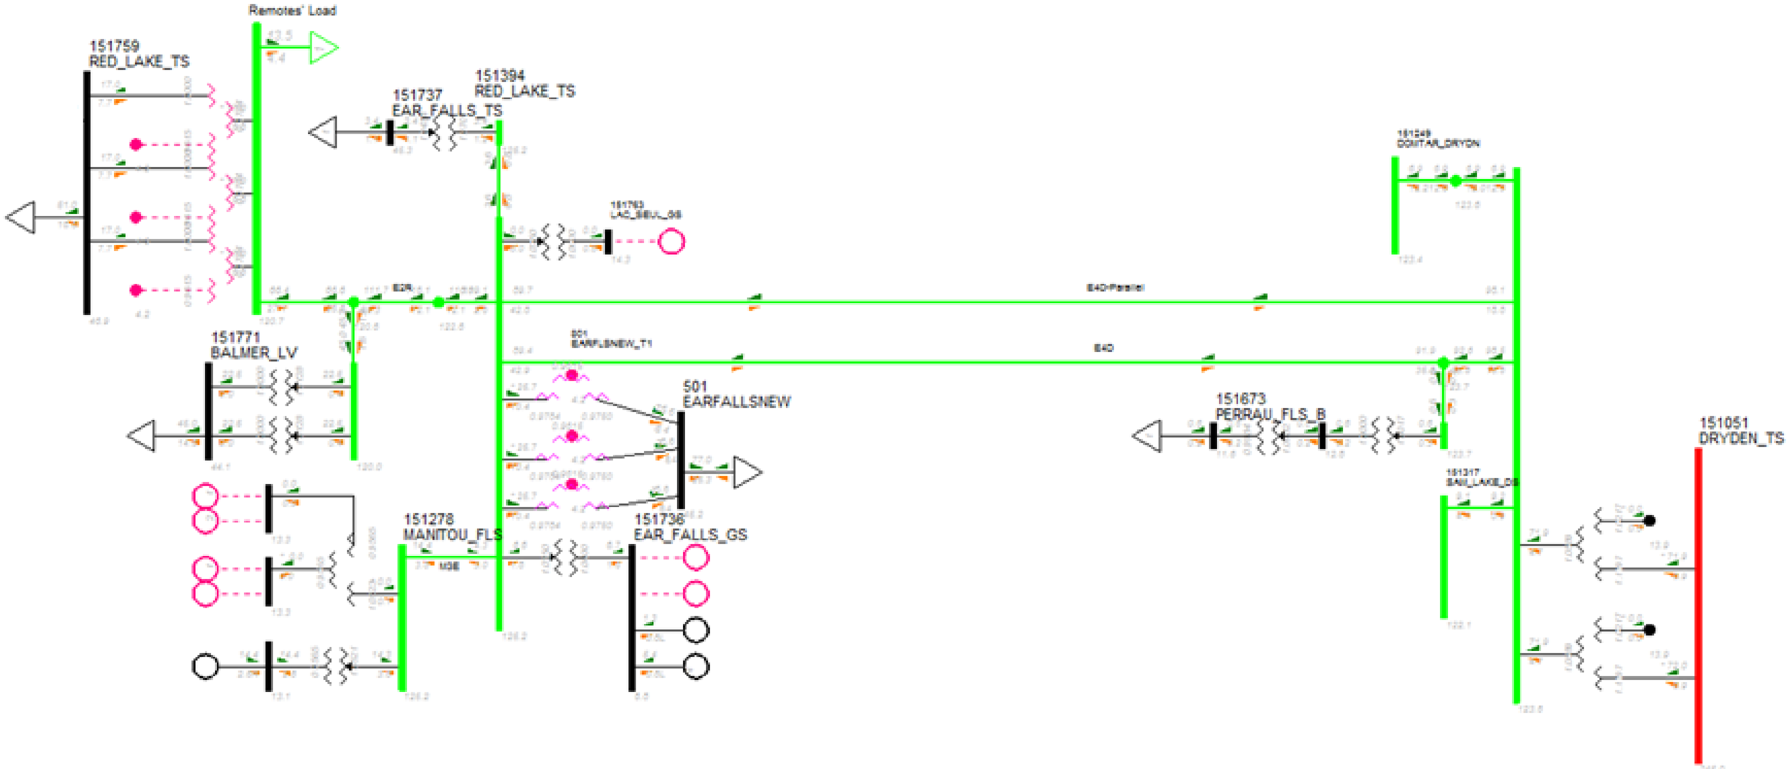
**Figure 30: 115 kV Line Option Red Lake Subsystem Configuration**



173

### 10.8.2 Pickle Lake Subsystem Transmission Options

The transmission options for the Pickle Lake subsystem include:

1. A new 115 kV single circuit line tapping the 115 kV line 29M1 near Valora with an in-line breaker on the tap line and terminating at Crow River DS in Pickle Lake;

2. A new 230 kV single circuit line tapping D26A east of Dryden with an in-line breaker on the tap line and running to Pickle Lake terminating at Crow River DS or a new TS in the Pickle Lake area with a new 230/115 kV autotransformer at Crow River DS or a new station; and

3. A new single circuit line pre-built to 230 kV standards (230 kV structures, and hardware) and connecting it to M2D on the 115 kV system east of Dryden with an in-line breaker on the tap line. When additional capacity is required the line would be reterminated on the 230 kV system near Dryden (D26A) and a 230/115 kV autotransformer would be installed at Crow River DS or a new station in Pickle Lake.

For all of these transmission options, it is assumed that following the installation of a new line to Pickle Lake, the line E1C, connecting Ear Falls TS to Crow River DS (at Pickle Lake), would be normally open at Ear Falls. As a result, all customers in the Pickle Lake subsystem would be normally supplied by the new line to Pickle Lake. During sustained outages of the new line to Pickle Lake, some load in the Pickle Lake subsystem may be able to be restored by closing the normally E1C at Ear Falls TS and serving load in the Pickle Lake subsystem from Ear Falls TS. The amount of load that can be restored in the Pickle Lake subsystem from Ear Falls TS will be limited by the available capacity of circuits E4D and E1C.

### *115 kV Line to Pickle Lake*

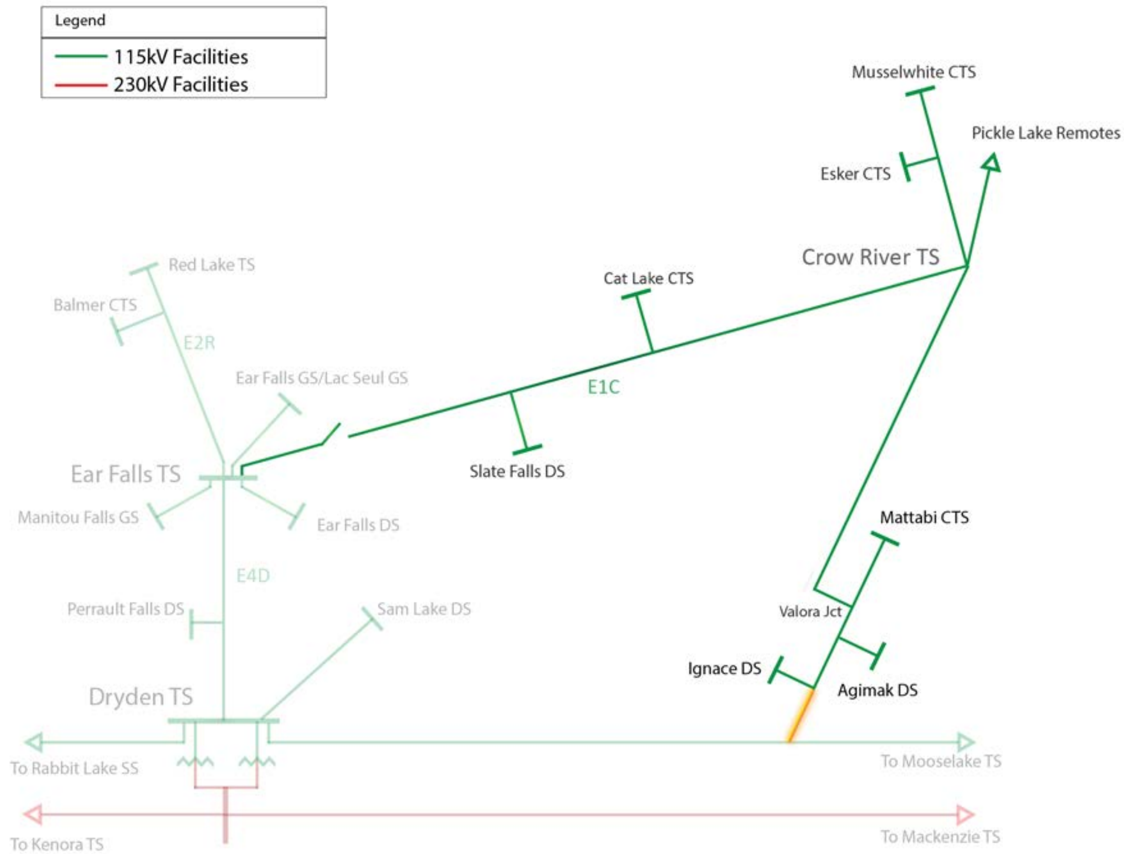
This option is to install a new 115 kV single circuit line tapping the 115 kV line 29M1 near Valora with an in-line breaker and terminating at Crow River DS in Pickle Lake. Currently, there are a number of short sections of 29M1 between Ignace and Valora which have thermal ratings which are lower than the rest of the line. These sections will need to be upgraded to a thermal rating of at least 500 amps to allow the new line to Pickle Lake to have the required transfer capability.

**Table 90: Summary of Load Meeting Capability**

| Option | Incremental Capacity | Load Meeting Capability | Low Forecast Demand | Reference Forecast Demand | High Forecast Demand |
|---|---|---|---|---|---|
| New 115 kV line from Valora to Pickle Lake | 46 MW | 70 MW | 48 MW | 78 MW (100 MW) | 90 MW (156 MW) |

Figure 31 shows the Pickle Lake subsystem with this option, highlighting the section of 29M1 that would require upgrading.

**Figure 31: New 115 kV line to Pickle Lake Diagram**



A summary of the cost for this option can be found in Table 91 below.

176

Figure 32 shows the load flow case during peak load. The Pickle Lake bus voltage is maintained in a healthy range of 120 kV to 125 kV.

### *230 kV Line to Pickle Lake*

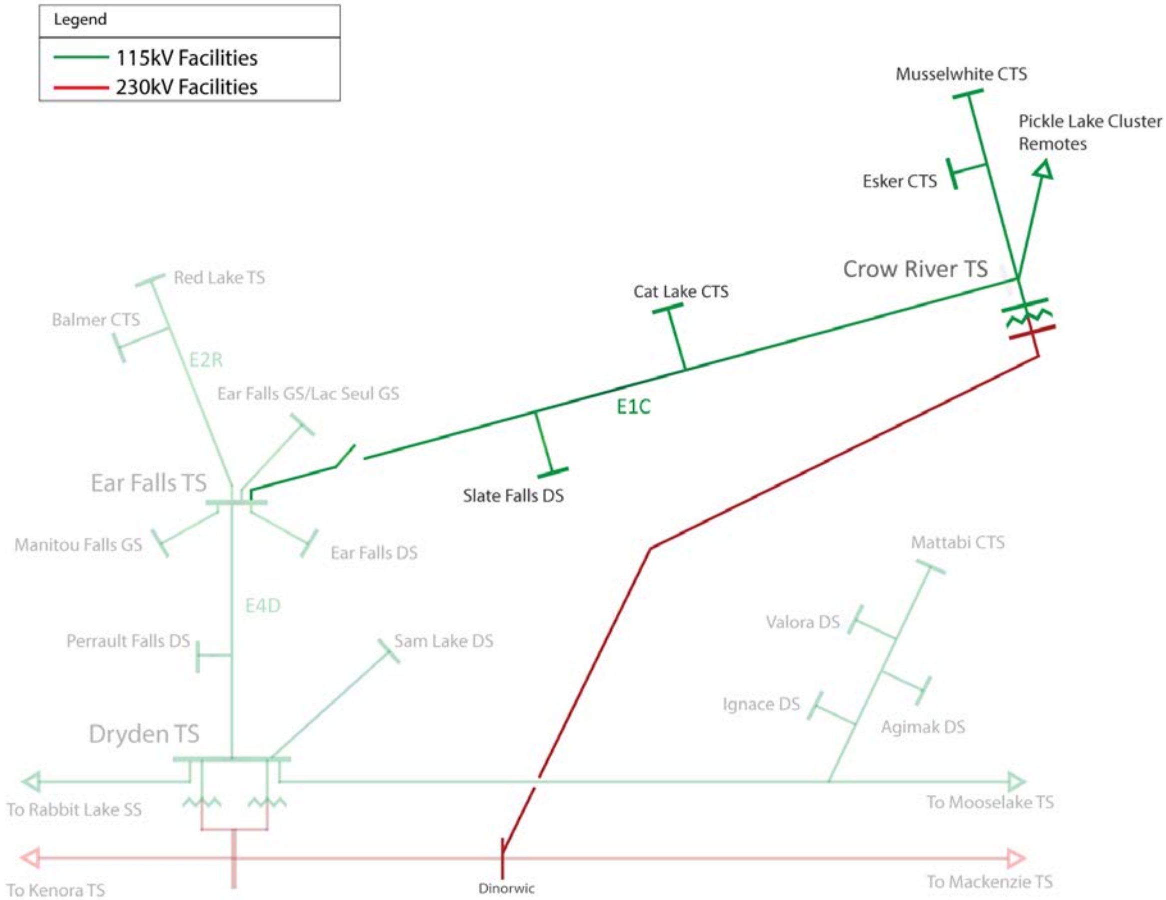
This option is to install a new 230 kV single circuit line tapping D26A east of Dryden with an in-line breaker running to Pickle Lake terminating at Crow River DS or at a new 230 kV station where a new 230/115 kV autotransformer will be installed.

**Table 92: Summary of Load Meeting Capability**

| Option | Incremental Capacity | Load Meeting Capability | Low Forecast Demand | Reference Forecast Demand | High Forecast Demand |
|---|---|---|---|---|---|
| New 230 kV line from Dryden/Ignace to Pickle Lake | 136 MW | 160 MW | 48 MW | 78 MW (100 MW) | 90 MW (156 MW) |

A diagram of this option is shown in Figure 33 below.

**Figure 33: New 230 kV line to Pickle Lake Diagram**



A summary of the cost for this option can be found in Table 93 and Table 94 below.

Table 94 shows an illustration of the peak load flow case for the new 230 kV line to Pickle Lake option. The voltage in the Pickle Lake area is maintained in a range of 240 kV to 245 kV, which helps to maintain voltages on existing and planned facilities within a healthy range.

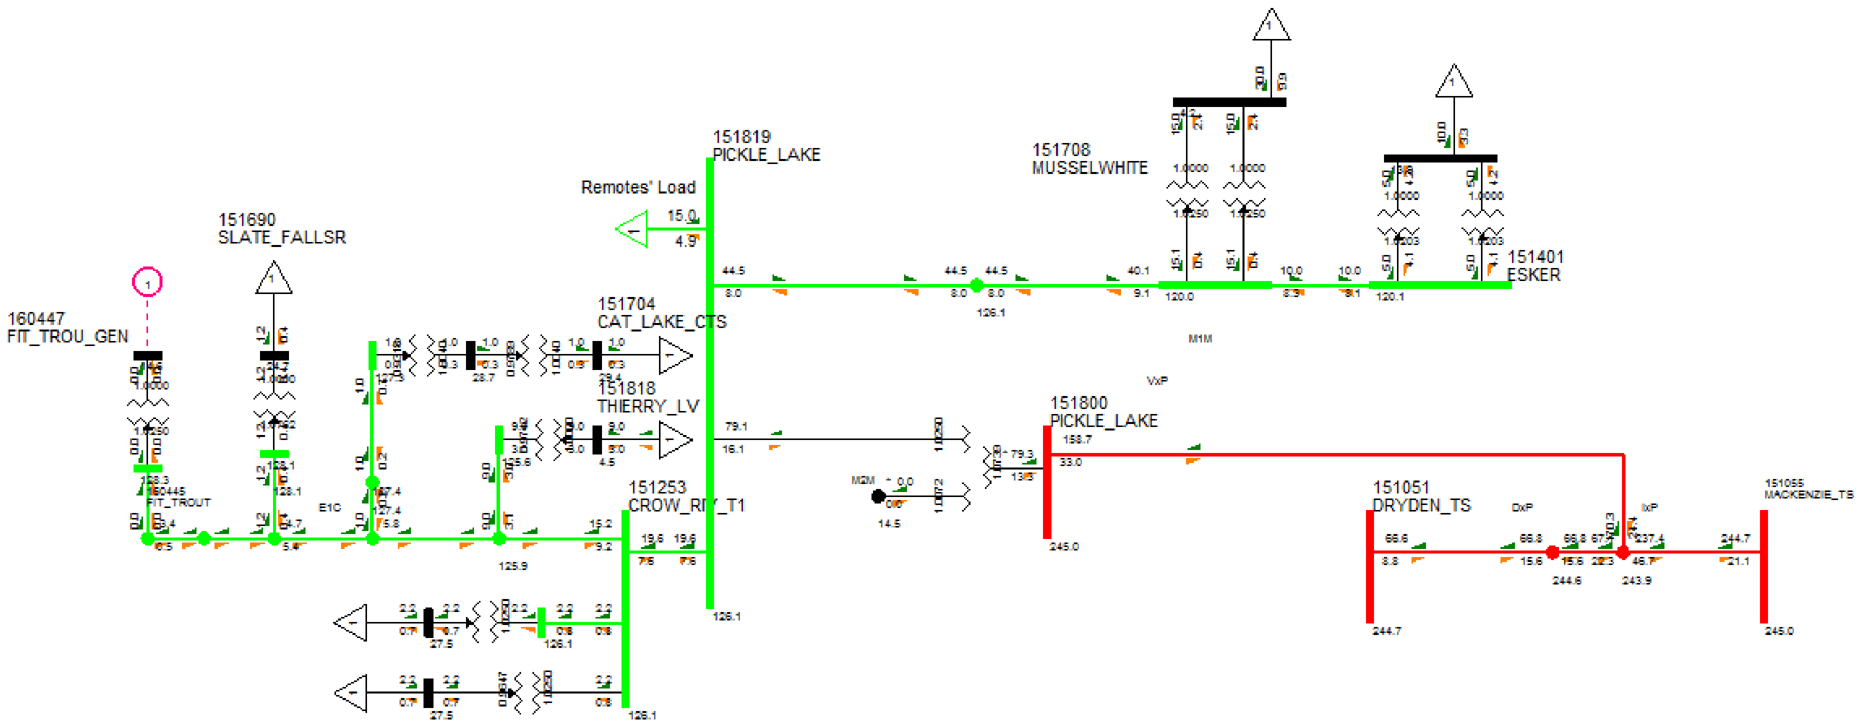
**Figure 34: 230 kV Line Option Pickle Lake Subsystem Configuration**



183

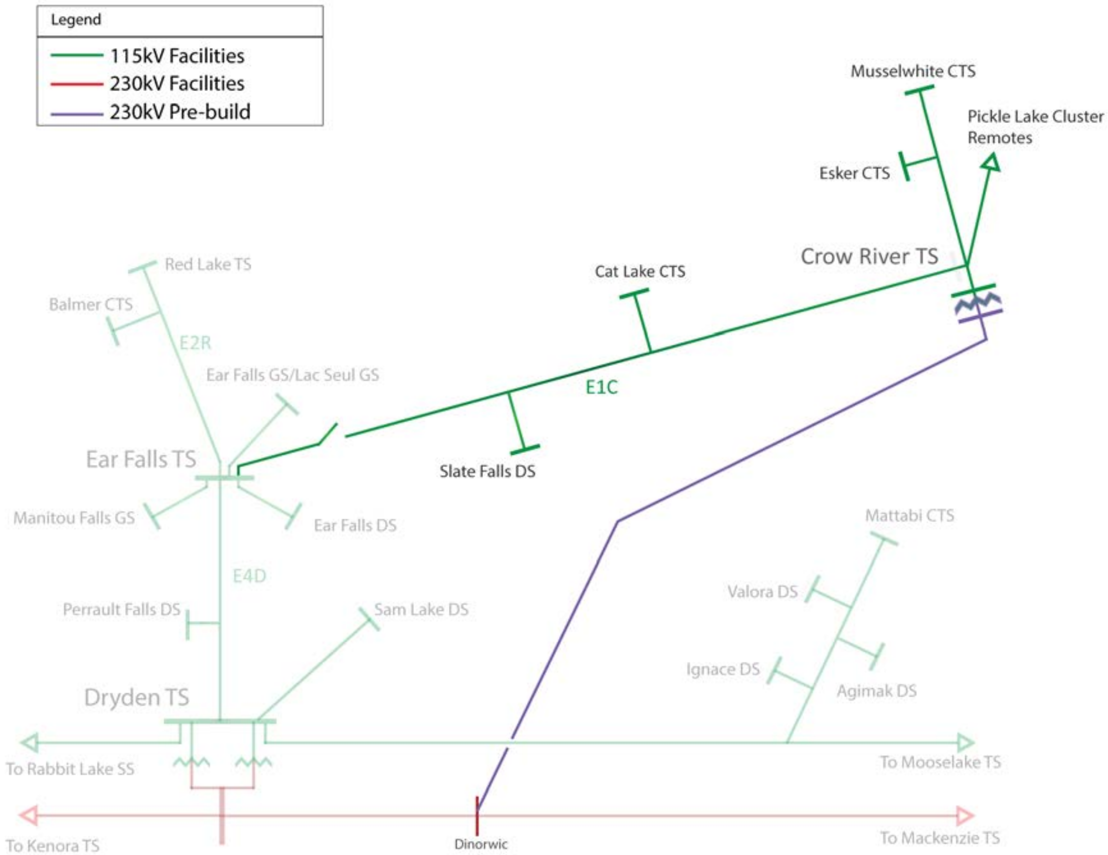
### *Pre-build 230 kV Line to Pickle Lake*

This option would pre-build a new single circuit line to 230 kV standards (230 kV structures and hardware) and connect it to the 115 kV system on M2D east Dryden with an in-line breaker and running to Pickle Lake where it would terminate at Crow River DS. When additional capacity is required, the line would be reterminated on the regional 230 kV system (D26A) east of Dryden and a 230/115 kV autotransformer would be installed either at Crow River DS or at a new TS in Pickle Lake.

| Option | Incremental Capacity | Load Meeting Capability | Low Forecast Demand | Reference Forecast Demand | High Forecast Demand |
|---|---|---|---|---|---|
| Pre-build 230 kV line from Dryden/Ignace to Pickle Lake:<br><br>Stage 1: operated at 115 kV<br><br>Stage 2: operated at 230 kV | 46 MW<br><br>90 MW | 70 MW<br><br>160 MW | 48 MW | 78 MW (100 MW) | 90 MW (156 MW) |

Figure 35 provides a diagram of the area with this option, while Table 95 provides a summary of costs and timing for this option.

**Figure 35: Pre-build 230 kV Line to Pickle Lake Option**



Note: the above diagram illustrates the second stage configuration (operated at 230 kV).

### 10.8.3 Ring of Fire Subsystem Transmission Options

The following table summarizes the capability of various transmission options to meet the forecasted demand levels for the Ring of Fire sub-system for the reference, high, and low scenarios:

| Option | Incremental Capacity | Load Meeting Capability | Low Forecast Demand | Reference Forecast Demand | High Forecast Demand |
|---|---|---|---|---|---|
| *East-West corridor* | | | 7 MW | 29 MW | 73 MW |
| 115 kV line from Pickle Lake | 60 MW | 60 MW | | | |
| 230 kV line from Pickle Lake | 78 MW | 78 MW | | | |
| *North-South corridor* | | | | | |
| 230 kV line from Marathon TS | 78 MW | 78 MW | | | |
| 230 kV line from east of Nipigon | 78 MW | 78 MW | | | |

The options and costs of the options are discussed in further detail below.

#### *115 kV Line Connection for Ring of Fire Remote Communities from Pickle Lake*

In a scenario where mines at the Ring of Fire do not connect to the transmission system, it has been assumed that the 5 remote communities in the Ring of Fire subsystem would develop a connection to Pickle Lake, based on the findings of the draft Remote Community Connection Plan. This option is to build a 115 kV line from Pickle Lake to a point near Webequie FN passing near Neskantaga FN. Neskantaga FN, Eabametoong FN and Marten Falls FN would connect by distribution lines to a new transformer station near Neskantaga FN, while Nibinamik FN and Webequie FN would connect by distribution line to a transformer station near Webequie FN.

Figure 36, provides an illustrative schematic of this option, while costs are provided in Table 98.

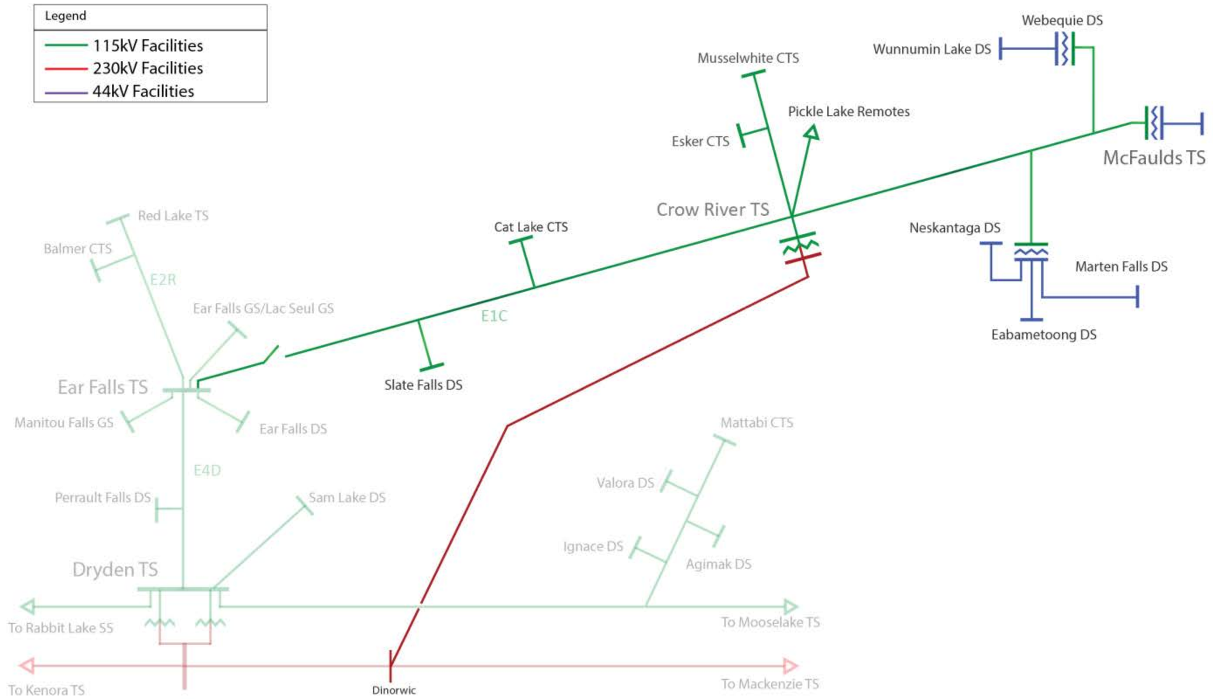
### *115 kV Line from Pickle Lake to Ring of Fire*

This option considers building a new 115 kV line from Pickle Lake to the Ring of Fire mining development area, and connecting the five remote communities in the Ring of Fire subsystem. The feasibility of this option is contingent on the completion of a new 230 kV line from east of Dryden to Pickle Lake. Power flow studies show that a single circuit 115 kV line from Pickle Lake could supply up to 60 MW of mining load at the Ring of Fire plus 7 MW of remote community load.

Figure 37, shows this option with the Pickle Lake subsystem.

**Figure 37: 115 kV Line from Pickle Lake to Ring of Fire**



A prorated portion of the costs for new a 230 kV transmission line and 230/115 kV transformer station from the Dryden area to Pickle Lake is included in the cost of this option because it is required for this option to be undertaken as is shown in the cost summary in Table 99.

Figure 38 provides the peak load flow for the North of Dryden sub-region, illustrating that voltages throughout the subsystem are maintained in a healthy range of 120 kV to 125 kV.

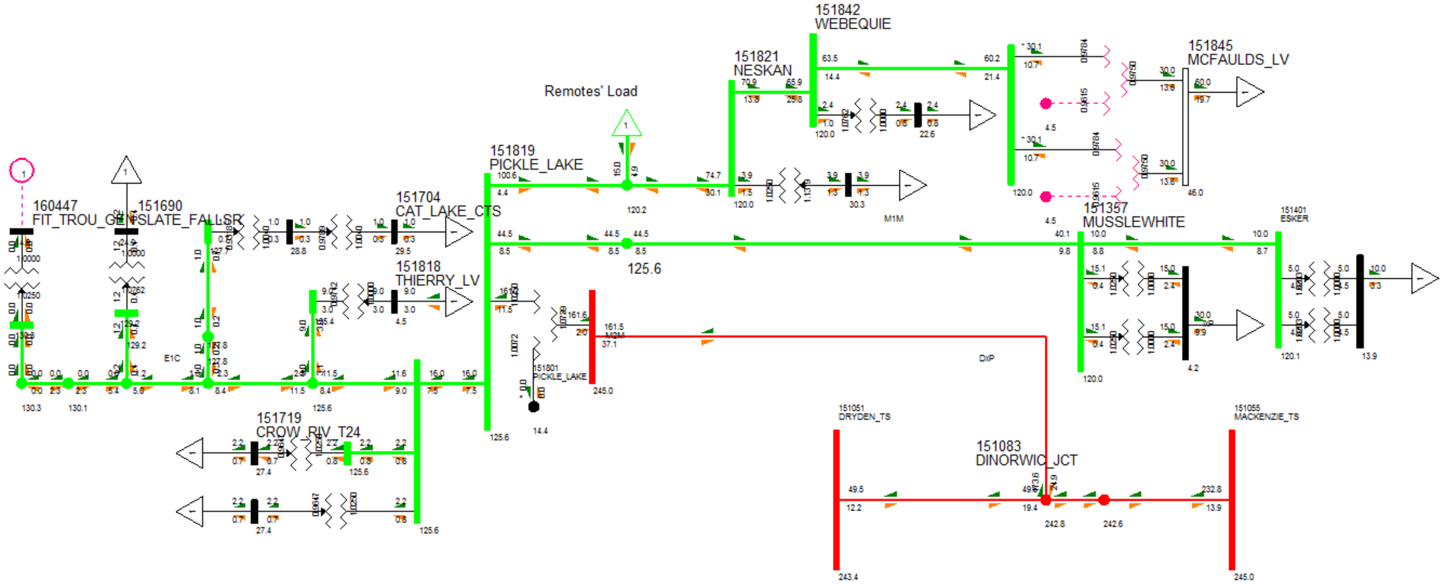
## Figure 38: 115 kV Line from Pickle Lake Option Ring of Fire Subsystem Configuration

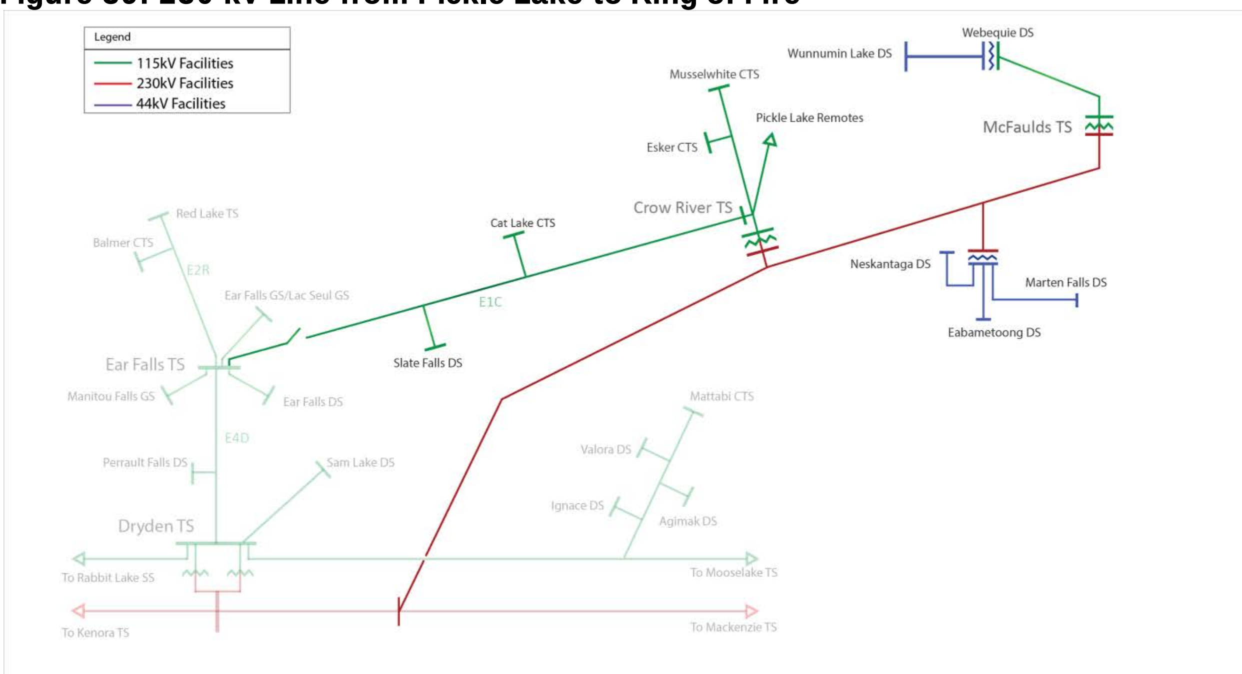


194

### *230 kV Line from Pickle Lake to Ring of Fire*

This option considers building a new 230 kV single circuit line from a new 230 kV station at Pickle Lake to the Ring of Fire, and a new 230/115 kV TS near Neskantaga FN and at the Ring of Fire. The feasibility of this option is contingent on the completion of a new 230 kV line from east of Dryden to Pickle Lake. This line would enable the connection of the five Matawa remote communities in the Ring of Fire subsystem as well as serve the high growth scenario (MW) for mining load at the Ring of Fire. Figure 39 shows the Pickle Lake and Ring of Fire subsystems with a new 230 kV line from the Dryden area to Pickle Lake and this option for a new 230 kV line from Pickle Lake to the Ring of Fire. Figure 39, shows this option implemented with the Pickle Lake subsystem.

**Figure 39: 230 kV Line from Pickle Lake to Ring of Fire**



A prorated portion of the costs for new a 230 kV transmission line and station from the Dryden area to Pickle Lake is included in the cost of this option, as shown in the cost summary in Table 101 below.

**Table 101: 230 kV line from Pickle Lake to Ring of Fire Cost Summary**

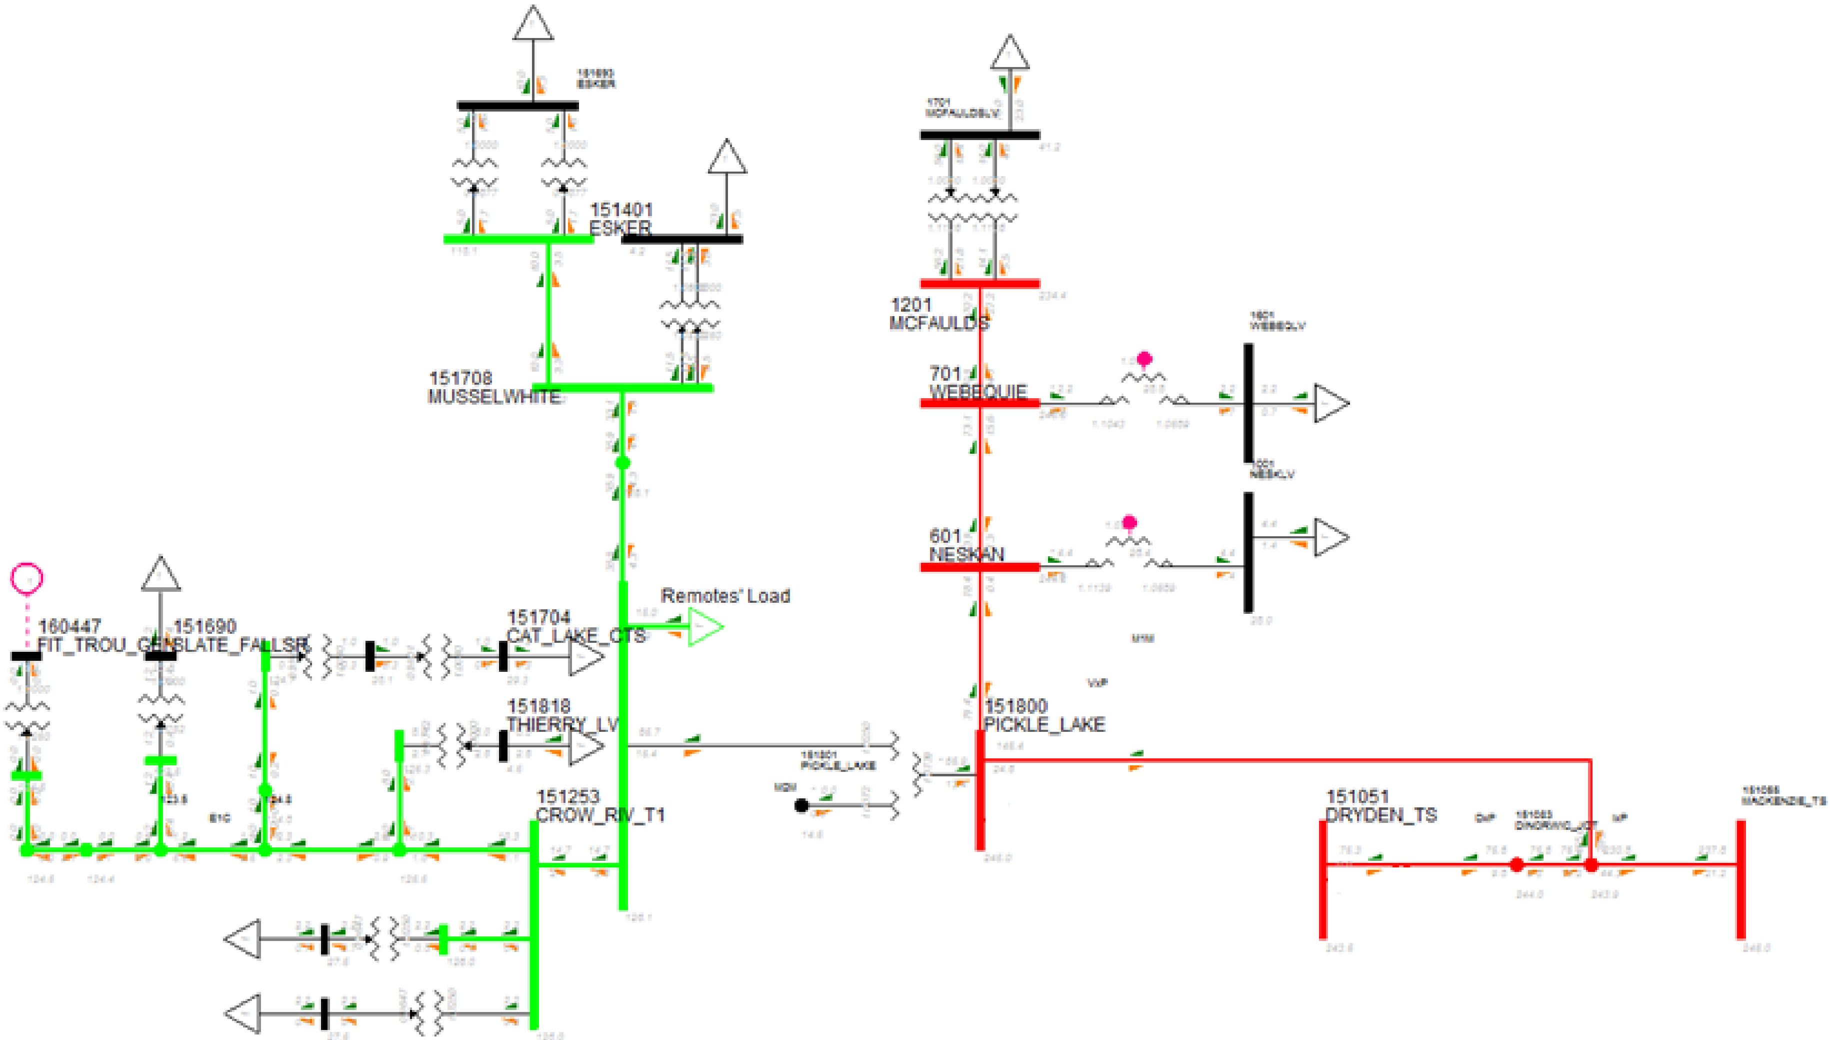
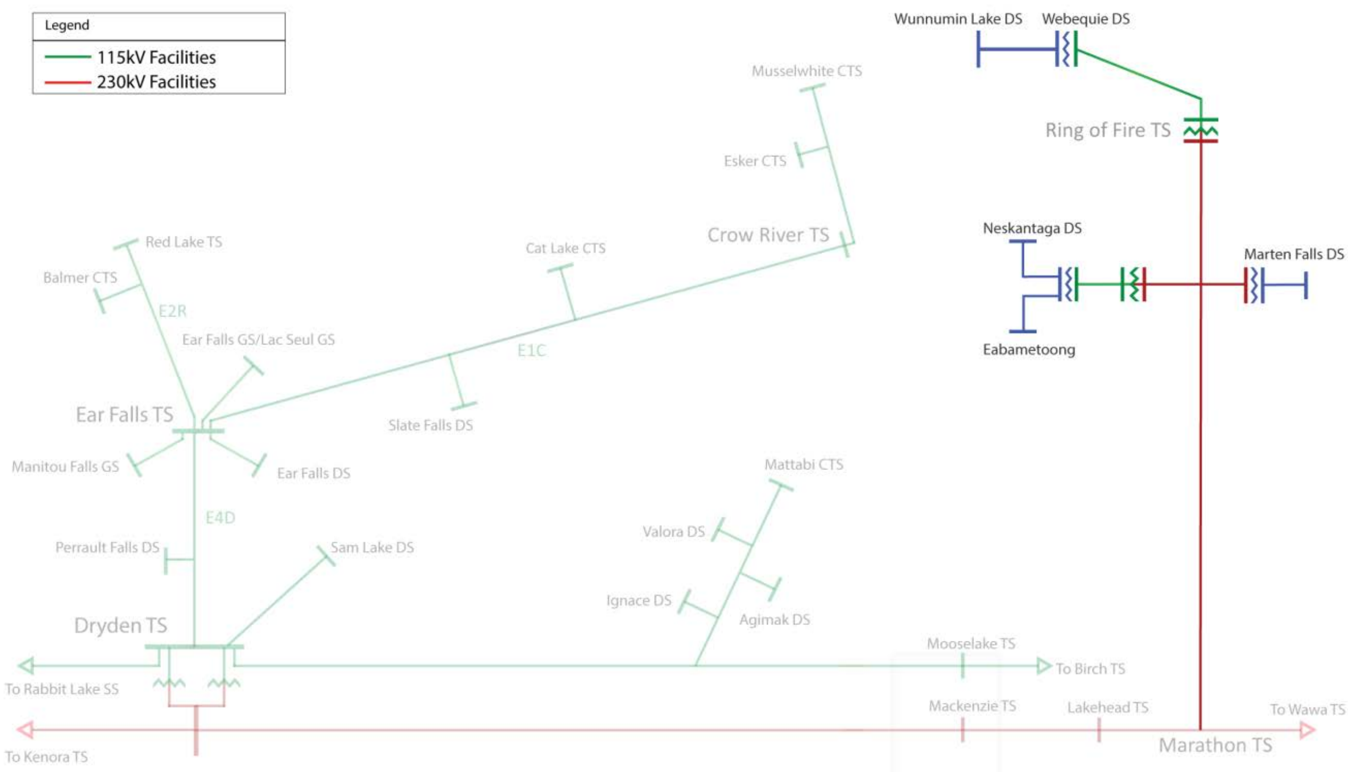
**Figure 40: 230 kV Line from Pickle Lake Option Ring of Fire Subsystem Configuration**



### *230 kV Line from Marathon TS or east of Nipigon to Ring of Fire*

Given the potential for a new all season road to serve the Ring of Fire mining development area from around Nakina, this option was developed to leverage the availability of the all season road assuming they can share a common right of way from Nakina. The existing transmission supply serving the Long Lac\Nakina area is the single circuit 115 kV line A4L, which has insufficient capability to serve the forecast load growth of the Ring of Fire subsystem. Therefore, a new 230 kV single circuit transmission line from either Marathon TS or east of Nipigon would be required for this option. These options have similar line lengths and are expected to have approximately the same costs. A diagram of this option is provided in Figure 41 below.

**Figure 41: 230 kV Line from Marathon or East of Nipigon to Ring of Fire**



The LMC of the Ring of Fire subsystem for this option is 77 MW. This includes 7 MW for the communities on the line as well as 70 MW at the Ring of Fire. A summary of the cost for this option can be found in Table 102 below.

**Table 102: 230 kV line from Marathon TS or east of Nipigon to Ring of Fire Cost Summary**

Ontario

July 29, 2016

Ms Rosemarie Leclair
Chair and Chief Executive Officer
Ontario Energy Board
2300 Yonge Street
PO Box 2319
Toronto ON M4P 1E4

Dear Ms Leclair:

The connection of remote First Nation communities was identified as a priority project in the 2013 Long-Term Energy Plan. This project will reduce reliance on diesel generation and bring a number of environmental, social and economic benefits to these First Nation communities. Under the authority of section 28.6.1 of the *Ontario Energy Board Act, 1998,* I have, with the approval of the Lieutenant Governor in Council, issued a directive with regard to the expansion of the transmission system by developing the Remotes Connection Project and the Line to Pickle Lake.

The Directive was approved by Order-in-Council on July 19, 2016, and both the Order-in-Council and Directive are attached to this letter. Please do not hesitate to contact my office with any questions.

Sincerely,

Glenn Thibeault
Minister

Enclosures

c: Dan Moulton, Senior Advisor (Communications), Ministry of Energy

Ontario

**Order in Council**
**Décret**

On the recommendation of the undersigned, the Lieutenant Governor of Ontario, by and with the advice and concurrence of the Executive Council of Ontario, orders that:

Sur la recommandation de la personne soussignée, la lieutenante-gouverneure de l'Ontario, sur l'avis et avec le consentement du Conseil exécutif de l'Ontario, décrète ce qui suit:

**WHEREAS** Ontario's 2013 Long-Term Energy Plan stated that the connection of twenty one remote First Nation communities and the Line to Pickle Lake are priorities for Ontario.

**AND WHEREAS** Ontario has determined the benefit of expanding Ontario's transmission system in order to connect the sixteen remote First Nation communities in Appendix A to the provincial electricity grid (the "Remotes Connection Project");

**AND WHEREAS** the Remotes Connection Project will also require enhancement of the existing transmission system that includes a new transmission line originating in or at a point between Ignace and Dryden to increase supply to Pickle Lake (the Line to Pickle Lake);

**AND WHEREAS** the Government has determined that the Remotes Connection Project and the Line to Pickle Lake should be undertaken by a transmitter that is best positioned to connect remote First Nation communities in the most timely and cost-efficient manner that protects ratepayer interests;

**AND WHEREAS** the Government has determined that the preferred manner of proceeding is to require 2472883 Ontario Limited on behalf of Wataynikaneyap Power LP to undertake the development of the Line to Pickle Lake and the Remotes Connection Project, including any and all steps which are deemed to be necessary and desirable in order to seek required approvals;

**AND WHEREAS** the Minister of Energy has, with the approval of the Lieutenant Governor in Council, the authority to issue Directives pursuant to section 28.6.1 of the *Ontario Energy Board Act, 1998,* which relate to the construction, expansion or re-enforcement of transmission systems;

**NOW THEREFORE** the Directive attached hereto is approved.

--------

**ATTENDU QUE** le plan énergétique à long terme de l'Ontario de 2013 a indiqué que le branchement de vingt-et-une collectivités éloignées des Premières Nations et la ligne vers Pickle Lake constituent des priorités pour l'Ontario.

**ET ATTENDU QUE** l'Ontario a déterminé l'avantage de prolonger le système de transport d'électricité de l'Ontario afin de brancher les seize collectivités éloignées des Premières Nations figurant à l'annexe A au réseau provincial d'électricité (« le projet de branchement des communautés éloignées »);

**ET ATTENDU QUE** le projet de branchement des communautés éloignées nécessitera également d'apporter des améliorations au système existant de transport d'électricité, y compris l'ajout d'une nouvelle ligne provenant d'un point entre Ignace et Dryden pour augmenter l'alimentation de Pickle Lake (la ligne vers Pickle Lake);

**ET ATTENDU QUE** le gouvernement a déterminé que le projet de branchement des communautés éloignées et la ligne vers Pickle Lake devraient être entrepris par le transporteur le mieux placé pour assurer le branchement des communautés éloignées des Premières Nations aussi rapidement et efficacement que possible afin d'assurer la protection des intérêts des usagers de l'électricité;

**ET ATTENDU QUE** le gouvernement a déterminé que la manière privilégiée pour ce faire est d'engager 2472883 Ontario Limited au nom de Wataynikaneyap Power LP pour entreprendre les travaux de la ligne de Pickle Lake et du projet de branchement des communautés éloignées, y compris toutes les étapes jugées nécessaires et souhaitables en vue de l'obtention des approbations nécessaires;

**ET ATTENDU QUE** le ministre de l'Énergie détient, avec l'approbation du lieutenant-gouverneur en conseil, l'autorité de publier des directives en vertu de l'article 28.6.1 de la *Loi de 1998 sur la*

*Commission de l'énergie de l'Ontario* liées à la construction, à l'expansion ou au renforcement des systèmes de transport d'électricité;

**POUR CES MOTIFS,** la directive jointe aux présentes est approuvée.

**Recommended:** Minister of Energy
**Recommandé par:** Ministre de l'Énergie

**Concurred:** Chair of Cabinet
**Appuyé par:** Le président/la présidente du Conseil des ministres,

**Approved and Ordered:**
**Approuvé et décrété le:** JUL 20 2016

**Lieutenant Governor**
**La lieutenante-gouverneure**

## MINISTER'S DIRECTIVE

## TO: THE ONTARIO ENERGY BOARD

I, Glenn Thibeault, hereby direct the Ontario Energy Board ("the Board") pursuant to section 28.6.1 of the *Ontario Energy Board Act, 1998* as follows:

1. The Board shall amend the conditions of 2472883 Ontario Limited on behalf of Wataynikaneyap Power LP's ("Wataynikaneyap Power LP") electricity transmission licence to include a requirement that Wataynikaneyap Power LP proceed to do the following related to expansion of the transmission system to connect the sixteen remote First Nation communities listed in Appendix A (collectively the "Remote Communities") to the provincial electricity grid:

    (i) Develop and seek approvals for a transmission line, which shall be composed of a new 230 kV line originating at a point between Ignace and Dryden and terminating in Pickle Lake (the "Line to Pickle Lake"). The development of the Line to Pickle Lake shall accord with the scope recommended by the Independent Electricity System Operator.

    (ii) Develop and seek approvals for the transmission lines extending north from Red Lake and Pickle Lake required to connect the Remote Communities to the provincial electricity grid. The development of these transmission lines shall accord with the scope supported by the Independent Electricity System Operator.

2. The Board shall require that Wataynikaneyap Power LP provide such reporting to the Board as the Board may consider appropriate, with respect to budget, timing, and risks in relation to the development of the projects referred to in paragraph 1.

3. The Board shall make the amendments to the electricity transmission licence of Wataynikaneyap Power LP without holding a hearing.

Minister of Energy

## DIRECTIVE DU MINISTRE

**DESTINATAIRE : COMMISSION DE L'ÉNERGIE DE L'ONTARIO**

Je, Glenn Thibeault, émets par les présentes à la Commission de l'énergie de l'Ontario (« la commission ») en vertu de l'article 28.6.1 de la *Loi de 1998 sur la Commission de l'énergie de l'Ontario* la directive suivante :

1. La commission modifiera les conditions du permis de 2472883 Ontario Limited au nom de Wataynikaneyap Power LP (« Wataynikaneyap Power LP ») pour exiger que Wataynikaneyap Power LP procède aux travaux nécessaires à l'expansion du système de transport d'éléctricité visant à brancher les seize collectivités éloignées des Premières Nations énumérées à l'annexe A (collectivement appelées « collectivités éloignées ») au réseau provincial d'électricité :

    (i) Définir et soumettre les demandes d'approbation d'une ligne de transport d'électricité, laquelle sera composée d'une nouvelle ligne de 230 kV provenant d'un point situé entre Ignace et Dryden et se terminant à Pickle Lake (la « ligne vers Pickle Lake »). La mise en place de la ligne vers Pickle Lake sera conforme à la portée recommandée par la Société indépendante d'exploitation du réseau d'électricité.

    (ii) Définir et soumettre les demandes d'approbation des lignes de transport d'électricité s'étendant au nord à partir de Red Lake et de Pickle Lake requises pour assurer le branchement des collectivités éloignées au réseau provincial d'électricité. La mise en place de ces lignes de transport sera conforme à la portée appuyée par la Société indépendante d'exploitation du réseau d'électricité.

2. La commission exigera de Wataynikaneyap Power LP qu'elle rende compte à la commission, comme la commission le juge approprié, relativement aux budgets, au calendrier et aux risques liés à la réalisation des projets énoncés au paragraphe 1.

3. La commission apportera les modifications nécessaires au permis de transport d'électricité de Wataynikaneyap Power LP sans tenir d'audience.

# Appendix D: Customer Satisfaction Survey Results

**Report on**
**Customer Service Research**

*Prepared for Hydro One*
*Remote Communities*

August 2015

**Viewpoints Research**
Winnipeg, Manitoba
(204) 988-9253
www.viewpoints.ca

# TABLE OF CONTENTS

# EXECUTIVE SUMMARY

On behalf of Hydro One, Viewpoints Research conducted a telephone survey of 205 Hydro One Remote Communities' residential, business and government-supported organization customers from June to August 2015.

Where possible, the survey tracks findings from six previous waves of customer surveys conducted approximately every two years since 2003. Home Heating Sources

## Sources of Heating Energy

Almost two thirds of respondents indicated they heat their homes primarily with wood (64%), while 16% heat primarily with electricity, 14% with oil and 5% use propane.

A majority of respondents indicated they also use a secondary source of energy to heat their homes (56%), including 36% who use electricity, 11% who use wood, 6% who mentioned oil and 3% who said propane.

More than half of respondents mentioned electricity as either their primary or secondary source of home heating energy (51%).

## Appliances at Home

Eight in ten respondents have a clothes dryer (83%) and slightly fewer have an electric stove (79%), while 64% have a stand-alone freezer and 56% have an air conditioner.

Only one in three respondents have a block heater for their car or truck (33%).

## Satisfaction with Electrical Service

Overall satisfaction with the electrical service they receive from Hydro One Remotes, is 91%, similar to levels recorded in 2009 (91%) and 2011 (90%), but down from 2013's high of 97%.

## Reasons for Customer Satisfaction

Having electricity available when they want it continues to be the main driver of satisfaction with Hydro One electrical service (65%). Satisfaction with this attribute increased 11 points since 2013 (51%) and 25 points since 2009 (40%).

Approximately one in three customers attributed their satisfaction to good or improved service (20%), or improved reliability (12%). Satisfaction with customer service, generally, has held steady during this time, with one in ten customers indicating this is why they are satisfied (10%).

## Reasons for Customer Dissatisfaction

There were 13 dissatisfied customers in this research. High rates (85%) and unreliable service (31%) were mentioned as reasons these customers are not satisfied. These reasons are consistent with those given in past waves of research.

## Perceptions of Reliability

The proportion of customers who believe the reliability of their hydro service has improved in the past few years has remained at or above 24% since 2009. This year, 25% said they believe reliability has improved, while two thirds of customers said it has stayed about the same (67%).

## Bill Payment

More than 7 in 10 customers indicated they are the person who usually (67%) or sometimes (5%) pays the hydro bill.

Among those who said they usually or sometimes pays the hydro bill (N=134), perceptions regarding the accuracy of Hydro One's billing has dropped somewhat since 2013 but is still among the highest levels recorded since 2003. In this wave 25% said their Hydro One bill is always correct, down from 36% in 2013 but higher than 2011 when it was 22%. In addition, 48% of respondents said their bill is usually correct, for a total of 73%, down 6 points over 2013 results. In total, 13% of customers said their bills were either not correct very often (6%) or never correct (7%), up 7 points over 2013 results. Consistent with previous years, 15% of respondents were unsure how to answer this question.

## Customer Contact

Four in ten customers said they contacted Hydro One in the past year (42%) compared to 38% in 2013 and 44% in 2011. As in previous years, the most common reason customers contacted the utility was to discuss their bill (26%). Other reasons for contact include customers needing information (17%) or the power being out (9%).

Customer satisfaction with how Hydro One Remotes handled their contact dropped 12 points to 76% after 2013's record high of 88%, but is still the second highest satisfaction rating since tracking began. Those who said they were very satisfied with their contact with Hydro One is down 13 points to 33%, its lowest level since 2007 (25%).

## Factors Driving Perceptions & Satisfaction with Service

The research tested customers' agreement with a number of statements related to customer service, to explore customers' experiences and perceptions in key service areas. Hydro One Remote Communities scored best at **dealing with emergencies** (80% agree overall) and **staff being polite and friendly** (75%). Customers were less likely to agree that **when they call the Hydro One office someone usually answers quickly,** though a majority still agreed (62%).

Agreement with each of these statements dropped when compared to results in 2013 and, in the case of the first two statements, to their lowest levels since tracking began. Overall agreement with the third statement dropped three points to 62%, one point higher than its lowest level in 2011 (61%).

## What Hydro One Can Do to Improve Service to Customers

When asked what Hydro One Remotes could be doing to improve service to customers, the most frequently mentioned improvement is lowering rates (18%).

The desire for better communications was mentioned by 8% of respondents, while reducing the number of outages and using better equipment and supplies were each mentioned by 6% of respondents.

## Informing Customers of Planned Outages

The perception that Hydro One informs customers and communities when power will be turned off for scheduled maintenance and service improvements has dropped slightly since 2013. The view that Hydro One always informs them lost 11 points to 44%, while those who feel they do so usually is up 4 points to 31%, and those who say they are informed sometimes is up 2 points to 12%.

Those who feel Hydro One never informs customers about planned outages doubled to 8% since 2013.

## Staff is Polite & Helpful

Two thirds of customers indicated that Hydro One Remote Communities staff is generally polite and helpful when they come to their community to do things such as bring the electricity back on (66%), down 9 points since 2013 and at its lowest level since tracking began on this question in 2009. Just 1% of customers said staff are not polite and helpful, an improvement over 2013 (2%), 2011 (5%) and 2009 (3%).

## Awareness of Local Staff

Awareness of who the local Hydro One operator is steadily rising, up 8 points to 70% in this wave of research, while 30% do not know the local operator, down 7 points. Awareness is also higher than 2011 and 2009 when 59% said they knew who their local Hydro One operator was.

More than seven in ten respondents know who their meter reader is (73%), up 6 points from 2013 and at its highest level over four waves of tracking. One in three customers surveyed admitted they do not know their local meter reader (27%), down 7 points.

## Environmental Protection

Fewer than two thirds of respondents said Hydro One takes environmental protection in the community seriously (63%), down 3 points since 2013. About one in ten said Hydro One does not take it seriously (9%), also down 3 points since the last wave of research. More than one quarter of respondents were unsure (28%), up 6 points.

## Energy Efficiency Incentives

Asked if they are aware that Hydro One will provide them with mail-in rebates of up to $200 when they buy energy efficient appliances, three in ten said they know about this program (31%) but a majority of customers said they did not (69%).

Hydro One also operates a program called LEAP, which gives low-income residential customers up to $600 a year to help them pay their electricity bill to avoid disruptions to their service. Awareness of this program is up 6 points to 18% since 2013 but four in five respondents were not aware of the program (81%).

One in four respondents were aware that communities like theirs can generate renewable electricity through solar, wind or small hydro water projects and sell it back to Hydro One Remotes (25%), while almost three times as many were not aware of this opportunity (74%).

## Hydro Rates

A majority of Hydro One Remotes customers believe their Hydro rates are either the same as the rest of Ontario (32%) or higher (40%), while one in four are unsure (24%). Just 3% of customers believe their rates are lower.

A majority of Hydro One Remotes customers are not willing to pay more for electricity generated from renewable sources such as water, solar or wind (51%), while fewer than one in five said they would be (18%). Three in ten are unsure (31%).

## Communication Materials

Survey respondents were asked if they look at *Connected*, the newsletter Hydro One Remotes mails to them. More than four in ten respondents said they look at or read the newsletter (43%) and, of these (N=79), nine in ten said they find the information helpful or interesting (89%).

## Internet Access & Usage

Approximately two thirds of customers said they have regular access to the internet (64%), down 5 points from 2013, while a third do not (35%).

Among those customers with regular access (N=119), two thirds think they would be likely to use the internet to get information from Hydro One such as their electricity bill and information about planned power outages (66%). This is similar to 2013 results.

One in four said they would not use the internet to access this type of information (30%) while 4% could not say whether they would or would not use it, or said it would depend.

# GOALS & METHODOLOGY

## Goals

On behalf of Hydro One Remote Communities, Viewpoints Research conducted telephone interviews with the utility's residential, commercial and government-supported organization customers from June 22 to August 7, 2015. Many of the questions included in this survey have been tracked from earlier customer surveys administered about every two years since 2003. The research explored the following:

- Primary and secondary sources of home heating energy,
- The incidence of specific electric appliances in homes in served by Hydro One Remotes,
- Overall satisfaction with the electricity service provided by Hydro One (tracked since 2003),
- Customers' views on the accuracy of their bills (since 2005),
- Contact with Hydro One Remote Communities and perceptions of the utility's customer service. Customers who had contacted Hydro One in the past year were asked questions evaluating this specific experience, while all customers were asked to provide their general impressions (general questions tracked since 2005),
- Initiatives Hydro One could take to improve customer service,
- Awareness of local Hydro One staff,
- Perceptions of Hydro One's commitment to environmental protection in their communities,
- Perceptions of their electricity rates relative to others in the province and their openness to paying higher rates for electricity from renewable sources,
- Awareness and use of programs or services offered by Hydro One to help customers upgrade to energy efficient appliances and provide financial assistance for low income residential customers,
- Awareness of communications by Hydro One, and whether or not customers find the information helpful or interesting, and

- Internet access and the likelihood of internet usage among customers to retrieve billing information and alerts about planned power outages.

## Methodology

Sample was drawn from listed and unlisted telephone numbers in the Hydro One Remote Communities' service area. Hydro One Remote Communities has about 3,536 customers in 21 communities. This year 185 customers were interviewed, including 168 residential customers, 7 business customers and 10 government-supported organizations. The survey has an overall confidence level of ±7%, nineteen times out of twenty.

The findings of this research were cross tabulated by the following demographic and attitudinal variables:

- Community,
- Main heat source,
- Type of service (residential, commercial, government-supported organization),
- Satisfaction with electrical service,
- Whether or not customers have contacted Hydro One in the last year,
- Gender, and
- Age.

## Reporting

This summary report highlights the overall views and perceptions of Hydro One Remote Communities customers. When the attitudes of a particular set of customers is statistically different from customers overall, this will be noted in the report in a bulleted point. The report also compares the findings to results from 6 previous waves of research conducted every two years since 2003.

There are significant differences of opinion among residents of the different communities served by Hydro One Remote Communities, however these results should be interpreted with caution since the number of respondents in most communities is very small. Caution should be applied, generally, when considering differences among sub-groups with fewer than 100 respondents.

# SUMMARY OF RESEARCH FINDINGS

## Profile of Survey Respondents

The following table summarizes the demographic attributes of all respondents participating in the research since 2003. The characteristics of customers participating in this research have generally remained consistent over time.

Table 1: **Respondent Profile**

| Respondent Profile | 2015 | 2013 | 2011 | 2009* | 2007 | 2005 | 2003 |
|---|---|---|---|---|---|---|---|
| **Customer Type** | | | | | | | |
| Home | **91%** | 82% | 89% | 87% | 81% | 82% | 96% |
| Business | **4%** | 10% | 5% | 7% | 6% | 8% | 2% |
| Government funded | **6%** | 9% | 6% | 6% | 13% | 10% | 2% |
| **Age** | | | | | | | |
| 18 – 24 years | **7%** | 8% | 6% | 8% | 13% | 10% | 13% |
| 25 – 34 years | **15%** | 15% | 17% | 20% | 26% | 23% | 22% |
| 35 – 44 years | **12%** | 19% | 19% | 21% | 24% | 28% | 26% |
| 45 – 54 years | **23%** | 26% | 21% | 21% | 20% | 23% | 21% |
| 55 – 64 years | **22%** | 16% | 22% | 19% | 11% | 10% | 11% |
| 65 years and older | **22%** | 15% | 15% | 11% | 5% | 4% | 7% |
| **Gender** | | | | | | | |
| Men | **54%** | 50% | 56% | 60% | 54% | 56% | 54% |
| Women | **46%** | 50% | 44% | 40% | 46% | 44% | 46% |

Tallies may not equal 100%. Customers who were unsure are not included.

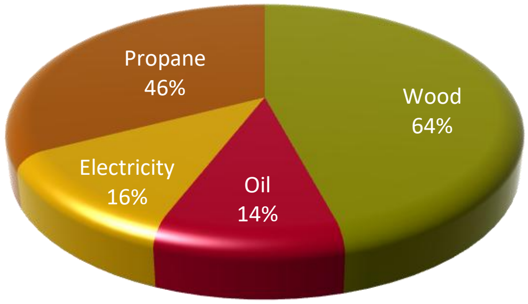
*Research conducted in 2009/2010 is reported as 2009 in this document.

## Home Heating Sources

### *Primary Source of Heating Energy*

Almost two thirds of respondents indicated they heat their homes primarily with wood (64%), while 16% heat primarily with electricity, 14% with oil and 5% use propane.

Chart 1: **Primary Source of Heating Energy**

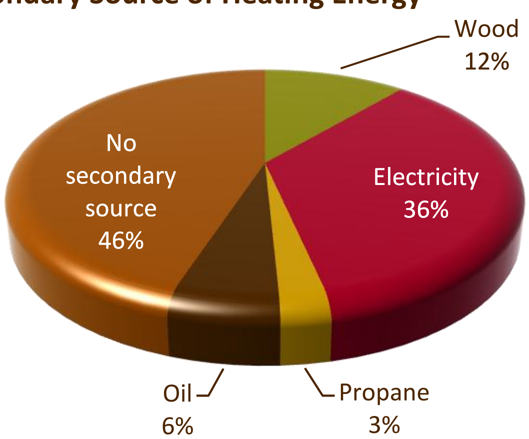


- Electricity is the primary source of heating energy in 100% of those interviewed in Hillsport/Mobert (4N). No respondents in the following communities heat primarily with electricity: Armstrong/Whitesands/Collins (3N), Bearskin Lake (9N), Fort Severn (5N), Gull Bay (9N), Lansdowne House/Neskantaga (6N), Marten Falls/Ogoki (2N), Sultan (14N), Wapekeka/Angling Lake (6N) and Webequie (7N).
- Men were more likely to say their households are heated primarily with wood (73% of 100N) than women (53% of 85N), while women were more likely to say their households are heated with electricity (20% vs. 12% men), propane (9% vs. 2% men) or oil (15% women vs. 13% men).

When asked, a majority of respondents indicated they also use a secondary source of energy to heat their homes (56%), including 36% who use electricity, 11% who use wood, 6% who mentioned oil and 3% who said propane.

More than half of respondents mentioned electricity as either their primary or secondary source of home heating energy (51%).

Chart 2: **Secondary Source of Heating Energy**

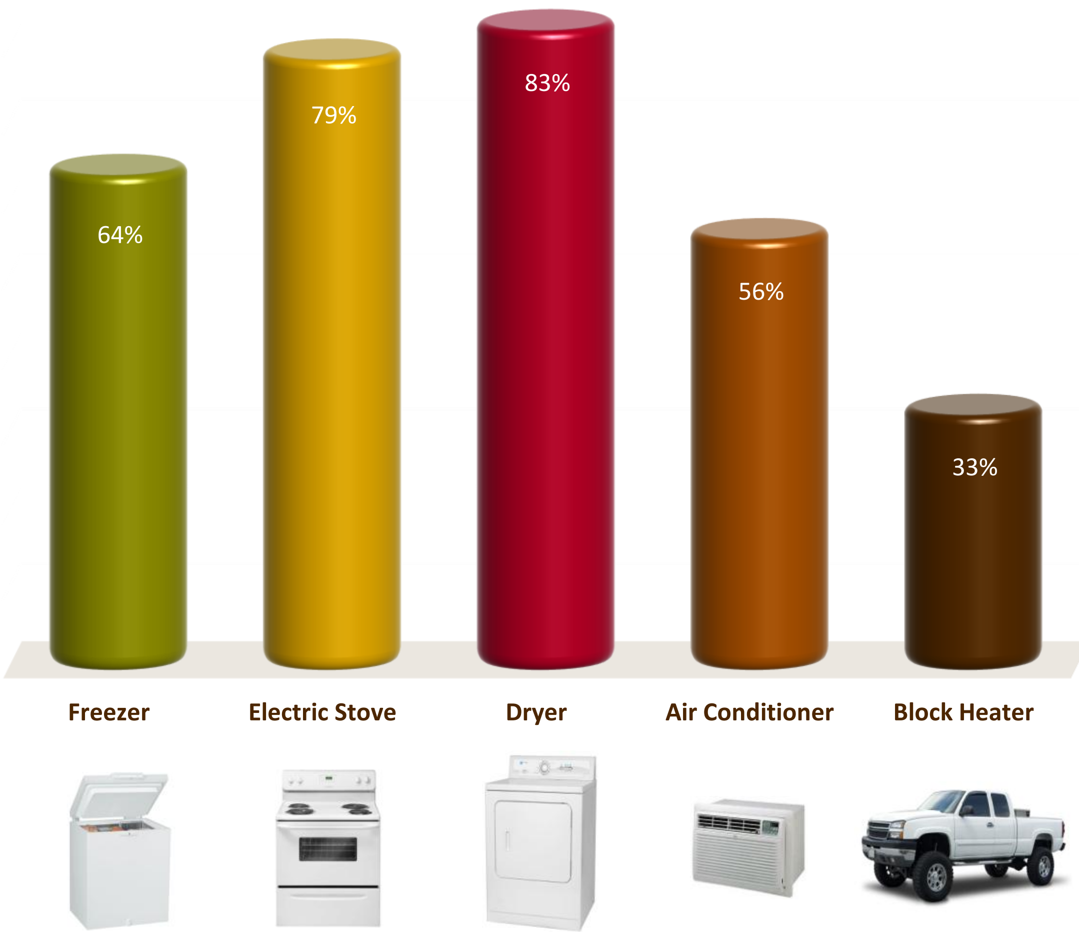


## Appliances at Home

Eight in ten respondents have a clothes dryer (83%) and slightly fewer have an electric stove (79%), while 64% have a stand-alone freezer and 56% have an air conditioner.

Only one in three respondents have a block heater for their car or truck (33%).

Chart 3: **Appliances at Home**

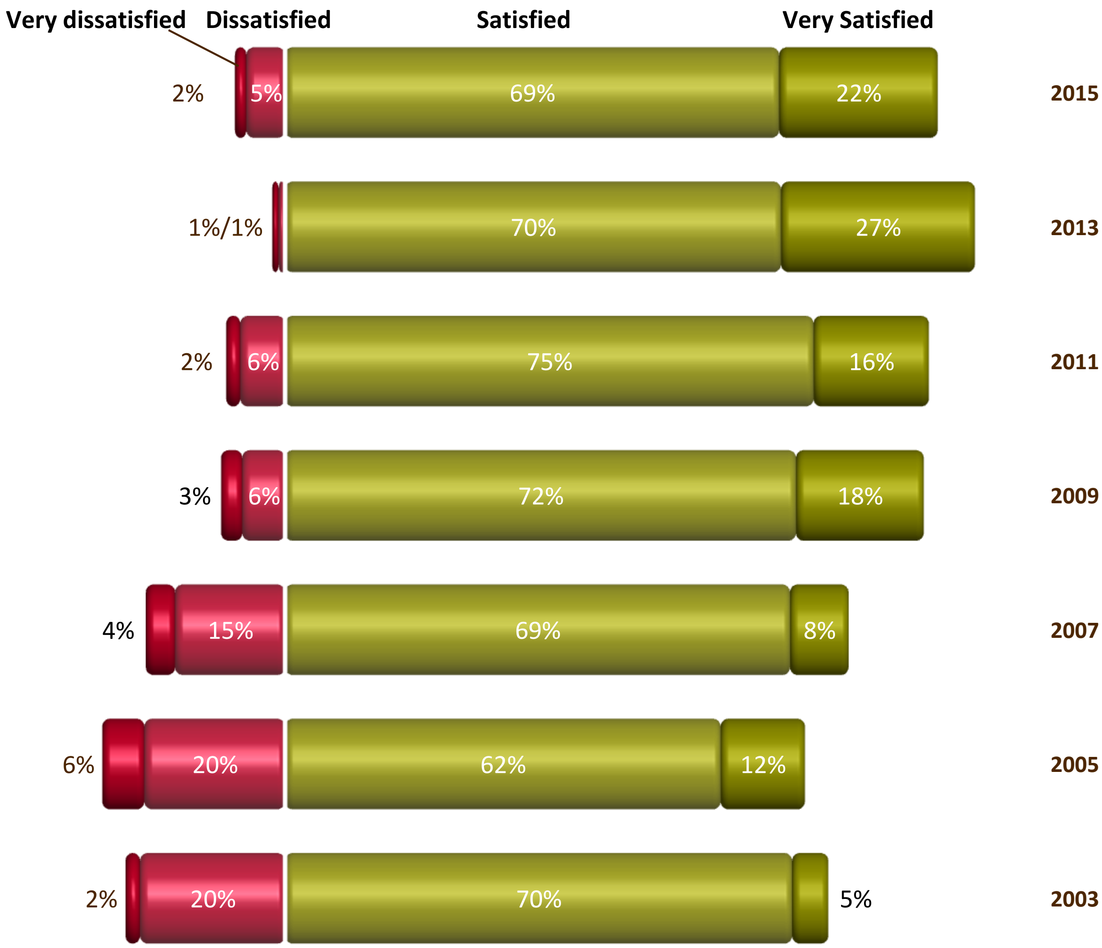


## Satisfaction with Electrical Service

### *Satisfaction with Electrical Service*

Overall satisfaction with the electrical service they receive from Hydro One Remotes, is 91%, similar to levels recorded in 2009 (91%) and 2011 (90%), but is down from 2013's high of 97%.

Chart 4: **Satisfaction with Electrical Service**



### *Reasons for Customer Satisfaction*

Having electricity available when they want it continues to be the main driver of satisfaction with Hydro One electrical service (65%). Satisfaction with this attribute increased 11 points since 2013 (51%) and 25 points since 2009 (40%).

Approximately one in three customers attributed their satisfaction to good or improved service (20%) or improved reliability (12%). Satisfaction with customer service, generally, has held steady during this time, with one in ten customers indicating this is why they are satisfied (10%).

Table 2 shows all the reasons for satisfaction mentioned and compares this year's results to past waves of research.

Table 2: **Reasons for Customer Satisfaction**

| Reasons for satisfaction | 2015 | 2013 | 2011 | 2009 | 2007 | 2005 | 2003 |
|---|---|---|---|---|---|---|---|
| Electricity there when needed | **65%** | 51% | 49% | 40% | 42% | 43% | 43% |
| Good/improved service | **20%** | 15% | 26% | 18% | 20% | 19% | 19% |
| Reliability has improved | **12%** | 17% | 25% | 20% | 12% | 10% | 10% |
| Fair rates | **4%** | 6% | 10% | 5% | 5% | 6% | 6% |
| Customer service | **10%** | 10% | 11% | 13% | 3% | 4% | 4% |
| Company doing the best they can | **4%** | 2% | 6% | 5% | 3% | 4% | 4% |
| Environmental practices | **0%** | 1% | 2% | 2% | <1% | 1% | 1% |
| Rates/problems not their fault | **1%** | NA | NA | NA | NA | NA | NA |
| No reason/other/unsure | **12%** | 19% | 10% | 27% | 26% | 26% | 26% |

Percentages do not total 100% because customers were permitted more than one response.

### *Reasons for Customer Dissatisfaction*

There were 13 dissatisfied customers in this research. High rates (85%) and unreliable service (31%) were mentioned as reasons these customers are not satisfied. These reasons are consistent with those given in past waves of research.

Table 3 summarizes the reasons given by customers for their dissatisfaction over the past six waves of research.

Table 3: **Reasons for Customer Dissatisfaction**

| Reasons for dissatisfaction | 2015 | 2013 | 2011 | 2009 | 2007 | 2005 | 2003 |
|---|---|---|---|---|---|---|---|
| **Rates** | | | | | | | |
| Expensive / high rates | **85%** | 50% | 56% | 48% | 64% | 73% | 63% |
| Rates discriminatory / unfair | **NA** | 25% | 8% | 4% | 9% | 14% | 13% |
| **Service Issues** | | | | | | | |
| Power not reliable | **31%** | 50% | 20% | 15% | 22% | 21% | 23% |
| Power quality problems, brownout / problems with appliances | **8%** | 25% | 4% | 11% | 5% | 7% | 21% |
| **Other** | | | | | | | |
| Don't like Hydro One | **NA** | NA | 0% | 5% | 5% | 8% | 3% |
| Bill is confusing | **NA** | 25% | 0% | 4% | 2% | 10% | 8% |
| Community / economy hurt by service / company | **NA** | 25% | 0% | 0% | 2% | 2% | 2% |
| Bad for environment / smelly / noisy | **NA** | 50% | 4% | 0% | 0% | 1% | 0% |
| No reason / other | **23%** | NA | 8% | 7% | 7% | 6% | 2% |

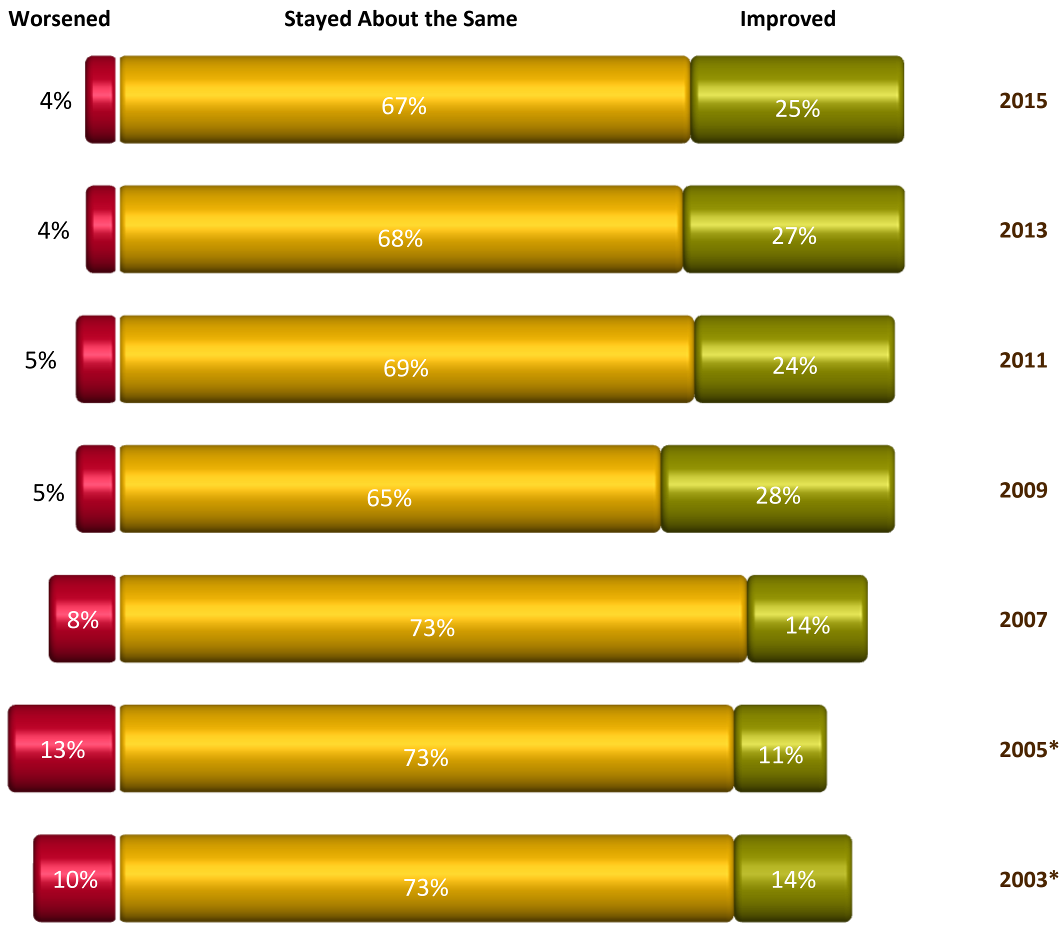
Percentages do not total 100% because customers were permitted more than one response.

### *Perceptions of Reliability*

After remaining stable below 15% from 2003 to 2007, the proportion of customers who believe the reliability of their hydro service has improved in the past few years has remained at or above 24% since. This year, 25% said they believe reliability has improved, while two thirds of customers said it has stayed about the same (67%). Since 2009, the proportion of customers who believe it has worsened has remained consistent at approximately one in twenty (4%).

The following chart illustrates changes in customers' impressions of their electrical service since 2003.

Chart 5: **Impressions of Reliability**



*In these years respondents were given the option to say that reliability has worsened/improved somewhat or a lot. These responses have been combined on this chart.

- Those most likely to think hydro reliability has improved reside in Marten Falls/Ogoki (100% on 2N), Webequie (57% 7N) and Kingfisher Lake (57% of 7N).
- Those most likely to think hydro reliability has worsened live in Hillsport/Mobert (50% of 4N) and Fort Severn (20% of 5N).
- Men are more likely to think hydro reliability has improved (34% vs. 14% women), while women are more likely to think it has stayed about the same (75% vs. 60% men).

## Bill Payment

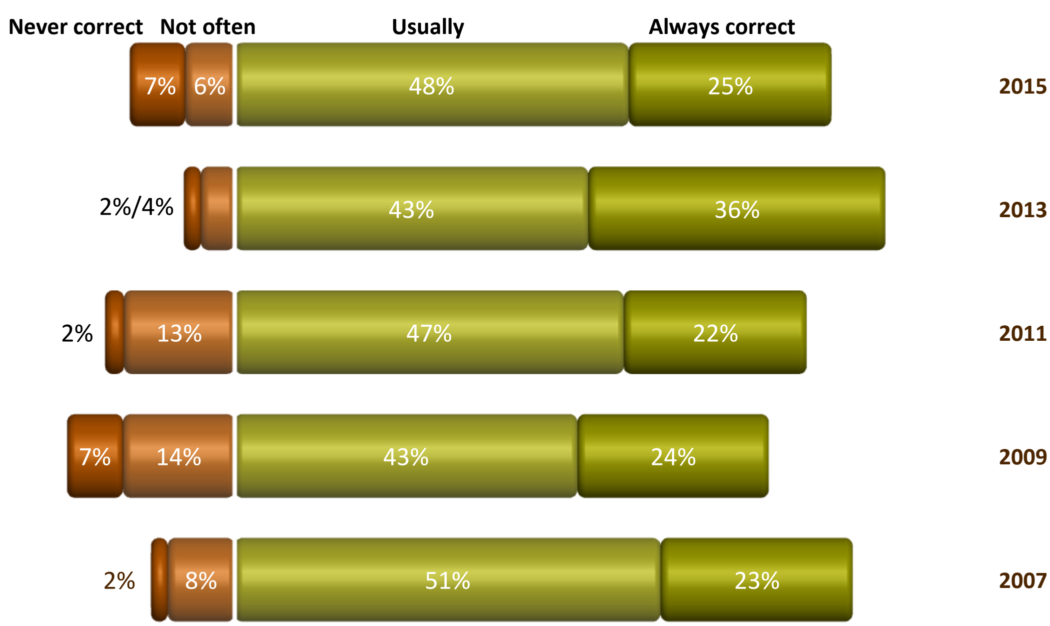
### *Billing Accuracy*

More than 7 in 10 customers indicated they are the person who usually (67%) or sometimes (5%) pays the hydro bill.

- Responsibility for paying the Hydro bill increases with age from 38% of those 18 to 34 (39N) to 79% of those 55+ (81N).
- Those who are responsible for paying the Hydro bill are more likely to have contacted Hydro last year (78% of 77N), compared to respondents overall (67%).
- Those contacted at home are more likely to be responsible for paying the Hydro bill (70% 168N) compared to those in government-supported organizations (50% of 10N) or businesses (29% of 7N).

Among those who said they usually or sometimes pays the hydro bill (N=134), perceptions regarding the accuracy of Hydro One's billing has dropped somewhat since 2013 but is still among the highest levels recorded since 2003. In this wave 25% said their Hydro One bill is always correct, down from 36% in 2013 but higher than 2011 when it was 22%. In addition, 48% of respondents said their bill is usually correct, for a total of 73%, down 6 points over 2013 results. In total, 13% of customers said their bills were either not correct very often (6%) or never correct (7%), up 7 points over 2013 results. Consistent with previous years, 15% of respondents were unsure how to answer this question.

Chart 6: **Billing Accuracy**



- Respondents contacted at government-supported organizations are more likely to feel their hydro bill is not very often correct (43% of 7N), than respondents overall (6%).

## Customer Contact

### *Incidence of Contact*

Four in ten customers said they contacted Hydro One in the past year (42%) compared to 38% in 2013 and 44% in 2011. As in previous years, the most common reason customers contacted the utility was to discuss their bill (26%). Other reasons for contact include customers needing information (17%) or the power being out (9%).

Table 4 shows all responses to this question and compares them to those from previous waves of research.

Table 4: **Customer Contact with Hydro One**

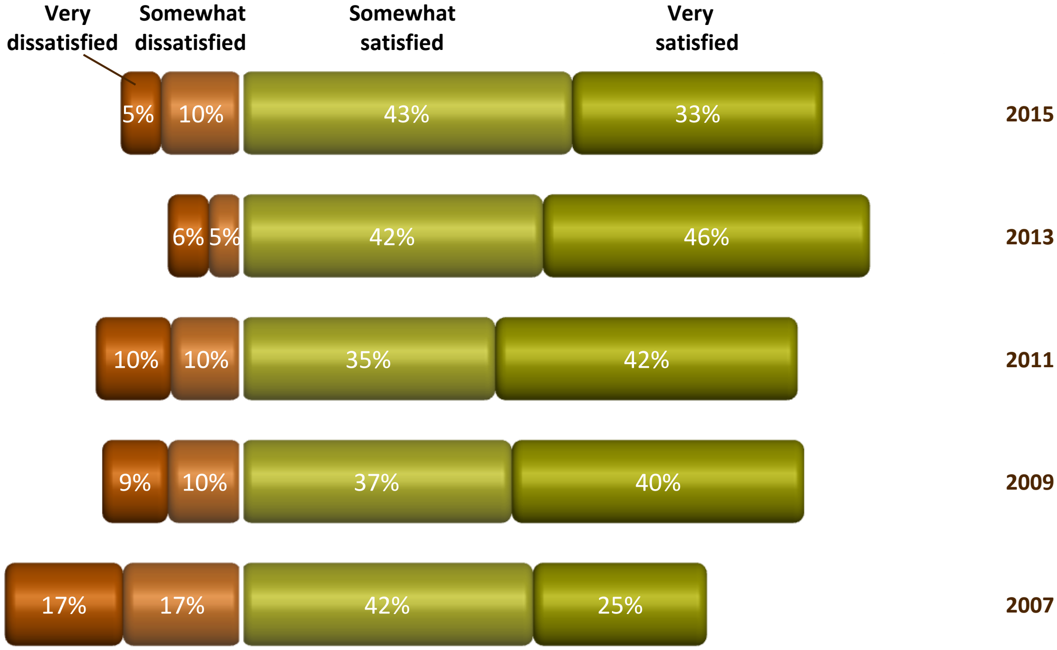
| Nature of Hydro One Inquiries | 2015 | 2013 | 2011 | 2009 |
|---|---|---|---|---|
| About your bill | 26% | 19% | 24% | 20% |
| Because power was out | 9% | 11% | 15% | 15% |
| For information | 17% | 12% | 13% | 18% |
| Another reason | 13% | 9% | 10% | 9% |
| Have not called Hydro One in past year | 58% | 62% | 54% | 57% |
| Don't recall | 0% | 1% | 2% | 2% |

Percentages do not total 100% because customers were permitted more than one response

### *Hydro One Remotes' Handling of Customer Contact*

Customer satisfaction with how Hydro One Remotes handled their contact dropped 12 points to 76% after 2013's record high of 88%, but is still the second highest satisfaction rating since tracking began. Those who said they were very satisfied with their contact with Hydro One is down 13 points to 33%, its lowest level since 2007 (25%).

Chart 7: **Satisfaction with Problem Resolution**



- Respondents whose primary heat source is electricity are most likely to be very satisfied with Hydro One Remotes handling of their problem (45% of 29N) and propane users are least satisfied (0% of 3N), compared to respondents overall (32%). When very satisfied and somewhat satisfied responses are combined, those who heat with wood are most satisfied (83% of 118N) and oil users are least satisfied (50% of 26N), compared to respondents overall (75%).

## Factors Driving Perceptions of Hydro One & Satisfaction with Service

The research tested customers' agreement with a number of statements related to customer service, to explore customers' experiences and perceptions in key service areas. Hydro One Remote Communities scored best at **dealing with emergencies** (80% agree overall) and **staff being polite and friendly** (75%). Customers were less likely to agree that **when they call the Hydro One office someone usually answers quickly,** though a majority still agreed (62%).

Agreement with each of these statements dropped when compared to results in 2013 and, in the case of the first two statements, to their lowest levels since tracking began. Overall agreement with the third statement dropped three points to 62%, one point higher than its lowest level in 2011 (61%).

Table 5: **Perceptions in Key Service Areas**

| Statement | 2015 | 2013 | 2011 | 2009 |
|---|---|---|---|---|
| Hydro One usually deals with emergencies, such as when as the power is out, in a reasonable amount of time. | 80%* (15%) | 88% (18%) | 85% (20%) | 86% (18%) |
| When I call the Hydro One office, the staff are polite and friendly to me. | 75% (17%) | 80% (20%) | 80% (18%) | 80% (20%) |
| When I call the Hydro One office someone usually answers the phone quickly. | 62% (11%) | 65% (11%) | 61% (12%) | 68% (12%) |

*Unbracketed percentages combine agree and strongly agree responses, bracketed percentages are strongly agree responses only.

Percentages do not total 100% because those who were unsure are not included.

- The view that Hydro One staff are polite and friendly is highest in Gull Bay (100% of 9N, including 33% strongly agree) and lowest in Webequie (43% of 7N, including 14% strongly).
- This perception is also highest among those who are generally very satisfied with Hydro One Remotes (39% of 41N), compared to customers overall (17%).

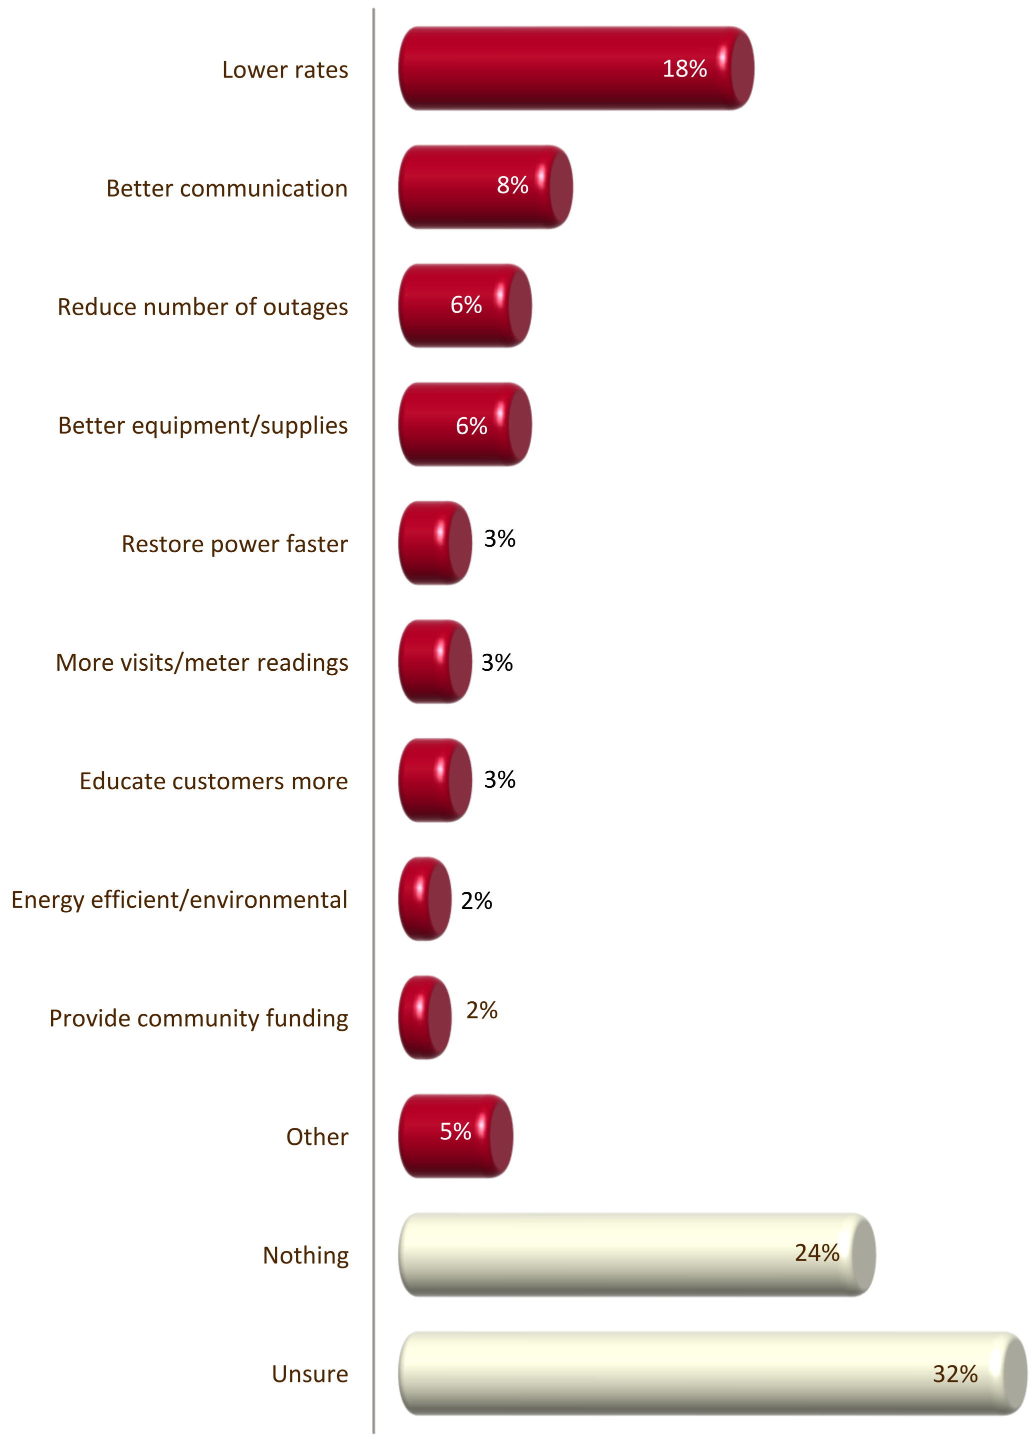
## What Hydro One Can Do to Improve Service to Customers

When asked what Hydro One Remotes could be doing to improve service to customers, the most frequently mentioned improvement is lowering rates (18%).

The desire for better communications was mentioned by 8% of respondents, while reducing the number of outages and using better equipment and supplies were each mentioned by 6% of respondents.

When respondents offered an answer that could not be classified on the list of response categories provided to interviewers, their answers were recorded verbatim by the interviewer (5%). These verbatim responses can be found in Appendix A.

Chart 8: **Ways to Improve Service**

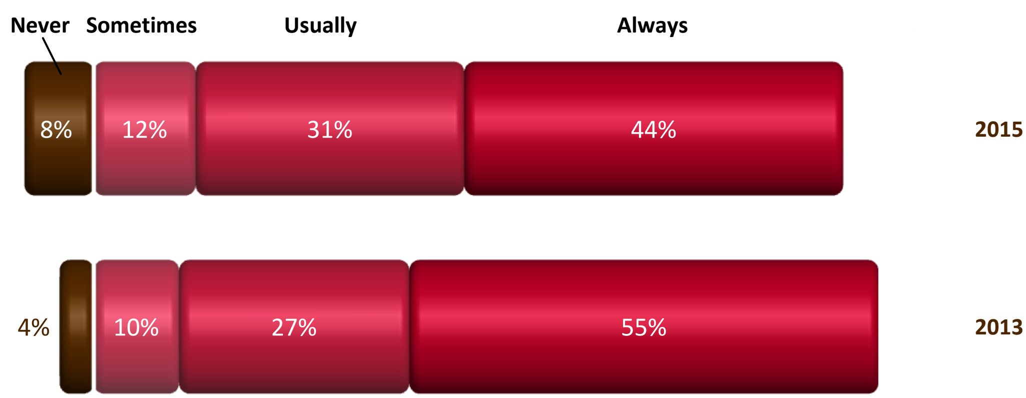


## Informing Customers of Planned Outages

The perception that Hydro One informs customers and communities when power will be turned off for scheduled maintenance and service improvements has dropped slightly since 2013. Those who feel Hydro One always informs them lost 11 points to 44%, while those who feel they do so usually is up 4 points to 31%, and those who say they are informed sometimes is up 2 points to 12%.

Those who feel Hydro One never informs customers about planned outages doubled to 8% since 2013.

Chart 9: **Informing Customers**

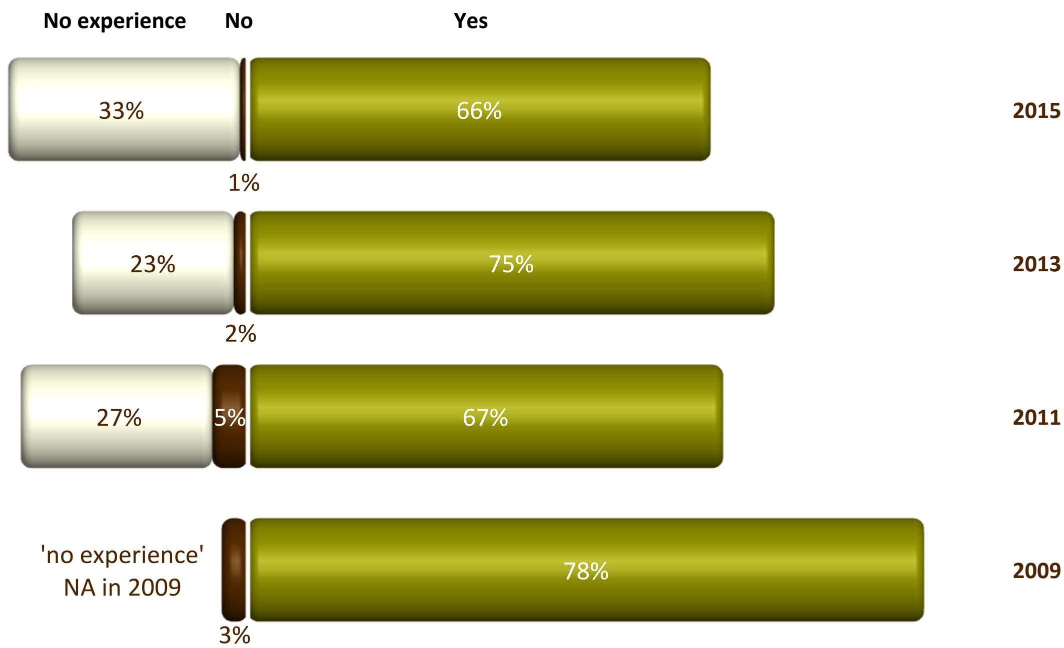


- The perception that Hydro One Remotes always lets its customers know about planned outages is highest among those whose primary heat source is electricity (52% of 29N) and lowest among propane users (10% of 10N).
- Those who are very satisfied with Hydro One Remotes generally are more likely to hold the view that Hydro One lets its customers know about planned outages (71% 41N), compared to respondents overall (44%).

## Staff is Polite & Helpful

Two thirds of customers indicated that Hydro One Remote Communities staff is generally polite and helpful when they come to their community to do things such as bring the electricity back on (66%), down 9 points since 2013 and at its lowest level since tracking began on this question in 2009. Just 1% of customers said staff are not polite and helpful, an improvement over 2013 (2%), 2011 (5%) and 2009 (3%). One in three customers said they do not have enough experience to answer this question, up 10 points since 2013 and above 2011 numbers (27%).

Chart 10: **Staff Polite & Helpful**

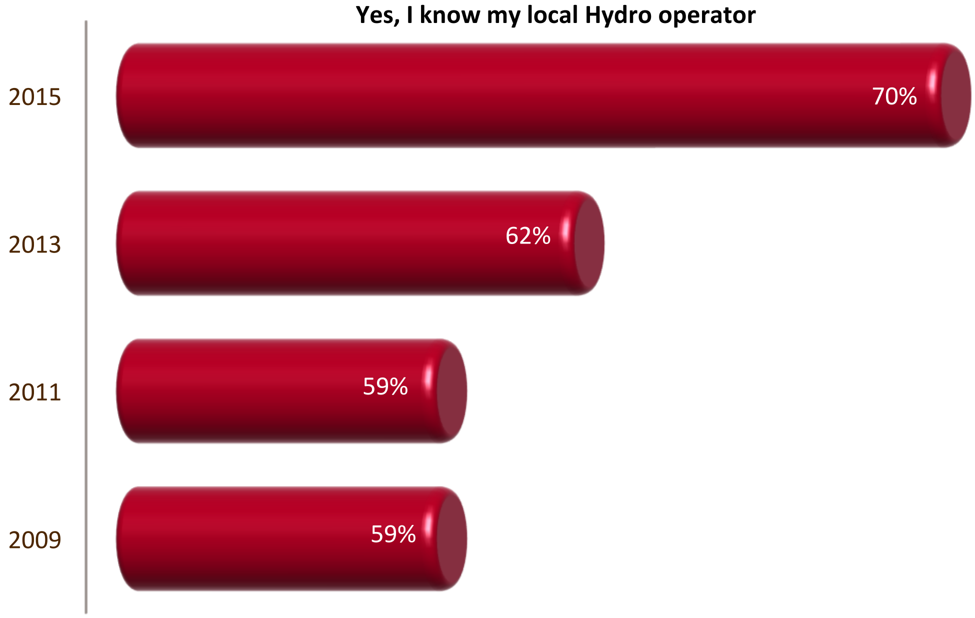


## Awareness of Local Staff

### *Local Operators*

Awareness of who the local Hydro One operator is steadily rising, up 8 points to 70% in this wave of research, while 30% do not know the local operator, down 7 points. Awareness is also higher than 2011 and 2009 when 59% said they knew who their local Hydro One operator was.

Chart 11: **Awareness of Local Operators**

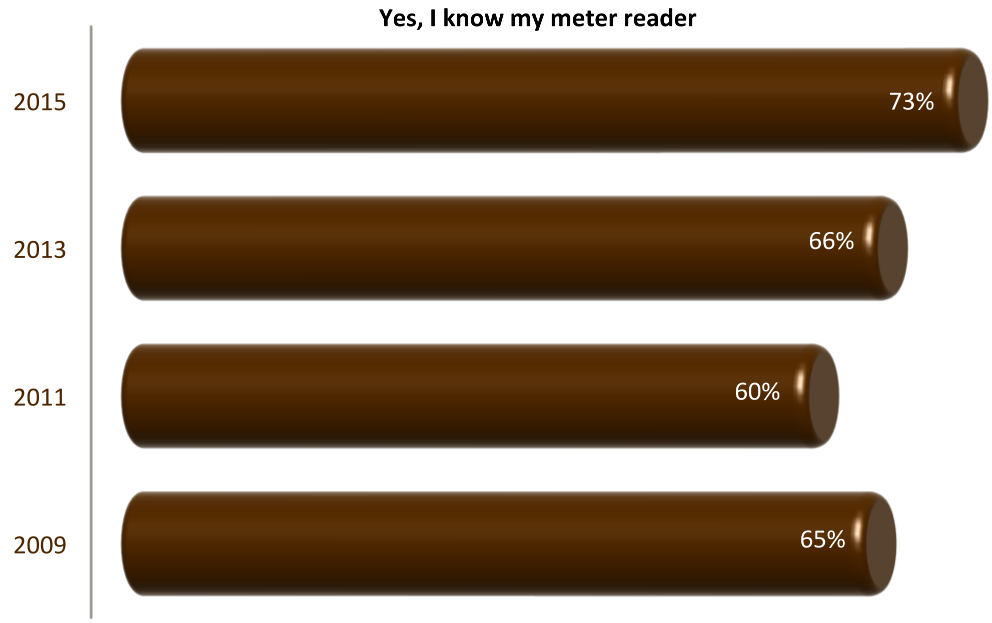


- Those most likely to know their Hydro operator live in: Bearskin Lake (9N), Kingfisher Lake (7N), Lansdowne House/Neskantaga (6N), Marten Falls/Ogoki (2N) and Wapekeke/Angling Lake (6N) (each 100%).
- Those least likely to know their Hydro operator live in: Hillsport/Mobert (0% of 4N) and Armstong/Whitesands/Colins (33% of 3N).
- Those who heat with wood are most likely to know their local Hydro operator (79% of 118N) and those who heat with propane are least likely to (40% of 10N). Those who heat primarily with electricity are less likely to know their local Hydro operator (55% of 29N) than respondents overall (70%).

### *Meter Readers*

More than seven in ten respondents know who their meter reader is (73%), up 6 points from 2013 and at its highest level over four waves of tracking. One in three customers surveyed admitted they do not know their local meter reader (27%), down 7 points.

Chart 12: **Awareness of Hydro Meter Readers**

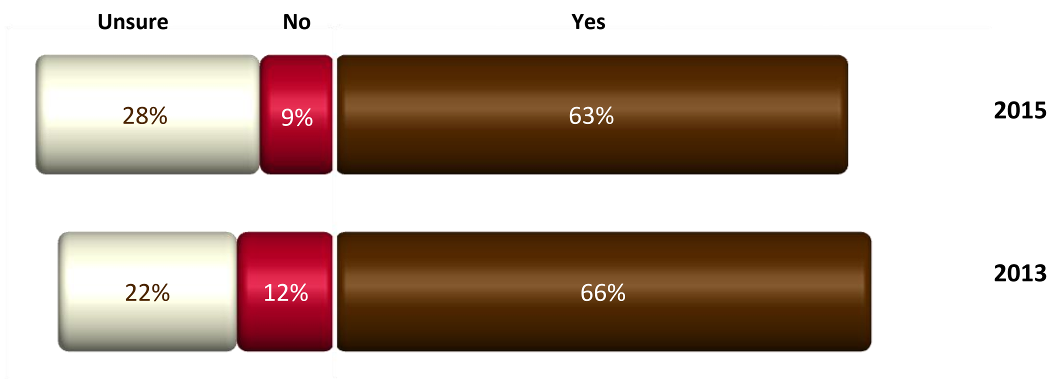


- The communities most likely to know their meter reader are Fort Severn (5N) Marten Falls/Ogoki (2N), Oba (2N), Sultan (14N) and Wapekeka/Angling Lake (6N), (all 100%).
- The communities least likely to know their meter reader are Armstrong/Whitesands/Colins (3N), Gull Bay (9N) and Hillsport/Mobert (4N), all 0%).

## Environmental Protection

Fewer than two thirds of respondents said Hydro One takes environmental protection in the community seriously (63%), down 3 points since 2013. About one in ten said Hydro One does not take it seriously (9%), also down 3 points since the last wave of research. More than one quarter of respondents were unsure (28%), up 6 points.

Chart 13: **Does Hydro Take Local Environmental Protection Seriously?**

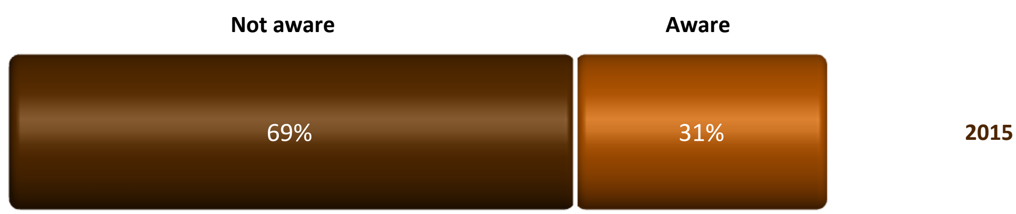


## Energy Efficiency Incentives

### *Appliance Rebates*

Asked if they are aware that Hydro One will provide them with mail-in rebates of up to $200 when they buy energy efficient appliances, three in ten said they know about this program (31%), but a majority of customers said they did not (69%).

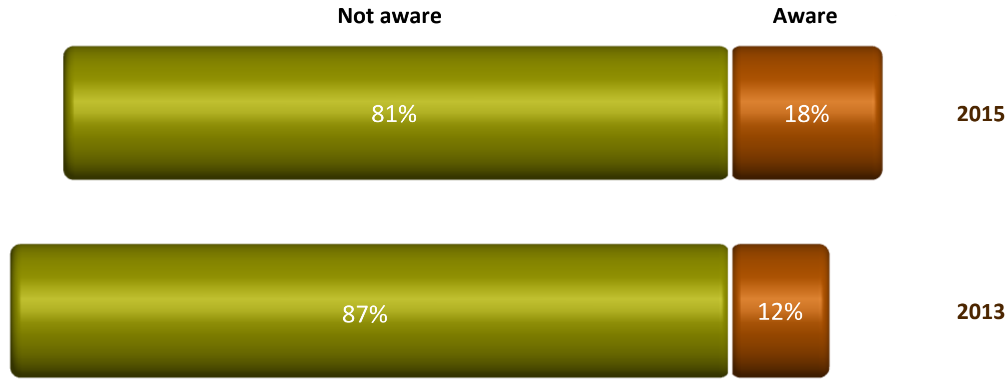
Chart 14: **Mail-In Appliance Rebates**



### *LEAP*

Hydro One operates a program called LEAP, which gives low-income residential customers up to $600 a year to help them pay their electricity bill to avoid disruptions to their service. Awareness of this program is up 6 points to 18% since 2013. Four of five respondents were not aware of the program (81%).

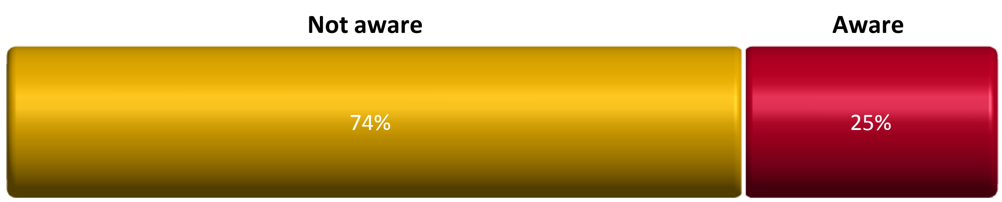
Chart 15: **LEAP Program**



### *Selling Electricity Back to Hydro*

One in four respondents were aware that communities like theirs can generate renewable electricity through solar, wind or small hydro water projects and sell it back to Hydro One Remotes (25%), while almost three times as many were not aware of this opportunity (74%).

Chart 16: **Selling Electricity Back to Hydro**

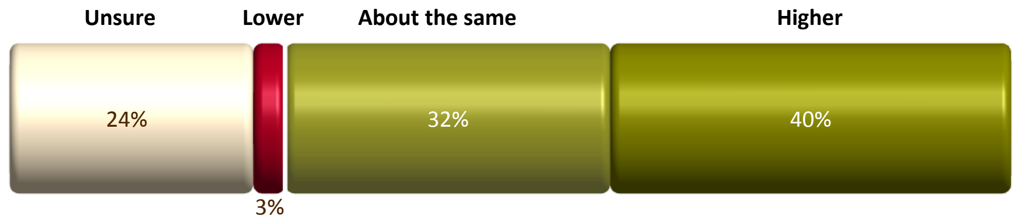


## Hydro Rates

### *Compared to Other Ontarians*

A majority of Hydro One Remotes customers believe their Hydro rates are either the same as the rest of Ontario (32%) or higher (40%), while one in four are unsure (24%). Just 3% of customers believe their rates are lower.

Chart 17: **Hydro Rates Compared to Other Ontarians**

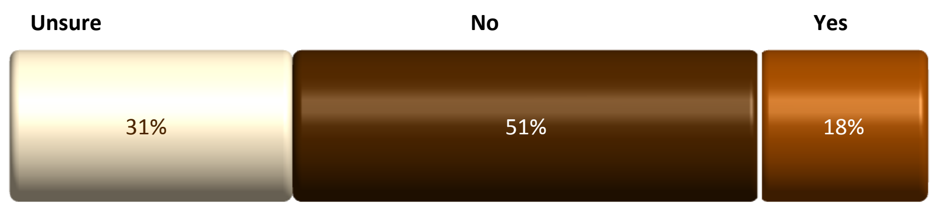


- Residents who are very satisfied are less likely to think their rates are higher than the rest of Ontario (20% of 41N), compared to respondents overall (40%).

### *Willing to Pay More?*

A majority of Hydro One Remotes customers are not willing to pay more for electricity generated from renewable sources such as water, solar or wind (51%), while fewer than one in five said they would be (18%). Three in ten are unsure (31%).

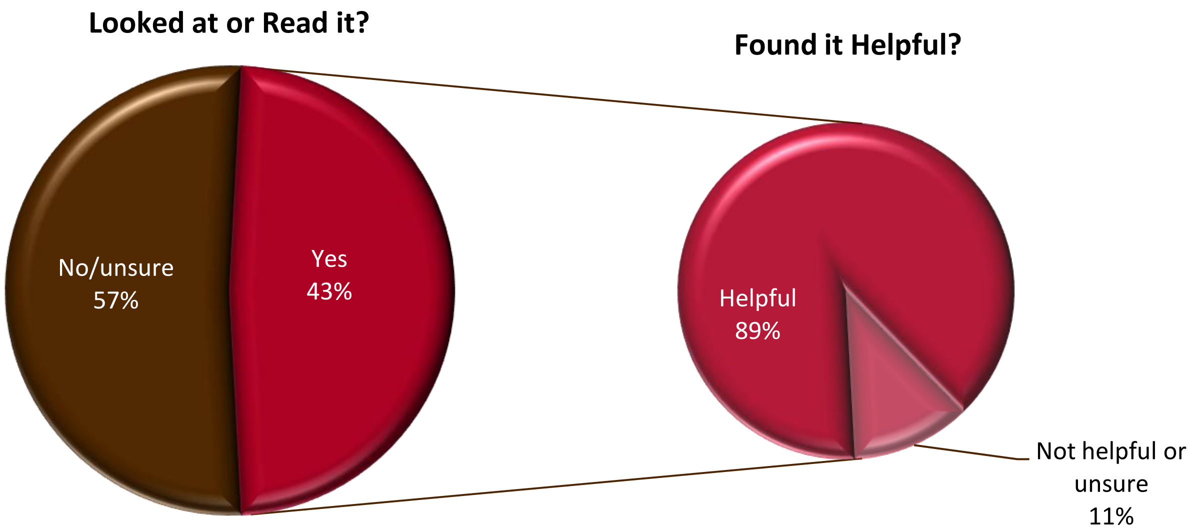
Chart 18: **Willing to Pay More?**



## Communication Materials

Survey respondents were asked if they look at *Connected*, the newsletter Hydro One Remotes mails to them. More than four in ten respondents said they look at or read the newsletter (43%) and, of these (N=79), nine in ten said they find the information helpful or interesting (89%).

Chart 19: ***Connected*, Newsletter from Hydro One Remotes**



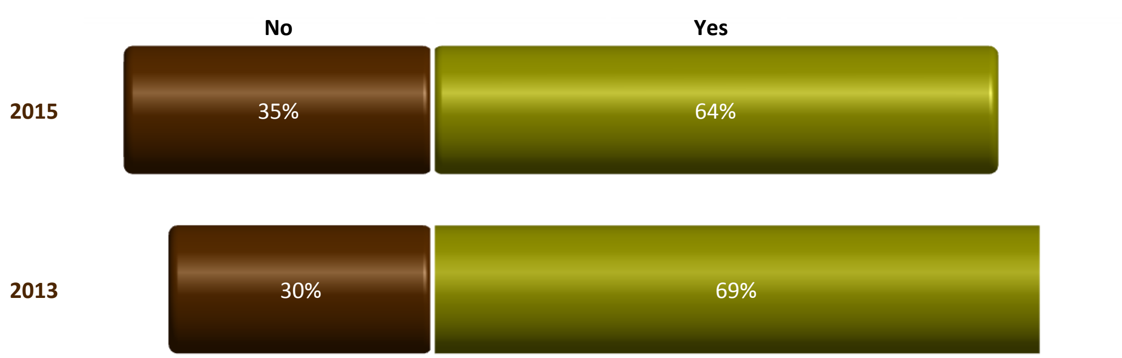
- Residents who had contacted Hydro One Remotes in the past year are more likely to find the newsletter helpful or interesting (100% of 38N), compared to those who did not contact Hydro One (78% of 41N).

## Internet Access & Usage

### *Internet Access*

Approximately two thirds of customers said they have regular access to the internet (64%), down 5 points from 2013, while a third do not (35%).

Chart 20: **Internet Access**



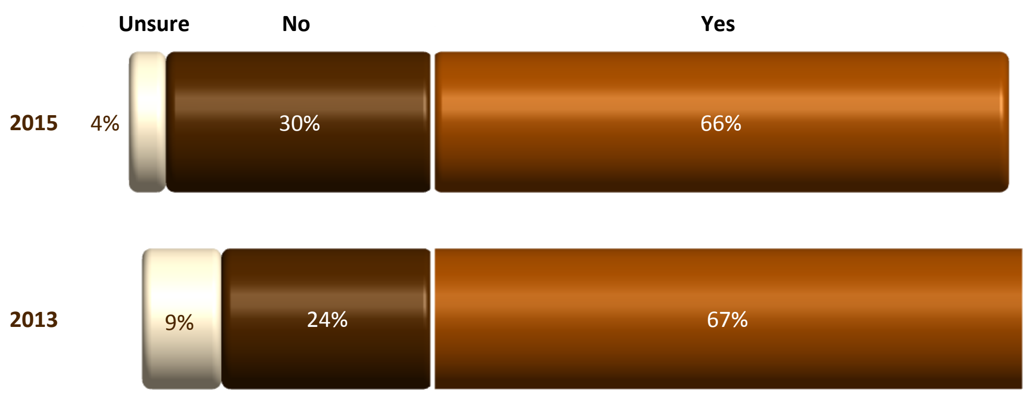
- Internet access is more than twice as high among 18 to 34 year olds (92% of 39N) than those 55+ (44% of 81N).

### *Internet Usage*

Among those customers with regular access (N=119), two thirds think they would be likely to use the internet to get information from Hydro One such as their electricity bill and information about planned power outages (66%). This is similar to 2013 results.

One in four said they would not use the internet to access this type of information (30%) while 4% could not say whether they would or would not use it or said it would depend.

Chart 21: **Internet Usage**



- Businesses (100% of 5N) and those who contacted Hydro One Remotes in the past year (80% of 50N) are more likely to use the internet to get information from Hydro One Remotes, compared to customers overall (66%).

# APPENDIX A

**Q26** What are the most important things that Hydro One Remotes, the company that provides you with electricity, should be doing to improve service to you?

| Community | Ways to Improve Service |
|---|---|
| Armstrong/ Whitesands/Colins | Seasonal rates are too high. |
| Bearskin Lake | Continue advertising their advice to save hydro.<br><br>Give energy conservation stuff like light bulbs. |
| Big Trout Lake/KI | Send surveys to the customers of First Nations.<br><br>Make themselves visible in the community.<br><br>The generator we have is at full capacity. It would be good if they could work on that.<br><br>Have fewer power outages.<br><br>It seems as if, every time they come out to our community when the power goes out, we notice an increase in our hydro bill the next billing cycle, and in the winter it's ridiculously high. |
| Biscotasing | Send out the papers about rebates.<br><br>Stop the power outages.<br><br>Increase reliability.<br><br>Move from the diesel generators and pursue the alternative energy sources including nuclear power generating stations.<br><br>When a brownout occurs, it would be helpful for them to explain why it happened. It would also be helpful to have some information about surges during brownout for the telephone and fridge. Improve communications by phone and cell phone.<br><br>Put in bigger diesels. There are always power outages on long weekends. Sometimes the letters don't correspond with the situation we have here. Fix problems instead of using bandaid solutions. |

| Community | Ways to Improve Service |
|---|---|
| Deer Lake | Get my new house hooked up. I have been waiting 3 years.<br><br>Keep the power on.<br><br>Keep it going.<br><br>Fewer outages.<br><br>There are too many bushes around the hydro poles and wires.<br><br>Make another dam.<br><br>Hook up my new house. It was built 4 or 5 years ago and I still have not been hooked up to hydro. |
| Fort Severn | Provide more and proper installment of lights and wiring and a program that will lower the rates. We need accurate, honest meter readers and we should be informed what our meter readings are. We are never informed by the meter reader.<br><br>Give more information sessions and promotional giveaways so we can get more information. Not everyone reads the pamphlets in the mail. It's just like another flyer. |
| Gull Bay | We like to be informed of planned outages. The hydro operator will turn off the power suddenly without notice. We don't know why. Sometimes it will be off about 5 minutes. |
| Hillsport / Mobert | Read the meter the monthly<br><br>Come down here and let us know what is going on, and what we can do to improve our electricity costs and bring down the bill. They are never helpful. |

| Community | Ways to Improve Service |
|---|---|
| Kasabonika Lake/ Kasabonika | Generate more power. There is not enough power in the community. When they put the Christmas lights out we get a blackout.<br><br>Continue maintaining the power and doing what needs to be done.<br><br>Upgrade the power.<br><br>Have seasonal decreased rates in winter time.<br><br>More of the executives should make long-term trips to these areas. I don't think you know how people live in this community. There has to be more exposure to these lifestyles, and that goes for any business selling services in these areas. |
| Kingfisher Lake | Bring a transmission line in instead of a generator.<br><br>Give discounts in remote communities.<br><br>Provide more information how to save power. |
| Lansdowne House/Neskantaga | Be more efficient so I don't live in darkness for even one hour. |
| Marten Falls / Ogoki | Make the power better with fewer outages. |
| Sachigo Lake | Provide lower rates especially during the winter.<br><br>Participate in the grid plan and help First Nations with the distribution of the power throughout the community.<br><br>Keep notifying us with all the information.<br><br>Provide more selection as to what comes into the house. Have an option for underground or overhanging lines. |

| Community | Ways to Improve Service |
|---|---|
| Sultan | We need new hydro poles in town. They were supposed to raise the wires up and they never did.<br><br>I don't believe the debt retirement should be on our bill. Provide this information properly. Notification of scheduled power outages should be advertised better. It affects sump pumps. The time of year that they choose to do the outages we had high waters and they almost flooded my basement. The outage wasn't advertised.<br><br>Get rid of the debt retirement charge and continue the 10% rebate.<br><br>Have someone come in to check the wiring.<br><br>It would be nice to have an online bill.<br><br>Our whole town has to be rewired. It's all 110 wire, and needs to be on 220. It's not sufficient for the winter. You lose a lot of your power between the amp and the house. If they had heavier wire in the towers our bills wouldn't be as high. |
| Sandy Lake | Make sure that there's no outages.<br><br>Talk to customers more often.<br><br>There are a lot of problems with the birds. Crows land on the poles and wires. They get electrocuted and knock out the power.<br><br>Have different options available for hooking up to the grid; or a way you can do it directly and not have to go through the Band. If you're not on the list of those scheduled to receive help you don't get hooked up. It would be great if there was a way you could do it yourself.<br><br>I use telephone banking and Hydro One doesn't have that.<br><br>Upgrade the boxes and wire and hydro lines. This is an old house and the plastic is chipping off the line. The meter guy said that's quite a hazard. The electrical inside the switches need to be upgraded in the old houses.<br><br>They should not increase the hydro rates because we live in a remote community where everything already costs so much. We barely get by as it is. It does hurt a lot of families when they get disconnected a lot. Put increase notices in the newsletter. |

| Community | Ways to Improve Service |
|---|---|
| Sandy Lake *cont'd* | The generator is growing weaker and weaker as more houses get hooked up. Improve the situation so we have service without interruptions e.g. at Christmas time.<br><br>Make sure they always let us know at least one day before, if possible, about power outages.<br><br>Figure out an alternative ways of getting power here. Diesel generated power is too much. Try a dam that won't affect the river too much. Find out more about geothermal heating.<br><br>They should hook us up to the provincial grid. We are fly-in reserve. There's no way to get fuel in except by airplanes and it would certainly benefit people to hook us up to the power grid. We, as residents, end up paying for the costs of the service as well as the high rates, which is why our bills are so high. Maybe twice a year, they force community members to pay up their bills in full or they come into our reserve and cut off people's service. They are not nice people. They just go and do what they want. They come into people's yards and cut them off. The ones that get cut off are the ones who can't afford the high prices. They practically force a gun down our throats and force us. We have no choice. This past February and March we got notice that they were going to come and disconnect houses and this was in the middle of winter. We had a hard winter and they're telling us they're coming here to disconnect houses! I think that's wrong! When the power goes off it affects our school here. We lose our school days. We lose out on school instructional days. It takes a while for Hydro to heat up the big building, it affects the kids and their families. There should be some kind of reward program for us in the fly-in reserve, rebated with some kind of credit towards our bills. I think Hydro One has a monopoly over us. They don't even reward us. Provide some kind of benefit program for paying our hydro bills on time. That would make people pay their bills on time more likely, if they thought they would get some kind of reward. Last year I got a big bill, about $3000, then the next month my bill was down to $600. I called Hydro One and they said they were in the middle of transferring from an old computer system to a new computer system. I wonder what else is fishy about their billing practices. My daughter collects welfare and her bill was about $400 and all of a sudden her bill went up to $3000. |

| Community | Ways to Improve Service |
|---|---|
| Wapekeka/Angling Lake | Have a newsletter or meetings sometimes.<br><br>Get the power back on faster. |
| Webequie | If they come into the community again they should notify the household that they're going to disconnect, because sometimes we have our payments on hand when they're coming into the community.<br><br>Check the hydro lines. Sometimes they can come down in between the hydro poles. Sometimes they hang across the road. They should have a backup system on the airport strip, in case there's an emergency. What if someone gets sick and power is off.<br><br>Come to the community more often, instead of just when there is an emergency. If they are coming to disconnect they should let the house owner know.<br><br>Support road access for remote First Nation communities, if and when the government decides to put it in. |

# Appendix E: 2016 Customer Workshop Presentation

# Hydro One Remote Communities Workshop

# Summary of Discussion

# November 23-24, 2016

# Sioux Lookout, ON          Sunset Inn

Workshop Objective: To provide an open discussion between HORCI served First Nations, HORCI, OEB and INAC in order to plan for connection and improve coordination, communication and community relations.

Participants:

| | |
|---|---|
| Sachigo Lake First Nation | Kingfisher Lake First Nation |
| Bearskin Lake First Nation | Weagamow Lake First Nation |
| Big Trout Lake First Nation | Wunnumin Lake First Nation |
| Kasabonika Lake First Nation | Wapekeka First Nation |

Regrets due to weather: Sandy Lake First Nation, Deer Lake First Nation

Mandy Wirta, INAC
Richard Habinski, Breann Brunton, Windigo
Donna Brunton, Laura Sayers, Shibogama
Franz Seibel, Roopa Rackshit, KO
Richard Chukra, IFNA
Karemer Coulter, Una O'Reiley, Kevin Mann, Ralph, HORCI
OEB

**November 23, 2016 AGENDA**

- Wataynikaneyap Project update
- Local Distribution Companies preparing for connection to transmission
- INAC presentation and discussion
- Hydro One Remote Communities Inc.
  Transmission readiness, connections and construction, joint use, safety, community relations, customer service, collections, rates, regulatory challenges, asset management, upgrading process, reindeer, retrofit and conservation programs, etc.

**Discussion Themes**

1. Backup Generation
2. Environment
3. Affordability, Billing, Rates and Customer Service
4. Housing Connections

5. Safety and Emergency Response
6. Community Relations
7. Access to Conservation and Renewable Programs

**1. Backup Generation**

Community jobs with be affected including contractors and generator operators. There is a concern regarding the reliability of the transmission line. Some buildings have backup generation, but many homes do not have generators. There is value in the generators that the First Nations own. It is difficult to maintain generators if they are not used for some time. Some are old or in disrepair and should not be kept. Any unused equipment and storage tanks should be removed.

*Recommendation: Continue to work together to establish a plan that works for HORCI, INAC and FNs for backup generation. Evaluate the backup generation requirements in each First Nation including which buildings have backup generators. Any new construction of essential service infrastructure needs to include backup generation (school, clinic, water plant).*

**2. Environment**

Sound pollution is an issue from the DGS. There is contamination at the fuel farm and also at sites where backup generators and fuel tanks were stored. Remotes audits and tracks improvements in emissions and contaminants. Remotes burns approximately 17 million liters of fuel each year. Clothes hung outside smell from the generator smoke. Used oil is removed from oil changes. Are old barrels or single walled tanks removed? Is there a plan to remediate DGS sites? Environment is very important to First Nations.

*Recommendation: Develop an environmental plan with the First Nations that includes current HORCI indicators and include any First Nation indicators. Provide annual reporting to the First Nations in order to monitor environmental indicators.*

**3. Affordability, Billing and Customer Service**

Disconnection policies and communication needs to be improved. LEAP and OESP need to be more accessible. There is lots of paperwork that ONWAA can assist with, but many applications are still not processed. Coordination with Ontario Works is essential to reducing the number of disconnections. How will the rates change after transmission? Customer service should be available in OjiCree. There should be a Remote Northern First Nation rate as the costs in remote First Nations are uniquely high. Interest rates on late payments should be reduced. Funding a First Nation liaison would reduce disconnections and late payments.

*Recommendation: Develop Customer Service policy that includes wages for a liaison in the First Nation, create a remote rate, improve accessibility to rebates, improve disconnection communication, include First Nation customers on customer service review committee.*

## 4. OEB Priority Setting

The OEB is asking utilities to work with customers to ensure that the utilities take into account customer priorities in business and investment planning. This discussion is an opportunity to understand what is important. Each participant was given $10 bills to "vote" for what is most important in various areas of Remotes' work program.

| | |
|---|---|
| Community Relations | 18 |
| Affordability | 17 |
| Customer Service | 17 |
| Renewable Energy | 18 |
| Safety | 11 |
| Reliability | 14 |
| Environmental Protection | 26 |

Discussion notes:

Environmental Protection: My grandfather taught me to protect the land as part of my religion and cannot be compromised.

Renewable Energy: Climate change is real. Makes sense to get our energy and other needs from the earth.

Community Relations and Customer Service: HORCI needs to understand what its customers want and their reality. Customer Relations and Customer Service are HORCI's weaknesses. Hydro One is strong technically but its management of its customer base is weak. You aren't in the community. You need to work in partnership with the community.

Electricity is not affordable. People can't afford it.

## 5. Housing Connections

HORCI requires an ESA inspection prior to connection. There is only one ESA inspector for remotes and there are often delays. In order to connect a building, HORCI must complete a housing layout, contractors cannot complete the layout or complete any work for HORCI due to the union. Fees are established based on established rates. Fees can be reduced if work is bundled. ESA may approve a house before its finished and the house can be connected before it is completed in order to provide electricity during construction. In this way power tools and heaters can be run from the house electricity. It is unclear what HORCI's role is regarding electricity between the meter and the DGS. There should be more options for electrical technicians on reserve.

Communication with HORCI can reduce costs of design and installation especially for positioning of the building and mast, subdivisions and community planning. Retrofit programs are available including LED street light retrofit and conservation programs. LDCs require regular maintenance and need to be kept safe. Colocation of internet cables on poles requires a HORCI engineered design. Annual colocation fees are not charged. Cash in full up front is difficult for First Nation cash flow. 50% cash would make things easier with funding. Will the location of transmission connection be at the DGS site?

*Recommendation: Improved communication between HORCI and First Nation infrastructure planning. HORCI to attend housing and public works conferences to improve understanding and communication with HORCI on housing construction and permits. Reduce HORCI layout and engineering fees. Hire more ESA inspectors.*

**6. Safety and Emergency Response**

HORCI operators are trained in house fire disconnection. Heavy equipment operators are not aware of electricity dangers if they hit lines. There is a handbook for emergency responders on how to deal with electricity emergencies. Firefighters and emergency responders and heavy equipment operators need training to deal with electricity emergencies. School visits are available.

*Recommendation: HORCI to provide training in electrical safety at regional conferences. First Nations to invite remote First Nations to provide safety awareness and complete school visits.*

**7. Community Relations**

HORCI staff housing used to be available as hotel overflow for visitors. Can people stay at the staff house? Does HORCI also rent houses or hotel rooms? HORCI provides training for apprentices at confederation college for linesman. HORCI is unionized and hiring follows the union process. What is the status of HORCI service contracts? Is it possible to sell HORCI generators and other equipment when transmission is connected? HORCI will need to prepare to serve seven IPA First Nations by hiring more staff. The disconnection list is sent every month even though disconnections are only twice per year. This improves communication and helps the band to work with customers.

The chief and council have been handling disconnections. It is a big job for council to manage however, the council is able to care for people and need to approve a visit from HORCI. A community liaison position would provide wages for someone to help people with programs, billing, safety and many other aspects of HORCI relations. There are some programs available with HORCI to support community activities, this helps with relations. A good partnership is required in order to deal with restrictions, disconnections, environment and community infrastructure development. Electricity is a treaty right due to the fact that essential services (health, shelter, education, water) require electricity.

*Recommendation: Develop a Community Relations and Engagement Policy that includes HORCI and First Nation roles and responsibilities. Schedule regular communication and engagement visits. Fund a community position to coordinate training, safety, billing, community relations, promoting conservation, etc.*

8. **Access to Conservation and Renewable Programs**

First Nations are developing renewable infrastructure that needs to be supported by HORCI. Other innovative opportunities needs to be considered as well including heat recovery furnace at garage, furnaces that burn used oil and geothermal. First Nations need HORCI to improve its process and partnership for renewables and the Reindeer program. Retrofit, streetlights and other programs need to be more accessible and promoted in the community. Housing retrofits are still the best way to improve efficiency and conservation. Overcrowding makes conservation difficult.

*Recommendation: More engagement when designing conservation and renewable programs so that they are accessible, meaningful and used.*

**November 24, 2016 AGENDA**

- OEB Presentation on remote residential rates
- Break out Discussions

**Discussion Themes**

- Reduce Standard A Rates
- Eliminate transmission delivery charge
- Secure RRRP
- Improve accessibility to rebates
- Create a separate Northern Remote First Nation Rate
- Reduce late payment interest rate
- Improve REINDEER rate
- First Nation cost of living and electricity as a treaty and human right
- Coordination between INAC, HORCI and OEB

**Group 1 Feedback**

- **Drop Standard A rates for remotes:** The current Standard A rate is 97 Cents/kWh for all the Government funded buildings and with grid connection it will drop to 29 Cents/kWh. It was suggested to consider implementing the 29 Cents/kWh now for a smooth transition to grid connections. OEB could help subsidize that.
- **Drop delivery charges:** Delivery charge was for the grid connected communities in the south that they wanted gone. To consider getting rid of monthly charge on bills for the northern First Nations.
- **Subsidies:** To be cautious on the subsidies during discussions with INAC and to ensure that they need to maintain the current Standard A rate subsidy until the grid connection. Funding cannot be reduced or stalled/when they see cost-savings. (When formulas are calculated for operations and maintenance, the Standard A rates are included and built into the subsidy electric component)
- **Other subsidies:** Construction costs for connections (poles etc) are much higher in the North than in the South.
- **Breakdown of the bundle rate:** The true cost of the power for North is to be provided towards customer education. The breakdown will facilitate better understanding of revenue sources, and payments made on specific allocations by home owners. Even though community members pay a subsidized cost, the breakdown could serve the purpose of an educational tool for RRRP and residential rate payers.
- **Customer relations and Customer service**: To enhance, the group suggested to tie into processes and structures through local RRRP workers who are closer to the communities and delivers energy programs. To initiate a customer education process on rates, bills etc, as part of customer education-a community-based approach. The conservation program could also be brought back as a behavioral modification on using less power,

on using technologies that reduces consumption, bills. (H1RC have an application-based…appliance program)

- H1RC in partnership with the community could engage with the rate payers on conservation, consumer education programs besides the bill collections. **More presence:** HORCI and OEB are asked to have more presence in the community.
- **Late payment charge**: 19.5% on an annual basis is too high and the time frame that kicks in is too short with 20 days. To consider with 60 days' time frame and to be tied to borrowing rates/user rate fees and not market-based rates.
- **Application based programs:** Special consideration is to be made for seniors and elders who find it difficult to navigate through the application process. Try to build/tie into some of the activities showed in the bill and maybe make them "automatic" rather than applying for them.
- **Include an "adder" to off-grid renewable projects:** REINDER programs are not enough, there need to be an "adder" to the REINDEER rate, as an incentive. The "adder" should consider the impact of reduction of the standard A rate. The renewable projects could be made more attractive to find capital/funding for the remotes.
- **Community-specific concerns:**
  KIFN: Senior complexes-individual apartments owned by seniors get Hydro bills but there is no funding for common areas.
  Bearskin: 20$% rebate across the board, on everybody's' bills -suggested directing the savings towards employment, childcare, education, lands and resources, restaurant etc.

**Group 2- Feedback on the OEB processes**

- **Electricity rates:** Hydro bill are too high. To consider seasonal rates as lot more electricity is used in the winter. Or, people who don't have woodstoves have higher costs, especially for the elders and seniors. There are cases with high bills and no jobs. To consider percentage reduction of energy bills.
- **Subsidies:** All customers are different. Some have trucked water, and require lots of electricity to run pumps, so, it is not one size fits all when considering subsidies.
- **Power, food, health:** Anecdotal references were made to situations when options is not food versus power with both being essential necessities. Junk food is cheaper which leads to health and medical treatment issues that is cost intensive. Profile of a different family sizes can be acquired from community economic development offices to iron out fairness in payments. Single mothers, grandparents caring for grandchildren, mentally-challenged, and disabled patients who are unable/or shy away from the welfare application process, become dependents on regular families stretching family budgets. There are no resources to bridge the application process.
- **Incentives**: Incentives for reduced energy use.

- **North versus South unfounded perspectives:** Decision-makers from the South have to visit the northern communities to see first-hand, ground realities. The communities in the north have to deal with a lot more situations that the south doesn't face. Also, "Thunder Bay is not north or reflective of the TRUE NORTH". Also, get an understanding of family structures and community way of life.
- **Energy Star Program**: To be made available to everyone and not just for low-income group people. The H1RC program swaps old appliances for Energy Star appliances.
- **Feedback on the H1RC processes**
- **Community relations**-To understand community' expectation on building relations- "H1RC version is different from ours". Mostly council members attend meetings in Thunder Bay and sometimes the information flow is restricted or stalls at that level. Suggestion was made to engage with the communities more through community meetings organized for EVERYONE to attend, open houses, FB, radio etc. Also, forward materials that are easily understood by the community. Sending program promotional/marketing pamphlets with bills doesn't always work.
  People who implement programs like OESP and LEAP need to go to communities, help them with the application process.
- **Housing:** Lack of housing leads to overcrowding that lead to high electricity bills. Eg: North Caribou. Also, with large families, it is very easy to go over the first 1000kwh threshold. To consider up to 2000 kwh. - 89 $ rate should go higher (upto 2000 kwh)
- **Renewable projects:** Community is interested to invest**,** own and run more renewable options.
- **Standard A** rate on band council building and assets needs to be lower. Shouldn't have to wait for grid connection to get lower standard "A" rate. Don't want rates to change or access to RRRP to go away when grid comes in. Need more than just the $20 service charge off and not make it comparable to the delivery charges of the south.
- **Joint process**: Consult with INAC for cost savings on when the grid comes in. And ensuring that any subsidies that come from OEB does not reflect on a reduced cost saving options from INAC.
- **Subsidies**: Should not be something we have to apply for.
  **Additional concerns:**
  Lots of power surges with diesel generation or power goes out for a few seconds. Thus, outages should result in lower bills and should be reflected on the bills.
  Sometimes when they come to communities to do the disconnections, they won't take any cash.
  Disconnect charges add an extra burden and are varying from 65$-165$ that ensues a long wait to be reconnected once the bill is paid.

**Group 3 Feedback**

- **Standard A rate:** There are two rates-one for the First Nations and one for the Municipal. So, the community deals with the individual bills and Municipal/Band type accounts. Rates are high that the Band office have to sometimes pay from other programs. It was suggested that the respective community band offices need to be made aware that with the grid connections, there is a possibility of the reduced/stalling of the INAC funding and subsequent subsidies. This needs clear understanding amongst all of us and we should be on the same page.
- **Understanding realities:** Both, the communities and H1RC want to be treated fairly and so, to approach the system through a holistic lens. There are realities on both sides-to acknowledge and respect. Adding or subtracting services without realizing the ground realities leads to misunderstanding and lack of expectations.
- **Time of Use rates:** Do not want time of use rates as there are unemployed people and energy consumptions to consider. Using the time of use rate will only hurt us.
- **Cost of living:** To take into account the cost of living and all costs including freight as they are significantly higher. Everything costs double in remote Northern Stores even with a subsidized rate.
  Need to help seniors and Elders who cannot keep up with the costs of living. Reference was made of the 700+ OSEP applications that are stuck in the systems process. This is not acceptable when community members rely on these programs. OEB could address the issue with the Ministry of Finance.
  Also single parents, some are too young to apply and get into the system. Grandparents are playing the roles of the parents and have extended responsibilities.
  Welfare is $400/month/person. How much can it be stretched to in a typical size family?
  Need to keep **“entrench”** RRRP and Standard A subsidies on a long-term basis irrespective of change in Governments. To ask the Province to approach INAC.
  Rates cannot go up (increase) with connection to the Provincial grid. If that happens then there is no value in being connected to grid. We cannot burden communities with additional payments-a principal used for guidance with grid connecting.
- **Customer Services:** Place someone in our community that can help with applications/Forms. Also, need help within the communities with arrear management and not just a 1-800 number. To include management of bills.. when trying to decide how to pay all bills-food, fuel or electricity.
  Reliability is a problem ..need someone in the community to keep the lights on. To explore solutions, H1RC need to visit the communities and talk to community members. Or the community can set a program and appoint someone in the community in partnership with H1RC. The group stressed on **education and communication**. Reference was made of initiating financial management skills.
  The group echoed that we are “remote” and have unique set of challenges. All FNs cannot be treated the same. Comparisons between the North and South should not be made. Reference was made with Land-Fill sites as an example.

- **Renewable Energy:** Walk hand in hand in renewable projects.
- **Watay Power:** To have discussions on bills and payments post grid connection. It is important to prepare the community.
- **Conservation:** Stressed on H1RC conservation programs, appliances and light bulbs replacement etc.
  Payments: Payments upfront
- **Back up generation**: A must for any catastrophe for basic services. No compromise on that. To consider portable units by H1RC. It is not only a back-up system, there are financial implications too.
- Quick response time, especially in the winter-someone on standby 24/7. Faster service.

# Appendix F: Request for IESO Comment Letter

BY COURIER

March 3, 2017

Ms. Miriam Heinz
Regulatory Coordinator
Independent Electricity System Operator
120 Adelaide Street West, Suite 1600
Toronto, ON, M5H 1T1

Dear Ms. Heinz:

**Re: Hydro One Remote Communities Inc. – Letter of Comment**

Hydro One Remote Communities Inc. ("Remotes") is preparing to file a Cost of Service ("CoS") rate application for 2018. As part of this application, Remotes will be including a Distribution System Plan ("DSP") which must be accompanied by a letter of comment from the Independent Electricity System Operator ("IESO").

Remotes' application is subject to the Ontario Energy Board's ("OEB") Filing Requirements for Electricity Transmission and Distribution Rate Applications. These requirements (Chapter 5) indicate the OEB expects the IESO comment letter will include:

- the applications it has received from renewable generators through the [Feed-in Tariff] ("FIT") program for connection in the distributor's service area;
- whether the distributor has consulted with the IESO, or participated in planning meetings with the IESO;
- the potential need for co-ordination with other distributors and/or transmitters or others on implementing elements of the Renewable Energy Generation ("REG") investments; and
- whether the REG investments proposed in the DSP are consistent with any Regional Infrastructure Plan.

In regards to the above points and the letter of comment, please note that:

- Remotes' service area is not eligible for the FIT program and, therefore, there are no FIT applications for connection in Remotes' service area;
- Remotes routinely consults with the IESO on various matters as appropriate;
- Each of the communities served by Remotes is electrically isolated and not connected to the bulk transmission system. Therefore co-ordination with other distributors and/or transmitters on implementing REG investments is not necessary.
- The Remote Community Connection Plan is still under development for Remotes' region.

Remotes respectfully requests a letter of comment from the IESO addressing these points, as appropriate, by April 3rd, 2017. If you have any questions, or require additional information, please contact our Regulatory Affairs group at Regulatory@HydroOne.com.

Sincerely,

ORIGINAL SIGNED BY KAREN TAYLOR

Karen Taylor
Senior Director, Applications Delivery
Regulatory Affairs

# IESO Letter of Comment

# Hydro One Remote Communities Inc.

# Renewable Energy Generation Investments

April 4, 2017

Independent Electricity System Operator

## Introduction

On March 28, 2013, the Ontario Energy Board ("the OEB" or "Board") issued its Filing Requirements for Electricity Transmission and Distribution Applications; Chapter 5 – Consolidated Distribution System Plan Filing Requirements (EB-2010-0377). Chapter 5 implements the Board's policy direction on 'an integrated approach to distribution network planning', outlined in the Board's October 18, 2012 Report of the Board - A Renewed Regulatory Framework for Electricity Distributors: A Performance Based Approach.

As outlined in the Chapter 5 filing requirements, the Board expects that the Ontario Power Authority[1] ("OPA") comment letter will include:

- the applications it has received from renewable generators through the FIT program for connection in the distributor's service area;
- whether the distributor has consulted with the OPA, or participated in planning meetings with the OPA;
- the potential need for co-ordination with other distributors and/or transmitters or others on implementing elements of the Renewable Energy Generation ("REG") investments; and
- whether the REG investments proposed in the DS Plan are consistent with any Regional Infrastructure Plan.

## Hydro One Remote Communities Inc. – Renewable Energy Generation Investments

On March 3, 2017, the IESO received a letter from Hydro One Remote Communities Inc. ("Remotes") in order to obtain a letter of comment from the IESO pertaining to Renewable Energy Generation Investments Information as part of its 5-year Distribution System Plan. The IESO has the following comments:

The letter contained no REG investments that required the IESO's comment. The IESO acknowledges that communities served by Remotes were/are not eligible for the FIT program, and therefore there is no need for REG Investments or co-ordination with other distributors and/or transmitters on this subject.

With respect to planning, the IESO confirms that Remotes is an active participant to the Remote Community Connection Plan for which the government issued an Order in Council on July 29, 2016, confirming the need for the project to connect 21 remote communities. Remote community connections are underway and supported by the government designating Wataynikaneyap Power as the transmitter for connecting 16 communities and the new line to Pickle Lake. Remotes is working closely with the IESO with respect to the ongoing work required to connect the remaining five remote communities.

The IESO looks forward to working further with Hydro One Remote Communities Inc. on planning for the connection of remote communities, and appreciates the opportunity to provide its letter of comment as required.

[1] On January 1, 2015, the Ontario Power Authority ("OPA") merged with the Independent Electricity System Operator ("IESO") to create a new organization that will combine the OPA and IESO mandates. The new organization is called the Independent Electricity System Operator.

# Appendix H: Hydro One Remotes Roof Assessment Report

February 13, 2014

John Supinski
Hydro One Remote Communities Inc.
680 Beaverhall Place
Thunder Bay, ON  P7E 6G9
(807)474-2808

**RE: 2013155 – DIESEL GENERATOR STATION ROOF ASSESSMENT REPORT & RECOMMENDATIONS (VARIOUS)**

Dear John,

The office of FORM Architecture Engineering was requested by the owner(Hydro One) to review existing roof construction for four(4) of their diesel generator stations within various remote communities of northern Ontario and to provide feedback to Hydro One on the condition of said roof construction, along with recommendations for future use. This review was requested to determine what, if any, capacity remained within the existing roof structure to accommodate an increase in thermal performance in order to alleviate persistent ice formation along the roof edges. The four(4) diesel generator stations selected by Hydro One for review were in the following communities; Kingfisher Lake, Lansdowne House, Big Trout Lake, and Weagamow First Nation communities.

Contained within the body of this report is a general description of the construction and current condition of each of the four(4) diesel generating station roof structures. The office of FORM Architecture Engineering is to provide recommendations on enhancing the longevity of existing roof construction for the above mentioned locations, as well as potential improvements to thermal performance of the roof structures.

**KINGFISHER LAKE: EXISTING CONDITIONS**

The diesel generator station located in Kingfisher Lake is a manufactured steel building(see photo#1). The exterior dimensions of the building in question are 19.51m(64’-0”)x7.32m(24’-0”).The roof structure consists of steel liner panels acting as the interior ceiling and doubling as the air/vapour barrier. The roof’s thermal layer is comprised of ±280mm(±11”) of fiberglass batt insulation(see photo#2) which equates to an approximate R-value of 40 for dry, uncompressed fiberglass insulation. Roof/ceiling support consists of horizontal steel L51x51x6.4(L2x2x¼”) angles at 2440mm(8’-0”) on-centre. Steel Z-girts run perpendicular to the horizontal structure to support the liner panel ceiling below. To create the sloped roof structure above the ceiling, steel roof panels are supported at the eaves, peak, as well as at the mid-span. Support at the eave is provided by the exterior wall framing, while the mid-span roof panel support is provided at both edges of every panel with what appears to be a vertical 51x51x0.91mm (2x2x20ga.) member(see photo#3) down to the ceiling framing & heavy gauge clips at the roof panels above. Roof panel support at the peak is provided by a pair of heavy gauge ‘Z’ girts, connected side-by-side at their legs and supported at 2440mm(8’-0”) on-centre with vertical L51x51x6.4 (L2x2x¼”) members directly to the horizontal members below(see photos#4-5). It was not feasible to get a direct measurement of the roof slope while onsite due to limited access, but existing slope of this roof appears to be ± 4:12.

The current condition of the existing roof structure appears to be decent. There are no observable signs of condensation issues either within the building or within the attic space. Ventilation is provided at both gable ends by means of a louver grill which is adequate for the main attic section, but a lack of ventilated airspace at the eaves is the likely cause of heat transfer and subsequent ice formation at the roof edge above(see photo#3). Though not apparent during the time of inspection, the owner's representative had expressed concerns over the above mentioned ice formation at the eaves of this building and the ensuing maintenance and safety issues that accompany this ice formation. The owner had previously taken steps to prevent ice formation from sliding from the roof onto the ground by attachment of bent light gauge steel to act as an ice-stop. Measures to-date are only temporary as the ice-stops are connected to light gauge roof panels only and fasteners continually pull out of the light gauge material. The current preventative methodology entails a great deal of maintenance to ensure performance. In addition, continual re-attachment of the temporary ice-stop material provides new penetrations through the roof panels, and compromises the effectiveness of the steel roofing panels to resist the elements(see photo#1).

**LANSDOWNE HOUSE: EXISTING CONDITIONS**

The diesel generator station in Lansdowne House consists of multiple manufactured steel buildings pieced together with various roof elevations and slopes. The portion of the building in question is 15.88m(52'-1")x7.32m(24'-0") with an eave height of 3.60m(11'-10") and a peak height of 4.24m(13'-11"). The slope of the existing roof is 2:12(see photos#6-7 – portions of building with lower roof elevations) though there are subtle differences in roof slope between the two lower elevation portions of roof, as well as the higher elevation roof structure. Roof construction for the 3.66m(12'-0") length addition completed in 1994(identified as Control Room 'A') are similar to that of the Kingfisher Lake Diesel Generator Station in that steel liner panels make up the ceiling and act as the air/vapour barrier, along with a similar construction type for the roof panel supports(see photos#8-10). There are no mid-span supports provided for the roof panels in this addition. It was observed that there is approximately 280mm(11") of fiberglass batt insulation, equating to an approximate R-value of 40 for a dry, uncompressed insulation layer. Roof structure for the 12.19m(40'-0") length section of building immediately adjacent the 1994 addition noted above, also at the lower roof elevation, is constructed from steel stud trusses which appear to be 1.22m(4'-0") on-center with steel 'Z'-girts above to support steel roof panels. The remainder of the existing structure which houses additional diesel generators is in a newer manufactured steel building. This building has a higher eave elevation of 4.37m(14'-4") and is not an area of concern for the owner(refer to photos#6-7).

Within the attic space of the additions, the steel roof panels and structure appear to be sound. There was no observed indications of condensation occurring within the space. There was some minor deterioration visible on the roof panel edges at the exterior of the building along the eaves, though not easily identifiable from any photographs. A major factor influencing this wear is most likely the consistent ice formation and subsequent freeze-thaw cycles that the eave roof panels are subjected to throughout the seasons. At the time of inspection, ice formation had already begun at both eaves of the lower portion of the building. The majority of the ice formation had thus far occurred at the eave side adjacent to the diesel storage tanks(side of building shown in photographs) and within proximity to the diesel generator room. The higher degree of ice formation at this location could be contributed to the diesel generator being the main heat source for this portion of the building. As with the roof at Kingfisher Lake, there is no ventilation allowed at the eave locations within the attic space(refer to photo#9), and as the insulation becomes compressed at the exterior wall, the potential for heat transfer becomes much greater and is the likely cause of ice formation at these locations.

At the time of inspection, there was no visible ice formation on the portion of the building with the higher roof elevation, with ice formation occurring at wall penetrations for exhaust vent locations only.

**BIG TROUT LAKE: EXISTING CONDITIONS**

The diesel generator station in Big Trout Lake appears to be from more than one manufactured steel building. All construction appears similar, as all exterior dimensions are consistent in terms of building width, eave elevation and roof slope. Roof construction spans the entire width of the building and bears upon structure at the exterior walls. Structure for the roof at the Big Trout Lake Generator Station is from fabricated structural steel trusses at 2.44m(8'-0") on-center. Top and bottom chords are comprised of 64mm(2½") square steel HSS sections and 25mm(1") square HSS sections for all vertical web members. Diagonal web members are from 38x10mm(1½"x3/8") steel flat bars(see photos#11-12). As with both the Kingfisher Lake and Lansdowne House Generator Stations, steel liner panels form the ceiling, as well as act as the air/vapour barrier and support the attic insulation. Thermal performance of the roof structure is provided by 280mm(11") of fiberglass batt insulation, which would equate to an approximate R-value of 40 for a dry, uncompressed insulation layer. Steel roof panels are supported at the eave, mid-span and peak by 125mm(5”) steel ‘Z’-girts. Roof slope appears to be at 2:12, though it could not be verified at the time of inspection.

Appearance of both the ceiling and roof panels were fair. There were no visible signs of condensation occurring within the attic space or any other indications that the performance of the steel panels has substantially deteriorated. Ice formation was not observed along the roof eaves during assessment, though the owner’s representative indicated that this station is prone to ice formation along its eaves throughout the winter season. Ventilation for this roof construction is limited to louvers at each gable end, and a lack of airspace at the eaves due to minimal truss heel height and insulation thickness is again a likely cause of heat transfer and subsequent ice formation at the eave locations(refer to photo#13).

**WEAGAMOW: EXISTING CONDITIONS**

Weagamow’s diesel generator station is, once again, a steel manufactured building. The station itself appears to be one building as additional structures tied into the base construction match in dimensions. The building itself is 19.58m(64’-3”) long and 7.32m(24’-0”) wide. Roof construction consists of horizontal steel liner panel acting as the ceiling and as the air/vapour barrier for the roof. Roof framing is from steel stud trusses @ 2.44m(8’-0”) on-center. Truss top and bottom chords are from 152mm(6”) steel stud, with 102mm(4”) steel stud web members. An exact thickness for truss members could not be obtained, though visual inspection indicated a material thickness of 0.91mm(20ga.) steel based upon standardized colour markings visible on steel members(white paint indicates 20ga material – see photo#14). Above steel stud trusses sits 102x3.2mm(4”x1/8”) cold-formed channel purlins at the eaves, mid-span, and peak for which steel roof panels sit atop(see photos#14-15). Visual observation of the attic space revealed that there appeared to be only a single 140mm(5½”) batt of fiberglass insulation throughout the structure, which would approximately be equal to an R-value of 15 for a dry, uncompressed insulation layer.

Ventilation for the entire attic space is from louver grills at each gable end of the structure and is most likely insufficient for the volume of attic space. In addition, there is no air space at the exterior wall locations due to insufficient heel height on the roof trusses(refer to photo#16). At the time of inspection, exterior temperatures were -27°C, though it was noticeably warmer inside the attic space which would indicate significant heat loss from the interior space as was also noticed by the significantly lower amount of snow build-up on the main roof as compared to the fuel line tray immediately adjacent(see photo#17). Though it is not readily apparent from photographs taken while FORM was onsite, photographs supplied by the owner’s representatives indicate that roof panels are beginning to show signs of deterioration on the exterior(see photo#18 – some signs of finish deterioration seen).

**RECOMMENDATIONS:**

A number of factors need to be considered in determining an effective recommendation for the above four(4) diesel generator stations roof maintenance procedures.

The request of the owner is to provide a solution that will minimize, if not eliminate ice formation along the roof eaves as this causes both maintenance as well as health and safety issues throughout the winter months of operation. The owner also requested a minimum R-value for all four(4) roof structures to be, at minimum, a value of 30. In addition, there is a requirement to utilize only non-combustible materials for additional structure and cladding for modifications to any of the facilities (ie. steel stud framing, metal roof panels, aluminum flashing, etc.). As all four(4) locations are situated in remote locations of northern Ontario, with limited transportation access(ie. winter roads for shipping material to site), solution options should make considerations for design optimization and material quantities wherever possible.

From site observations of all four(4) facilities, as well as subsequent review of existing construction, it is the opinion of FORM Architecture Engineering that ice formation on all four diesel generator stations is largely the result of a lack of tempered air space directly above the existing roof insulation layer at eave locations. This lack of tempered air space at eave locations facilitates thermal bridging and subsequent heat loss directly to the metal roof panels above. Any snow present at these locations proceeds to melt and migrate down to the roof edge. Once melted snow reaches a point of the façade where exterior surfaces are below the freezing point, and in combination with outside air temperatures being below freezing, water will re-solidify as ice. This process will continue throughout the winter months provided that snow accumulates upon the roof of the structure and there is heat generation from within. Additionally, in the case of the Weagamow diesel generator station, insufficient insulation provided throughout the roof assembly further contributes to the heat loss and eventual ice formation(as described above) at the eave locations.

In order to expedite the process of remediation, minimize cost impacts to the owner, and based upon assessment of the existing roof structure, the following are recommendations to minimize further ice formation and any damage resulting at the above mentioned generator facilities.

**KINGFISHER LAKE, LANSDOWNE HOUSE & BIG TROUT LAKE GENERATOR STATIONS:**

The three(3) above mentioned facilities have sufficient insulation performance as required by the owner. As such, it is not recommended to proceed with providing additional insulation over and above what is existing in these facilities. Given the lack of ventilation at the eave locations, additional insulation added to the attic space would fail to address the persistence of ice formation along the building eaves.

Through observations on site, and subsequent discussions with a local steel building supplier, it has been determined that the existing roof panels and framing are sufficient to support the minimal additional dead load applied by the application of new roof panels and support framing directly to the existing panels. Discussion with the steel building supplier has indicated that existing steel roof panels are 406mm(16”) wide by 0.61mm (24ga.) thick with 76mm(3”) ridges at their interlock joint. This panel type is consistent for all of the roof additions which are supported at the eaves, peak and mid spans. The steel roof panels for one addition at Lansdowne House in which there are no mid span supports is believed to be from 406mm(16”) wide by 1.9mm(14ga.)thick sheet steel with 102mm(4”) ridges at their interlock.

After assessment of the existing steel roof panels, and steel framing below, it is recommended that for the above three(3) locations, the formation of tempered air space above the existing panels be created. In addition, proper airflow from soffit to the ridge should also be created within the new tempered air space. By providing a tempered space above the existing steel roof, any heat loss which would occur at the eave location must now be transferred through the air space before transmitting heat to the new roof panels above. Creating proper airflow into the air space by allowing fresh cold air in from the soffit and venting out at the ridge, heat transfer through the air space to the new steel roof panels can be significantly reduced.

It is proposed that the owner create an area of tempered air space above existing roof panels by the addition of 152mm(6”) perforated heavy gauge steel ‘Z’ girts running parallel to the ridge at 610mm(2’-0”c/c) and fastened at each existing roof panel ridges with self-tapping sheet metal screws. Soffit venting can be achieved by way of sheet metal framing and perforated sheet at the eave locations, and ridge venting to be provided by a manufactured ridge vent suitable for metal roofing applications. In addition, consideration should be made to incorporate snow-stops along the access side at the Kingfisher Lake generator facility. This station has a steeper pitched roof slope, which increases the potential for snow to fall from the building roof. To accommodate snow-stops, proper sub-framing is to be installed prior to placement of any new roofing panels. Refer to the attached drawing sheet S2 – Big Trout Lake Plans/Elevations/Details(24x36). Details for Kingfisher Lake and Lansdowne House facilities are similar, drawing sheets for these facilities yet to be completed(scheduled for remediation by the owner in 2015).

**WEAGAMOW GENERATOR STATION:**

In addition to the ventilation issue identified for the other three diesel generator stations, Weagamow Generator Station was also observed to have insufficient insulation within the attic space to what is required by the owner. As there is limited space within the existing attic for placement of additional batt insulation, the recommendation of FORM for this structure is as follows: (1) Removal of existing roof panels to facilitate the addition of another 140mm(5½”) fibreglass batt insulation, and (2), similar to the recommendations for the three other stations above, creation of a tempered air space above existing by way of 305mm(12”) perforated heavy gauge steel ‘Z’ girts running parallel to the ridge at 610mm(2’-0”)c/c and fastened to each steel stud roof truss with self-tapping sheet metal screws. Soffit and ridge venting are to be similar to as noted above. Refer to the attached drawing sheet S1 – Weagamow Plans/Elevations/Details(24x36).

**LIMITATIONS:**

Findings and recommendations by FORM Architecture Engineering have been based upon visual assessment and, in part, on information provided by others. Unless noted otherwise, FORM has assumed this information to be correct for the development of the recommendations contained within this report. There is a possibility that unforeseen conditions may be encountered on site during implementation of any or all of the recommendations listed within this document that have not been documented. Should any such unforeseen instance(s) occur, the owner should notify the consultant to determine what, if any impact the discoveries have on the above noted recommendations given.

Please do not hesitate to contact the offices of FORM Architecture Engineering if there are any questions, concerns, or comments about information provided within this report.

Sincerely,

LICENSED PROFESSIONAL ENGINEER

METSCO
MAKING IT POSSIBLE

19 July 2017

Una O'Reilly
Business Integration Manager
Hydro One Remote Communities Inc.
12th Floor, North Tower
483 Bay Street,
Toronto, ON; M5G 2P5

Dear Una,

## Re: Consolidated Distribution System Plan

This letter is to confirm that METSCO Energy Solutions Inc. has assisted Hydro One Remote Communities Inc. (Remotes) with the creation of a Consolidated Distribution System Plan (DSP) as part of Remotes' 2018 Cost of Service Application. The DSP has been prepared in accordance with the Ontario Energy Board's (OEB's) *Chapter 5 Consolidated Distribution System Plan Filing Requirements dated 28 March 2013.* Remotes' DSP supports the four key objectives from the OEB's *Renewed Regulatory Framework for Electricity Distributors: A Performance-Based Approach* (*RRFE*): customer focus, operational effectiveness, public policy responsiveness, and financial performance.

Best regards,

Alex Bakulev
Vice President, Strategy and Assets

# RATE BASE AND WORKING CAPITAL

## 1.0 INTRODUCTION

This exhibit provides the forecast of Remotes' rate base for the 2018 test year and provides a detailed description of each of the rate base components.

In accordance with the 2006 Electricity Distribution Rate Handbook ("Handbook") and the "Filing Requirements" updated by the Board on July 14, 2017, the rate base underlying the test year revenue requirement includes a forecast of net fixed assets, calculated on a mid-year average basis, plus a working capital allowance. Net fixed assets are gross plant in service minus accumulated depreciation and contributed capital[1]. Working capital is calculated using the formula as described in Section 5.4 of 2006 Electricity Distribution Rate Handbook.

## 2.0 UTILITY RATE BASE

Utility rate base for Remotes for the test year is filed at Exhibit C2, Tab 1, Schedule 1. Remotes' forecast rate base for the test year is $44,445K.

[1] Contributed capital refers to amounts contributed by third parties to specific capital projects, e.g. Joint Use Assets, Customer Contributions

**Table 1**

**Remotes Rate Base (in $K)**

| **Description** | **Board Approved 2013** | **Test Year 2018** |
|---|---|---|
| Gross Plant | 60,084 | 71,866 |
| Accumulated Depreciation | (24,740) | (31,182) |
| Net Plant | **35,344** | **40,684** |
| Cash Working Capital | 5,746 | 3,761 |
| **Distribution Rate Base** | **41,090** | **44,445** |
| *$ Change* | | *3,335* |
| *% Change* | | *8.2%* |

The mid-year gross plant balance reflects the capital expenditure programs forecast for the bridge and test years. These programs are described in detail in the company's written evidence and supporting schedules filed in the DSP at Exhibit B1, Tab 1, Schedule 1, Section 2.1.1. The justification for capital projects in excess of $283K (0.5% of revenue requirement) are filed at Exhibit B1, Tab 1, Schedule 1, Appendix A.

Continuity schedules are provided in Exhibit C2, Tab 2, Schedule 1, Attachments 1 through 6.

**Table 2**

**Continuity of Fixed Assets Summary (in $K)**

| Description | Board Approved | Historic | | | | Bridge | Test |
|---|---|---|---|---|---|---|---|
| | 2013 | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 |
| Opening Gross Asset Balance | 58,973 | 54,790 | 58,905 | 63,601 | 65,373 | 67,532 | 70,664 |
| In-Service Additions | 7,486 | 9,203 | 5,970 | 3,278 | 4,656 | 3,606 | 3,197 |
| Retirements | (5,264) | (5,088) | (1,274) | (1,506) | (1,915) | (474) | (793) |
| Adjustments | - | - | - | - | (582) | - | - |
| Closing Gross Asset Balance | 61,195 | 58,905 | 63,601 | 65,373 | 67,532 | 70,664 | 73,068 |
| Mid-Year Gross Asset Balance | 60,084 | 56,848 | 61,253 | 64,487 | 66,453 | 69,098 | 71,866 |
| *$ Change (2018 Test vs. 2013 Board Approved)* | | | | | | | *11,782* |
| *% Change (2018 Test vs. 2013 Board Approved)* | | | | | | | *19.6%* |

In-service additions reflect the placing in-service of Remotes' capital programs. These programs are described in detail at Exhibit B1, Tab 1, Schedule 1, Section 2.1.1.

Retirements in 2013 are higher than typical when compared to all other years mainly due to an increased volume of retirements related to engine replacements. 2013 also includes the retirement of major assets replaced during the Weagamow upgrade. The slight increase in 2016 (over 2014 and 2015) reflects the retirement of assets replaced during Fort Severn, Deer Lake, and Kasabonika Station upgrades. Retirements in 2017 and 2018 are expected to decrease as fewer Station upgrades are expected to be placed into service and only one engine replacement is planned.

The nature and composition of Remotes' assets are described in detail in Exhibit B1, Tab 1, Schedule 1, Section 2.1.1

## 3.0 WORKING CAPITAL

Working capital is at 7.5% of eligible OM&A expenses per the Filing Requirements for Electricity Transmission and Distribution Applications, updated July 14, 2017. A detailed calculation is found in Exhibit C2, Tab 5, Schedule 1.

**Table 3**

| **Working Capital Calculation** | **(in $K)** |
|---|---|
| Total Eligible OM&A Expenses | 50,143 |
| Working Capital Allowance @ 7.5% | 3,761 |

# INTEREST CAPITALIZED AND CAPITALIZATION OF OVERHEADS

## 1.0 INTEREST CAPITALIZED

Consistent with the Board's Decision in EB-2008-0408, effective January 1, 2012, no allowance for funds used during construction ("AFUDC") rate is specified by the Board for use by Hydro One. Hydro One was directed to base its interest capitalization rate on its embedded cost of debt used to finance capital expenditures. This is consistent with Hydro One's adoption of United States generally accepted accounting principles ("US GAAP") per the Board's Decision in EB-2011-0399 and US GAAP requirements for determination of interest capitalized. The rates used in calculating capitalized interest for the bridge and test years represent the effective rate of Remotes' forecast average debt portfolio during the year.

The interest capitalization rate/AFUDC rate for historical, bridge and test years are shown in Table 1:

**Table 1**

**Interest Capitalization Rates**

| Year | | Interest Capitalized / AFUDC | |
|---|---|---|---|
| | | **Rate (%)** | **(in $K)** |
| | **Board Approved 2013** | 4.3 | 266 |
| **Historical** | **2013** | 5.6 | 376 |
| | **2014** | 4.8 | 146 |
| | **2015** | 4.6 | 97 |
| | **2016** | 5.2 | 115 |
| **Forecast** | **2017** | 5.8 | 176 |
| | **2018** | 4.4 | 117 |

## 2.0 CAPITALIZATION OF OVERHEADS

Remotes capitalizes costs that are directly attributable to the acquisition and construction of capital projects. Remotes also capitalizes certain overhead and indirect costs that are supporting capital projects. With the Board's approval of US GAAP as the basis for regulatory accounting and rate setting for Remotes and consistent with the Board's Decision in EB-2012-0137, Remotes continues to capitalize attributable overhead costs consistent with US GAAP.

The Remotes' overhead capitalization rate is a calculated percentage representing the amount of Common Corporate Functions and Services ("CCFS") overhead costs that are required to support capital projects in a given year. Specifically, this rate reflects the total CCFS amounts to be capitalized as a percentage of total capital expenditures. Due to the lumpiness of Remotes' capital program, CCFS amounts to be capitalized are determined based a 3-year average of direct capital expenditures as a percentage of the total capital and OM&A work program. The overhead capitalization rate for 2018 is 4.9%. Hydro One Networks in 2007 began reviewing the overhead capitalization rate on a quarterly basis to determine if the rate needed to be changed to reflect in-year changes in capital spending and associated support costs.

The following table shows capitalized overheads, and the related overhead capitalization rates for the historical, bridge and test years.

**Table 2**

**Overhead Capitalization - Historical, Bridge and Test Years**

***Notes:***

1 Tables in the format outlined above covering all fixed asset accounts should be submitted for the Test Year, Bridge Year and all relevant historical years. At a minimum , the applicant must provide data for the earlier of: 1) all historical years back to its last rebasing; or 2) at least three years of historical actuals, in addition to Bridge Year and Test Year forecasts.

2 The "CCA Class" for fixed assets should agree with the CCA Class used for tax purposes in Tax Returns. Fixed Assets sub-components may be used where the underlying asset components are classified under multiple CCA Classes for tax purposes. If an applicant uses any different classes from those shown in the table, an explanation should be provided. (also see note 3 below).

3 The table may need to be customized for a utility's asset categories or for any new asset accounts announced or authorized by the Board.

4 The depreciation column (D) is not required as the relevant information will be provided in the following 2-C series of appendices.

***Notes:***

1 Tables in the format outlined above covering all fixed asset accounts should be submitted for the Test Year, Bridge Year and all relevant historical years. At a minimum , the applicant must provide data for the earlier of: 1) all historical years back to its last rebasing; or 2) at least three years of historical actuals, in addition to Bridge Year and Test Year forecasts.

2 The "CCA Class" for fixed assets should agree with the CCA Class used for tax purposes in Tax Returns. Fixed Assets sub-components may be used where the underlying asset components are classified under multiple CCA Classes for tax purposes. If an applicant uses any different classes from those shown in the table, an explanation should be provided. (also see note 3 below).

3 The table may need to be customized for a utility's asset categories or for any new asset accounts announced or authorized by the Board.

4 The depreciation column (D) is not required as the relevant information will be provided in the following 2-C series of appendices.

***Notes:***

1 Tables in the format outlined above covering all fixed asset accounts should be submitted for the Test Year, Bridge Year and all relevant historical years. At a minimum , the applicant must provide data for the earlier of: 1) all historical years back to its last rebasing; or 2) at least three years of historical actuals, in addition to Bridge Year and Test Year forecasts.

2 The "CCA Class" for fixed assets should agree with the CCA Class used for tax purposes in Tax Returns. Fixed Assets sub-components may be used where the underlying asset components are classified under multiple CCA Classes for tax purposes. If an applicant uses any different classes from those shown in the table, an explanation should be provided. (also see note 3 below).

3 The table may need to be customized for a utility's asset categories or for any new asset accounts announced or authorized by the Board.

4 The depreciation column (D) is not required as the relevant information will be provided in the following 2-C series of appendices.

***Notes:***

1 Please provide a breakdown of the major components of each capital project undertaken in each year. Please ensure that all projects below the materiality threshold are included in the miscellaneous line. Add more projects as required.

2 The applicant should group projects appropriately and avoid presentations that result in classification of significant components of the capital budget in the miscellaneous category.

## Appendix 2-AB

## Appendix 2-D
## Overhead Expense

Applicants are to provide a breakdown of OM&A before capitalization in the below table. OM&A before capitalization may be broken down by cost center, program, drivers or another format best suited to focus on capitalized vs. uncapitalized OM&A.

| OM&A Before Capitalization | 2013 Historical Year | 2014 Historical Year | 2015 Historical Year | 2016 Historical Year | 2017 Bridge Year | 2018 Test Year |
|---|---|---|---|---|---|---|
| Generation Expenses Operations | $ 29,874 | $ 30,129 | $ 27,587 | $ 28,088 | $ 31,304 | $ 32,519 |
| Generation Expenses Maintenance | $ 8,648 | $ 9,932 | $ 8,610 | $ 9,574 | $ 11,392 | $ 11,640 |
| Other Power Supply Expenses | $ - | $ - | $ - | $ - | $ - | $ - |
| Distribution Expense Operations | $ 62 | $ 80 | $ 199 | $ 212 | $ 111 | $ 116 |
| Distribution Expense Maintenance | $ 1,399 | $ 1,799 | $ 2,216 | $ 1,780 | $ 2,008 | $ 2,087 |
| Collecting and Billing | $ 3,584 | $ 2,285 | $ 919 | $ 2,014 | $ 2,271 | $ 2,304 |
| Administration General Expenses | $ 1,715 | $ 1,833 | $ 1,822 | $ 1,846 | $ 1,675 | $ 1,739 |
| Other Deductions | $ 250 | $ 223 | $ 316 | $ 393 | $ 186 | $ 186 |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| **Total OM&A Before Capitalization (B)** | $ 45,532 | $ 46,281 | $ 41,669 | $ 43,907 | $ 48,947 | $ 50,591 |

Applicants are to provide a breakdown of capitalized OM&A in the below table. Capitalized OM&A may be broken down using the categories listed in the table below if possible. Otherwise, applicants are to provide its own break down of capitalized OM&A.

| Capitalized OM&A | 2013 Historical Year | 2014 Historical Year | 2015 Historical Year | 2016 Bridge Year | 2017 Test Year | 2018 Test Year | Directly Attributable? (Y/N) | Explanation for Change in Overhead Capitalized |
|---|---|---|---|---|---|---|---|---|
| Shared Services | $ 320 | $ 342 | $ 556 | $ 410 | $ 562 | $ 448 | Y | Directly attributable to total labour costs charged to capital |

# COST OF SERVICE SUMMARY, COST DRIVERS AND SUMMARY OF OM&A EXPENDITURES

## 1.0 COST OF SERVICE SUMMARY

This evidence presents an overview of Remotes Cost of Service evidence. The Cost of Service submissions include the following components:

- Operation, Maintenance and Administration expenses;
- Depreciation and Amortization Expense;
- Payments in Lieu of Corporate Income Taxes; and
- External Costs.

Each of these components is separately addressed within the company's evidence. Exhibit reference numbers are provided below.

Remotes' forecast cost of service has been developed consistent with its corporate objectives. The Company's planning process is described in detail at Exhibit B1 and Exhibit A, Tab 7, Schedule 3.

### 1.1 Operation, Maintenance and Administration Expenses (OM&A)

Total OM&A expenses for the 2018 test year are $50,143K.

Remotes plans and organizes its OM&A expenses on the basis of the various work programs and functions performed by the company. Exhibits in support of OM&A costs have been prepared by program area, and appear within the submitted evidence as follows:

**Table 1**

**OM&A Cost Categories**

| **Program Areas** | **2018 Total Cost (in $K)** | **Reference** |
|---|---:|---|
| **Summary of OM&A Expenses** | **$50,143** | **Exhibit D1, Tab 1, Sch 1** |
| Generation | $44,159 | Exhibit D1, Tab 1, Sch 2 |
| Distribution | $2,203 | Exhibit D1, Tab 1, Sch 3 |
| Customer Care | $1,999 | Exhibit D1, Tab 1, Sch 4 |
| Community Relations | $305 | Exhibit D1, Tab 1, Sch 5 |
| Shared Services and Other Administrative Costs | $1,342 | Exhibit D1, Tab 1, Sch 6 |
| Cost of External Work | $135 | Exhibit D1, Tab 2, Sch 1 |

In order to satisfy the requirements of the *2006 Electricity Distribution Rate Handbook* and the *Filing Requirements for Transmission and Distribution Applications* (updated July 14, 2017) Exhibit D2, Tab 2, Schedule 1 identifies OM&A costs by grouped USofA accounts.

## 1.2 Resourcing

Labour costs are charged to OM&A and Capital work programs using standard labour rates. The evidence contained at Exhibit D2, Tab 5, Schedule 2 presents staff levels and costs incurred by the company. Exhibit D1, Tab 5, Schedule 1 describes standard labour rates.

### 1.3 Corporate Cost Allocation

Hydro One Networks Inc. provides common services to Distribution and Transmission and Hydro One Inc. subsidiaries, including Remotes, on a centralized and shared basis. The costs of these services and assets are assigned to business units on the basis of cost causation and benefit. These costs and assets are directly assigned where it is possible to do so.

In 2004, Black & Veatch ("B&V") was engaged by Hydro One to recommend a best practice methodology to distribute Common Corporate Costs to Hydro One and its subsidiaries and partnerships. The methodology is based on clearly articulated shared services and an established cost allocation approach based on cost causality and benefit principles. This Common Corporate Cost Allocation is supported by a recent B&V Review of Common Corporate Costs in 2015 prepared for Hydro One Networks Transmission (EB-2016-0160) and a later Review of Common Corporate Costs prepared for Hydro One Networks Distribution (EB-2017-0049).

The evidence included herein on the allocation of common corporate costs uses this methodology and is shown in Exhibit D1, Tab 5, Schedule 1.

Exhibit C1, Tab 2, Schedule 1 provides evidence regarding the derivation of Overhead Capitalization Rates.

### 1.4 Depreciation and Amortization Expense

The depreciation expense for Remotes' submission for the 2018 revenue requirement was based on the methodology in an independent study conducted by Foster Associates for Hydro One Remote Communities in 2011 and approved by the Board in EB-2012-0137.

The company is proposing to recover $4,608K in depreciation and amortization expenses. Remotes' evidence on depreciation expense is filed at Exhibit D1, Tab 6, Schedule 1.

### 1.5 Income Taxes

Evidence outlining the calculation of Payments of Utility Income Taxes of ($69)K appears at Exhibit D2, Tab 8, Schedule 1.

## 2.0 SUMMARY OF OM&A EXPENDITURES

The requested OM&A expenditures result from a business planning and work prioritization process that reflects risk-based decision making to ensure that appropriate, environmentally responsible and cost effective solutions are in place. This process is described in detail at Exhibit A, Tab 7, Schedule 3.

The proposed OM&A programs are required to meet public and employee safety objectives, to comply with regulatory requirements and government direction, to protect the environment, to maintain service quality and reliability at targeted performance levels, and to ensure public confidence as stewards of the assets entrusted to us.

Remotes' OM&A budget is grouped by investment categories: Generation, Distribution, Customer Care, Community Relations, Administration and Other OM&A and External Costs. Table 1 provides a summary of Remotes' OM&A expenditures for the historical, bridge and test years.

**Table 2**

**Summary of OM&A Budget (in $K)**

| Description | Board Approved | Historic (Actual) | | | | Bridge | Test |
|---|---|---|---|---|---|---|---|
| | **2013** | **2013** | **2014** | **2015** | **2016** | **2017** | **2018** |
| **Generation** | 36,632 | 38,522 | 40,061 | 36,197 | 37,662 | 42,696 | 44,159 |
| **Distribution** | 2,980 | 1,461 | 1,879 | 2,415 | 1,992 | 2,119 | 2,203 |
| Customer Care | 1,903 | 3,064 | 1,731 | 628 | 1,876 | 1,892 | 1,999 |
| Community Relations | 750 | 520 | 554 | 291 | 138 | 379 | 305 |
| Shared Services and Other Administrative Costs | 1,157 | 1,439 | 1,542 | 1,317 | 1,487 | 1,164 | 1,342 |
| **External Costs** | 61 | 206 | 172 | 265 | 342 | 135 | 135 |
| **TOTAL** | **43,483** | **45,212** | **45,939** | **41,113** | **43,497** | **48,385** | **50,143** |
| *% Change (year-over-year)* | - | *9.8%* | *1.6%* | *-10.5%* | *5.8%* | *11.2%* | *3.6%* |
| *$ Change (Test vs. 2013 Board Approved)* | - | - | - | - | - | - | *6,660* |
| *% Change (Test vs. 2013 Board Approved)* | - | - | - | - | - | - | *15.3%* |

Total OM&A expenditures are expected to increase by 4% or $1,758K over the 2017 to 2018 period. The increase is primarily driven by the cost of diesel fuel.

The cost drivers and detailed descriptions of the work activities in each area of Remotes' OM&A expense and the reasons for the changes in costs over the 2013 to 2018 period are discussed in the schedules that make up Exhibit D1, Tab 1, Schedules 2 to 6.

## 3.0 GENERATION

The Generation OM&A budget represents costs required to maintain and operate the existing generation stations and associated facilities to meet community loads. The proposed costs are intended to ensure that the overall reliability of the generating assets is maintained and that customer commitments are achieved, and that all legislative, regulatory and safety requirements are met. Details of the expenditures under this program are provided at Exhibit D1, Tab 1, Schedule 2.

## 4.0 DISTRIBUTION

The Distribution OM&A budget represents planned maintenance, forestry and right-of-way maintenance, trouble response, data collection and system condition assessment, and meter re-verification, testing and checking. The proposed costs are intended to ensure that the overall reliability of the distribution systems is improved, that customer commitments are met, and that all legislative, regulatory, environmental and safety requirements are met. Details of the expenditures under this program are described in detail at Exhibit D1, Tab 1, Schedule 3.

## 5.0 CUSTOMER CARE

The Customer Care OM&A expenses represent the costs associated with meter reading, customer billing, collections and bad debt expenses. Details of the expenditures under this program are filed at Exhibit D1, Tab 1, Schedule 4.

## 6.0 COMMUNITY RELATIONS

The Community Relations OM&A work program includes CDM programs, outreach activities, the Customer Advisory Board ("CAB"), and community safety program. Details of the expenditures under this program are filed at Exhibit D1, Tab 1, Schedule 5.

## 7.0 SHARED SERVICES AND OTHER ADMINISTRATIVE COSTS

The Shared Services and Other Administrative costs include the common corporate functions and services to support the Remotes business, as well as the maintenance of existing infrastructure, including business systems, facilities, and information technology. The common corporate functions and services include the provision of financial, human resource, legal, information technology and strategic planning services. Other OM&A programs also include the credits for overheads capitalized. Details of the expenditures under this program are filed at Exhibit D1, Tab 1, Schedule 6.

## 8.0 EXTERNAL COSTS

Remotes performs a small amount of unregulated external work. There are three main areas of work: assistance to the Electricity Safety Authority to facilitate inspections of Remotes' distribution systems and of customer installations; maintenance of street lights and First Nation owned generating equipment in Remotes' service territory; and assessments of the Independent Power Authority generating stations (First Nation-owned and operated generating stations in remote communities Remotes does not serve). External work is described in Exhibit D1, Tab 2, Schedule 1.

# GENERATION OM&A

## 1.0 INTRODUCTION

Due to the lack of grid connection, Remotes generates electricity to meet its obligations under section 29 of the *Electricity Act, 1998*. Diesel generation is currently the prime source of electricity within the communities. Remote also owns and operates two run-of-the-river mini-hydro electric generating facilities and has four demonstration project windmills. The feasibility of using further renewable technologies is continually examined as new technologies evolve, but diesel is currently the most reliable and cost effective technology.

There are presently 57 diesel generators in service, ranging in size from 60kW to 1500kW. Most stations have three generators, sized to meet community load at different times of the day. Automated operation ensures that the generation units are run to maximize fuel efficiency by matching the generator size to the community load. Depending on electrical demand, Remotes handles approximately 18 million litres of fuel each year.

Remotes has fuel storage tanks ("tank farms") within each community to ensure adequate diesel fuel supply. Tanks are equipped with measurement and alarm devices to reduce the risk of fuel spills and to enhance fuel control measurement. Most tanks are double-walled to enhance containment.

Due to the high cost of transportation to the communities, Remotes' staff generally reside in the communities while undertaking planned and unplanned maintenance. Remotes maintains staff houses and trailers at fourteen sites. Commercial accommodations are used at the other sites.

The proposed Generation OM&A expenditures for 2018 are $44,159K and include $27,600K for diesel fuel required to generate electricity. These expenditures are required to meet customer, regulatory and statutory requirements regarding service and reliability.

## 2.0 OVERVIEW

The Operation and Maintenance spending for historic, bridge and test years are presented in the table below.

**Table 1**

**Generation Operation & Maintenance OM&A (in $K)**

| Category | Board Approved | Historic (Actual) | | | | Bridge | Test |
|---|---|---|---|---|---|---|---|
| | 2013 | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 |
| **Generation Maintenance** | 6,012 | 8,648 | 9,932 | 8,610 | 9,574 | 11,392 | 11,640 |
| **Generation Operations** | 4,573 | 4,306 | 4,260 | 4,337 | 4,358 | 4,819 | 4,919 |
| **Fuel** | 24,067 | 25,568 | 25,869 | 23,250 | 23,669 | 26,485 | 27,600 |
| **Other Power Supply Expenses** | 1,980 | 0 | 0 | 0 | 61 | 0 | 0 |
| **Total** | **36,632** | **38,522** | **40,061** | **36,197** | **37,662** | **42,696** | **44,159** |

## 3.0 GENERATION MAINTENANCE

Generation maintenance includes planned and unplanned maintenance related to the generation site, buildings, engines, systems and fuel storage and fuel systems. Planned maintenance prevents premature equipment and system failures and contributes to service reliability. Unplanned maintenance includes maintenance and repair related to trouble reports and equipment or component failures.

As outlined in Exhibit A, Tab 3, Schedule 2 and in the DSP, in response to overall funding constraints, Indigenous and Northern Affairs Canada ("INAC") and Remotes have developed a more incremental approach to funding required upgrades. INAC now funds the cost of replacing an existing engine with a larger engine. In some cases, where engine rooms are too small for the new engine, INAC will also fund the cost to modify the generating station. Adopting this strategy is critical from a customer perspective. Since 2013, eight communities have been in load restrictions, where new services could not be connected to the electrical systems. The shift to more incremental funding has satisfied customer needs and expectations for safe, reliable power and has to date removed connection restrictions in seven communities. A project to remove restrictions is planned in the remaining growth-constrained community. Because the stations are not replaced by INAC as originally planned, investments are still required to maintain aging auxiliary systems and station buildings.

### 3.1 Maintenance of Diesel Engines

Planned maintenance of diesel engines is prescribed by the engine manufacturer and is required to keep generating units available and operating to meet community load. Intensive maintenance procedures are scheduled based on engine operating hours and vary from year to year. Forecasts of planned maintenance engines are based on forecast engine operating hours, not the age of the unit. Actual engine maintenance performed varies according to actual load in the community and the hours each engine is picked to run by the automated control system. Regular maintenance is also performed on the run-of-the-river hydro stations.

### 3.2 Maintenance of Plant and Auxiliary Systems

Planned maintenance of plant and auxiliary systems includes inspection and maintenance of: all electrical system and SCADA systems; secondary heating systems; engine fuel controls, primary cooling and ventilation systems; overhead cranes; and mandatory annual inspection and maintenance of fire suppression systems.

The plant auxiliary systems were installed when stations were newly constructed, and must be maintained, tested, inspected and calibrated to keep them in service. As proposed and approved in EB-2012-0137, an ongoing program to meet regulatory requirements for annual certification of fire systems was established in 2013.

### 3.3 Maintenance of Buildings

Planned maintenance related to structures includes civil repair work (required to maintain all generating station buildings, fences, yard sites and staff houses), annual inspections, and bi-annual sampling of water facilities for the staff houses and generation stations. Delays to station upgrades mean that ongoing civil repair work increases significantly as buildings that were expected to be replaced continue to age and require increased maintenance.

### 3.4 Maintenance of Tank Farms

Planned maintenance of tank farms includes expenditures required to inspect, maintain and address deficiencies in the generating station fuel offload, bulk storage tanks and fuel transfer equipment in order to keep fuel systems in standard operating condition. Fuel system maintenance is directly related to Remotes' responsibility for station operation as prescribed in the Electrification Agreements, Canadian Standards Association fuel regulations B-139-15, and Fuel Oil Regulation 212. Liquid Fuels Handling Code, Technical Standards and Safety Association.

### 3.5 Design, Construction and Asset Management (Engineering) Support

Design, Construction and Asset Management maintenance programs and projects are related to improvements in the efficiency, safety and operation of generation assets and include engineering investigations, electrical drawing projects and renewable energy improvements.

**Table 2**

**Generation Maintenance OM&A (in $K)**

| Category | Board Approved | Historic (Actual) | | | | Bridge | Test |
|---|---|---|---|---|---|---|---|
| | 2013 | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 |
| **Generation Maintenance** | 6,012 | 8,648 | 9,932 | 8,610 | 9,574 | 11,392 | 11,640 |

Increases in generation maintenance between the 2013 OEB-approved amounts and 2013 actual amounts are primarily due to higher unplanned maintenance, including unit failures in Weagamow, Deer Lake, Wapekeka and Fort Severn, higher maintenance of auxiliary and plant systems and renewable energy maintenance. Increased building maintenance, electrical station drawing projects and engineering investigations also contributed to this variance, partially offset by lower planned maintenance of engines.

Increases in generation maintenance between 2013 and 2014 are primarily related to higher planned maintenance of engines and increased maintenance of auxiliary and plant systems, which were identified as a leading cause of unplanned generation outages. Increased work on leak detection sensor improvements, engineering investigations, and electrical station drawing projects also contributed to the variance and are partially offset by lower unplanned engine maintenance in 2014 and lower planned and renewable energy maintenance.

Decreases in generation maintenance between 2014 and 2015 are mainly due to a shift in resources to focus on fully recoverable capital upgrade work, lower planned maintenance of engines and lower maintenance of auxiliary and plant systems which was a major focus in 2014. Lower expenditures on unplanned maintenance of engines, leak detection sensor improvements, engineering investigations, and electrical station drawing projects also contributed to this variance. These decreases are offset by higher renewable energy maintenance and increased environmental improvements.

Increases in generation maintenance between 2015 and 2016 are related to higher planned maintenance of engines, unplanned maintenance of engines, and spill detection operational improvements. Increased planned maintenance of buildings, renewable energy maintenance, and engineering investigations also contributed to this variance. These increases are offset by decreased plant maintenance auxiliaries and systems and fewer electrical station drawing projects.

Increases in generation maintenance between 2016 and 2017 bridge year forecast are associated with higher planned maintenance of engines, unplanned maintenance of engines, maintenance of auxiliary and plant systems and safety improvements, engineering investigations, and station electrical drawing projects. These increases are offset by lower planned maintenance of buildings.

Increases in generation maintenance between 2017 bridge year forecast and 2018 test year are associated with higher maintenance of engines, auxiliary and plant systems, and renewable energy maintenance.

## 4.0 GENERATION OPERATIONS

Generation operations represent expenditures required for safe and reliable day-to-day operation of the generating plants, and are required to keep the generating station and associated facilities in a standard operating condition as required to meet community load. This is associated with Remotes' responsibilities prescribed by the Electrification Agreements, the Certificate of Approval to Operate the Generating Station under the *Environmental Protection Act*, and Section 6.2.27 of the Distribution System Code.

The inaccessibility of its service territory is Remotes' greatest operational risk. Within each community, Remotes contracts for local operators, who perform regular routine inspection and maintenance of equipment at generating facilities including the generating units, auxiliary equipment and the bulk storage tank farm. The operators provide on-site monitoring of fuel deliveries, and the safe handling, transportation and disposal of waste. Operators are also responsible for keeping the stations clean, undertaking filter changes, checking diesel plants and reporting and troubleshooting problems to the Thunder Bay Service Centre. Operators are also responsible for responding to emergencies such as power outages, house fires and spills.

Operations staff in Thunder Bay is responsible for ensuring that the diesel plants operate safely and reliably. Operations staff is also the primary contact for the operators, responsible for supervising and scheduling, developing plant-specific procedures, logistical and troubleshooting support, assisting the operator in emergency response, plant reporting and for ensuring that the operators are competent to perform daily maintenance activities. Operations staff is responsible for conducting and documenting operator training. Each operator must successfully complete a comprehensive on-site training program each year. On average, each operator requires annual refresher training of two weeks to learn to operate the plant systems, respond to emergencies and perform day-to-day maintenance.

Generation operations also include a variety of environmental programs. These programs are conducted to ensure that Remotes complies with all legal and corporate requirements related to environmental protection, including obtaining and respecting Certificates of Approvals and permits for the transportation of dangerous goods and with various reporting requirements under the *Environmental Protection Act.*

In 1999, Remotes developed an Environmental Management System ("EMS") to help improve environmental performance. The EMS is registered to the ISO 14001-2015 standard and requires regular audits, spills prevention, support and training for staff and agents, and internal and public communications.

Generation operations, excluding fuel and power purchases, in the historic, bridge and test years are presented in Table 3 below.

**Table 3**
**Generation Operations OM&A (in $K)**

| Category | Board Approved | Historic (Actual) | | | | Bridge | Test |
|---|---|---|---|---|---|---|---|
| | 2013 | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 |
| **Generation Operations** | 4,573 | 4,306 | 4,260 | 4,337 | 4,358 | 4,819 | 4,919 |

Decreases in generation operations between the 2013 OEB-approved amounts and 2013 actual amounts are due to investments in operator training in 2012 and earlier years that led to lower compliance related items and corrective actions, improvements in on-site tools and equipment, and the successful re-negotiation of the winter road contract.

2016 expenditures were lower than planned due to an unanticipated vacancy associated with the long-term illness of one of the two operations officers. Increases in generation operations between 2016 and 2017 relate to renegotiated operator contracts and the re-establishment of two regular operations staff.

## 5.0 FORECAST OF FUEL USAGE, PRICING AND DELIVERY

Fuel purchases for the historic, bridge and test years are shown in Table 4 below.

**Table 4**

**Fuel Purchases (in $K)**

| Category | Board Approved | Historic (Actual) | | | | Bridge | Test |
|---|---|---|---|---|---|---|---|
| | 2013 | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 |
| **Fuel** | 24,067 | 25,568 | 25,869 | 23,250 | 23,669 | 26,485 | 27,600 |

Increases in fuel between the 2013 OEB-approved amounts and 2013 actual amounts are due to increased fuel volumes associated with higher community load, offset by a decrease in unit price. Decreases in fuel between 2014 and 2015 relate primarily to lower unit price. Increases between 2016 and the bridge year 2017 relate primarily to higher unit price. Increases between 2017 bridge year forecast and 2018 test year are due to increased volume and unit price.

Remotes forecasts load in order to plan for and meet customer loads, to estimate customer revenues and to forecast its fuel and maintenance costs. As a result of Remotes' break-even business model, cost and revenue differences between forecast loads and forecast fuel costs do not result in a profit or loss to Remotes, but are added to or drawn from the RRRP Variance Account. The load forecast methodology and statistics related to load forecast are discussed in more detail in Exhibit G1, Tab 1, Schedule 1, and in the supporting schedules to that Exhibit.

### 5.1 Fuel Usage Forecast

Remotes tracks actual historical data on energy usage by community, customer class, and time period. This historical data provides the baseline starting point for forecasting usage/kWh sold. Adjustments are made to this baseline data on a going-forward basis using average load growth, historical customer growth patterns and seasonality. Feedback is solicited from communities about upcoming construction or community programs that may impact future loads.

The Usage Forecast (kWhs sold) forms the basis of the fuel forecast. Once the usage forecast is established, historic operating fuel efficiency ratios and load loss rates are utilized to forecast generated kWhs and fuel litres required. The fuel forecast is done on a site by site basis, given different load characteristics and plant efficiencies.

Expected fuel commodity prices are based on market prices at the time the forecast is made. Fuel commodity prices are escalated based on Consumer Price Index (“CPI”). As there is no Canadian forecast for diesel fuel commodity prices, commodity pricing is confirmed through a high level analysis of the published fuel indices that are used by each supplier.

The cost of delivery accounts for about 44% of the delivered price of fuel. As a result, supply delivery contract data is critical in developing the forecast costs. Supplier contracts are subject to a competitive tendering process and delivery costs are forecast on the basis of supplier contracts and historical deliveries of winter road fuel. Air delivery typically constitutes about 56% of fuel delivered to Remotes’ communities, followed by all-weather road delivery at 13%, winter road delivery at 18% and First Nation contracts at about 13%.

**Table 5**

**Total Cost of Fuel**

| | |
|---|---:|
| Fuel Efficiency (kWh/litre) | 3.42 |
| Total litres of fuel issued (in KL) | 18,203 |
| Average delivered cost per litre ($) | $1.516 |
| Total Cost of Fuel (in $K) | $27,600 |

## 5.2 Fuel Cost Management

Overall fuel costs are affected by three main factors: price, volume and delivery. Two of these factors can be influenced by Remotes, volume and costs of delivery. Remotes has several initiatives underway to address volume. To influence fuel volumes, Remotes makes CDM available to customers, is reinvesting in its Programmable Logic Controller ("PLC") system and is installing new, more fuel efficient engines when engines are at end of life.

Since 2007, Remotes has been reducing delivery costs, by improving delivery contracts for both air and winter road fuel by improving supplier contracts, requiring that fuel levels are drawn down in advance of winter road openings and by continuing to expand its contracting with First Nation-owned tank farms for the supply and storage of winter road fuel. Fuel commodity prices, on the other hand, are the result of market forces and are not within Remotes' control.

In order to reduce diesel fuel usage, Remotes has done the following:

- Introduced a CDM program and supported the development of community-led, energy planning discussed in Exhibit D1 Tab 1, Schedule 5;
- Operated and introduced customer-owned Renewable Energy Technologies ("REINDEER program") generation facilities (Exhibit A, Tab 3, Schedule 3);
- Invested in improving fuel generating efficiency through a proactive scheduled maintenance program; and
- Maintained an active generation asset replacement program, and introduced more efficient technology.

In order to mitigate the impact of rising fuel rates Remotes has done the following:

- Negotiated long-term fuel delivery contracts with multiple suppliers;
- Maximized winter road deliveries (cheaper delivery methods) where possible through supplier relationships and improved tank storage; and
- Negotiated an increased number of fuel contracts directly with the First Nation communities with fuel storage on site where Remotes does not have adequate fuel storage facilities to take advantage of winter road delivery pricing.

## 6.0 POWER PURCHASES

### 6.1 Shoulderblade Falls Hydroelectric Station

During the 1990s, Ontario Hydro, Deer Lake First Nation and INAC jointly funded the construction of a small hydroelectric station at Shoulderblade Falls as a demonstration of renewable technology in the north. In 1999, Deer Lake and Ontario Hydro agreed that Ontario Hydro would operate the station for ten (10) years and then would transfer ownership to Deer Lake at the end of 2009. Ontario Hydro agreed to pay Deer Lake for purchased power based on the avoided cost of diesel fuel. Remotes inherited this agreement from Ontario Hydro. At the request of Deer Lake First Nation, the transfer of the station was deferred until the end of 2012. At the time of the last filing, Remotes expected to transfer the station to Deer Lake First Nation and to purchase power from the community starting in 2013. The First Nation decided to defer taking over the station for another ten (10) years; therefore, power has not been purchased from the station. In the interim, Remotes pays Deer Lake First Nation $120K per year for the use of the facility and $10K for road maintenance as part of an agreement to share the benefits of the station with the community. The benefit-sharing costs are currently included in generation maintenance. Renewable energy purchased through the REINDEER program is an offset to fuel expense. The REINDEER program is discussed further in Exhibit A, Tab 3, Schedule 3.

**Table 6**

**Shoulderblade Falls Power Purchases**

| | **2013 OEB-Approved** | **2013 Actual** |
|---|---|---|
| Total MWh purchased | 1,881 | 0 |
| Estimated Cost of Power (in $K) | $612 | $0 |

## 6.2 Forecast Power Purchases for Grid Connected Communities

Remotes expected to begin serving the communities of Cat Lake and Pikangikum in 2013. Neither community has yet signed an agreement for service with Remotes. Discussions on a service agreement with Cat Lake are currently in abeyance, as the community has requested some time to resolve certain issues with Hydro One Networks. Although discussions on the transfer of service are not currently active, Remotes staff is working with Cat Lake First Nation on a community soil remediation project (some contamination in the community relates related to the old Ontario Hydro generation station), and believes that an agreement for service will eventually be reached.

Pikangikum was unable in 2013 to get the capital required to build a distribution line to the community. In March, 2016, Pikangikum First Nation wrote to Remotes noting that it was working with the Watay project and wished to revive negotiations for a service agreement. Discussions with Pikangikum are currently active and Watay has developed a project plan to connect the community. It is Remotes' expectation that Pikangikum will receive funding for this project and that Remotes will serve the community. However, no revenues or costs associated with service to either Cat Lake or Pikangikum are included in this filing as neither community is currently expected to enter Remotes service territory in 2018.

**Table 7**

**Forecast Purchases by Community (MWhs)**

| **Category** | **Board Approved** | **Historic (Actual)** | | | | **Bridge** | **Test** |
|---|---|---|---|---|---|---|---|
| | **2013** | **2013** | **2014** | **2015** | **2016** | **2017** | **2018** |
| Cat Lake | 1,921 | 0 | 0 | 0 | 0 | 0 | 0 |
| Pikangikum | 10,682 | 0 | 0 | 0 | 0 | 0 | 0 |
| Total (includes line losses) | 12,603 | 0 | 0 | 0 | 0 | 0 | 0 |
| Total Cost of Power (in $K) | $1,980 | $0 | $0 | $0 | $0 | $0 | $0 |

# DISTRIBUTION OM&A

## 1.0 INTRODUCTION

Remotes served approximately 3,550 customers at the end of 2016 through nineteen isolated distribution systems to serve twenty-one communities. Within each system, Remotes is responsible for transformation, voltage regulation, delivery and metering of power. The distribution systems are isolated, distinct and stand-alone, the result of the distance between each community. These distribution systems operate at distribution voltages ranging from 4.8 kV to 25 kV. The distribution in-service assets maintained by Remotes include approximately 242 kilometers of line and transformers distributed throughout the system, which are used for voltage transformation.

The proposed OM&A expenditures are driven by the need to meet customer, regulatory and statutory requirements regarding service and reliability.

**Table 1**
**Distribution OM&A (in $K)**

| **Category** | **Board Approved** | **Historic (Actuals)** | | | | **Bridge** | **Test** |
|---|---|---|---|---|---|---|---|
| | **2013** | **2013** | **2014** | **2015** | **2016** | **2017** | **2018** |
| **Distribution Maintenance** | 2,679 | 1,399 | 1,799 | 2,216 | 1,780 | 2,008 | 2,087 |
| **Distribution Operations** | 301 | 62 | 80 | 199 | 212 | 111 | 116 |
| **Total** | **2,980** | **1,461** | **1,879** | **2,415** | **1,992** | **2,119** | **2,203** |

Distribution maintenance includes both planned and unplanned maintenance and trouble calls. Unplanned power interruptions on the distribution system generally result from line component failures and contact by trees or animals. Unplanned maintenance is reactive and varies due to external factors such as storms, variability in equipment deterioration and random equipment failures. Planned maintenance includes equipment maintenance that is primarily cyclical in nature, including maintenance of line equipment (reclosers and line regulators).

Distribution maintenance also includes costs associated with metering. Revenue metering is federally regulated under the *Electricity and Gas Inspection Act* and is governed by Measurement Canada. Under Measurement Canada regulations, all revenue meters must be approved and routinely inspected and maintained. Remotes complies with Measurement Canada rules and regulations. Based on Measurement Canada rules, meters must regularly be removed from service to verify that they are performing accurately and within specifications. Electricity customers require a meter to measure their electricity usage, and the proper functioning of billing meters is essential to ensure customers are neither overbilled nor underbilled.

Distribution operations includes data collection and system condition assessment used to plan corrective and preventative maintenance, joint use activities and engineering support for distribution. The Distribution System Code requires that all local distribution companies assess the condition of its assets and patrol their distribution lines to identify structural problems, damaged equipment and components that may cause a power interruption, as well as any hazards such as leaning poles, damaged equipment enclosures and vandalism.

Distribution maintenance in 2013 was lower than the OEB-approved 2013 level primarily due to the delay in reaching service agreements with Cat Lake and Pikangikum. The cancellation of collection trips due to the implementation of the CIS project also contributed to the lower than planned spending.

Higher distribution maintenance expenditures in 2014 compared to 2013, primarily reflect the resumption of collection trips after CIS stabilization and increased planned forestry activities, partially offset by lower trouble calls.

Higher distribution maintenance expenditures in 2015 compared to 2014 primarily reflect increased trouble response, planned maintenance, and forestry activities.  Increased distribution operations expenditures in 2015 compared to 2014 reflect increased costs related to a project to automate distribution data collection.

Lower distribution maintenance in 2016 compared to 2015 primarily reflects a decrease in planned forestry activities.

Higher distribution maintenance in 2017 compared to 2016 primarily reflects an increase in planned forestry activities.  Remotes is currently on track to complete the planned distribution maintenance in 2017.

# CUSTOMER CARE OM&A

## 1.0 INTRODUCTION

Remotes provides general customer account services including in-community customer service activities to all customers connected to its distribution system. These services are established by Remotes' Distribution Licence, rate schedules, and in the Codes and Rules established by the Board, and are documented in Remotes' Conditions of Service. Remotes' customer care team is responsible for billing, collections, meter reading, and responding to customer inquiries and complaints.

The Customer Care spending for historic, bridge and test years is shown in Table 1 below. Bad Debt expense is included in the Customer Care OM&A category.

**Table 1**
**Customer Care OM&A (in $K)**

| **Category** | **Board Approved** | **Historic (Actuals)** | | | | **Bridge** | **Test** |
|---|---|---|---|---|---|---|---|
| | **2013** | **2013** | **2014** | **2015** | **2016** | **2017** | **2018** |
| Customer Care | 1,855 | 2,844 | 1,906 | 1,733 | 1,897 | 1,857 | 1,939 |
| Bad Debt | 48 | 220 | (175) | (1,105) | (21) | 35 | 60 |
| **Total** | **1,903** | **3,064** | **1,731** | **628** | **1,876** | **1,892** | **1,999** |

## 2.0 CUSTOMER CARE

Customer care expenses include costs to read meters, bill customers, collect on outstanding accounts and respond to customer inquiries. Remotes has two staff in the Thunder Bay service centre who are responsible for entering meter readings into the Customer Service System, answering customer calls and inquiries, entering bill payments, organizing collection trips, contacting customers and Band Councils prior to collection activity and negotiating payment arrangements. Field staff undertake collection activities in the communities. Meter reading is contracted out through Band Councils to individuals in the communities.

Higher customer care spending in 2013 compared to the Board-approved 2013 level, is due to Remotes' involvement in the project design and implementation of the CIS billing system. Lower customer care spending in 2014 compared to 2013 reflects the implementation of the CIS billing system in 2013 as required involvement in the project wound down.

## 3.0 BAD DEBIT

Bad debt expense is made up of direct write-offs offset by recoveries, plus adjustments to the provision for bad debts. The bad debt allowance is based on a combination of applying a model percentage against outstanding energy accounts receivables and specific identification of high risk receivables. The provision is an allowance taken against receivables where full recovery is in doubt and is determined using allowance rates on previous actual payment history, the normal payment curve and specific adjustments for large or unusual receivables based on management judgment. Adjustments to this allowance are charged to bad debt expense when outstanding receivables increase. When outstanding balances are reduced, the provision is reduced and the adjustments are credited to bad debts.

Credits to bad debt expense in 2014 and 2016 reflect Remotes' success in negotiating payment arrangements with First Nation Band Councils. The credit in 2015 primarily reflects the successful early completion of a long term payment plan. Since January 2013, outstanding First Nation accounts receivable have been reduced from $4,407K to $2,613K in December 2016, when most First Nations had successfully completed their payment plans. As a result of these successful payment arrangements, the provision has been reduced. Bad debt expense is expected to increase to reflect the conclusion of most of these payment plans in the bridge and test years.

# COMMUNITY RELATIONS OM&A

Community Relations expenses include various customer outreach activities, including a Conservation and Demand Management (CDM) program, the Customer Advisory Board (CAB) and public safety measures such as the joint use program.

**Table 1**

**Community Relations ($K)**

| Category | Board Approved | Historic (Actuals) | | | | Bridge | Test |
|---|---|---|---|---|---|---|---|
| | 2013 | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 |
| **Total** | **750** | **520** | **554** | **291** | **138** | **379** | **305** |

Until 2016, CDM was the largest element of Remotes' Community Relations activities. Between 2011 and 2014 CDM activities were carried out by the Remotes' Conservation and Renewable Energy ("CaRE") officer. Most of Remotes' customers are residential, therefore the program focused on residential conservation. In 2013, Remotes' customers also benefited from an Ontario Power Authority ("OPA") Program that also focused on residential customer conservation. Between the two programs, most customers participated in programs that were designed to develop sustainable conservation by developing local expertise and buy-in, and from access to energy efficient products and appliances.

In 2013 and 2014, the OPA and the federal government also sponsored the development of community energy plans in various communities that Remotes serves. Remotes supported this work by offering advice and information on usage and costs. These energy plans included conservation, but also focused on renewable energy development, alternatives to diesel fuel and the potential for grid access. By 2015, most Band Councils expressed a preference for Remotes to focus on activities related to grid-readiness and on opportunities for renewable energy development. Where conservation was seen as a priority, it was directed toward Band accounts (i.e., Standard A customers) as these rates are much higher and were making it difficult for Band Councils to pay their bills. Remotes therefore decided to continue to offer residential programs through an application based program, and to also offer its commercial customers separate application-based programs. The move to application-based programs resulted in lower program spending part way through 2015 and 2016 and is also reflected in the bridge and test years.

Other Community Relations activities include Remotes' Customer Advisory Board ("CAB"), customer research activities, customer communications and community relations expenses such as community meetings. Remotes surveys its customers and Band Councils annually to discuss service satisfaction, planned program activities, areas that services can be improved and related matters. Customer communications includes bill inserts and other mailings to customers. Community relations activities include community meetings and other outreach activities to discuss service issues. CAB members are residential and commercial customers from within Remotes' service territory. The CAB offers advice on service policies and procedures, and ways to improve services within the communities. Costs for this program are related primarily to meeting facilities, transportation to meetings and travel expenses for CAB members. See Exhibit A, Tab 4, Schedule 1 - Customer Service and Engagement Strategy for information on CAB discussions.

Variances from 2014 to 2016 relate to reduced spending on CDM activities. The CDM expenditure level is expected to return to the normal level in 2017. Variances from 2017 to 2018 relate to an expected increase in uptake of conservation programs and a small increase in community outreach activities related to public safety and community meetings.

# SHARED SERVICES AND OTHER ADMINISTRATIVE COSTS

## 1.0 SHARED SERVICES

The shared service model allows for the delivery of specialized services performed by Hydro One without replicating these functions within each separate subsidiary. Shared Services include common corporate functions and services ("CCF&S"), telecommunications, enterprise technology, supply management services and the use of assets.

Benefits to Remotes include the following:

- Ensures availability of required specialised professional expertise and resources in diverse areas;
- Ensures application of consistent policies, governance frameworks, business processes;
- Rationalizes and offers consistent levels of service across all Hydro One subsidiaries irrespective of size (human resources, pay and financial services, infrastructure support);
- Uses common technology systems and platforms providing better access to high quality and accurate information and to required services; and
- Allows Remotes to benefit from economies of scale in such areas as accounts payable processing, procurement processes and management of supplier relationships.

**Table 1**

**Remotes' Shared Services (in $K)**

| Description | Historic | | | | | Bridge | Test |
|---|---|---|---|---|---|---|---|
| | 2013 OEB Approved | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 |
| **CCF&S** | 905 | 868 | 993 | 956 | 1,144 | 1,032 | 1,027 |
| **Enterprise Technology Services** | 217 | 213 | 219 | 266 | 219 | 145 | 135 |
| **Telecommunications Services** | 118 | 124 | 125 | 140 | 135 | 141 | 140 |
| **System Services & Lease of Computer Equipment** | 180 | 219 | 299 | 299 | 276 | 261 | 261 |
| **Customer System Operations** | 53 | 54 | 39 | 43 | 43 | 46 | 47 |
| **Total Shared Services** | **1,473** | **1,478** | **1,675** | **1,704** | **1,817** | **1,625** | **1,610** |
| **Supply Chain Services** | 77 | 76 | 76 | 76 | 76 | 76 | 76 |
| **Total** | **1,550** | **1,554** | **1,751** | **1,780** | **1,893** | **1,701** | **1,686** |

CCF&S are also discussed in Exhibit A, Tab 6, Schedule 1, and include Corporate Management, Finance, Outsourcing Services, Internal Audit, Tax, Legal, Corporate Secretariat, Regulatory, Corporate Communications and Services, First Nation and Metis Relations, Security, Human Resources and Labour Relations.

## 2.0 OTHER ADMINISTRATIVE COSTS

Other Administrative Costs include Remotes' project costs, Ontario Energy Board cost assessment, costs awards and proceeding-specific costs and expenses related to the

OEB's Low-Income Emergency Assistance Program. No political or charitable donations have been made or are planned for recovery.

**Table 2**

**Other Administrative Costs (in $K)**

| Description | Historic | | | | | Bridge | Test |
|---|---|---|---|---|---|---|---|
| | OEB Approved | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 |
| **OEB Initiated Regulatory Expenses** | 86 | 122 | 129 | 142 | 68 | 40 | 50 |
| **Applicant Driven Regulatory Expenses** | 54 | 140 | 9 | 0 | 0 | 90 | 125 |
| **Low-Income Energy Assistance Program (LEAP)** | 52 | 52 | 52 | 52 | 52 | 52 | 52 |
| **Total** | **192** | **314** | **190** | **194** | **120** | **182** | **227** |

Regulatory expenses include the Ontario Energy Board's allocation of its expenses to Remotes and Section 30 costs associated with OEB led proceedings. Year over year variances in 2013, 2014 and 2015 relate primarily to differences in OEB initiated Section 30 costs. Variances between 2015 and subsequent years relate to the new cost allocation methodology adopted by the Board. Variances between 2013 OEB-approved and 2013 actual amounts reflect intervenor costs for EB-2011-0021 and EB-2012-0137. Increased expenses in 2017 reflect the cost for Notice and for consultant support for the DSP. Test year expenses primarily reflect expected intervenor cost awards. Details related to these costs are shown in Exhibit D2, Tab 6, Schedule 1.

LEAP is an OEB directed initiative, which started in 2011.

## 3.0 TOTAL SHARED SERVICES AND OTHER ADMINISTRATION

Total Shared Services and Other Administration include credits associated with direct program assignments, non-energy bad debts and capitalized overheads.

Direct Program Assignments are services that can be directly assigned to an OM&A program, such as billing. These are deducted from Shared Services and Administration. Non-energy bad debts are also removed and are included in Customer Care (Exhibit E1 Tab 1, Schedule 4).

Capitalized Overheads are the portion of Common Corporate Costs attributable to overhead and indirect costs related to capital projects that are capitalized, as discussed in Exhibit C1, Tab 2, Schedule 1 and are deducted from Shared Services and Other Costs.

**Table 3**

**Total Shared Services and Other Administrative Costs (in $K)**

| Description | Historic | | | | | Bridge | Test |
|---|---|---|---|---|---|---|---|
| | 2013 OEB Approved | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 |
| **Shared Services** | 1,550 | 1,554 | 1,751 | 1,780 | 1,893 | 1,701 | 1,686 |
| **Other Administrative Costs** | 192 | 314 | 190 | 194 | 120 | 182 | 227 |
| **Total** | **1,742** | **1,868** | **1,941** | **1,974** | **2,013** | **1,883** | **1,915** |
| **Less Direct Program Assignments** | (130) | (130) | (115) | (119) | (119) | (122) | (123) |
| **Less Capitalized Overheads** | (455) | (320) | (342) | (556) | (410) | (562) | (448) |
| **Total Shared Services and Other Administration** | **1,157** | **1,418** | **1,484** | **1,299** | **1,484** | **1,199** | **1,342** |

# COST OF EXTERNAL WORK

## 1.0 OVERVIEW

Remotes performs a small amount of external work for other parties. The main areas of work are: 1) assistance to the Electricity Safety Authority and other parties to facilitate their work in the communities; 2) maintenance activities (streetlights and First Nation-owned generating equipment in Remotes' service territory) and engineering design and assessments related to the connection and integration of renewable generation to Remotes' electricity distribution and generating systems; and 3) assessments of the Independent Power Authority ("IPA") generating stations (First Nation owned and-operated generating stations in remote communities that Remotes does not serve).

Assessments of IPA assets are undertaken from time to time in cooperation with Watay/OSLP ("Opiikapawin Services Limited Partnership"), Indigenous and Northern Affairs Canada ("INAC") and the local community. Assessments identify operational risks and efficiency measures that could be undertaken by INAC or the local First Nation. Connection impact assessments for renewable energy facilities wishing to connect to Remotes' distribution systems may also include engineering design work associated with integration with the existing diesel plant, depending on the size of the installation.

Costs related to external work are shown in Table 1. Revenues from external work are an offset to the revenue requirement and are discussed in Exhibit G1, Tab 3, Schedule 1.

**Table 1**

**Costs Related to External, Unregulated Work (in $K)**

| Category | Board Approved | Historic (Actuals) | | | | Bridge | Test |
|---|---|---|---|---|---|---|---|
| | 2013 | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 |
| **Total** | **61** | **206** | **172** | **265** | **342** | **135** | **135** |

The increase in external costs from 2013 OEB-approved to 2013 actuals is due to connection and commissioning of the temporary trailer in the community of Weagamow. Higher external costs in 2015 as compared to 2014 are due to higher ESA requests and the completion of a tank farm in the community of Sachigo. Higher external work in 2016 compared to 2015 due to the completion of a street light retrofit in the community of Weagamow and engineering design work associated with customer-owned renewable energy facilities. Lower external costs in 2017 and 2018 result primarily from fewer projected customer impact/system assessments related to renewable energy and fewer expected IPA community assessments.

# CORPORATE STAFFING

## 1.0 STAFFING STRATEGY AND OVERVIEW

Remotes' work is performed by regular staff, hiring hall staff, co-op students and summer students, services purchased from Hydro One Networks Inc., contracts with external firms who provide environmental services and by contracts for services with local communities, for agents and meter readers, and for casual resources related to land assessment and remediation, construction and CDM projects. Over 40% of Remotes' work is performed by non-regular resources.

Remotes has fifty-one full-time, regular staff. Remotes' work program has increased significantly over the past four years. Most of the increased work program has been handled through non-regular staff. Additional resources used to supplement Remotes' regular employees include casual skilled trades staff contracted through the Hiring Hall (Power Workers' Union) and temporary staff. Together with students and apprentices, Remotes employs approximately ten full-time equivalent hiring hall staff, apprentices and students each year.

Remotes staff complement performs the following functions: design and manage generation and distribution assets, construction planning, project management and commissioning, environmental management and support services, financial support and services, regulatory support and services, customer outreach, contact and billing/collection services, program management, work execution, planning and management/supervision, skilled electrical and mechanical trades work and fuel and material inventory management.

Due to the nature of Remotes' service territory, extensive travel and time away from home may be required. Staff retention and recruitment can therefore be challenging. Additionally, about 41% of Remotes employees are eligible for an undiscounted retirement over the next five years. Remotes has a number of regular staff positions that are essentially "one of" positions. If an employee leaves the company to retire or pursue other opportunities, Remotes' work program can be negatively affected until the job duties are mastered by the departing employee's replacement.

To address the training risk associated with staff retirements, Remotes creates succession plans for key employees and attempts to offer some overlap between new employees and retiring employees so that a skill and knowledge transfer can take place. Remotes also participates in Hydro One Networks Inc. established recruitment, apprenticeship and training programs, and benefits from opportunities to employ skilled staff on a temporary basis (on rotations for example). Three full-time equivalent apprentices and three full time equivalent co-op/summer students are used to supplement regular and hiring hall (casual) staff resources.

Contracts with First Nation Agents/Operators through Band offices provide the following functions: minor maintenance on diesel generators; initial emergency response and assessment; fuel delivery, receipting and inventory monitoring; diesel station and staff house janitorial work; line switching in the event of a house fire; and meter reading. External workers are also secured through Band offices for translation and logistical assistance for community/customer meetings, to work on construction projects and on Land Assessment and Remediation projects.

Remotes also contracts with Hydro One Networks Inc. for various services. These contracts give Remotes access to a greater pool of employees than would otherwise be the case for a small utility. Remotes also secures lines and trouble response services, forestry services, purchasing services, legal services, information technology services, corporate accounting services, safety and work methods and training services from Hydro One Networks Inc. under Service Level Agreements. These agreements allow Remotes to supplement their regular staff and to access professional and trades staff required on a less than full-time basis.

## 2.0 STAFFING STRUCTURE

There are seven main categories of labor resources:

(i) PWU-represented staff: The PWU is an industrial union that represents the trades, technicians and clerical workers. Within Remotes, PWU staff perform line work, electrical, mechanical, protection and control, civil, stock keeping, other technical and clerical/administrative work. These include Hydro One electrical maintainers, line maintainers, mechanical maintainers, engineering technicians and administrative employees.

(ii) Society-represented staff: The Society is a professional union that represents engineers, accounting, technical, administrative and supervisory staff. They perform engineering, high level technical and administrative work as well as supervisory functions.

(iii) Management staff are excluded from representation because they carry out managerial duties or work on confidential labour relations matters or legal matters.

(iv) Temporary Employees who are employees performing work in any of the three categories set out above and who are engaged in work that is not of a continuing nature.

(v) Contracted Staff are individuals engaged as independent contractors and are not on Remotes' payroll. They are engaged for varying amounts of time and paid varying amounts commensurate with their skill sets and the market rate for that skill.

Contract staff are tracked and charged to Remotes by work programs or activities and not by headcount. Where applicable, the procurement of contract staff is governed by the terms of the collective agreements between the Corporation and its respective unions.

(vi) Station operator agents and meter readers are community-based resources normally contracted through the local Band Council. Station operators are responsible for routine inspections of the diesel plants; minor maintenance such as changing oil filters; reporting station problems to the Thunder Bay service centre; monitoring fuel deliveries; emergency response; and the safe handling and disposal of waste. Remotes has an agent and a back-up agent for each station. Meter readers are responsible for reading meters and for reporting meter readings to the Thunder Bay Service Centre. Remotes has a meter reader in each community.

(vii) Casual workers are used for building projects, Land Assessment and Remediation projects and CDM projects. Casual workers may be acquired through the PWU hiring hall, or contracted through local Band Councils, depending on the type of work and skills available in the community.

As a subsidiary of Hydro One, Remotes is subject to the same collective agreements as Hydro One Networks Distribution and Transmission. PWU and Society-represented staff are compensated in accordance with the collective agreements negotiated by Hydro One. Remotes' Management Staff are non-Executive management and are compensated through base salaries and a short-term incentive plan that rewards performance. Detailed information on wages, salaries and overtime payments related to regular, temporary and hiring hall employees can be found in Exhibit D2, Tab 5, Schedules 1 and 2.

# PENSION AND BENEFIT COSTS (“OPEBS”)

## 1.0 PENSION COSTS

Remotes is a participant in the Hydro One Pension Plan (“the Plan”). The Plan is a contributory, defined-benefit pension plan whose members are comprised of represented employees of the Power Workers Union (“PWU”), the Society of Energy Professionals (“Society”), non-represented Management (“MCP”) employees, pensioners who were employees, and pensioners who are beneficiaries of employees or pensioners.

The Plan covers Hydro One and its subsidiaries, except Hydro One Sault St. Marie Transmission. The Plan does not segregate assets in a separate account for individual subsidiaries, nor is the accrual cost of the benefit plans allocated to, or funded separately by, entities within the consolidated group. Accordingly, for Remotes, the Plan is accounted for as a defined contribution plan and no deferred pension asset or liability is recorded on Remotes’ financial statements.

Hydro One recovers its pension expense on a cash basis. Hydro One believes this method is more beneficial to its customers than the accrual method because it results in a lower cost recovered through rates. The cash method is also more predictable, allowing Hydro One to forecast the effect on rates for up to a three-year period.

The Board has previously accepted cash payments related to pension obligations to be included in revenue requirement (RP-1998-0001) for Hydro One and its subsidiaries, and has approved full recovery of these cash payments in various proceedings since then. The Board and intervenors accepted this treatment for Remotes’ pension obligations in EB-2012-0137.

For Remotes, the charge to be recovered through rates in 2018 is $1,707K provided in Table 1 below.

**Table 1**
**Pension Costs (in $K)**

| Category | Board Approved | Historic (Actual) | | | | Bridge | Test |
|---|---|---|---|---|---|---|---|
| | **2013** | **2013** | **2014** | **2015** | **2016** | **2017** | **2018** |
| **OM&A** | 799 | 1,064 | 1,198 | 1,084 | 712 | 1,149 | 1,220 |
| **Capital** | 401 | 338 | 347 | 464 | 285 | 552 | 487 |
| **Total** | **1,200** | **1,401** | **1,545** | **1,548** | **997** | **1,701** | **1,707** |

## 2.0 ACTUARIAL CALCULATION

The most recent actuarial valuation for the Plan was as at December 31, 2016. In May 2017, Hydro One filed this actuarial valuation with the Financial Services Commission of Ontario ("FSCO"). The valuation showed that the Plan had a surplus of $434 million, on a going-concern basis. Starting in 2017, the required contribution for the Hydro One companies was set at $73 million, variable based on the level of base pensionable earnings. In accordance with applicable regulations, Hydro One makes all required contributions on a monthly basis.

Hydro One's next actuarial valuation is required by December 31, 2019. The valuation will depend on investment returns, changes in benefits, and actuarial assumptions.

During 2014, 2015 and 2016, actual contributions were $174 million, $177 million, and $110 million, respectively. Actual contribution requirements in 2018 may differ depending on the level of base pension earnings used to compute the monthly contribution.

## 3.0 PENSION PLAN GOVERNANCE AND PERFORMANCE

Hydro One is the Plan sponsor and administers the pension assets and obligations of the Plan. As of December 31, 2016, the Plan had a reported net asset value of $6,870 million and about 13,087 members. Approximately 42% of the Plan's members are active. The remaining Plan members are inactive, either retired, beneficiaries of retirees, former employees eligible for a deferred pension, or members on long-term disability.

The Fund has consistently outperformed the benchmark made up of passive market indices. In the period from June 29, 2001 (the Fund's inception) to December 31, 2016, the Fund returned 7.04% annualized while the Fund's target benchmark is 6.80%, thus outperforming its target benchmark return by 0.24%. The fund's investments are divided into asset classes and each asset class has a corresponding market index (i.e. Canadian Equities market index is the S&P/TSX). The actual performance of each asset class is then measured against this market index (policy benchmark). The Fund's policy benchmark is a calculated weighted average benchmark based on the Fund's strategic asset mix.

## 4.0 DEFINED CONTRIBUTION PENSION PLAN

Effective January 1, 2016, Hydro One introduced a Defined Contribution Pension Plan ("the DC Plan"). The DC Plan allows eligible employees to contribute up to 6% of their pensionable earnings with a 100% match of contributions by Hydro One. The DC Plan is open to all new MCP employees, who are no longer eligible to participate in the Plan.

## 5.0 OTHER POST-EMPLOYMENT BENEFITS ("OPEB") COSTS

Hydro One utilizes the accrual method for accounting of OPEBs costs. The accrual method is appropriate because it reflects the costs incurred during the time period and, as such, more accurately attributes those costs to the appropriate ratepayers. Table 2 summarizes historical and forecast OPEB costs included in rates.

**Table 2**

**OPEB Costs Included in Rates (in $K)**

| **Amounts Included in Rates** | **2013** | **2014** | **2015** | **2016** | **2017** | **2018** | **Total** |
|---|---|---|---|---|---|---|---|
| OM&A | 775 | 941 | 760 | 866 | 846 | 909 | **5,096** |
| Capital (Note 1) | 250 | 272 | 325 | 347 | 406 | 363 | **1,963** |
| **Total** | **1,025** | **1,213** | **1,085** | **1,213** | **1,252** | **1,272** | **7,059** |
| Paid Benefits Amounts | 264 | 91 | 51 | 63 | 576 | 605 | **1,650** |
| Net Excess - amount included in rates vs. amount actually paid | 761 | 1,122 | 1,034 | 1,150 | 676 | 667 | **5,409** |

Note 1 – The Capital component of OPEB costs is recovered over the useful life of the assets to which it is capitalized and not in the years noted. Therefore, the Net Excess as noted does not represent the excess recovery in each year.

In March 2017, the Financial Accounting Standards Board ("FASB") issued an Accounting Standard's Update (ASU 2017-07) that affects the accounting for pensions and OPEBs effective January 1, 2018.

As part of ASU 2017-07, Topic 715 – Compensation – Retirement Benefits of the US GAAP Accounting Standards Codification has been amended. The amendments allow only the service cost component of the net periodic pension cost and net periodic post-retirement benefit cost to be eligible for capitalization when applicable. For rate-setting purposes, Remotes accounts for its pension costs on a cash basis and therefore this amendment is not anticipated to affect the amounts included in this application. The changes to the accounting for OPEB, which Remotes accounts for on an accrual basis for rate-setting purposes, will affect this application.

The re-classification of these elements to OM&A would have an adverse impact on rates in a given year. As Remotes operates on a break-even basis, the net periodic post-retirement benefit cost other than service cost that would have been classified as capital prior to the issuance of ASU 2017-07 will flow through the RRRP account effective January 1, 2018.

# COSTING OF WORK

## 1.0 OVERVIEW

Remotes' work program costs are comprised primarily of expenditures associated with labour, equipment, material acquisition and sundry. Consistent with common industry practice, trade labour and equipment hours are distributed directly to benefiting programs and projects by weekly time-entry. Standard hourly labour and equipment rates are then used to convert the reported hours into costs. Both labour and equipment rates are "fully loaded" to ensure that all associated support costs required to deploy resources and equipment are accurately and cost effectively distributed to the benefiting work.

In terms of material and contract costs, a material surcharge is included in this cost category to capture material and contract services procurement costs benefiting the particular program or project. In the case of distribution capital projects and external sales, a freight surcharge is also included to distribute the freight costs associated with the winter road delivery of distribution line materials into the remote communities.

As thirteen of the communities Remotes serves are not accessible by year-round road, staff, equipment and cargo are transported to the communities by aircraft. Remotes contracts out the passenger and cargo transportation services. Flight costs are charged to the project that the personnel are working on. Cost efficiencies achieved by co-ordination of work crew scheduling are captured whenever possible.

Remotes staff most often stay several days at a time in the company's staff house in the remote community in which they are working. To efficiently reflect the cost of food to direct work, food expense is allocated to all projects in which there are labour hours incurred by trade and technical staff. This cost is implicit in the labour rate ("fully loaded") and is $5 per hour in the test year.

In terms of estimating and costing capital work, there may be circumstances when removal costs or customer contributions need to be separately identified. The cost of removal work is accounted for as Depreciation and Amortization and customer contributions are netted against the gross capital costs. Capital work also receives a monthly charge for its share of Corporate Common Functions and Services, overhead costs and capitalized interest where applicable.

## 2.0 PROJECT / PROGRAM MAJOR COST CATEGORIES

### 2.1 Standard Labour Rates

On an annual basis, Remotes' standard labour rates are derived based on information gathered through the annual budgeting process. Resource budgets for each major resource category are calculated and categorized into three basic cost components; forecast billable (direct charged) hours, forecast non-billable hours and forecast non-billable expenses. Total payroll costs include allowances (as per negotiated contracts), company benefits, Government obligations and contractual time away from work (vacation, statutory holidays, sick leave) along with assigned Remote administrative costs. Those total payable costs are divided by the forecast billable hours, to create the Remotes standard labour rates. The cost elements embedded in the standard rate are illustrated in Table 1 and explained in the pages following, using the Remotes Technician rate as an example.

**Table 1**

**Remote Communities Technician (Regular Staff) 2018 Forecasted Labour Rate**

| Rate Component | Billable $ per Hr. |
|---|---|
| Meal Surcharge | $5 |
| Payroll Obligations | $70 |
| Non-Labour Administration Costs | $13 |
| Non-Project, Administration, Management and Support Services Labour | $81 |
| **Total** | **$169** |

### 2.1.1 Payroll Obligations ($70)

A brief description of the cost elements included in this category is provided below.

Labour and Payroll Allowances (75.3% of Payroll Obligations)

- Base Pay: Contractually negotiated and reflected in union wage schedules.
- Overtime: Contractually negotiated.
- Payroll Allowances: Allowances are also contractually negotiated and stated in union collective agreements. Regular staff (PWU) are entitled to travel, footwear and on-call allowances. Casual trades are entitled to travel and subsistence allowances where circumstances permit. Staff are also entitled to Northern and Remote overnight and lodging allowances when working directly in communities served by local diesel generation.

Company Benefits (20.6% of Payroll Obligations)

- Regular Staff: Comprised of Pension (12.4% of base pensionable earnings) and current and post employment benefits; health, dental, etc. (29.3% of base pensionable earnings).

Government Obligations (4.1% of Payroll Obligations)

- Consists of Canada Pension Plan, Employment Insurance, Employee Health Tax and Workplace Safety and Insurance Board Schedule 1 Premiums;
- In 2018, 5.5% is to be applied against total earnings (includes base pay, bonus, overtime, benefits and taxable allowances) to recover these costs.

### 2.1.2 Non-Labour Administration Costs ($13)

This category consists primarily of non-labour expenses incurred by the business necessary for the business operations. This includes facility costs related to the main office, property taxes, utilities, telephone, insurance, maintenance, materials and supplies. It also includes items such as travel, training, advertising, postage, office supplies and low value computer equipment and services. Non-labour administration costs are budgeted based on historical trends and consider current company initiatives and individual interdepartmental needs.

### 2.1.3 Non-Project, Administration and Support Services Labour ($81)

This category consists of labour costs incurred in non-project, administrative, management or support service roles. These costs include management and technical staff providing support services to manage and monitor the status of the assigned programs and projects. Some other functions include finance, stock-keeping, fuel management and flight logistics. Additionally, it includes time for attendance at safety meetings, housekeeping and downtime often resulting from inclement weather. This category includes employee vacation and statutory holidays, all established and identified in union collective agreements; sickness costs are also included. These estimates are based on historical trends and consider current company initiatives.

### 2.2 Transport & Work Equipment ("T&WE")

Remotes utilizes Hydro One Networks Inc. owned fleet assets as per the conditions of the Service Level Agreement ("SLA") with Hydro One Networks Inc. This SLA is for fleet management, maintenance, repair and rental services relating to the use of transport and work equipment used by Remotes. Remotes incurs the cost of transporting T&WE into the remote locations as well as flight costs associated with sending the Hydro One Networks Inc. fleet mechanic to these locations. Periodically, Remotes also incurs fuel and maintenance costs outside of those incurred by Hydro One Networks Inc. (and included in the SLA). Each equipment class has a standard equipment rate which is calculated by dividing the annual forecast cost by the annual forecast hours the class of equipment is required to work (utilization hours). Utilization hours are derived based on a review of historical trends and an annual review of the upcoming work program.

| | |
|---|---|
| 2018 TWE Cost Forecast (including SLA) | $1,153K |
| 2018 Forecasted TWE Hours | 24,386 |
| 2018 Total Average TWE Rate/Hour | $47 |

### 2.3 Material Costs and Surcharges

Material costs charged to a project or program are based on the issue cost from Inventory, which is the Average Unit Price or the direct-shipped purchase order price. On a monthly basis, the total monthly material and contract charges are surcharged with a fixed percentage to cost effectively recover the Corporate Common Functions and Services cost allocation to Remotes for services provided by Supply Management Services ("SMS"). These are costs associated with purchasing, negotiating contracts and transportation management. The percentage rate is derived by assigning the costs of SMS to projects based on an annual material and contract forecast. The 2018 forecasted SMS rate is 1.0%.

A freight surcharge is applied to all distribution capital and external work in order to allocate freight costs incurred for winter road delivery of distribution inventory line materials to remote communities. The percentage rate is derived by using the forecasted freight expense and projected material expense for planned distribution capital.

### 2.4 Sundry – Passenger Flight Costs and Meals

The cost of transporting staff to remote locations is charged to the project that is benefiting from this expense. This service is tendered to obtain the most cost competitive contract. Efficiencies are achieved with coordinating the schedule of work and work groups to share flights.

In order to carry out operating, maintenance and capital work activities, it is necessary for trade and technical staff to stay overnight in remote communities at Remotes' staff houses on an ongoing basis. Food supplies are required and the cost of these supplies is allocated to direct work programs based on labour hours charged by the two primary trade and technical labour groups and is therefore recovered in the hourly charge out rate. The rate per hour is based on forecasted meal expense and planned labour hours.

# DEPRECIATION AND AMORTIZATION EXPENSES

## 1.0 INTRODUCTION

The purpose of this evidence is to summarize the method and cost of Remotes' depreciation and amortization expense for the 2018 test year.

The depreciation expense for Remotes' submission for the 2018 revenue requirement was based on the methodology in an independent study conducted by Foster Associates for Hydro One Remote Communities in 2011 and approved by the Board in EB-2012-0137.

Amortization expense pertains to costs the Board has allowed Remotes to defer for recognition at a future date. The Board has, in past decisions, approved the amount of the cost to be deferred for future recovery, the prescribed period or method of amortization and prescribed the time period over which the costs in each account should be amortized. Historical, bridge and test year amortization schedules are filed at Exhibit D2, Tab 7, Schedule 1.

## 2.0 DEPRECIATION EXPENSE

The aforementioned Foster methodology was used in determining the depreciation expense for the 2018 test year. Historical, bridge and test year depreciation expense schedule is filed at Exhibit D2, Tab 7, Schedule 2.

**Table 1**

**Depreciation Expense (in $K)**

| Description | Board Approved | Historic | | | | Bridge | Test |
|---|---|---|---|---|---|---|---|
| | **2013** | **2013** | **2014** | **2015** | **2016** | **2017** | **2018** |
| Depreciation on Fixed Assets | 2,596 | 2,563 | 2,594 | 2,711 | 2,751 | 2,877 | 2,942 |
| Asset Removal Costs | 721 | 590 | 430 | 969 | 620 | 1,041 | 634 |
| **Total** | **3,317** | **3,153** | **3,024** | **3,680** | **3,371** | **3,918** | **3,576** |

Fixed asset removal costs are charged to depreciation expense on an "as incurred" basis. Removals increased significantly in 2015 and 2017 (projected) due to a higher level of engine replacements.

OEB Chapter 2, Appendix 2-BB – Service Life Comparison, is not applicable as Remotes does not have an expected change in asset life.

OEB Chapter 2, Appendix 2-C – Depreciation and Amortization Expense for 2013 to 2018 are filed at Exhibit D2, Tab 10, Schedules 1 to 6. The variances are due to the following:

- The OEB model calculates depreciation expense on Net Book Value (NBV) whereas Remotes uses Cost.
- The OEB model assumes a straight line depreciation rate based on the life of the asset whereas Remotes uses the rates provided by their depreciation consultants, Foster Associates, based on Iowa Curves.

OEB Chapter 2, Appendix 2-C (2013) has a material variance of $562K for USofA 1670 (Prime Movers). The 2013 NBV for 1670 is low as many assets in this category were at or approaching the end of their useful lives, resulting in a low estimate for depreciation expense for 2013 per the OEB calculation on NBV instead of Cost. The adjustments from the 2011 Depreciation Study are reflected in the 2014 opening balances. An increase in the useful life for USofA 1670 (Prime Movers) caused a decrease in the depreciation rate, resulting in lower variances for the 2014 to 2018 years.

## 3.0 AMORTIZATION EXPENSE

Remotes recognizes a liability for estimated future expenditures required to remediate past environmental contamination associated with the assessment and remediation of contaminated lands, based on the net present value of these estimated future expenditures. Since these expenditures are expected to be recoverable in future rates, Remotes has recognized an equivalent amount as a regulatory asset. This balance is amortized as expenditures as they are incurred each year. The Board accepted this accounting treatment for Remotes in EB-2005-0020, EB-2008-0232 and in EB-2012-0137. The treatment of these costs in this Submission is consistent with the treatment in those proceedings. Remotes reviews its estimates of future environmental expenditures on an annual basis.

**Table 2**

**Amortization Expense (in $K)**

| Description | Board Approved | Historic | | | | Bridge | Test |
|---|---|---|---|---|---|---|---|
| | 2013 | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 |
| Environmental Assets | 2,713 | 1,656 | 1,599 | 1,222 | 1,247 | 1,163 | 1,032 |

Table 2 shows historic bridge and test expenditures of Land Assessment Remediation ("LAR"). The LAR program involves assessment of historically contaminated lands, the implementation of remedial measures to treat, remove or otherwise manage the contamination found on and off-site and the implementation of on-site management controls to mitigate future off-site property impacts. Most of the contamination at Remotes' sites is associated with historic spills of diesel fuel.

LAR projects are normally planned to coincide with major capital projects such as generation upgrades and extend over multiple years. As such, variances in year over year expense are typical, based on the timing of these discrete projects. As these projects are normally undertaken with the involvement of the local First Nations, negotiations are required and project delays can occur. The decrease between the 2013 OEB-approved amounts and 2013 actual amounts is a result of a delay in the remediation of Pikangikum, Attawapiskat and Webequie, which is partially offset by higher costs than planned in Sachigo. The remediation project at Sandy Lake started earlier than planned and was substantially completed in 2014, leading to a decrease in cost in 2015. Differences between the planned and actual expenditures approved as part of Remotes' revenue requirement flow through the RRRP account, which is further discussed in Exhibit F1, Tab 1, Schedule 1. The duration and cost have been impacted by lengthy negotiations on sites where multiple parties are involved and agreement of responsibility is required, funding constraints from other parties, weather restrictions, and the inability to put the work out for competitive bidding.

## 4.0 LAND ASSESSMENT REMEDIATION PROGRAM

Hydro One Remotes reviews and updates its environmental liability pertaining to its LAR program on an annual basis to determine if any revisions are required to its environmental provisions and related regulatory assets. In 2016, the provision assumptions were reviewed for significant changes in work program plans (e.g. quantity of contaminated sites, extent of contamination, the year in which certain sites are anticipated to become grid connected), including costs and timing for monitoring and remediation, and changes in regulations. No major regulatory changes occurred in 2016. This review encompasses an assessment of the current state of applicable regulations as well as the sufficiency and accuracy of the current dollar cost estimate of performing the work and any revisions to the assumed pattern of expected future cash flows that give rise to the obligation's present value. Expected future cash flows are compiled by experienced Remotes staff and are reviewed by management at Hydro One Networks Inc. and Remotes. Remotes' environmental liabilities consist of the present value of LAR. The same value is used to record the related environmental regulatory asset. The Board accepted this accounting treatment for Remotes, in EB-2005-0020, EB-2008-0232 and in EB-2012-0137.

Remotes confirmed significant increases to the provision consistent with changes in the scope and timing of remediation work and the impact of the grid connection. The Remotes LAR provision was increased in 2016 by $25.7 million (present value). The duration of the program was also extended a further 17 years (originally 2027) to the period ending 2044 to accommodate the additional work. The LAR provision is based on the most reliable information currently available and is mainly driven by revisions in the estimated scope of site remediation, the most recent information available for the costs of remediation, and an increase to annual monitoring costs due to remediation timing. The impact of grid connection is expected to occur in 2024 for ten of the communities that Remotes currently serves, in which the generating stations will be used as backup until the end of their useful lives. The generating stations at the road access sites will continue until the end of their useful lives. There are multiple moving parts with respect to grid connection of the communities and therefore the timing or use of current generation assets may be impacted by future decisions by Indigenous and Northern Affairs Canada, provincial government, OEB, and the IESO. If and when it is, it will be reflected in the provision. Monitoring costs are incurred until a site can be remediated, after which time they continue for two more years in order to ensure that the site is fully remediated. Remediation cannot occur until the station and its components are removed from the site.

At the end of 2016 the provision reflects what is reliably determinable based on facts known at that date and assumptions based on prior experience.

# INCOME TAXES AND PAYMENTS IN LIEU OF CORPORATE INCOME TAXES

## 1.0 INTRODUCTION

This Exhibit explains how Remotes calculates its income tax expenses for the purposes of rate recovery. Exhibit D2, Tab 8, Schedules 1 to 4 contain detailed calculations for rate recovery purposes of income tax liabilities, supporting reconciliations, as needed, as well as copies of Remotes's December 31, 2013, December 31, 2014, October 31, 2015, November 4, 2015, December 31, 2015 and December 31, 2016 tax returns at Exhibit D2, Tab 9. The information provided in this Application is consistent with section 2.8.11 of the Filing Requirements. Material exceptions have been identified and explained.

## 2.0 DEPARTURE FROM PILS REGIME

Under the *Electricity Act, 1998* (Ontario), as a Crown-owned company exempted under section 149(1) of the *Income Tax Act* (Canada) and the *Taxation Act*, 2007 (Ontario) (Federal Tax Regime) from paying corporate income taxes, Remotes was obligated to make payments in lieu of corporate income taxes ("PILs") to the Ontario Electricity Financial Corporation.

Effective as of October 31, 2015, in connection with a public offering of its parent companies shares (Hydro One), Remotes was no longer subject to this exemption and exited the PILs regime. Under the *Income Tax Act*, Remotes was deemed to have disposed of its assets at fair market value at that time and immediately re-acquired them at the same value. Remotes was obligated to pay a one-time PILs departure tax of approximately $5 million based on an estimated gain under the *Electricity Act, 1998*.

Neither the departure tax nor the change in tax regime will have any impact on ratepayers. For regulatory purposes, income tax expenses will continue to be calculated according to the method prescribed by the Board's 2006 EDR Tax Model and 2006 EDR Handbook, Section 7.1 "OEB 2006 Regulatory Taxes Expense Methodology".

The tax amounts included in rates relate solely to the estimated current tax liability associated with the regulatory net income before tax, based on the applicable statutory tax rates for the year. Future taxes reflect the future tax liabilities/assets associated with timing differences between the tax basis of assets and liabilities and their carrying amounts for accounting purposes. These are not taken into consideration. When future income taxes become payable or receivable, it is expected that they will be included in the rates approved by the Board and recovered from customers at that time.

## 3.0 INCOME TAX RATE (FEDERAL AND ONTARIO):

A combined income tax rate of 26.5% has been used for the 2018 test year, comprised of a federal rate of 15% and a provincial rate of 11.5%. Due to the way rates are set for Remotes' customers, any variance between actual taxes payable and forecast taxes, as a result of tax policy changes or rate changes for income tax or capital cost allowance will be captured in the RRRP variance account, described further in Exhibit H1, Tab 1, Schedules 1.

## 4.0 RECONCILIATION BETWEEN REGULATORY NET INCOME BEFORE TAX AND TAXABLE INCOME

Reconciliation between the regulatory Net Income Before Tax ("NIBT") and taxable income for the 2018 test year is provided in Exhibit D2, Tab 8, Schedules 1 and 2. This Schedule contains the income tax computation. It also shows how the taxable income is computed by making adjustments to the regulatory NIBT for items such as depreciation and capital cost allowance ("CCA").

Reconciliation between the accounting NIBT and taxable income for the historical years 2013, 2014, 2015 and 2016 is also provided in Exhibit D2, Tab 8, Schedules 3 to 4. In order to make it easier to follow these reconciliations, Remotes has placed these adjustments into the following five categories:

1) recurring items that must be added (deducted) because they have been included in the OM&A expenses in arriving at the revenue requirement, or for which appropriate tax adjustments are made (for example, depreciation versus capital cost allowance ("CCA");
2) deferral accounts not included in the revenue requirement;
3) reversal of accounting adjustments not included in the revenue requirement;
4) recurring items not in the revenue requirement; and
5) items whose impact is immaterial in total, and as such, have not been included in the Remote's investment plan.

## 5.0 OVERVIEW OF PROCESS TO ARRIVE AT TAXABLE INCOME

The starting point for the computation of Remotes taxable income for regulatory purposes is the NIBT as shown on the utility's income statement for the year. The NIBT is prepared using U.S. Generally Accepted Accounting Principles, but taxable income is computed using the relevant tax legislation, interpretations and assessment practices. Therefore, many adjustments are typically made to the NIBT to arrive at taxable income. Essentially, the NIBT is increased by amounts that are not deductible for tax purposes. This includes items such as depreciation, contingent liabilities, accounting losses, accounting provisions such as Other Post-Employment Benefits ("OPEB") and revenue that has been received but not recognized for accounting purposes (for example, income received with respect to a deferral account that has been set-up on the balance sheet rather than shown as additional income on the income statement). On the other hand, the NIBT is reduced by amounts that are deductible for tax purposes but have not been deducted in computing NIBT. This includes items such as CCA, the deductible portion of capitalized overhead, accounting gains and OPEB payments. Such reductions also include expenses incurred for which a deferral account has been set up on the balance sheet, rather than shown as a deduction through the income statement.

Consequently, it is imperative that the NIBT be adjusted for amounts that have been included (or deducted) for accounting purposes that are not income (or deductible) for tax return purposes.

## 6.0 TREATMENT OF DEFERRAL ACCOUNTS (REGULATORY ASSETS AND LIABILITIES)

Deferral accounts are typically recognized by utilities' balance sheets for foregone revenue or for incurred expenses, for which recovery will be sought from ratepayers through future rates. The Board determines disposition of the deferral accounts.

For example, as shown in Table 1, assuming that a 26.5% tax rate is used and a $100 expense is incurred, the utility will be allowed to deduct the $100 in computing taxable income for the year in which the expense has been incurred. If the Board subsequently approves recovery of this expense over a two-year period through a rate rider, the income will be included in computing taxable income for the year in which it is billed to ratepayers. The net result is that the utility has recovered the $100 cost although the income or expense has been taxed or deducted in different years.

**Table 1**

**Example: Income Tax Treatment of Deferral Account Disposition**

| | Year 1 | Year 2 | Year 3 | CUM |
|---|---|---|---|---|
| **Income (deduction)** | (100) | 50 | 50 | NIL |
| **Tax Refund (payable)** | 26.5 | (13.25) | (13.25) | NIL |
| **Cash Inflow (outflow)** | (73.5) | 36.75 | 36.75 | NIL |

Therefore, deferral accounts have not been included in computing tax payable for purposes of the revenue requirement since the tax benefit has or will be obtained through the tax system. This conclusion is consistent with the "2006 EDR Handbook Report of the Board" issued May 11, 2005, (page 61), that states:

> “A PILS or tax provision is not needed for the recovery of deferredy asset costs, because the distributors have deducted, or will deduct, these costs in calculating taxable income in their returns. The Handbook will reflect this treatment.”

## 7.0 CONTINGENT LIABILITIES/ACCOUNTING RESERVES

Where an accounting provision is recognized for certain contingent costs that the utility may have to incur in the future (such as obsolescence provisions, lawsuits, staff reductions), the provision will reduce the NIBT of the utility. In each subsequent year, the balance for the contingent liability/accounting reserve is reviewed by the utility for reasonableness based on all available information. The balance may be adjusted upward or downward, with NIBT either decreasing or increasing, respectively.

However, for tax purposes, a contingent liability or accounting reserve is not deductible. Rather, the amount will only be deductible (or capitalized) in computing taxable income for the taxation year in which the obligation has actually been settled. Therefore, to the extent that the current year NIBT has been increased (or decreased) by the contingent liability or accounting reserve provision, the NIBT must be adjusted to reverse the increase (or decrease) in computing taxable income.

Remotes has not adjusted the 2018 through 2022 NIBT for contingent liabilities in computing taxable income since no changes were forecast in the contingent liability balances for 2018 through 2022. Therefore, such amounts are not included in the tax computation for purposes of the revenue requirement.

The combined (federal and provincial) enacted income tax rates are as set out in Table 2.

**Table 2**

## 8.0 INTEGRITY CHECKS

Remotes has performed the integrity checks set described in 2.4.5.2 of the Filing requirements.

## 2017 REGULATORY TAX ADJUSTMENT

As a result of the Initial Public Offering ("IPO") of Hydro One Limited, Remotes exited the PILS regime. This triggered a deemed disposition of all of its assets at Fair Market Value ("FMV").

As a result of the deemed disposition on IPO, Remotes was not able to claim the capital cost allowance ("CCA") for the January 1 to October 31, 2015 period for tax purposes. It was discovered that the additional tax expense from not claiming CCA was not returned to rate payers – which resulted in additional amounts being collected in rates (via the Rural and Remote Rate Protection (RRRP) account).

The rate payers should not be impacted as a result of the IPO. Any tax deductions that were lost as a result of the IPO should stay with the shareholder as opposed to being included in rates to keep the rate payers whole.

Tax deductions lost as a result of the IPO were factored into rates resulting in lower taxes and a higher net income in Remotes for 2015. As Remotes operates a break-even business, this higher net income must be returned to rate payers through the RRRP variance account. As a result, the CCA from January 1, 2015 to October 31, 2015 will be claimed for rate filing purposes.

As Remotes' net income is nil, the overstatement of taxes resulted in the RRRP account being overstated by $682K. Consequently, the RRRP account has been adjusted lower by $682K.

# PROPERTY TAXES AND CROWN LEASE PAYMENTS

## 1.0 SUMMARY OF PROPERTY TAXES AND CROWN LEASE PAYMENTS

This Exhibit describes property taxes and crown lease payments made in respect of Remotes. These costs are externally imposed and are summarized in Table 1. The property taxes and crown lease payments are included as part of the costing of work as described in Exhibit D1, Tab 5, Schedule 1.

**Table 1**
**Property Taxes and Crown Lease Payments (in $K)**

| **Category** | **Board Approved** | **Historic (Actuals)** | | | | **Bridge** | **Test** |
|---|---|---|---|---|---|---|---|
| | **2013** | **2013** | **2014** | **2015** | **2016** | **2017** | **2018** |
| Property Taxes | 50 | 49 | 48 | 48 | 48 | 55 | 55 |
| Crown Lease Payments | 8 | 8 | 8 | 8 | 8 | 8 | 8 |
| **Total** | **58** | **57** | **56** | **56** | **56** | **63** | **63** |

Remotes property taxes are regulated under the *Electricity Act 1998*, the *Municipal Act 2001*, and the *Assessment Act 1990*. Property taxes are paid to the City of Thunder Bay each year on the service centre site located at 680 Beaverhall Place. The total assessed property values are assigned by the Municipal Property Assessment Corporation and updated using the same schedule as the rest of the province.

Remotes pays a nominal fee for the right to use Crown land.

As Table 1 shows, actual payments are materially in line with approved levels.

The test year property tax forecast is based on most recent property tax information available.

***Notes:***

1 Please provide a breakdown of the major components of each OM&A Program undertaken in each year. Please ensure that all Programs below the materiality threshold are included in the miscellaneous line. Add more Programs as required.

2 The applicant should group projects appropriately and avoid presentations that result in classification of significant components of the OM&A budget in the miscellaneous category

**Notes:**

1 If it has been more than three years since the applicant last filed a cost of service application, additional years of historical actuals should be incorporated into the table, as necessary, to go back to the last cost of service application. If the applicant last filed a cost of service application less than three years ago, a minimum of three years of actual information is required.

2 The method of calculating the number of customers must be identified. Should correspond with data provided in Appendix 2-IB

3 The method of calculating the number of FTEs must be identified. See also Appendix 2-K

4 The number of customers and the number of FTEs should correspond to mid-year or average of January 1 and December 31 figures.

5 For the test year, the applicant should take into account the system O&M (line 22 of Appendix 2-AB) in developing its forecasted OM&A.

**Note:**
**1** **This appendix must be completed in relation to each service provided or received for the Historical (actuals), Bridge and Test years. The required information includes:**

**Legend:**
"HOI" Hydro One Inc.
"HONI" Hydro One Netwo
"Remotes" Hydro One Remotes Inc.

***Type of Service:*** **Services such as billing, accounting, payroll, etc. The applicant must identify any costs related to the Board of Directors of the parent company that are allocated to the applicant.**

***Pricing Methodology:*** **Pricing Methodology includes approaches such as cost-base, market-base, tendering, etc. The applicant must provide evidence demonstrating the pricing methodology used. The applicant must also provide a description of why that pricing methodology was chosen, whether or not it is in conformity with ARC, and why it is appropriate.**

***% Allocation:*** **The applicant must provide the percentage of the costs allocated to the entity for the service being offered. The Applicant must also provide a description of the allocator and why it is an appropriate allocator.**

**Note:**

[1] If an applicant wishes to use headcount, it must also file the same schedule on an FTE basis.

[2] Board Approved amounts from Last Rebasing Year (2013) did not include Casual Employees.

[3] Current employee benefits, plus Pension and Other Post-Employment Benefits costs, as recorded for recovery in distribution rates. Should be consistent with OPEBs costs as documented in Appendix 2-KA.

# Appendix 2-KA
# OPEBs (Other Post-Employment Benefits) Costs

**A** Please indicate if OPEBs were recovered on a cash or accrual accounting basis for each year since the distributor started to recover OPEBs in distribution rates from

**Notes:**
(Please add any information to explain the accounting basis used for OPEBs cost recovery in rate setting. If basis is other than Cash or Accrual, an explanation is required.)

Hydro One utilizes the accrual method for accounting of Other Post-Employment Benefit ("OPEBs") costs. The accrual method is appropriate because it reflects the costs incurred during the time period and, as such, more accurately attributes those costs to the appropriate ratepayers.

**B** Please complete the following table:

| OPEBS | First Year of recovery to 2012 | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 | Total |
|---|---|---|---|---|---|---|---|---|
| **Amounts included in Rates** | | | | | | | | |
| | | $ 774,554 | $ 940,931 | $ 759,957 | $ 865,879 | $ 846,227 | $ 908,769 | $ 5,096,317 |
| OM&A | | $ 249,988 | $ 272,391 | $ 324,924 | $ 346,852 | $ 406,241 | $ 362,546 | $ 1,962,942 |
| Capital | $ - | $ 1,024,542 | $ 1,213,322 | $ 1,084,881 | $ 1,212,731 | $ 1,252,468 | $ 1,271,315 | $ 7,059,259 |
| Total **Paid benefit amounts** | | $ 263,986 | $ 91,388 | $ 51,140 | $ 62,671 | $ 575,553 | $ 604,984 | $ 1,649,722 |
| **Net excess amount included in rates relative to amounts actually paid.** | $ - | $ 760,556 | $ 1,121,934 | $ 1,033,741 | $ 1,150,060 | $ 676,915 | $ 666,331 | $ 5,409,537 |

**C** Please describe what the distributor has done with the recoveries in excess of cash payments:

The Capital component of OPEB costs is recovered over the useful life of the assets to which it is capitalized and not in the years noted. Therefore, the Net Excess as noted does not represent the excess recovery in each year.

## Appendix 2-M
## Regulatory Cost Schedule

| | Regulatory Cost Category | USoA Account | USoA Account Balance | Ongoing or One-time Cost? [2] | Last Rebasing Year (2013 Board Approved) | 2013 Actuals | 2014 Actuals | 2015 Actuals | Most Current Actuals Year 2016 | 2017 Bridge Year | Annual % Change | 2018 Test Year | Annual % Change |

# T2 Corporation Income Tax Return

055 Do not use this area

Filed: 2017-08-28
EB-2017-0051
Exhibit D2-09-01
Attachment 1
Page 1 of 87

This form serves as a federal, provincial, and territorial corporation income tax return, unless the corporation is located in Quebec or Alberta. If the corporation is located in one of these provinces, you have to file a separate provincial corporation return.

All legislative references on this return are to the federal *Income Tax Act*. This return may contain changes that had not yet become law at the time of publication.

Send one completed copy of this return, including schedules and the *General Index of Financial Information* (GIFI), to your tax centre or tax services office. You have to file the return within six months after the end of the corporation's tax year.

For more information see **www.cra.gc.ca** or Guide T4012, *T2 Corporation – Income Tax Guide*.

## Identification

**Business number (BN)** . . . . . . . . . . 001 87083 6269 RC0001

**Corporation's name**
002 Hydro One Remote Communities Inc.

**Address of head office**
Has this address changed since the last time we were notified? . . . . . . . . . . . . 010 1 Yes [ ] 2 No [X]
(If **yes**, complete lines 011 to 018.)
011 483 Bay Street 8th Floor
012 South Tower
City: 015 Toronto
Province, territory, or state: 016 ON
Country (other than Canada): 017
Postal code/Zip code: 018 M5G 2P5

**Mailing address** (if different from head office address)
Has this address changed since the last time we were notified? . . . . . . . . . . . 020 1 Yes [X] 2 No [ ]
(If **yes**, complete lines 021 to 028.)
021 c/o Selma Yam
022 483 Bay Street 7th Floor
023 South Tower
City: 025 Toronto
Province, territory, or state: 026 ON
Country (other than Canada): 027

**Location of books and records**
Has the location of books and records changed since the last time we were notified? . . . . . . . . . . . . . . . . . . . . . 030 1 Yes [X] 2 No [ ]
(If **yes**, complete lines 031 to 038.)
031 483 Bay Street 7th Floor
032 South Tower
City: 035 Toronto
Province,territory, or state: 036 ON
Country (other than Canada): 037
Postal code/Zip code: 038 M5G 2P5

040 **Type of corporation at the end of the tax year**
1 [X] Canadian-controlled private corporation (CCPC)
2 [ ] Other private corporation
3 [ ] Public corporation
4 [ ] Corporation controlled by a public corporation
5 [ ] Other corporation (specify, below)

If the type of corporation changed during the tax year, provide the effective date of the change . . . . . . . . . . . . . . . 043 ________ YYYY MM DD

**To which tax year does this return apply?**
Tax year start 060 2013-01-01 (YYYY MM DD)
Tax year-end 061 2013-12-31 (YYYY MM DD)

Has there been an acquisition of control to which subsection 249(4) applies since the tax year start on line 060? . . . . . . . . 063 1 Yes [ ] 2 No [X]
If **yes**, provide the date control was acquired . . . . . . . . . . . . . . 065 ________ YYYY MM DD

**Is the date on line 061 a deemed tax year-end according to:**
subparagraph 88(2)(a)(iv)? . . . . . . . . 064 1 Yes [ ] 2 No [X]
subsection 249(3.1)? . . . . . . . . . . . . 066 1 Yes [ ] 2 No [X]

**Is the corporation a professional corporation that is a member of a partnership?** . . . . . . . . . . . . . . . . 067 1 Yes [ ] 2 No [X]

**Is this the first year of filing after:**
Incorporation? . . . . . . . . . . . . . . . 070 1 Yes [ ] 2 No [X]
Amalgamation? . . . . . . . . . . . . . . . 071 1 Yes [ ] 2 No [X]
If **yes**, complete lines 030 to 038 and attach Schedule 24.

**Has there been a wind-up of a subsidiary under section 88 during the current tax year?** . . . . . . . . . . . . . . . 072 1 Yes [ ] 2 No [X]
If **yes**, complete and attach Schedule 24.

**Is this the final tax year before amalgamation?** . . . . . . . . . . 076 1 Yes [ ] 2 No [X]

**Is this the final return up to dissolution?** . . . . . . . . . . . . . . . . . . 078 1 Yes [ ] 2 No [X]

**If an election was made under section 261, state the functional currency used** . . . . . . . . . . . . . . . . 079 ________

**Is the corporation a resident of Canada?**
080 1 Yes [X] 2 No [ ] If **no**, give the country of residence on line 081 and complete and attach Schedule 97.
081 ________

**Is the non-resident corporation claiming an exemption under an income tax treaty?** . . . . . . . . . . . 082 1 Yes [ ] 2 No [X]
If **yes**, complete and attach Schedule 91.

**If the corporation is exempt from tax under section 149, tick one of the following boxes:**
085
1 [ ] Exempt under paragraph 149(1)(e) or (l)
2 [ ] Exempt under paragraph 149(1)(j)
3 [ ] Exempt under paragraph 149(1)(t)
4 [ ] Exempt under other paragraphs of section 149

095 ________ 096 ________

## Attachments

**Financial statement information:** Use GIFI schedules 100, 125, and 141.
**Schedules** – Answer the following questions. For each **yes** response, **attach** the schedule to the T2 return, unless otherwise instructed.

| Question | Line | Yes | Schedule |
|---|---|---|---|
| Is the corporation related to any other corporations? | 150 | X | 9 |
| Is the corporation an associated CCPC? | 160 | X | 23 |
| Is the corporation an associated CCPC that is claiming the expenditure limit? | 161 | | 49 |
| Does the corporation have any non-resident shareholders who own voting shares? | 151 | | 19 |
| Has the corporation had any transactions, including section 85 transfers, with its shareholders, officers, or employees, other than transactions in the ordinary course of business? Exclude non-arm's length transactions with non-residents | 162 | | 11 |
| If you answered **yes** to the above question, and the transaction was between corporations not dealing at arm's length, were all or substantially all of the assets of the transferor disposed of to the transferee? | 163 | | 44 |
| Has the corporation paid any royalties, management fees, or other similar payments to residents of Canada? | 164 | X | 14 |
| Is the corporation claiming a deduction for payments to a type of employee benefit plan? | 165 | X | 15 |
| Is the corporation claiming a loss or deduction from a tax shelter? | 166 | | T5004 |
| Is the corporation a member of a partnership for which a partnership account number has been assigned? | 167 | | T5013 |
| Did the corporation, a foreign affiliate controlled by the corporation, or any other corporation or trust that did not deal at arm's length with the corporation have a beneficial interest in a non-resident discretionary trust (without reference to section 94)? | 168 | | 22 |
| Did the corporation have any foreign affiliates during the year? | 169 | | 25 |
| Has the corporation made any payments to non-residents of Canada under subsections 202(1) and/or 105(1) of the federal *Income Tax Regulations*? | 170 | | 29 |
| Has the corporation had any non-arm's length transactions with a non-resident? | 171 | | T106 |
| For private corporations: Does the corporation have any shareholders who own 10% or more of the corporation's common and/or preferred shares? | 173 | X | 50 |
| Has the corporation made payments to, or received amounts from, a retirement compensation plan arrangement during the year? | 172 | | |
| Is the net income/loss shown on the financial statements different from the net income/loss for income tax purposes? | 201 | X | 1 |
| Has the corporation made any charitable donations; gifts to Canada, a province, or a territory; gifts of cultural or ecological property; or gifts of medicine? | 202 | | 2 |
| Has the corporation received any dividends or paid any taxable dividends for purposes of the dividend refund? | 203 | | 3 |
| Is the corporation claiming any type of losses? | 204 | X | 4 |
| Is the corporation claiming a provincial or territorial tax credit or does it have a permanent establishment in more than one jurisdiction? | 205 | X | 5 |
| Has the corporation realized any capital gains or incurred any capital losses during the tax year? | 206 | | 6 |
| i) Is the corporation claiming the small business deduction and reporting income from: a) property (other than dividends deductible on line 320 of the T2 return), b) a partnership, c) a foreign business, or d) a personal services business; or ii) does the corporation have aggregate investment income at line 440? | 207 | | 7 |
| Does the corporation have any property that is eligible for capital cost allowance? | 208 | X | 8 |
| Does the corporation have any property that is eligible capital property? | 210 | | 10 |
| Does the corporation have any resource-related deductions? | 212 | | 12 |
| Is the corporation claiming deductible reserves (other than transitional reserves under section 34.2)? | 213 | | 13 |
| Is the corporation claiming a patronage dividend deduction? | 216 | | 16 |
| Is the corporation a credit union claiming a deduction for allocations in proportion to borrowing or an additional deduction? | 217 | | 17 |
| Is the corporation an investment corporation or a mutual fund corporation? | 218 | | 18 |
| Is the corporation carrying on business in Canada as a non-resident corporation? | 220 | | 20 |
| Is the corporation claiming any federal or provincial foreign tax credits, or any federal or provincial logging tax credits? | 221 | | 21 |
| Does the corporation have any Canadian manufacturing and processing profits? | 227 | | 27 |
| Is the corporation claiming an investment tax credit? | 231 | | 31 |
| Is the corporation claiming any scientific research and experimental development (SR&ED) expenditures? | 232 | | T661 |
| Is the total taxable capital employed in Canada of the corporation and its related corporations over $10,000,000? | 233 | | |
| Is the total taxable capital employed in Canada of the corporation and its associated corporations over $10,000,000? | 234 | | |
| Is the corporation claiming a surtax credit? | 237 | | 37 |
| Is the corporation subject to gross Part VI tax on capital of financial institutions? | 238 | | 38 |
| Is the corporation claiming a Part I tax credit? | 242 | | 42 |
| Is the corporation subject to Part IV.1 tax on dividends received on taxable preferred shares or Part VI.1 tax on dividends paid? | 243 | | 43 |
| Is the corporation agreeing to a transfer of the liability for Part VI.1 tax? | 244 | | 45 |
| Is the corporation subject to Part II - Tobacco Manufacturers' surtax? | 249 | | 46 |
| For financial institutions: Is the corporation a member of a related group of financial institutions with one or more members subject to gross Part VI tax? | 250 | | 39 |

| Net income or (loss) for income tax purposes from Schedule 1, financial statements, or GIFI. | 300 | | | -2,524,507 | A |
| **Deduct:** Charitable donations from Schedule 2 | 311 | | | | |
| Gifts to Canada, a province, or a territory from Schedule 2 | 312 | | | | |
| Cultural gifts from Schedule 2 | 313 | | | | |
| Ecological gifts from Schedule 2 | 314 | | | | |
| Gifts of medicine from Schedule 2 | 315 | | | | |
| Taxable dividends deductible under section 112 or 113, or subsection 138(6) from Schedule 3 | 320 | | | | |
| Part VI.1 tax deduction* | 325 | | | | |
| Non-capital losses of previous tax years from Schedule 4 | 331 | | | | |
| Net capital losses of previous tax years from Schedule 4 | 332 | | | | |
| Restricted farm losses of previous tax years from Schedule 4 | 333 | | | | |
| Farm losses of previous tax years from Schedule 4 | 334 | | | | |
| Limited partnership losses of previous tax years from Schedule 4 | 335 | | | | |
| Taxable capital gains or taxable dividends allocated from a central credit union | 340 | | | | |
| Prospector's and grubstaker's shares | 350 | | | | |
| Subtotal | | | ► | | B |
| Subtotal (amount A **minus** amount B) (if negative, enter "0") | | | | | C |
| **Add:** Section 110.5 additions or subparagraph 115(1)(a)(vii) additions | 355 | | | | D |
| **Taxable income** (amount C **plus** amount D) | 360 | | | | |
| Income exempt under paragraph 149(1)(t) | 370 | | | | |
| **Taxable income** for a corporation with exempt income under paragraph 149(1)(t) (line 360 **minus** line 370) | | | | | Z |

* This amount is equal to 3.5 times the Part VI.1 tax payable at line 724 on page 8. Use 3.2 for tax years ending before 2012.

## Small business deduction

**Canadian-controlled private corporations (CCPCs) throughout the tax year**

Income from active business carried on in Canada from Schedule 7 . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . **400** ______ A

Taxable income from line 360 on page 3, **minus** 100/28* 3.57143 of the amount on line 632** on page 7, **minus** 1/(0.38 - X***) 4 times the amount on line 636**** on page 7, and **minus** any amount that, because of federal law, is exempt from Part I tax . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . **405** ______ B

Business limit (see notes 1 and 2 below) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . **410** ______ C

**Notes:**

1. For CCPCs that are not associated, enter $ 500,000 on line 410. However, if the corporation's tax year is less than 51 weeks, prorate this amount by the number of days in the tax year divided by 365, and enter the result on line 410.
2. For associated CCPCs, use Schedule 23 to calculate the amount to be entered on line 410.

**Business limit reduction:**

Amount C ______ x **415** ***** ______ D = . . . . . . . . . . . . . . . . . . . . . . . . ______ E
11,250

Reduced business limit (amount C **minus** amount E) (if negative, enter "0") . . . . . . . . . . . . . . . . . . . . . . . . . . . . **425** ______ F

**Small business deduction**

Amount A, B, C, or F, whichever is the least ______ x 17 % = . . . . . . . . . . . . . . . . . . . . . . . . **430** ______ G

Enter amount G on line 1 on page 7.

* 10/3 for tax years ending before November 1, 2011. The result of the multiplication by line 632 has to be pro-rated based on the number of days in the tax year that are in each period: before November 1, 2011, and after October 31, 2011.

** Calculate the amount of foreign non-business income tax credit deductible on line 632 without reference to the refundable tax on the CCPC's investment income (line 604) and without reference to the corporate tax reductions under section 123.4.

*** General rate reduction percentage for the tax year. It has to be pro-rated based on the number of days in the tax year that are in each calendar year. See page 5.

**** Calculate the amount of foreign business income tax credit deductible on line 636 without reference to the corporation tax reductions under section 123.4.

***** **Large corporations**

- If the corporation is not associated with any corporations in both the current and previous tax years, the amount to be entered on line 415 is: (total taxable capital employed in Canada for the **prior year** minus $10,000,000) x 0.225%.
- If the corporation is not associated with any corporations in the current tax year, but was associated in the previous tax year, the amount to be entered on line 415 is: (total taxable capital employed in Canada for the **current year** minus $10,000,000) x 0.225%.
- For corporations associated in the current tax year, see Schedule 23 for the special rules that apply.

## FINANCIAL STATEMENTS

## DECEMBER 31, 2013

**HYDRO ONE REMOTE COMMUNITIES INC.**
**INDEPENDENT AUDITORS' REPORT**

To Directors of Hydro One Remote Communities Inc.

We have audited the accompanying financial statements of Hydro One Remote Communities Inc., which comprise the balance sheet as at December 31, 2013, the statements of operations and comprehensive income, changes in shareholder's deficit and cash flows for the year then ended, and notes, comprising a summary of significant accounting policies and other explanatory information.

*Management's Responsibility for the Financial Statements*

Management is responsible for the preparation and fair presentation of these financial statements in accordance with United States Generally Accepted Accounting Principles, and for such internal control as management determines is necessary to enable the preparation of financial statements that are free from material misstatement, whether due to fraud or error.

*Auditors' Responsibility*

Our responsibility is to express an opinion on these financial statements based on our audit. We conducted our audit in accordance with Canadian generally accepted auditing standards. Those standards require that we comply with ethical requirements and plan and perform the audit to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on our judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, we consider internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

*Opinion*

In our opinion, the financial statements present fairly, in all material respects, the financial position of Hydro One Remote Communities Inc. as at December 31, 2013, and its results of operations and its cash flows for the year then ended in accordance with United States Generally Accepted Accounting Principles.

HYDRO ONE REMOTE COMMUNITIES INC.
NOTES TO FINANCIAL STATEMENTS
**For the years ended December 31, 2013 and 2012**

## 1. DESCRIPTION OF THE BUSINESS

Hydro One Inc. (Hydro One) was incorporated on December 1, 1998, under the *Business Corporations Act* (Ontario) and is wholly owned by the Province of Ontario (Province). The principal businesses of Hydro One are the transmission and distribution of electricity to customers within Ontario.

Hydro One Remote Communities Inc. (Hydro One Remote Communities or the Company) was incorporated on August 18, 1998 under the *Business Corporations Act* (Ontario), and is a wholly owned subsidiary of Hydro One. Hydro One Remote Communities operates 19 small electrical, generation and distribution systems in remote communities in northern Ontario that are not connected to the Province's electricity grid. The Company's business is regulated by the Ontario Energy Board (OEB).

## 2. SIGNIFICANT ACCOUNTING POLICIES

### Basis of Accounting

These Financial Statements are prepared and presented in accordance with United States (US) Generally Accepted Accounting Principles (GAAP) and in Canadian dollars.

The Company uses a cost recovery model applied to achieve breakeven net income and are for the specific use of the OEB. Certain amounts presented in these Financial Statements represent allocations from Hydro One that are subject to review and approval by the OEB. Consolidated Financial Statements of Hydro One for the year ended December 31, 2013 have been prepared and are publicly available.

Hydro One Remote Communities performed an evaluation of subsequent events through to March 26, 2014, the date these Financial Statements were available to be issued, to determine whether any events or transactions warranted recognition and disclosure in these Financial Statements. No such events or transactions were identified.

### Use of Management Estimates

The preparation of financial statements requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities at the date of the financial statements and the reported amounts of revenues and expenses during the reporting periods. Management evaluates these estimates on an on-going basis based upon: historical experience; current conditions; and assumptions believed to be reasonable at the time the assumption is made with any adjustments being recognized in results of operations in the period they arise. Significant estimates relate to regulatory assets and regulatory liabilities, environmental liabilities, post-retirement and post-employment benefits, asset impairment, contingencies, unbilled revenue, allowance for doubtful accounts and deferred income tax assets and liabilities. Actual results may differ significantly from these estimates, which may be impacted by future decisions made by the OEB or the Province.

### Rate Setting

On April 3, 2012, the OEB approved the Company's request to use US GAAP as the basis for rate setting and regulatory accounting and reporting, effective January 1, 2012.

In November 2011, Hydro One Remote Communities filed an Incentive Regulation Mechanism (IRM) application with the OEB for 2012 rates. In March 2012, the OEB approved an increase of approximately 1.1% to basic rates for the distribution and generation of electricity, with an effective date of May 1, 2012. In September 2012, Hydro One Remote Communities filed a cost of service application for 2013 distribution rates. The application requested an increase of 3.45% to customer rates for generation and distribution and an increase of approximately $7 million to annual Rural and Remote Rate Protection (RRRP). In September, 2013, the OEB approved the proposed rate increase and annual RRRP of approximately $32.3 million.

**Regulatory Accounting**

The OEB has the general power to include or exclude costs, revenues, losses or gains in the rates of a specific period, resulting in a change in the timing of accounting recognition from that which would have applied in an unregulated company. Such change in timing involves the application of rate-regulated accounting, giving rise to the recognition of regulatory assets and liabilities. The Company's regulatory assets represent certain amounts receivable from future customers and costs that have been deferred for accounting purposes because it is probable that they will be recovered in future rates. In addition, the Company has recorded regulatory liabilities that generally represent amounts that are refundable to future electricity customers. The Company continually assesses the likelihood of recovery of each of its regulatory assets and continues to believe that it is probable that the OEB will factor its regulatory assets and liabilities into the setting of future rates. If, at some future date, the Company judges that it is no longer probable that the OEB will include a regulatory asset or liability in setting future rates, the appropriate carrying amount will be reflected in results of operations in the period that the assessment is made.

Hydro One Remote Communities is regulated under a cost recovery model applied to achieve breakeven net income, after consideration of the recovery of / provision for payments in lieu of corporate income taxes (PILs). Any excess or deficiency in RRRP amounts necessary to lead to breakeven net income is added to, or drawn from, the Remote Rate Protection Revenue (RRPR) variance account. The balance in the RRPR variance account is subject to future review and disposition by the OEB.

**Revenue Recognition**

Revenues are recognized on an accrual basis and include billed and unbilled revenues. Revenues attributable to the generation and delivery of electricity are based on OEB-approved distribution rates and are recognized as electricity is delivered to customers. The Company estimates monthly revenue for a period based on wholesale electricity purchases because customer meters are not generally read at the end of each month. At the end of each month, the electricity delivered to customers, but not billed, is estimated and revenue is recognized. The unbilled revenue estimate is affected by energy demand, weather, line losses and changes in the composition of customer classes.

Distribution revenue also includes RRRP which is an amount relating to rate protection for remote customers received from the Independent Electricity System Operator (IESO) based on a standardized customer rate that is approved by the OEB. Current legislation provides RRRP for prescribed classes of rural, residential and remote consumers by reducing the electricity rates that would otherwise apply.

Revenues are recorded net of indirect taxes.

**Accounts Receivable and Allowance for Doubtful Accounts**

Billed accounts receivable are recorded at the invoiced amount and overdue amounts related to regulated billings bear interest at OEB approved rates. The allowance for doubtful accounts reflects the Company's best estimate of losses on accounts receivable balances. The allowance is based on accounts receivable aging, historical experience and other currently available information. The Company estimates the allowance for doubtful accounts on customer receivables by applying internally developed loss rates to the outstanding receivable balances by risk segment. Risk segments represent groups of customers with similar credit quality indicators and are computed based on various attributes, including number of days receivables are past due, delinquency of balances and payment history. Loss rates applied to the accounts receivable balances are based on historical average write-offs as a percentage of accounts receivable in each risk segment. An account is considered delinquent if the amount billed is not received within 120 days from the bill due date. Accounts receivable are written off against the allowance when they are deemed uncollectible. The existing allowance for uncollectible accounts will continue to be affected by changes in volume, prices and economic conditions.

**Corporate Income Taxes**

Under the *Electricity Act, 1998*, Hydro One Remote Communities is required to make (recover) PILs to (from) the Ontario Electricity Financial Corporation (OEFC). These payments are calculated in accordance with the rules for computing income and other relevant amounts contained in the *Income Tax Act* (Canada) and the *Taxation Act, 2007* (Ontario), as modified by the *Electricity Act, 1998*, and related regulations.

Current and deferred income taxes are computed based on the tax rates and tax laws enacted at the balance sheet date. Tax benefits associated with income tax positions taken, or expected to be taken, in a tax return are recorded only when the "more-likely-than-not" recognition threshold is satisfied and are measured at the largest amount of benefit that has a greater than 50% likelihood of being realized upon settlement. Management evaluates each position based solely on the technical merits and facts and circumstances of the position, assuming the position will be examined by a taxing authority having full knowledge of all relevant information. Significant management judgement is required to determine recognition thresholds and the related amount of tax benefits to be recognized in the Financial Statements. Management re-evaluates tax positions each period in which new information about recognition or measurement becomes available.

*Current Income Taxes*

The recovery of or the provision for current taxes and the assets and liabilities recognized for the current and prior periods are measured at the amounts receivable from, or payable to, the OEFC.

*Deferred Income Taxes*

Deferred income taxes are provided for using the liability method. Deferred income taxes are recognized based on the estimated future tax consequences attributable to temporary differences between the carrying amount of assets and liabilities in the Financial Statements and their corresponding tax bases.

Deferred income tax liabilities are generally recognized on all taxable temporary differences. Deferred tax assets are recognized to the extent that it is more-likely-than-not that these assets will be realized from taxable income available against which deductible temporary differences can be utilized.

Deferred income taxes are calculated at the tax rates that are expected to apply in the period when the liability is settled or the asset is realized, based on the tax rates and tax laws that have been enacted at the balance sheet date. Deferred income taxes that are not included in the rate-setting process are charged or credited to the Statements of Operations and Comprehensive Income.

If management determines that it is more-likely-than-not that some or all of a deferred income tax asset will not be realized, a valuation allowance is recorded against the deferred income tax asset to report the net balance at the amount expected to be realized. Previously unrecognized deferred income tax assets are reassessed at each balance sheet date and are recognized to the extent that it has become more-likely-than-not that the tax benefit will be realized.

The Company records regulatory assets and liabilities associated with deferred income taxes that will be included in the rate-setting process.

The Company uses the flow-through method to account for investment tax credits (ITCs) earned on eligible scientific research and experimental development expenditures, and apprenticeship job creation. Under this method, only non-refundable ITCs are recognized as a reduction to income tax expense.

**Inter-company Demand Facility**

Hydro One maintains pooled bank accounts for its use and for the use of its subsidiaries, including Hydro One Remote Communities. The balance in the inter-company demand facility represents the cumulative net effect of all deposits and withdrawals made by the Company to and from the pooled cash accounts. Interest is earned on positive inter-company balances based on the average of the bankers' acceptance rate at the beginning and end of the month, less 0.02%. Interest is charged on overdraft inter-company balances based on the same bankers' acceptance rate, plus 0.15%.

**Fuel, Materials and Supplies**

Fuel is used in the generation of electricity. Materials and supplies represent consumables, small spare parts and construction materials held for internal construction and maintenance of property, plant and equipment. These assets are carried at average cost less any impairments recorded.

**Property, Plant and Equipment**

Property, plant and equipment is recorded at original cost, net of customer contributions received in aid of construction and any accumulated impairment losses. The cost of additions, including betterments and replacements of asset components, is included on the Balance Sheets as property, plant and equipment.

The original cost of property, plant and equipment includes direct materials, direct labour (including employee benefits), contracted services, attributable capitalized financing costs, and direct and indirect overheads that are related to the capital project or program. Indirect overheads include a portion of corporate costs such as finance, treasury, human resources, information technology and executive costs. Overhead costs, including corporate functions and field services costs, are capitalized on a fully allocated basis, consistent with an OEB-approved methodology.

Property, plant and equipment in service consists of generation, distribution, and administration and service assets. Property, plant and equipment also includes future use assets, such as major components and spare parts and capitalized project development costs associated with deferred capital projects.

*Generation*

Generation assets are used in the generation of electricity, including hydroelectric equipment, wind turbines, diesel generators, and tank farms.

*Distribution*

Distribution assets include assets related to the distribution of low-voltage electricity, including lines, poles, switches, transformers, protective devices, and metering systems.

*Administration and Service*

Administration and service assets include administrative buildings, personal computers, transport and work equipment, tools, and other minor assets.

**Capitalized Financing Costs**

Capitalized financing costs represent interest costs attributable to the construction of property, plant and equipment. The financing cost of attributable borrowed funds is capitalized as part of the acquisition cost of such assets. The capitalized portion of financing costs is a reduction to financing charges recognized in the Statements of Operations and Comprehensive Income. Capitalized financing costs are calculated using the Company's weighted average effective cost of debt.

**Construction in Progress**

Construction in progress consists of the capitalized cost of constructed assets that are not yet complete and which have not yet been placed in service.

**Depreciation**

The cost of property, plant and equipment is depreciated on a straight-line basis based on the estimated remaining service life of each asset category, except for transport and work equipment, which is depreciated on a declining balance basis.

The Company periodically initiates an external independent review of its property, plant and equipment depreciation rates, as required by the OEB. Any changes arising from such a review are implemented on a remaining service life basis, consistent with their inclusion in electricity rates. The last review resulted in changes to rates effective January 1, 2013.

A summary of average service lives and depreciation and amortization rates for the various classes of assets is included below:

| | Average Service Life | Rate (%) Range | Average |
|---|---|---|---|
| Generation | 22 years | 3% – 7% | 5% |
| Distribution | 36 years | 1% – 7% | 3% |
| Administration and service | 20 years | 3% – 20% | 3% |

In accordance with group depreciation practices, the original cost of property, plant and equipment, or major components thereof, that are normally retired, is charged to accumulated depreciation with no gain or loss being reflected in results of operations. Where a disposition of property, plant and equipment occurs through sale, a gain or loss is calculated based on proceeds and such gain or loss is included in depreciation expense. Depreciation expense also includes the costs incurred to remove property, plant and equipment assets where no asset retirement obligation has been recorded.

**Long-Lived Asset Impairment**

When circumstances indicate the carrying value of long-lived assets may not be recoverable, the Company evaluates whether the carrying value of such assets has been impaired. For such long-lived assets, impairment exists when the carrying value exceeds the sum of the future estimated undiscounted cash flows expected to result from the use and eventual disposition of the asset. When alternative courses of action to recover the carrying amount of a long-lived asset are under consideration, a probability-weighted approach is used to develop estimates of future undiscounted cash flows. If the carrying value of the long-lived asset is not recoverable based on the estimated future undiscounted cash flows, an impairment loss is recorded, measured as the excess of the carrying value of the asset over its fair value. As a result, the asset's carrying value is adjusted to its estimated fair value. As at December 31, 2013, no asset impairment had been recorded.

**Costs of Arranging Debt Financing**

For financial liabilities classified as other than held-for-trading, the Company defers the external transaction costs related to obtaining debt financing and presents such amounts as deferred debt costs on the Balance Sheets. Deferred debt costs are amortized over the contractual life of the related debt on an effective-interest rate basis and the amortization is included within financing charges in the Statements of Operations and Comprehensive Income. Transaction costs for items classified as held-for-trading are expensed immediately.

**Comprehensive Income**

Comprehensive income is comprised of net income and other comprehensive income (OCI). OCI includes the amortization of net unamortized hedging losses on the Company's proportionate share of Hydro One's discontinued cash flow hedges. The Company amortizes its net unamortized hedging losses on discontinued cash flow hedges to financing charges using the effective interest method over the term of the associated hedged debt. Hydro One Remote Communities presents OCI and net income in a single continuous Statement of Operations and Comprehensive Income.

**Financial Assets and Liabilities**

All financial assets and liabilities are classified into one of the following five categories: held-to-maturity investments; loans and receivables; held-for-trading; other liabilities; or available-for-sale. Financial assets and liabilities classified as held-for-trading are measured at fair value. All other financial assets and liabilities are measured at amortized cost, except accounts receivable which are measured at the lower of cost or fair value. Accounts receivable are classified as loans and receivables. The Company considers the carrying amount of accounts receivable to be a reasonable estimate of fair value because of the short time to maturity of these instruments. Provisions for impaired accounts receivable are recognized as adjustments to the allowance for doubtful accounts and are recognized when there is objective evidence that the Company will not be able to collect amounts according to the original terms.

The Company determines the classification of its financial assets and liabilities at the date of initial recognition. The Company designates certain of its financial assets and liabilities to be held at fair value, when it is consistent with the Company's risk management policy disclosed in Note 11 – Fair Value of Financial Instruments and Risk Management.

Transaction costs associated with financial assets and liabilities that are designated as held-for-trading are recognized immediately in results of operations. All financial instrument transactions are recorded at trade date.

**Derivative Instruments and Hedge Accounting**

The Company currently does not engage in derivative trading or speculative activities and had no derivative instruments outstanding at December 31, 2013. OCI includes the amortization of net unamortized hedging losses on the Company's proportionate share of Hydro One's discontinued cash flow hedges.

**Employee Future Benefits**

Employee future benefits provided by Hydro One include pension, post-retirement and post-employment benefits. The costs of Hydro One's pension, post-retirement and post-employment benefit plans are recorded over the periods during which employees render service.

Hydro One recognizes the funded status of its pension, post-retirement and post-employment plans on its Consolidated Balance Sheets and subsequently recognizes the changes in funded status at the end of each reporting year. Pension, post-retirement and post-employment funds are considered to be underfunded when the projected benefit obligation exceeds the fair value of the plan assets. Liabilities are recognized in the Consolidated Balance Sheets of Hydro One for any net underfunded projected benefit obligation. The net underfunded projected benefit obligation may be disclosed as a current liability, long-term liability, or both. The current portion is the amount by which the actuarial present value of benefits included in the benefit obligation payable in the next 12 months exceeds the fair value of plan assets. If the fair value of plan assets exceeds the projected benefit obligation of the plan, an asset is recognized equal to the net overfunded projected benefit obligation. The post-retirement and post-employment benefit plans are unfunded because there are no related plan assets. For the year ended December 31, 2013, the measurement date for the Plans was December 31.

*Pension benefits*

Hydro One has a contributory defined benefit pension plan covering all regular employees of Hydro One and its subsidiaries, including Hydro One Remote Communities, but not including Hydro One Brampton Inc. The Hydro One pension plan does not segregate assets in a separate account for individual subsidiaries, nor is the obligation of the pension plan allocated to, or funded separately by, entities within the consolidated group. Accordingly, for purposes of these Financial Statements, the pension plan is accounted for as a defined contribution plan and no pension benefit asset or liability is recorded.

A detailed description of Hydro One pension benefits is provided in Note 15 – Pension and Post-Retirement and Post-Employment Benefits, to the Consolidated Financial Statements of Hydro One for the year ended December 31, 2013.

*Post-retirement and post-employment benefits*

Hydro One has post-retirement and post-employment benefit plans covering all regular employees of Hydro One and its subsidiaries, including Hydro One Remote Communities. The benefit obligations of the these post-retirement and post-employment benefit plans are not segregated, or funded separately, for Hydro One Remote Communities. Accordingly, for purposes of these Financial Statements, the post-retirement and post-employment benefit obligations are allocated to the Company based on base pensionable earnings.

The Company records a regulatory asset equal to its allocated share of Hydro One's incremental net unfunded projected benefit obligation for post-retirement and post-employment plans at each year end based on annual actuarial reports. The regulatory asset for the incremental net unfunded projected benefit obligation for post-retirement and post-employment plans, in absence of regulatory accounting, would be recognized in accumulated OCI (AOCI). A regulatory asset is recognized because management considers it to be probable that post-retirement and post-employment benefit costs will be recovered in the future through the rate-setting process.

Post-retirement and post-employment benefits, are recorded and included in rates on an accrual basis. Costs are determined by independent actuaries using the projected benefit method prorated on service and based on assumptions that reflect management's best estimates. Past service costs from plan amendments are amortized to results of operations based on the expected average remaining service period.

For post-retirement benefits, all actuarial gains or losses are deferred using the "corridor" approach. The amount calculated above the "corridor" is amortized to results of operations on a straight-line basis over the expected average remaining service lives of active Hydro One employees in the plan and over the remaining life expectancy of inactive Hydro One employees in the plan. The post-retirement benefit obligation is remeasured to its fair value at each year end based on an annual actuarial report, with an offset to associated regulatory asset, to the extent of the remeasurement adjustment.

For post-employment obligations, the actuarial gains and losses that are incurred during the year are recognized immediately to results of operations. The post-employment benefit obligation is remeasured to its fair value at each year end based on an annual actuarial report, with an offset to associated regulatory asset, to the extent of the remeasurement adjustment.

All post-retirement and post-employment future benefit costs are attributed to labour and are either charged to results of operations or capitalized as part of the cost of property, plant and equipment and intangible assets.

A detailed description of Hydro One post-retirement and post-employment benefits is provided in Note 15 – Pension and Post-Retirement and Post-Employment Benefits, to the Consolidated Financial Statements of Hydro One for the year ended December 31, 2013.

**Loss Contingencies**

Hydro One Remote Communities is involved in certain legal and environmental matters that arise in the normal course of business. In the preparation of its Financial Statements, management makes judgements regarding the future outcome of contingent events and records a loss for a contingency based on its best estimate when it is determined that such loss is probable and the amount of the loss can be reasonably estimated. When a range estimate for the probable loss exists and no amount within the range is a better estimate than any other amount, the Company records a loss at the minimum amount within the range.

Management regularly reviews current information available to determine whether recorded provisions should be adjusted and whether new provisions are required. Estimating probable losses may require analysis of multiple forecasts and scenarios that often depend on judgements about potential actions by third parties, such as federal, provincial and local courts or regulators. Contingent liabilities are often resolved over long periods of time. Amounts recorded in the Financial Statements may differ from the actual outcome once the contingency is resolved. Such differences could have a material impact on future results of operations, financial position and cash flows of the Company.

Provisions are based upon current estimates and are subject to greater uncertainty the longer the projection period. A significant upward or downward trend in the number of claims filed, the nature of the alleged injury, and the average cost of resolving each such claim could change the estimated provision, as could any substantial adverse or favorable verdict at trial. A federal or provincial legislative outcome or structured settlement could also change the estimated liability. Legal fees are expensed as incurred.

**Environmental Liabilities**

Environmental liabilities are recorded in respect of past contamination when it is determined that future environmental remediation expenditures are probable under existing statute or regulation and the amount of the future expenditures can be reasonably estimated. Hydro One Remote Communities records a liability for the estimated future expenditures associated with the contaminated land assessment and remediation (LAR) based on the present value of these estimated future expenditures. The Company determines the present value with a discount rate equal to its credit-adjusted risk-free interest rate on financial instruments with comparable maturities to the pattern of future environmental expenditures. As the Company anticipates that the future expenditures will continue to be recoverable in future rates, an offsetting regulatory asset has been recorded to reflect the future recovery of these environmental expenditures from customers. Hydro One Remote

Communities reviews its estimates of future environmental expenditures annually or more frequently if there are indications that circumstances have changed.

## 3. NEW ACCOUNTING PRONOUNCEMENTS

**Recently Adopted Accounting Pronouncements**

In December 2011, the Financial Accounting Standards Board (FASB) issued Accounting Standards Update (ASU) 2011-11, Balance Sheet (Topic 210): Disclosures about Offsetting Assets and Liabilities. This ASU requires an entity to disclose both gross and net information about financial instruments and transactions eligible for offset on the Balance Sheets as well as financial instruments and transactions executed under a master netting or similar arrangement and was issued to enable users of financial statements to understand the effects or potential effects of those arrangements on its financial position. This ASU was required to be applied retrospectively and was effective for fiscal years, and interim periods within those years, beginning on or after January 1, 2013. The adoption of this ASU did not have a significant impact on the Company's Financial Statements.

In February 2013, the FASB issued ASU 2013-02, Comprehensive Income (Topic 220): Reporting of Amounts Reclassified Out of Accumulated Other Comprehensive Income. This ASU requires an entity to provide information about the amounts reclassified out of accumulated other comprehensive income by component. In addition, an entity is required to present, either on the face of the statement where net income is presented or in the notes, significant amounts reclassified out of accumulated other comprehensive income by the respective line items of net income, but only if the amount reclassified is required under US GAAP to be reclassified to net income in its entirety in the same reporting period. For other amounts that are not required under US GAAP to be reclassified in their entirety to net income, an entity is required to cross-reference to other disclosures required under US GAAP that provide additional detail about those amounts. This ASU was required to be applied prospectively and was effective for fiscal years, and interim periods within those years, beginning after December 15, 2012. The adoption of this ASU did not have a significant impact on the Company's Financial Statements.

**Recent Accounting Guidance Not Yet Adopted**

In July 2013, the FASB issued ASU 2013-11, Income Taxes (Topic 740): Presentation of an Unrecognized Tax Benefit When a Net Operating Loss Carryforward, a Similar Tax Loss, or a Tax Credit Carryforward Exists. This ASU provides guidance on the presentation of unrecognized tax benefits. This ASU is effective for fiscal years, and interim periods within those years, beginning after December 15, 2013, and should be applied prospectively to all unrecognized tax benefits that exist at the effective date. Retrospective application is permitted. The adoption of this ASU is not anticipated to have a significant impact on the Company's Financial Statements.

## 4. DEPRECIATION AND AMORTIZATION

| *Year ended December 31 (thousands of dollars)* | 2013 | 2012 |
|---|---|---|
| Depreciation of property, plant and equipment | 2,564 | 2,946 |
| Asset removal costs | 589 | 560 |
| Gain on disposition of property, plant and equipment | – | (2) |
| Amortization of regulatory assets | 1,656 | 2,515 |
| | 4,809 | 6,019 |

## 5. FINANCING CHARGES

| *Year ended December 31 (thousands of dollars)* | 2013 | 2012 |
|---|---|---|
| Interest on long-term debt | 1,237 | 1,237 |
| Interest on inter-company demand facility | 216 | 83 |
| Amortization of hedging losses | 13 | 12 |
| Other | 14 | 5 |
| Less: Interest capitalized on construction in progress | (376) | (321) |
| | 1,104 | 1,016 |

## 6. PROVISION FOR PILS

The provision for PILs differs from the amount that would have been recorded using the combined Canadian Federal and Ontario statutory income tax rate. The reconciliation between the statutory and the effective tax rates is provided as follows:

| *Year ended December 31 (thousands of dollars)* | 2013 | 2012 |
|---|---|---|
| Loss before recovery of PILs | (1,091) | (1,436) |
| Canadian Federal and Ontario statutory income tax rate | 26.50% | 26.50% |
| Recovery of PILs at statutory rate | (289) | (381) |
| | | |
| Increase (decrease) resulting from: | | |
| | | |
| Net temporary differences included in amounts charged to customers: | | |
| Depreciation and amortization in excess of capital cost allowance | 469 | 913 |
| Environmental expenditures | (439) | (667) |
| Overheads capitalized for accounting but deducted for tax purposes | (82) | (102) |
| Interest capitalized for accounting but deducted for tax purposes | (100) | (85) |
| Post-retirement and post-employment benefit expense in excess of cash payments | 135 | 74 |
| RRPR variance account | (318) | (1,029) |
| Pension contribution in excess of pension expense | (90) | (107) |
| Other | 56 | (15) |
| Net temporary differences | (369) | (1,018) |
| Prior year adjustments | (332) | – |
| Rate difference on loss carryback | (110) | – |
| Other permanent differences | 9 | (37) |
| Total recovery of PILs | (1,091) | (1,436) |
| | | |
| Current recovery of PILs | (1,091) | (1,436) |
| Deferred recovery of PILs | – | – |
| Total recovery of PILs | (1,091) | (1,436) |
| | | |
| Effective income tax rate | 100% | 100% |

The recovery of payments in lieu of current income taxes of $1,091 thousand (2012 – $1,436 thousand) represents the amount that is recoverable from the OEFC with respect to current year income. The balance receivable from the OEFC at December 31, 2013 was $2,697 thousand (2012 – $1,589 thousand).

**Deferred Income Tax Assets**

Deferred income tax assets and liabilities arise from differences between the carrying amounts and tax bases of the Company's assets and liabilities. At December 31, 2013 and 2012, deferred income tax assets and liabilities consisted of the following:

| *December 31 (thousands of dollars)* | **2013** | **2012** |
|---|---|---|
| **Deferred income tax assets** | | |
| Environmental expenditures | 4,840 | 4,283 |
| Post-retirement and post-employment benefits expense in excess of cash payments | 4,466 | 4,266 |
| Depreciation and amortization in excess of capital cost allowance | 1,845 | 2,263 |
| Regulatory amounts not recognized for tax | (6,615) | (5,726) |
| Debt costs and hedging losses recognized for tax but not for accounting purposes | (189) | (245) |
| Total deferred income tax assets | 4,347 | 4,841 |
| Less: current portion | 108 | 108 |
| | 4,239 | 4,733 |

During 2013, there was no change in the rate applicable to future taxes (2012 – a change in rate applicable to future rates resulted in a $464 thousand increase to deferred tax liability).

## 7. ACCOUNTS RECEIVABLE

| *December 31 (thousands of dollars)* | Current accounts receivable | Long-term accounts receivable | Total |
|---|---|---|---|
| **2013** | | | |
| Accounts receivable – billed | 3,887 | 674 | 4,561 |
| Accounts receivable – unbilled | 1,404 | – | 1,404 |
| Accounts receivable, gross | 5,291 | 674 | 5,965 |
| Allowance for doubtful accounts | (296) | – | (296) |
| Accounts receivable, net | 4,995 | 674 | 5,669 |
| **2012** | | | |
| Accounts receivable – billed | 2,963 | 423 | 3,386 |
| Accounts receivable – unbilled | 1,527 | – | 1,527 |
| Accounts receivable, gross | 4,490 | 423 | 4,913 |
| Allowance for doubtful accounts | (297) | (5) | (302) |
| Accounts receivable, net | 4,193 | 418 | 4,611 |

The following table shows the movements in the total allowance for doubtful accounts for the years ended December 31, 2013 and 2012:

| *Year ended December 31 (thousands of dollars)* | **2013** | **2012** |
|---|---|---|
| Allowance for doubtful accounts – January 1 | (302) | (658) |
| Write-offs | 95 | 222 |
| Adjustments to allowance for doubtful accounts | (89) | 134 |
| Allowance for doubtful accounts – December 31 | (296) | (302) |

## 8. PROPERTY, PLANT AND EQUIPMENT

| *December 31 (thousands of dollars)* | Costs | Accumulated Depreciation | Construction in Progress | Total |
|---|---|---|---|---|
| **2013** | | | | |
| Generation | 41,616 | 19,517 | 2,716 | 24,815 |
| Distribution | 8,394 | 1,748 | 596 | 7,242 |
| Administration and Service | 10,545 | 1,991 | 161 | 8,715 |
| | 60,555 | 23,256 | 3,473 | 40,772 |
| **2012** | | | | |
| Generation | 38,803 | 22,056 | 6,764 | 23,511 |
| Distribution | 7,757 | 1,785 | 315 | 6,287 |
| Administration and Service | 9,803 | 1,938 | 171 | 8,036 |
| | 56,363 | 25,779 | 7,250 | 37,834 |

Financing charges capitalized on property, plant and equipment under construction were $376 thousand in 2013 (2012 – $321 thousand).

## 9. REGULATORY ASSETS AND LIABILITIES

Regulatory assets and liabilities arise as a result of the rate-making process. Hydro One Remote Communities has recorded the following regulatory assets and liabilities:

| *December 31 (thousands of dollars)* | 2013 | 2012 |
|---|---|---|
| **Regulatory assets:** | | |
| Environmental | 13,426 | 11,880 |
| Post-retirement and post-employment benefits | 2,939 | 3,144 |
| RRPR variance account | 1,985 | 787 |
| IFRS transition cost variance | – | 72 |
| Total regulatory assets | 18,350 | 15,883 |
| Less: current portion | 2,427 | 1,823 |
| | 15,923 | 14,060 |
| **Regulatory liabilities:** | | |
| Deferred income tax regulatory liability | 4,347 | 4,841 |
| Total regulatory liabilities | 4,347 | 4,841 |
| Less: current portion | 108 | 108 |
| | 4,239 | 4,733 |

### Environmental

The Company records a liability for the estimated future expenditures required to remediate environmental contamination. Management considers it probable that such expenditures will be recovered in the future through the rate-setting process, and as such, the Company has recorded an equivalent amount as a regulatory asset. In 2013, this regulatory asset increased by $2,872 thousand (2012 – decreased by $583 thousand) to reflect related changes in the Company's environmental liabilities. The environmental regulatory asset is amortized to results of operations based on the pattern of actual expenditures incurred and charged to environmental liabilities. The OEB has the discretion to examine and assess the prudency and the timing of recovery of all of the Company's actual environmental expenditures. In the absence of rate-regulated accounting, 2013 operation, maintenance and administration expenses would have been higher by $2,872 thousand (2012 – lower by $583 thousand). In addition, 2013 amortization expense would have been lower by $1,656 thousand (2012 – $2,515 thousand), and 2013 financing charges would have been higher by $330 thousand (2012 – $399 thousand).

**Post-Retirement and Post-Employment Benefits**

The Company recognizes the net unfunded status of post-retirement and post-employment obligations on the Balance Sheets with an incremental offset to the associated regulatory assets. A regulatory asset is recognized because management considers it to be probable that post-retirement and post-employment benefit costs will be recovered in the future through the rate-setting process. The post-retirement and post-employment benefit obligation is remeasured to its fair value at each year end based on an annual actuarial report, with an offset to the associated regulatory asset, to the extent of the remeasurement adjustment. In the absence of rate-regulated accounting, 2013 OCI would have been higher by $205 thousand (2012 – lower by $1,941 thousand).

**RRPR Variance Account**

Hydro One Remote Communities receives RRRP amounts from the IESO. At December 31, 2013, the Company has recognized a regulatory asset representing the amounts required to achieve breakeven net income, as regulated under the cost recovery model, in excess of net RRRP amounts received. At December 31, 2012, net RRRP amounts received were also lower than amounts required to achieve breakeven net income, and as such, a regulatory asset was also recognized. In the absence of rate-regulated accounting, 2013 revenue would have been lower by $1,198 thousand (2012 – $3,957 thousand).

**IFRS Transition Costs Variance**

Hydro One Remote Communities recorded an asset for the variance between its one-time incremental costs incurred in its uncompleted transition to IFRS and amounts included in rates in respect of this project. In 2013, the company decided not to seek recovery of this amount from rate payers and it was included in the Statement of Operations.

**Deferred Income Tax Regulatory Liability**

Deferred income taxes are recognized on temporary differences between the carrying amount of assets and liabilities in the financial statements and the corresponding tax bases used in the computation of taxable profit. The Company has recognized regulatory assets and liabilities that correspond to deferred income taxes that flow through the rate-setting process. In the absence of rate-regulated accounting, the Company's provision for PILs would have been recognized using the liability method and there would be no regulatory accounts established for taxes to be recovered through future rates. As a result, the 2013 recovery of PILs would have been lower by approximately $367 thousand (2012 – $771 thousand).

## 10. LONG-TERM DEBT

Long-term debt represents a note payable to Hydro One. The note was issued on May 19, 2005, with a carrying value of $23,000 thousand and interest at a rate of 5.38% per annum. The note matures on May 20, 2036. The note was issued on maturity of a previous note in the same principal amount that was issued on April 1, 1999 in consideration of the purchase price of Hydro One Remote Communities' net assets.

On issuance of this note, $115 thousand of transaction costs and a $31 thousand debt discount incurred by Hydro One were allocated to Hydro One Remote Communities, based on its proportionate share of Hydro One's related debt issue.

## 11. FAIR VALUE OF FINANCIAL INSTRUMENTS AND RISK MANAGEMENT

Fair value is considered to be the exchange price in an orderly transaction between market participants to sell an asset or transfer a liability at the measurement date. The fair value definition focuses on an exit price, which is the price that would be received in the sale of an asset or the amount that would be paid to transfer a liability.

Hydro One Remote Communities classifies its fair value measurements based on the following hierarchy, as prescribed by the accounting guidance for fair value, which prioritizes the inputs to valuation techniques used to measure fair value into three levels:

Level 1 inputs are unadjusted quoted prices in active markets for identical assets or liabilities that Hydro One Remote Communities has the ability to access. An active market for the asset or liability is one in which transactions for the asset or liability occurs with sufficient frequency and volume to provide ongoing pricing information.

Level 2 inputs are those other than quoted market prices that are observable, either directly or indirectly, for an asset or liability. Level 2 inputs include, but are not limited to, quoted prices for similar assets or liabilities in an active market, quoted prices for identical or similar assets or liabilities in markets that are not active and inputs other than quoted market prices that are observable for the asset or liability, such as interest rate curves and yield curves observable at commonly quoted intervals, volatilities, credit risk and default rates. A Level 2 measurement cannot have more than an insignificant portion of the valuation based on unobservable inputs.

Level 3 inputs are any fair value measurements that include unobservable inputs for the asset or liability for more than an insignificant portion of the valuation. A Level 3 measurement may be based primarily on Level 2 inputs.

**Non-Derivative Financial Assets and Liabilities**

At December 31, 2013 and 2012, the Company's carrying amounts of accounts receivable, inter-company demand facility, and accounts payable are representative of fair value because of the short-term nature of these instruments.

**Fair Value Hierarchy**

The fair value hierarchy of financial assets and liabilities at December 31, 2013 and 2012 are as follows:

| *December 31, 2013 (thousands of dollars)* | Carrying Value | Fair Value | Level 1 | Level 2 | Level 3 |
|---|---|---|---|---|---|
| **Liabilities:** | | | | | |
| Inter-company demand facility | 18,031 | 18,031 | 18,031 | – | – |
| Long-term debt | 23,000 | 25,450 | – | 25,450 | – |
| | 41,031 | 43,481 | 18,031 | 25,450 | – |

| *December 31, 2012 (thousands of dollars)* | Carrying Value | Fair Value | Level 1 | Level 2 | Level 3 |
|---|---|---|---|---|---|
| **Liabilities:** | | | | | |
| Inter-company demand facility | 11,212 | 11,212 | 11,212 | – | – |
| Long-term debt | 23,000 | 28,486 | – | 28,486 | – |
| | 34,212 | 39,698 | 11,212 | 28,486 | – |

The fair value of the long-term debt is based on unadjusted period-end market prices for the same or similar debt of the same remaining maturities.

There were no significant transfers between any of the levels during the years ended December 31, 2013 and 2012.

**Risk Management**

Exposure to market risk, credit risk and liquidity risk arises in the normal course of the Company's business.

***Market Risk***

Market risk refers primarily to the risk of loss that results from changes in commodity prices, foreign exchange rates and interest rates. The Company does not have commodity risk. The foreign exchange risk is currently not significant, although Hydro One could in the future decide to issue and allocate foreign currency-denominated debt to the Company, along with an allocation of the resulting foreign exchange gains and losses. The Company is exposed to fluctuations in interest rates related

to the interest charges passed on by Hydro One on the outstanding inter-company demand facility. The Company is charged interest on overdraft inter-company balances based on the bankers' acceptance rate, plus 0.15%.

*Credit Risk*

Financial assets create a risk that a counterparty will fail to discharge an obligation, causing a financial loss. At December 31, 2013 and 2012, there were no significant concentrations of credit risk with respect to any class of financial assets. The Company's revenue is earned from a broad base of customers. As a result, Hydro One Remote Communities did not earn a significant amount of revenue from any individual customer. At December 31, 2013 and 2012, there was no significant accounts receivable balance due from any single customer.

At December 31, 2013, the Company's total provision for bad debts was $296 thousand (2012 – $302 thousand). Adjustments and write-offs are determined on the basis of a review of overdue accounts, taking into consideration historical experience. At December 31, 2013, approximately 47% of the Company's current accounts receivable were aged more than 60 days (2012 – 34%). Sufficient allowances have been recorded to reflect the risk of potential credit losses.

*Liquidity Risk*

Liquidity risk refers to the Company's ability to meet its financial obligations as they come due. Hydro One Remote Communities meets its short-term liquidity requirements through the inter-company demand facility with Hydro One and funds from operations. The short-term liquidity available to the Company should be sufficient to fund normal operating requirements.

At December 31, 2013, accounts payable and accrued liabilities in the amount of $5,657 thousand (2012 – $6,863 thousand) are expected to be settled in cash at their carrying amounts within the next year.

At December 31, 2013, Hydro One Remote Communities had long-term debt in the principal l amount of $23,000 thousand (2012 – $23,000 thousand). No long-term debt matures during the next year. Interest payments for the next 12 months on the Company's outstanding long-term debt amount to $1,237 thousand (2012 – $1,237 thousand). Principal repayments and interest payments are summarized by the number of years to maturity in the following table.

| Years to Maturity | Principal Outstanding on Long-term Debt *(thousands of dollars)* | Interest Payments *(thousands of dollars)* |
|---|---|---|
| 1 year | – | 1,237 |
| 2 years | – | 1,237 |
| 3 years | – | 1,237 |
| 4 years | – | 1,237 |
| 5 years | – | 1,237 |
| | – | 6,185 |
| 6 – 10 years | – | 6,185 |
| Over 10 years | 23,000 | 15,468 |
| | 23,000 | 27,838 |

## 12. PENSION AND POST-RETIREMENT AND POST-EMPLOYMENT BENEFITS

Hydro One has a defined benefit pension plan, a supplementary pension plan, and post-retirement and post-employment benefit plans. The defined benefit pension plan (Pension Plan) is contributory and covers all regular employees of Hydro One and its subsidiaries, except Hydro One Brampton Networks. The supplementary pension plan provides members of the Pension Plan with benefits that would have been earned and payable under the Pension Plan but for the limitations imposed by the *Income Tax Act* (Canada). The supplementary pension plan obligation is included with other post-retirement and post-employment benefit obligations on the Balance Sheets.

**Pension Benefits**

The Pension Plan provides benefits based on highest three-year average pensionable earnings. For new management employees who commenced employment on or after January 1, 2004, and for new Society of Energy Professionals represented staff hired after November 17, 2005, benefits are based on highest five-year average pensionable earnings. After retirement, pensions are indexed to inflation.

Company and employees' contributions to the Pension Plan are based on actuarial valuations performed at least every three years. Hydro One's annual Pension Plan contributions for 2013 of $160 million (2012 – $163 million) were based on an actuarial valuation effective December 31, 2011 and the level of 2013 pensionable earnings. Hydro One's estimated annual Pension Plan contributions for 2014 are approximately $160 million, based on the December 31, 2011 valuation and the projected level of pensionable earnings.

At December 31, 2013, based on the December 31, 2011 actuarial valuation, the present value of Hydro One's projected pension benefit obligation was estimated to be $6,576 million (2012 – $6,507 million). The fair value of pension plan assets available for these benefits was $5,731 million (2012 – $4,992 million).

**Post-Retirement and Post-Employment Benefits**

During the year ended December 31, 2013, Hydro One Remote Communities charged $775 thousand (2012 – $537 thousand) of post-retirement and post-employment benefit costs to results of operations, and capitalized $250 thousand (2012 – $223 thousand) as part of the cost of property, plant and equipment. Benefits paid by the Company in 2013 were $264 thousand (2012 – $259 thousand). In addition, the associated post-retirement and post-employment benefits regulatory asset was decreased by $205 thousand (2012 – increased by $1,941 thousand) and recorded on the Company's Balance Sheets to reflect the expected regulatory inclusion of this amount in future rates, which would otherwise be recorded in OCI.

The Company presents its post-retirement and post-employment benefit liability on the Balance Sheets within the following line items:

| *December 31 (thousands of dollars)* | **2013** | **2012** |
|---|---|---|
| Accrued liabilities | 300 | 300 |
| Post-retirement and post-employment benefit liability | 12,088 | 11,532 |
| | 12,388 | 11,832 |

## 13. ENVIRONMENTAL LIABILITIES

The Company has accrued the following discounted amounts for environmental liabilities on the Balance Sheets at December 31, 2013 and 2012:

| *December 31 (thousands of dollars)* | **2013** | **2012** |
|---|---|---|
| Environmental liabilities, January 1 | 11,880 | 14,579 |
| Interest accretion | 330 | 399 |
| Expenditures | (1,656) | (2,515) |
| Revaluation adjustment | 2,872 | (583) |
| Environmental liabilities, December 31 | 13,426 | 11,880 |
| Less: current portion | 2,427 | 1,823 |
| | 10,999 | 10,057 |

The following table illustrates the reconciliation between the undiscounted basis of the environmental liabilities and the amount recognized on the Balance Sheets after factoring in the discount rate:

| *December 31 (thousands of dollars)* | **2013** | **2012** |
|---|---|---|
| Undiscounted environmental liabilities, December 31 | 14,014 | 12,503 |
| Less: discounting accumulated liabilities to present value | 588 | 623 |
| Discounted environmental liabilities, December 31 | 13,426 | 11,880 |

Estimated future environmental expenditures for each of the five years subsequent to December 31, 2013 and in total thereafter are as follows: 2014 – $2,427 thousand; 2015 – $2,175 thousand; 2016 – $2,844 thousand; 2017 – $1,261 thousand; 2018 – $1,651 thousand; and thereafter – $3,653 thousand. These expenditures are expected to be incurred over the period from 2014 to 2020.

There are uncertainties in estimating future environmental costs due to potential external events such as changes in legislation or regulations and advances in remediation technologies. All factors used in estimating the Company's environmental liabilities represent management's best estimates of the present value of the cost required to meet existing legislation or regulations. However, it is reasonably possible that numbers or volumes of contaminated assets, cost estimates to perform work, inflation assumptions and the assumed pattern of annual cash flows may differ significantly from the Company's current assumptions. Estimated environmental liabilities are reviewed annually or more frequently if significant changes in regulation or other relevant factors occur. Estimate changes are accounted for prospectively. The Company records a regulatory asset reflecting its expectation that future environmental costs will be recoverable in rates.

In determining the amounts to be recorded as environmental liabilities, the Company estimates the current cost of completing required work and makes assumptions as to when the future expenditures will actually be incurred, in order to generate future cash flow information. A long-term inflation assumption of approximately 2% has been used to express these current cost estimates as estimated future expenditures. Future environmental expenditures have been discounted using factors ranging from 3.57% to 4.87%, depending on the appropriate rate for the period when increases in the obligations were first recorded.

As a result of its annual review of the environmental liabilities, the Company recorded a revaluation adjustment to increase the LAR environmental liability by $2,872 thousand (2012 – decrease by $583 thousand).

## 14. SHARE CAPITAL

### Common Shares

The Company has 2 issued and outstanding common shares. The Company is authorized to issue an unlimited number of common shares.

### Dividends

The Company has no retained earnings and does not pay dividends under its breakeven business model.

## 15. RELATED PARTY TRANSACTIONS

Hydro One Remote Communities is a subsidiary of Hydro One, and Hydro One is owned by the Province. The OEFC, IESO, Ontario Power Authority (OPA), Ontario Power Generation Inc. (OPG) and the OEB are related parties to Hydro One Remote Communities because they are controlled or significantly influenced by the Province. Transactions between these parties and Hydro One Remote Communities are described below.

Hydro One Remote Communities receives amounts for RRRP from the IESO. RRRP amounts received for the year ended December 31, 2013 were $33,046 thousand (2012 – $27,549 thousand). Consistent with its breakeven business model, the Company recognized $34,245 thousand as RRRP revenue in 2013 (2012 – $31,506 thousand). This 2013 revenue exceeded

amounts received by $1,199 thousand (2012 – $3,957 thousand) and the RRPR variance account balance was adjusted by this amount.

The recovery of PILs was received or receivable from the OEFC.

The amounts due to and from related parties as a result of the transactions referred to above are as follows:

| *December 31 (thousands of dollars)* | 2013 | 2012 |
|---|---|---|
| Accounts receivable | 97 | 88 |
| Income tax receivable | 2,697 | 1,589 |

Transactions with related parties occur at normal market prices or at a proxy for fair value based on the requirements of the OEB's Affiliate Relationships Code. Outstanding balances at period end are interest free and settled in cash.

**Hydro One and Subsidiaries**

The Company provides services to, and receives services from, Hydro One and its other subsidiaries. Amounts due to and from Hydro One and its other subsidiaries are settled through the inter-company demand facility.

The Company has entered into various agreements with Hydro One and its other subsidiaries related to the provision of corporate functions and services, such as legal, financial and human resources services, and operational services, such as environmental, forestry, and line services. 2013 revenues include $195 thousand (2012 – $130 thousand) related to the provision of services to Hydro One and its other subsidiaries. 2013 operation, maintenance and administration costs include $3,475 thousand (2012 – $2,607 thousand) related to the purchase of services from Hydro One and its other subsidiaries.

The Company's long-term debt is due to Hydro One. In addition, balances payable or receivable under the inter-company demand facility are due to or from Hydro One and its other subsidiaries. Financing charges include interest expense on the long-term debt in the amount of $1,237 thousand (2012 – $1,237 thousand), and interest expense on the inter-company demand facility in the amount of $216 thousand (2012 – $83 thousand). At December 31, 2013, the Company had accrued interest payable to Hydro One totaling $142 thousand (2012 – $142 thousand).

## 16. STATEMENTS OF CASH FLOWS

The changes in non-cash balances related to operations consist of the following:

| *Year ended December 31 (thousands of dollars)* | 2013 | 2012 |
|---|---|---|
| Accounts receivable | (802) | (258) |
| Materials and supplies | 443 | 638 |
| Income taxes receivable | (1,108) | (1,426) |
| Long-term accounts receivable | (256) | (49) |
| Accounts payable | (284) | (443) |
| Accrued liabilities | (1,526) | 91 |
| Post-retirement and post-employment benefit liability | 760 | 500 |
| | (2,773) | (947) |
| **Supplementary information:** | | |
| Net interest paid | 1,453 | 1,320 |

As a result of using the cost recovery model applied to achieve after tax breakeven net income, any PILs paid are fully recovered.

## 17. CONTINGENCIES

### Legal Proceedings

Hydro One Remote Communities is involved in various lawsuits, claims and regulatory proceedings in the normal course of business. In the opinion of management, the outcome of such matters will not have a material adverse effect on the Company's financial position, results of operations or cash flows.

### Transfer of Assets

The transfer orders by which the Company acquired Ontario Hydro's remote communities business on April 1, 1999 did not transfer title to some assets located on lands held for First Nation bands under the *Indian Act* (Canada). Currently, OEFC holds legal title to these assets and the Company manages them until the Company has obtained necessary authorizations to complete the title transfer. To occupy reserve land, the Company must have valid permits issued by Her Majesty the Queen in the Right of Canada. For each permit, the Company must negotiate an agreement (in the form of a Memorandum of Understanding) with the band, OEFC and any First Nation individuals who have occupancy rights. The agreement includes provisions whereby the First Nation band consents to the federal Department of Aboriginal Affairs and Northern Development issuing a permit. It is difficult to predict the aggregate amount that the Company may have to pay, either on an annual or one-time basis, to obtain the required agreements from the First Nation bands. In 2013, the Company paid approximately $2 million (2012 – $1 million) in respect of these consents. OEFC will continue to hold these assets until the Company is able to negotiate agreements with the First Nation bands and occupants. If the Company cannot reach satisfactory agreements and obtain federal permits, the Company may have to relocate these assets from the reserve lands to other locations at a cost that could be substantial. In a limited number of cases, it may be necessary to abandon a line and replace it with diesel generation facilities. The costs relating to these assets could have a material adverse effect on the Company's net income if the Company is not able to recover them in future rate orders.

## 18. COMMITMENTS

### Operating Lease

Hydro One Remote Communities is committed as lessee to an operating lease agreement for use of reserve land to operate a hydro facility for a period of 10 years.

At December 31, 2013, the future minimum lease payments under this operating lease are as follows:

| *Year ended December 31 (thousands of dollars)* | **2013** |
|---|---|
| Within one year | 120 |
| After one year but not more than five years | 510 |
| More than five years | 600 |
| | 1,230 |

During the year ended December 31, 2013, the Company made upfront lease payments totalling $1 million which is being amortized based over the contractual term of the lease.

**Schedule 141**

# Notes checklist

| Corporation's name | Business number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- Parts 1, 2, and 3 of this schedule must be completed from the perspective of the person (referred to in these parts as the **accountant**) who prepared or reported on the financial statements. If the person preparing the tax return is not the accountant referred to above, they must still complete Parts 1, 2, 3, and 4, as applicable.
- For more information, see Guide RC4088, *General Index of Financial Information (GIFI)* and Guide T4012, *T2 Corporation – Income Tax Guide.*
- Complete this schedule and include it with your T2 return along with the other GIFI schedules.

## Part 1 – Information on the accountant who prepared or reported on the financial statements

Does the accountant have a professional designation? .......... **095** 1 Yes [X] 2 No [ ]

Is the accountant connected* with the corporation? .......... **097** 1 Yes [ ] 2 No [X]

* A person connected with a corporation can be: (i) a shareholder of the corporation who owns more than 10% of the common shares; (ii) a director, an officer, or an employee of the corporation; or (iii) a person not dealing at arm's length with the corporation.

**Note**

If the accountant does not have a professional designation **or** is connected to the corporation, you do not have to complete Parts 2 and 3 of this schedule. However, you **do have** to complete Part 4, as applicable.

## Part 2 – Type of involvement with the financial statements

Choose the option that represents the highest level of involvement of the accountant: .......... **198**

Completed an auditor's report .......... 1 [X]

Completed a review engagement report .......... 2 [ ]

Conducted a compilation engagement .......... 3 [ ]

## Part 3 – Reservations

If you selected option **1** or **2** under **Type of involvement with the financial statements** above, answer the following question:

Has the accountant expressed a reservation? .......... **099** 1 Yes [ ] 2 No [X]

## Part 4 – Other information

If you have a professional designation and are not the accountant associated with the financial statements in Part 1 above, choose one of the following options: .......... **110**

Prepared the tax return (financial statements prepared by client) .......... 1 [X]

Prepared the tax return and the financial information contained therein (financial statements have not been prepared) .......... 2 [ ]

Were notes to the financial statements prepared? .......... **101** 1 Yes [X] 2 No [ ]

If **yes**, complete lines 104 to 107 below:

Are subsequent events mentioned in the notes? .......... **104** 1 Yes [ ] 2 No [X]

Is re-evaluation of asset information mentioned in the notes? .......... **105** 1 Yes [ ] 2 No [X]

Is contingent liability information mentioned in the notes? .......... **106** 1 Yes [X] 2 No [ ]

Is information regarding commitments mentioned in the notes? .......... **107** 1 Yes [X] 2 No [ ]

Does the corporation have investments in joint venture(s) or partnership(s)? .......... **108** 1 Yes [ ] 2 No [X]

## Part 4 – Other information (continued)

**Impairment and fair value changes**

In any of the following assets, was an amount recognized in net income or other comprehensive income (OCI) as a result of an impairment loss in the tax year, a reversal of an impairment loss recognized in a previous tax year, or a change in fair value during the tax year? . . . . 200 1 Yes [ ] 2 No [X]

If **yes**, enter the amount recognized:

| | | **In net income** Increase (decrease) | | **In OCI** Increase (decrease) |
|---|---|---|---|---|
| Property, plant, and equipment | 210 | | 211 | |
| Intangible assets | 215 | | 216 | |
| Investment property | 220 | | | |
| Biological assets | 225 | | | |
| Financial instruments | 230 | | 231 | |
| Other | 235 | | 236 | |

**Financial instruments**

Did the corporation derecognize any financial instrument(s) during the tax year (other than trade receivables)? . . . . 250 1 Yes [ ] 2 No [X]

Did the corporation apply hedge accounting during the tax year? . . . . 255 1 Yes [X] 2 No [ ]

Did the corporation discontinue hedge accounting during the tax year? . . . . 260 1 Yes [ ] 2 No [X]

**Adjustments to opening equity**

Was an amount included in the opening balance of retained earnings or equity, in order to correct an error, to recognize a change in accounting policy, or to adopt a new accounting standard in the current tax year? . . . . 265 1 Yes [ ] 2 No [X]

If **yes**, you have to maintain a separate reconciliation.

**SCHEDULE 100**

# Corporation Loss Continuity and Application

| Corporation's name | Business number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- Use this form to determine the continuity and use of available losses; to determine a current-year non-capital loss, farm loss, restricted farm loss, or limited partnership loss; to determine the amount of restricted farm loss and limited partnership loss that can be applied in a year; and to ask for a loss carryback to previous years.
- A corporation can choose whether or not to deduct an available loss from income in a tax year. The corporation can deduct losses in any order. However, for each type of loss, deduct the oldest loss first.
- According to subsection 111(4) of the *Income Tax Act*, when control has been acquired, no amount of capital loss incurred for a tax year ending before that time is deductible in computing taxable income in a tax year ending after that time. Also, no amount of capital loss incurred in a tax year ending after that time is deductible in computing taxable income of a tax year ending before that time.
- When control has been acquired, subsection 111(5) provides for similar treatment of non-capital and farm losses, except as listed in paragraphs 111(5)(a) and (b).
- For information on these losses, see the *T2 Corporation – Income Tax Guide.*
- File one completed copy of this schedule with the T2 return, or send the schedule by itself to the tax centre where the return is filed.
- All legislative references are to the federal *Income Tax Act.*

## Part 1 – Non-capital losses

**Determination of current-year non-capital loss**

| | | | | |
|---|---|---|---|---|
| Net income (loss) for income tax purposes | | | -2,524,507 | A |
| **Deduct:** (increase a loss) | | | | |
| Net capital losses deducted in the year (enter as a positive amount) | | a | | |
| Taxable dividends deductible under section 112 or subsection 113(1) or 138(6) | | b | | |
| Amount of Part VI.1 tax deductible | | c | | |
| Amount deductible as prospector's and grubstaker's shares – Paragraph 110(1)(d.2) | | d | | |
| Subtotal (total of amounts a to d) | | | | B |
| Subtotal (amount A **minus** amount B; if positive, enter "0") | | | -2,524,507 | C |
| **Deduct:** (increase a loss) | | | | |
| Section 110.5 or subparagraph 115(1)(a)(vii) – Addition for foreign tax deductions | | | | D |
| Subtotal (amount C **minus** amount D) | | | -2,524,507 | E |
| **Add:** (decrease a loss) | | | | |
| Current-year farm loss (whichever is less: the net loss from farming or fishing included in the income, or the non-capital loss before deducting the farm loss) | | | | F |
| Current-year non-capital loss (amount E **plus** amount F; if positive, enter "0") | | | -2,524,507 | G |

If amount G is negative, enter it on line 110 as a positive.

**Continuity of non-capital losses and request for a carryback**

| | | | | | |
|---|---|---|---|---|---|
| Non-capital loss at the end of the previous tax year | | | e | | |
| **Deduct:** Non-capital loss expired* | 100 | | f | | |
| Non-capital losses at the beginning of the tax year (amount e **minus** amount f) | 102 | | | | H |
| **Add:** | | | | | |
| Non-capital losses transferred on an amalgamation or the wind-up of a subsidiary corporation | 105 | | g | | |
| Current-year non-capital loss (from amount G) | 110 | 2,524,507 | h | | |
| Subtotal (amount g **plus** amount h) | | 2,524,507 | | 2,524,507 | I |
| Subtotal (amount H **plus** amount I) | | | | 2,524,507 | J |

* A non-capital loss expires as follows:
- after **7** tax years if it arose in a tax year ending before March 23, 2004;
- after **10** tax years if it arose in a tax year ending after March 22, 2004, and before 2006; and
- after **20** tax years if it arose in a tax year ending after 2005.

An allowable business investment loss becomes a net capital loss as follows:
- after **7** tax years if it arose in a tax year ending before March 23, 2004; and
- after **10** tax years if it arose in a tax year ending after March 22, 2004.

## Part 1 – Non-capital losses (continued)

**Deduct:**

| | | | | | |
|---|---|---|---|---|---|
| Other adjustments (includes adjustments for an acquisition of control) | 150 | | i | | |
| Section 80 – Adjustments for forgiven amounts | 140 | | j | | |
| Subsection 111(10) – Adjustments for fuel tax rebate | | | j.1 | | |
| Non-capital losses of previous tax years applied in the current tax year<br>Enter amount k on line 331 of the T2 return. | 130 | | k | | |
| Current and previous year non-capital losses applied against current-year taxable dividends subject to Part IV tax** | 135 | | l | | |
| Subtotal (total of amounts i to l) | | | | | K |
| Non-capital losses before any request for a carryback (amount J **minus** amount K) | | | | 2,524,507 | L |

**Deduct – Request to carry back non-capital loss to:**

| | | | | | |
|---|---|---|---|---|---|
| First previous tax year to reduce taxable income | 901 | | m | | |
| Second previous tax year to reduce taxable income | 902 | | n | | |
| Third previous tax year to reduce taxable income | 903 | 2,435,715 | o | | |
| First previous tax year to reduce taxable dividends subject to Part IV tax | 911 | | p | | |
| Second previous tax year to reduce taxable dividends subject to Part IV tax | 912 | | q | | |
| Third previous tax year to reduce taxable dividends subject to Part IV tax | 913 | | r | | |
| Total of requests to carry back non-capital losses to previous tax years (total of amounts m to r) | | 2,435,715 | | 2,435,715 | M |
| Closing balance of non-capital losses to be carried forward to future tax years (amount L **minus** amount M) | 180 | | | 88,792 | N |

** Amount l is the total of lines 330 and 335 from Schedule 3, *Dividends Received, Taxable Dividends Paid, and Part IV Tax Calculation.*

## Part 2 – Capital losses

**Continuity of capital losses and request for a carryback**

| | | | | | |
|---|---|---|---|---|---|
| Capital losses at the end of the previous tax year | 200 | | a | | |
| Capital losses transferred on the amalgamation or the wind-up of a subsidiary corporation | 205 | | b | | |
| Subtotal (amount a **plus** amount b) | | | | | A |
| **Deduct:** | | | | | |
| Other adjustments (includes adjustments for an acquisition of control) | 250 | | c | | |
| Section 80 – Adjustments for forgiven amounts | 240 | | d | | |
| Subtotal (amount c **plus** amount d) | | | | | B |
| Subtotal (amount A **minus** amount B) | | | | | C |
| **Add:** Current-year capital loss (from the calculation on Schedule 6, *Summary of Dispositions of Capital Property*) | 210 | | | | D |
| Unused non-capital losses that expired in the tax year* | | | e | | |
| Allowable business investment losses (ABIL) that expired as non-capital losses in the tax year** | | | f | | |
| Enter amount e or f, whichever is less | 215 | | | | |
| ABILs expired as non-capital loss: line 215 **divided** by 0.500000 | 220 | | | | E |
| Subtotal (total of amounts C to E) | | | | | F |

**Note**

If there has been an amalgamation or a windup of a subsidiary, do a separate calculation of the ABIL expired as non-capital loss for each predecessor or subsidiary. Add all these amounts and enter the total on line 220 above.

* If the losses were incurred in a tax year ending before March 23, 2004, enter the losses from the 8th previous tax year. If the losses were incurred in a tax year ending after March 22, 2004, and before 2006, enter the losses from the 11th previous tax year. Enter the losses from the 21st previous tax year if the losses were incurred in a tax year ending after 2005. Enter the part that was not used in previous years and the current year on line e.

** If the losses were incurred in a tax year ending before March 23, 2004, enter the losses from the 8th previous tax year. If the losses were incurred in a tax year ending after March 22, 2004, enter the losses from the 11th previous tax year. Enter the full amount on line f.

## Part 2 – Capital losses (continued)

**Deduct:** Capital losses from previous tax years applied against the current-year net capital gain*** . . . . . . . . . . . . . . . . . . **225** ______ G

Capital losses before any request for a carryback (amount F **minus** amount G) ______ H

**Deduct – Request to carry back capital loss to******:

| | Capital gain (100%) | | Amount carried back (100%) | | | |
|---|---|---|---|---|---|---|
| First previous tax year | | 951 | | g | | |
| Second previous tax year | | 952 | | h | | |
| Third previous tax year | | 953 | | i | | |
| | Subtotal (total of amounts g to i) | | | ▶ | | I |

Closing balance of capital losses to be carried forward to future tax years (amount H **minus** amount I) **280** ______ J

*** To get the net capital losses required to reduce the taxable capital gain included in the net income (loss) for the purpose of current-year tax, enter the amount from line 225 **multiplied** by 50% on line 332 of the T2 return.

**** On line 225, 951, 952, or 953, whichever applies, enter the actual amount of the loss. When the loss is applied, **multiply** this amount by the 50% inclusion rate.

## Part 3 – Farm losses

**Continuity of farm losses and request for a carryback**

| | | | | | |
|---|---|---|---|---|---|
| Farm losses at the end of the previous tax year | | | a | | |
| **Deduct:** Farm loss expired* | 300 | | b | | |
| Farm losses at the beginning of the tax year (amount a **minus** amount b) | 302 | | ▶ | | A |
| **Add:** | | | | | |
| Farm losses transferred on the amalgamation or the windup of a subsidiary corporation | 305 | | c | | |
| Current-year farm loss (amount F in Part 1) | 310 | | d | | |
| Subtotal (amount c **plus** amount d) | | | ▶ | | B |
| Subtotal (amount A **plus** amount B) | | | | | C |
| **Deduct:** | | | | | |
| Other adjustments (includes adjustments for an acquisition of control) | 350 | | e | | |
| Section 80 – Adjustments for forgiven amounts | 340 | | f | | |
| Farm losses of previous tax years applied in the current tax year<br>Enter amount g on line 334 of the T2 return. | 330 | | g | | |
| Current and previous year farm losses applied against current-year taxable dividends subject to Part IV tax** | 335 | | h | | |
| Subtotal (total of amounts e to h) | | | ▶ | | D |
| Farm losses before any request for a carryback (amount C **minus** amount D) | | | | | E |
| **Deduct – Request to carry back farm loss to:** | | | | | |
| First previous tax year to reduce taxable income | 921 | | i | | |
| Second previous tax year to reduce taxable income | 922 | | j | | |
| Third previous tax year to reduce taxable income | 923 | | k | | |
| First previous tax year to reduce taxable dividends subject to Part IV tax | 931 | | l | | |
| Second previous tax year to reduce taxable dividends subject to Part IV tax | 932 | | m | | |
| Third previous tax year to reduce taxable dividends subject to Part IV tax | 933 | | n | | |
| Subtotal (total of amounts i to n) | | | ▶ | | F |
| Closing balance of farm losses to be carried forward to future tax years (amount E **minus** amount F) | | | | 380 | G |

* A farm loss expires as follows:
- after **10** tax years if it arose in a tax year ending before 2006; and
- after **20** tax years if it arose in a tax year ending after 2005.

** Amount h is the total of lines 340 and 345 from Schedule 3.

## Part 4 – Restricted farm losses

**Current-year restricted farm loss**

| | | | | |
|---|---|---|---|---|
| Total losses for the year from farming business | 485 | | | A |
| **Minus** the deductible farm loss: | | | | |
| (amount A above ______ – $2,500) **divided** by 2 = ______ a | | | | |
| Amount a or $ 15,000 *, whichever is less | | | b | |
| | | 2,500 | c | |
| Subtotal (amount b **plus** amount c) | | 2,500 | | 2,500 B |
| Current-year restricted farm loss (amount A **minus** amount B) | | | | C |

**Continuity of restricted farm losses and request for a carryback**

| | | | | |
|---|---|---|---|---|
| Restricted farm losses at the end of the previous tax year | | | d | |
| **Deduct:** Restricted farm loss expired** | 400 | | e | |
| Restricted farm losses at the beginning of the tax year (amount d **minus** amount e) | 402 | | | D |
| **Add:** | | | | |
| Restricted farm losses transferred on the amalgamation or the wind-up of a subsidiary corporation | 405 | | f | |
| Current-year restricted farm loss (from amount C) | 410 | | g | |
| Enter amount g on line 233 of Schedule 1, *Net Income (Loss) for Income Tax Purposes.* | | | | |
| Subtotal (amount f **plus** amount g) | | | | E |
| Subtotal (amount D **plus** amount E) | | | | F |
| **Deduct:** | | | | |
| Restricted farm losses from previous tax years applied against current farming income | 430 | | h | |
| Enter amount h on line 333 of the T2 return. | | | | |
| Section 80 – Adjustments for forgiven amounts | 440 | | i | |
| Other adjustments | 450 | | j | |
| Subtotal (total of amounts h to j) | | | | G |
| Restricted farm losses before any request for a carryback (amount F **minus** amount G) | | | | H |
| **Deduct – Request to carry back restricted farm loss to:** | | | | |
| First previous tax year to reduce farming income | 941 | | k | |
| Second previous tax year to reduce farming income | 942 | | l | |
| Third previous tax year to reduce farming income | 943 | | m | |
| Subtotal (total of amounts k to m) | | | | I |
| Closing balance of restricted farm losses to be carried forward to future tax years (amount H **minus** amount I) | 480 | | | J |

**Note**

The total losses for the year from all farming businesses are calculated without including scientific research expenses.

* For tax years that end before March 21, 2013, use $6,250 instead of $15,000.

** A restricted farm loss expires as follows:
- after **10** tax years if it arose in a tax year ending before 2006; and
- after **20** tax years if it arose in a tax year ending after 2005.

## Part 5 – Listed personal property losses

**Continuity of listed personal property loss and request for a carryback**

| | | | | |
|---|---|---|---|---|
| Listed personal property losses at the end of the previous tax year | | a | | |
| **Deduct:** Listed personal property loss expired after seven tax years | 500 | b | | |
| Listed personal property losses at the beginning of the tax year (amount a **minus** amount b) | 502 | ▶ | | A |
| **Add:** Current-year listed personal property loss (from Schedule 6) | | | 510 | B |
| Subtotal (amount A **plus** amount B) | | | | C |
| **Deduct:** | | | | |
| Previous year personal property losses applied in the current tax year against listed personal property gains | 530 | c | | |
| Enter amount c on line 655 of Schedule 6. | | | | |
| Other adjustments | 550 | d | | |
| Subtotal (amount c **plus** amount d) | | ▶ | | D |
| Listed personal property losses remaining before any request for a carryback (amount C **minus** amount D) | | | | E |
| **Deduct – Request to carry back listed personal property loss to:** | | | | |
| First previous tax year to reduce listed personal property gains | 961 | e | | |
| Second previous tax year to reduce listed personal property gains | 962 | f | | |
| Third previous tax year to reduce listed personal property gains | 963 | g | | |
| Subtotal (total of amounts e to g) | | ▶ | | F |
| Closing balance of listed personal property losses to be carried forward to future tax years (amount E **minus** amount F) | | | 580 | G |

## Part 7 – Limited partnership losses

### Current-year limited partnership losses

| 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|---|---|---|---|---|---|---|
| Partnership identifier 600 | Tax year ending YYYY/MM/DD 602 | Corporation's share of limited partnership loss 604 | Corporation's at-risk amount 606 | Total of corporation's share of partnership investment tax credit, farming losses, and resource expenses 608 | Column 4 **minus** column 5 (if negative, enter "0") | Current-year limited partnership losses (column 3 **minus** 6) 620 |
| | | | | | | |
| | | | | | **Total** (enter this amount on line 222 of Schedule 1) | |

### Limited partnership losses from previous tax years that may be applied in the current year

| 8 | 9 | 10 | 11 | 12 | 13 | 14 |
|---|---|---|---|---|---|---|
| Partnership identifier 630 | Tax year ending YYYY/MM/DD 632 | Limited partnership losses at the end of the previous tax year 634 | Corporation's at-risk amount 636 | Total of corporation's share of partnership investment tax credit, business or property losses, and resource expenses 638 | Column 11 **minus** column 12 (if negative, enter "0") | Limited partnership losses that may be applied in the year (the lesser of columns 10 and 13) 650 |
| | | | | | | |

### Continuity of limited partnership losses that can be carried forward to future tax years

| 15 | 16 | 17 | 18 | 19 | 20 |
|---|---|---|---|---|---|
| Partnership identifier 660 | Limited partnership losses at the end of the previous tax year 662 | Limited partnership losses transferred on an amalgamation or the windup of a subsidiary 664 | Current-year limited partnership losses (from column 7) 670 | Limited partnership losses applied in the current year (cannot be more than column 14) 675 | Current year limited partnership losses closing balance to be carried forward to future years (column 16 **plus** column 17 **plus** column 18 **minus** column 19) 680 |
| | | | | | |
| | | | **Total** (enter this amount on line 335 of the T2 return) | | |

**Note**

If you have any current–or previous–year losses, enter your partnership identifier on line 600, 630, or 660.

## Part 8 – Election under paragraph 88(1.1)(f)

If you are making an election under paragraph 88(1.1)(f), check the box . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 190 Yes ☐

Further to a winding-up of a subsidiary, the portion of a non-capital loss, restricted farm loss, farm loss, or limited partnership loss from a wholly-owned subsidiary is deemed to be the loss of a parent from its tax year starting after the commencement of the winding-up.

**Note**

This election applies only for wind-ups under subsection 88(1) that are reported on Schedule 24, *First-Time Filer after Incorporation, Amalgamation, or Winding-up of a Subsidiary into a Parent*, and the deemed provision is only for tax years that begin after the start of the wind-up.

# Non-Capital Loss Continuity Workchart

## Part 6 – Analysis of balance of losses by year of origin

### Non-capital losses – losses that can be carried forward over 20 years

| Year of origin | Balance at beginning of year | Loss incurred in current year | Adjustments and transfers | Loss carried back Parts I & IV | Applied to reduce | | Balance at end of year |
|---|---|---|---|---|---|---|---|
| | | | | | Taxable income | Part IV tax | |
| Current | N/A | 2,524,507 | | 2,435,715 | N/A | | 88,792 |
| 1st preceding taxation year 2012-12-31 | | N/A | | N/A | | | |
| 2nd preceding taxation year 2011-12-31 | | N/A | | N/A | | | |
| 3rd preceding taxation year 2010-12-31 | | N/A | | N/A | | | |

**Schedule 5**

# TAX CALCULATION SUPPLEMENTARY – CORPORATIONS

| Corporation's name | Business Number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- Use this schedule if, during the tax year, the corporation:
  - had a permanent establishment in more than one jurisdiction (corporations that have no taxable income should only complete columns A, B and D in Part 1);
  - is claiming provincial or territorial tax credits or rebates (see Part 2); or
  - has to pay taxes, other than income tax, for Newfoundland and Labrador, or Ontario (see Part 2).
- Regulations mentioned in this schedule are from the *Income Tax Regulations*.
- For more information, see the *T2 Corporation – Income Tax Guide*.
- Enter the regulation number in field 100 of Part 1.

## Part 1 – Allocation of taxable income

**100** ______________________ Enter the Regulation that applies (402 to 413).

| A<br>Jurisdiction<br>Tick yes if the corporation had a permanent establishment in the jurisdiction during the tax year. * | | B<br>Total salaries and wages paid in jurisdiction | C<br>(B x taxable income**) / G | D<br>Gross revenue | E<br>(D x taxable income**) / H | F<br>Allocation of taxable income (C + E) x 1/2***<br>(where either G or H is nil, do not multiply by 1/2) |
|---|---|---|---|---|---|---|
| Newfoundland and Labrador | 003 1 Yes ☐ | 103 | | 143 | | |
| Newfoundland and Labrador offshore | 004 1 Yes ☐ | 104 | | 144 | | |
| Prince Edward Island | 005 1 Yes ☐ | 105 | | 145 | | |
| Nova Scotia | 007 1 Yes ☐ | 107 | | 147 | | |
| Nova Scotia offshore | 008 1 Yes ☐ | 108 | | 148 | | |
| New Brunswick | 009 1 Yes ☐ | 109 | | 149 | | |
| Quebec | 011 1 Yes ☐ | 111 | | 151 | | |
| Ontario | 013 1 Yes ☐ | 113 | | 153 | | |
| Manitoba | 015 1 Yes ☐ | 115 | | 155 | | |
| Saskatchewan | 017 1 Yes ☐ | 117 | | 157 | | |
| Alberta | 019 1 Yes ☐ | 119 | | 159 | | |
| British Columbia | 021 1 Yes ☐ | 121 | | 161 | | |
| Yukon | 023 1 Yes ☐ | 123 | | 163 | | |
| Northwest Territories | 025 1 Yes ☐ | 125 | | 165 | | |
| Nunavut | 026 1 Yes ☐ | 126 | | 166 | | |
| Outside Canada | 027 1 Yes ☐ | 127 | | 167 | | |
| **Total** | | 129 G | | 169 H | | |

* "Permanent establishment" is defined in Regulation 400(2).

** If the corporation has income or loss from an international banking centre: the taxable income is the amount on line 360 or line Z of the T2 return **plus** the total amount not required to be included, or **minus** the total amount not allowed to be deducted, in calculating the corporation's income under section 33.1 of the federal *Income Tax Act*. This does not apply to tax years starting after March 20, 2013.

*** For corporations other than those described under Regulation 402, use the appropriate calculation described in the Regulations to allocate taxable income.

**Notes:**
1. After determining the allocation of taxable income, you have to calculate the corporation's provincial or territorial tax payable. For more information on how to calculate the tax for each province or territory, see the instructions for Schedule 5 in the *T2 Corporation – Income Tax Guide*.
2. If the corporation has provincial or territorial tax payable, complete Part 2.

## Part 2 – Ontario tax payable, tax credits, and rebates

| Total taxable income | Income eligible for small business deduction | Provincial or territorial allocation of taxable income | Provincial or territorial tax payable before credits |
|---|---|---|---|
| | | | |

| | | | | |
|---|---|---|---|---|
| **Ontario basic income tax** (from Schedule 500) | 270 | | | |
| **Deduct:** Ontario small business deduction (from Schedule 500) | 402 | | | |
| Subtotal | | | ▶ | A6 |
| **Add:** | | | | |
| Ontario additional tax re Crown royalties (from Schedule 504) | 274 | | | |
| Ontario transitional tax debits (from Schedule 506) | 276 | | | |
| Recapture of Ontario research and development tax credit (from Schedule 508) | 277 | | | |
| Subtotal | | | ▶ | B6 |
| Subtotal (amount A6 **plus** amount B6) | | | | C6 |
| **Deduct:** | | | | |
| Ontario resource tax credit (from Schedule 504) | 404 | | | |
| Ontario tax credit for manufacturing and processing (from Schedule 502) | 406 | | | |
| Ontario foreign tax credit (from Schedule 21) | 408 | | | |
| Ontario credit union tax reduction (from Schedule 500) | 410 | | | |
| Ontario transitional tax credits (from Schedule 506) | 414 | | | |
| Ontario political contributions tax credit (from Schedule 525) | 415 | | | |
| Ontario tax credit for the purchase of vehicles that use natural gas as a fuel | | | | |
| Subtotal | | | ▶ | D6 |
| Subtotal (amount C6 **minus** amount D6) (if negative, enter "0") | | | | E6 |
| **Deduct:** Ontario research and development tax credit (from Schedule 508) | | | 416 | |
| Ontario corporate income tax payable before Ontario corporate minimum tax credit (amount E6 **minus** amount on line 416) (if negative, enter "0") | | | | F6 |
| **Deduct:** Ontario corporate minimum tax credit (from Schedule 510) | | | 418 | |
| Ontario corporate income tax payable (amount F6 **minus** amount on line 418) (if negative, enter "0") | | | | G6 |
| **Add:** | | | | |
| Ontario corporate minimum tax (from Schedule 510) | 278 | | | |
| Ontario special additional tax on life insurance corporations (from Schedule 512) | 280 | | | |
| Subtotal | | | ▶ | H6 |
| Total Ontario tax payable before refundable credits (amount G6 **plus** amount H6) | | | | I6 |
| **Deduct:** | | | | |
| Ontario qualifying environmental trust tax credit | 450 | | | |
| Ontario co-operative education tax credit (from Schedule 550) | 452 | 12,000 | | |
| Ontario apprenticeship training tax credit (from Schedule 552) | 454 | 18,604 | | |
| Ontario computer animation and special effects tax credit (from Schedule 554) | 456 | | | |
| Ontario film and television tax credit (from Schedule 556) | 458 | | | |

| 13. | 45 | | 1,225 | | | 0 | | 1,225 | 45 | 0 | 0 | 551 | 674 |
| 14. | 47 | | 2,512,031 | 224,212 | | 14 | 112,099 | 2,624,130 | 8 | 0 | 0 | 209,930 | 2,526,299 |
| 15. | 50 | | 3,083 | | | 0 | | 3,083 | 55 | 0 | 0 | 1,696 | 1,387 |
| | | **Totals** | 35,496,432 | 8,305,011 | | 14 | 4,152,500 | 39,648,929 | | | | 2,826,199 | 40,975,230 |

**Note:** Class numbers followed by a letter indicate the basic rate of the class taking into account the additional deduction allowed.
Class 1a: 4% + 6% = 10% (class 1 to 10%), class 1b: 4% + 2% = 6% (class 1 to 6%).

* Include any property acquired in previous years that has now become available for use. This property would have been previously excluded from column 3. List separately any acquisitions that are not subject to the 50% rule, see Regulation 1100(2) and (2.2).

** Include amounts transferred under section 85, or on amalgamation and winding-up of a subsidiary. See the *T2 Corporation Income Tax Guide* for other examples of adjustments to include in column 4.

*** The net cost of acquisitions is the cost of acquisitions (column 3) **plus** or **minus** certain adjustments from column 4. For exceptions to the 50% rule, see Interpretation Bulletin IT-285, *Capital Cost Allowance – General Comments*.

**** Enter a rate only, if you are using the declining balance method. For any other method (for example the straignt-line method, where calculations are always based on the cost of acquisitions), enter N/A. Then enter the amount you are claiming in column 11.

***** If the tax year is shorter than 365 days, prorate the CCA claim. Some classes of property do not have to be prorated. See the *T2 Corporation Income Tax Guide* for more information.

**SCHEDULE 14**

# MISCELLANEOUS PAYMENTS TO RESIDENTS

| Name of corporation | Business Number | Tax year end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- This schedule must be completed by all corporations who made the following payments to residents of Canada: royalties for which the corporation has not filed a T5 slip; research and development fees; management fees; technical assistance fees; and similar payments.
- Please enter the name and address of the recipient and the amount of the payment in the applicable column. If several payments of the same type (i.e., management fees) were made to the same person, enter the total amount paid. If similar types of payments have been made, but do not fit into any of the categories, enter these amounts in the column entitled "Similar payments".

| | Name of recipient 100 | Address of recipient 200 | Royalties 300 | Research and development fees 400 | Management fees 500 | Technical assistance fees 600 | Similar payments 700 |

# Deferred Income Plans

| Corporation's name | Business number | Tax year end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- Complete the information below if the corporation deducted payments from its income made to a registered pension plan (RPP), a registered supplementary unemployment benefit plan (RSUBP), a deferred profit sharing plan (DPSP), a pooled registered pension plan (PRPP), or an employee profit sharing plan (EPSP).
- If the trust that governs an employee profit sharing plan is **not resident** in Canada, please indicate if the T4PS, *Statement of Employees Profit Sharing Plan Allocations and Payments*, Supplementary slip(s) were filed for the last calendar year, and whether they were filed by the trustee or the employer.

| | Type of plan (see note 1) 100 | Amount of contribution $ (see note 2) 200 | Registration number (RPP, RSUBP, PRPP, and DPSP only) 300 | Name of EPSP trust 400 | Address of EPSP trust 500 | T4PS slip(s) (see note 3) 600 |
|---|---|---|---|---|---|---|
| 1 | 1 | 1,401,481 | 1059104 | | | |

**Note 1**

Enter the applicable code number:

1 – RPP
2 – RSUBP
3 – DPSP
4 – EPSP
5 – PRPP

**Note 2**

You do not need to add to Schedule 1 any payments you made to deferred income plans.
To reconcile such payments, calculate the following amount:

Total of all amounts indicated in column 200 of this schedule . . . . . . . . . . . . . . . . . . . 1,401,481 A

**Less:**

Total of all amounts for deferred income plans deducted in your financial statements . . . . . 1,401,481 B

**Deductible amount for contributions to deferred income plans**
(amount A **minus** amount B) (if negative, enter "0") . . . . . . . . . . . . . . . . . . . . . . . . . C

Enter amount C on line 417 of Schedule 1

**Note 3**

T4PS slip(s) filed by: 1 – Trustee
2 – Employer
(EPSP only)

**SCHEDULE 23**

# AGREEMENT AMONG ASSOCIATED CANADIAN-CONTROLLED PRIVATE CORPORATIONS TO ALLOCATE THE BUSINESS LIMIT

- For use by a Canadian-controlled private corporation (CCPC) to identify all associated corporations and to assign a percentage for each associated corporation. This percentage will be used to allocate the business limit for purposes of the small business deduction. Information from this schedule will also be used to determine the date the balance of tax is due and to calculate the reduction to the business limit.
- An associated CCPC that has more than one tax year ending in a calendar year, is required to file an agreement for each tax year ending in that calendar year.

**Column 1:** Enter the legal name of each of the corporations in the associated group. Include non-CCPCs and CCPCs that have filed an election under subsection 256(2) of the *Income Tax Act* (ITA) not to be associated for purposes of the small business deduction.

**Column 2:** Provide the Business Number for each corporation (if a corporation is not registered, enter "NR").

**Column 3:** Enter the association code that applies to each corporation:

1 – Associated for purposes of allocating the business limit (unless code 5 applies)

2 – CCPC that is a "third corporation" that has elected under subsection 256(2) not to be associated for purposes of the small business deduction

3 – Non-CCPC that is a "third corporation" as defined in subsection 256(2)

4 – Associated non-CCPC

5 – Associated CCPC to which code 1 does not apply because of a subsection 256(2) election made by a "third corporation"

**Column 4:** Enter the business limit for the year of each corporation in the associated group. The business limit is computed at line 4 on page 4 of each respective corporation's T2 return.

**Column 5:** Assign a percentage to allocate the business limit to each corporation that has an association code 1 in column 3. The total of all percentages in column 5 cannot exceed 100%.

**Column 6:** Enter the business limit allocated to each corporation by multiplying the amount in column 4 by the percentage in column 5. Add all business limits allocated in column 6 and enter the total at line A. Ensure that the total at line A falls within the range for the calendar year to which the agreement applies:

| Calendar year | Acceptable range |
|---|---|
| 2006 | maximum $300,000 |
| 2007 | $300,001 to $400,000 |

| Calendar year | Acceptable range |
|---|---|
| 2008 | maximum $400,000 |
| 2009 | $400,001 to $500,000 |

If the calendar year to which this agreement applies is after 2009, ensure that the total at line A does not exceed $500,000.

## Allocating the business limit

Date filed (do not use this area) . . . . . 025 Year Month Day

Enter the calendar year to which the agreement applies . . . . . 050 Year 2013

Is this an amended agreement for the above-noted calendar year that is intended to replace an agreement previously filed by any of the associated corporations listed below? . . . . . 075 1 Yes [ ] 2 No [X]

| | 1 Names of associated corporations 100 | 2 Business Number of associated corporations 200 | 3 Association code 300 | 4 Business limit for the year (before the allocation) $ | 5 Percentage of the business limit % 350 | 6 Business limit allocated* $ 400 |
|---|---|---|---|---|---|---|
| 1 | Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 1 | 500,000 | | |
| 2 | Hydro One Inc. | 86999 4731 RC0001 | 1 | 500,000 | | |
| 3 | Hydro One Networks Inc. | 87086 5821 RC0001 | 1 | 500,000 | 100.0000 | 500,000 |
| 4 | Hydro One Telecom Inc. | 86800 1066 RC0001 | 1 | 500,000 | | |
| 5 | Hydro One Telecom Link Limited | 88786 7513 RC0001 | 1 | 500,000 | | |
| 6 | Hydro One Brampton Networks Inc. | 86486 7635 RC0001 | 1 | 500,000 | | |
| 7 | Hydro One Lake Erie Link Management Inc | 87892 1519 RC0001 | 1 | 500,000 | | |
| 8 | Hydro One Lake Erie Link Company Inc. | 87560 6519 RC0001 | 1 | 500,000 | | |
| 9 | Hydro One B2M LP Inc. | 81838 2046 RC0001 | 1 | 500,000 | | |
| 10 | B2M GP Inc. | 81838 1840 RC0001 | 1 | 500,000 | | |
| 11 | Hydro One B2M Holdings Inc. | 82217 7531 RC0001 | 1 | 500,000 | | |
| 12 | 1908872 Ontario Inc. | 82581 6838 RC0001 | 1 | 500,000 | | |
| 13 | 1908873 Ontario Inc. | 83392 0978 RC0001 | 1 | 500,000 | | |

| | 1<br>Names of associated corporations<br>100 | 2<br>Business Number of associated corporations<br>200 | 3<br>Asso-ciation code<br>300 | 4<br>Business limit for the year (before the allocation)<br>$ | 5<br>Percentage of the business limit<br>%<br>350 | 6<br>Business limit allocated*<br>$<br>400 | |
|---|---|---|---|---|---|---|---|
| 14 | 1893080 Ontario Inc. | 82217 7333 RC0001 | 1 | 500,000 | | | |
| | | | | Total | 100.0000 | 500,000 | A |

**Business limit reduction under subsection 125(5.1) of the ITA**

The business limit reduction is calculated in the small business deduction area of the T2 return. One of the factors used in this calculation is the "Large corporation amount" at line 415 of the T2 return. If the corporation is a member of an associated group** of corporations in the current tax year, the amount at line 415 of the T2 return is equal to 0.225% x (A - $10,000,000) where, "A" is the total of taxable capital employed in Canada*** of each corporation in the associated group for its last tax year ending in the preceding calendar year.

* Each corporation will enter on line 410 of the T2 return, the amount allocated to it in column 6. However, if the corporation's tax year is less than 51 weeks, prorate the amount in column 6 by the number of days in the tax year divided by 365, and enter the result on line 410 of the T2 return.

Special rules apply if a CCPC has more than one tax year ending in a calendar year and is associated in more than one of those years with another CCPC that has a tax year ending in the same calendar year. If the tax year straddles January 1, 2009, the business limit for the second (or subsequent) tax year(s) will be equal to the lesser of the business limit that would have been determined for the first tax year ending in the calendar year, if $500,000 was used in allocating the amounts among associated corporations and the business limit determined for the second (or subsequent) tax year(s) ending in the same calendar year. Otherwise, the business limit for the second (or subsequent) tax year(s) will be equal to the lesser of the business limit determined for the first tax year ending in the calendar year and the business limit determined for the second (or subsequent) tax year(s) ending in the same calendar year.

** The associated group includes the corporation filing this schedule and each corporation that has an "association code" of 1 or 4 in column 3.

*** "Taxable capital employed in Canada" has the meaning assigned by subsection 181.2(1) or 181.3(1) or section 181.4 of the ITA.

# Summary of Investment Tax Credit Carryovers

# GENERAL RATE INCOME POOL (GRIP) CALCULATION

| Name of corporation | Business Number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

On: 2013-12-31

- If you are a Canadian-controlled private corporation (CCPC) or a deposit insurance corporation (DIC), use this schedule to determine the general rate income pool (GRIP).
- When an eligible dividend was paid in the tax year, file a completed copy of this schedule with your *T2 Corporation Income Tax Return*. Do not send your worksheets with your return, but keep them in your records in case we ask to see them later.
- Subsections referred to in this schedule are from the *Income Tax Act*.
- Subsection 89(1) defines the terms eligible dividend, excessive eligible dividend designation, general rate income pool, and low rate income pool.

## Eligibility for the various additions

Answer the following questions to determine the corporation's eligibility for the various additions:

**2006 addition**

1. Is this the corporation's first taxation year that includes January 1, 2006? ☐ Yes ☒ No
2. If not, what is the date of the taxation year end of the corporation's first year that includes January 1, 2006? Enter the date and go directly to question 4 ..... 2006-12-31
3. During that first year, was the corporation a CCPC or would it have been a CCPC if not for the election of subsection 89(11) ITA? ☒ Yes ☐ No
   **If the answer to question 3 is yes, complete Part "GRIP addition for 2006".**

**Change in the type of corporation**

4. Was the corporation a CCPC during its preceding taxation year? ☒ Yes ☐ No
5. Corporations that become a CCPC or a DIC ☐ Yes ☒ No
   **If the answer to question 5 is yes, complete Part 4.**

**Amalgamation (first year of filing after amalgamation)**

6. Corporations that were formed as a result of an amalgamation ☐ Yes ☒ No
   **If the answer to question 6 is yes, answer questions 7 and 8. If the answer is no, go to question 9.**
7. Was one or more of the predecessor corporations neither a CCPC nor a DIC? ☐ Yes ☐ No
   **If the answer to question 7 is yes, complete Part 4.**
8. Was one or more of the predecessor corporation a CCPC or a DIC during the taxation year that ended immediately before amalgamation? ☐ Yes ☐ No
   **If the answer to question 8 is yes, complete Part 3.**

**Winding-up**

9. Has the corporation wound-up a subsidiary in the preceding taxation year? ☐ Yes ☒ No
   **If the answer to question 9 is yes, answer questions 10 and 11. If the answer is no, go to Part 1.**
10. Was the subsidiary neither a CCPC nor a DIC during its last taxation year? ☐ Yes ☐ No
    **If the answer to question 10 is yes, complete Part 4.**
11. Was the subsidiary a CCPC or a DIC during its last taxation year? ☐ Yes ☐ No
    **If the answer to question 11 is yes, complete Part 3.**

## Part 1 – Calculation of general rate income pool (GRIP)

GRIP at the end of the previous tax year . . . **100** 1,223,283 A

Taxable income for the year (DICs enter "0") * . . . **110** ______ B

Income for the credit union deduction * (amount E in Part 3 of Schedule 17) . . . **120** ______

Amount on line 400, 405, 410, or 425 of the T2 return, whichever is less * . . . **130** ______

For a CCPC, the lesser of aggregate investment income (line 440 of the T2 return) and taxable income * . . . **140** ______

Subtotal (**add** lines 120, 130, and 140) ______ ► ______ C

Income taxable at the general corporate rate (line B **minus** line C) (if negative enter "0") . . . **150** ______

After-tax income (line 150 x general rate factor for the tax year ** 0.72 ) . . . **190** ______ D

Eligible dividends received in the tax year . . . **200** ______

Dividends deductible under section 113 received in the tax year . . . **210** ______

Subtotal (**add** lines 200 and 210) ______ ► ______ E

GRIP addition:

Becoming a CCPC (line PP from Part 4) . . . **220** ______

Post-amalgamation (total of lines EE from Part 3 and lines PP from Part 4) . . . **230** ______

Post-wind-up (total of lines EE from Part 3 and lines PP from Part 4) . . . **240** ______

Subtotal (**add** lines 220, 230, and 240) ______ ► **290** ______ F

Subtotal (**add** lines A, D, E, and F) 1,223,283 G

Eligible dividends paid in the previous tax year . . . **300** ______

Excessive eligible dividend designations made in the previous tax year . . . **310** ______

**Note:** If becoming a CCPC (subsection 89(4) applies), enter "0" on lines 300 and 310.

Subtotal (line 300 **minus** line 310) ______ ► ______ H

GRIP before adjustment for specified future tax consequences (line G **minus** line H) (amount can be negative) . . . **490** 1,223,283

Total GRIP adjustment for specified future tax consequences to previous tax years (amount W from Part 2) . . . **560** 1,503,909

**GRIP at the end of the tax year** (line 490 **minus** line 560) . . . **590** -280,626

Enter this amount on line 160 of Schedule 55.

* For lines 110, 120, 130, and 140, the income amount is the amount before considering specified future tax consequences. This phrase is defined in subsection 248(1). It includes the deduction of a loss carryback from subsequent tax years, a reduction of Canadian exploration expenses and Canadian development expenses that were renounced in subsequent tax years (e.g., flow-through share renunciations), reversals of income inclusions where an option is exercised in subsequent tax years, and the effect of certain foreign tax credit adjustments.

** The **general rate factor** for a tax year is 0.68 for any portion of the tax year that falls before 2010, 0.69 for any portion of the tax year that falls in 2010, 0.70 for any portion of the tax year that falls in 2011, and 0.72 for any portion of the tax year that falls after 2011. Calculate the general rate factor in Part 5 for tax years that straddle these dates.

## Part 2 – GRIP adjustment for specified future tax consequences to previous tax years

Complete this part if the corporation's taxable income of any of the previous three tax years took into account the specified future tax consequences defined in subsection 248(1) from the current tax year. Otherwise, enter "0" on line 560.

**First previous tax year** 2012-12-31

Taxable income before specified future tax consequences from the current tax year . . . ______ J1

Enter the following amounts before specified future tax consequences from the current tax year:

Income for the credit union deduction (amount E in Part 3 of Schedule 17) . . . ______ K1

Amount on line 400, 405, 410, or 425 of the T2 return, whichever is less . . . ______ L1

Aggregate investment income (line 440 of the T2 return) . . . ______ M1

Subtotal (**add** lines K1, L1, and M1) ______ ► ______ N1

Subtotal (line J1 **minus** line N1) (if negative, enter "0") ______ ► ______ O1

## Part 2 – GRIP adjustment for specified future tax consequences to previous tax years (continued)

| Future tax consequences that occur for the current year<br>Amount carried back from the current year to a prior year | | | | | |
|---|---|---|---|---|---|
| **Non-capital loss carry-back (paragraph 111 (1)(a) ITA)** | **Capital loss carry-back** | **Restricted farm loss carry-back** | **Farm loss carry-back** | **Other** | **Total carrybacks** |
| | | | | | |

Taxable income after specified future tax consequences . . . . . . . . ____ P1

Enter the following amounts after specified future tax consequences:

Income for the credit union deduction (amount E in Part 3 of Schedule 17) . . . ____ Q1

Amount on line 400, 405, 410, or 425 of the T2 return, whichever is less . . . . ____ R1

Aggregate investment income (line 440 of the T2 return) . . . . . . . . . ____ S1

Subtotal (**add** lines Q1, R1, and S1) ____ ▶ ____ T1

**GRIP adjustment for specified future tax consequences to the third previous tax year**
(line V3 **multiplied by** the general rate factor for the tax year 0.72 ) . . . **540** 1,503,909

**Total GRIP adjustment for specified future tax consequences to previous tax years:**
(**add** lines 500, 520, and 540) (if negative, enter "0") . . . 1,503,909 W

Enter amount W on line 560.

## Part 3 – Worksheet to calculate the GRIP addition post-amalgamation or post-wind-up (predecessor or subsidiary was a CCPC or a DIC in its last tax year)

**nb. 1** Post amalgamation . . . ☐ Post wind-up . . . ☐

Complete this part when there has been an amalgamation (within the meaning assigned by subsection 87(1)) or a wind-up (to which subsection 88(1) applies) and the predecessor or subsidiary corporation was a CCPC or a DIC in its last tax year. In the calculation below, **corporation** means a predecessor or a subsidiary. The last tax year for a predecessor corporation was its tax year that ended immediately before the amalgamation and for a subsidiary corporation was its tax year during which its assets were distributed to the parent on the wind-up.

For a post-wind-up, include the GRIP addition in calculating the parent's GRIP at the end of its tax year that immediately follows the tax year during which it receives the assets of the subsidiary.

Complete a separate worksheet for **each** predecessor and **each** subsidiary that was a CCPC or a DIC in its last tax year. Keep a copy of this calculation for your records, in case we ask to see it later.

Corporation's GRIP at the end of its last tax year . . . ______ AA

Eligible dividends paid by the corporation in its last tax year . . . ______ BB

Excessive eligible dividend designations made by the corporation in its last tax year . . . ______ CC

Subtotal (line BB **minus** line CC) ______ ▶ ______ DD

**GRIP addition post-amalgamation or post-wind-up (predecessor or subsidiary was a CCPC or a DIC in its last tax year)**
(line AA **minus** line DD) . . . ______ EE

After you complete this calculation for each predecessor and each subsidiary, calculate the total of all the EE lines. Enter this total amount on:

- line 230 for post-amalgamation; or
- line 240 for post-wind-up.

## Part 4 – Worksheet to calculate the GRIP addition post-amalgamation, post-wind-up (predecessor or subsidiary was not a CCPC or a DIC in its last tax year), or the corporation is becoming a CCPC

**nb. 1** Corporation becoming a CCPC . . . . . . ☐ Post amalgamation . . . . . . . . . . ☐ Post wind-up . . . . . . . . . . . . . ☐

Complete this part when there has been an amalgamation (within the meaning assigned by subsection 87(1)) or a wind-up (to which subsection 88(1) applies) and the predecessor or subsidiary was not a CCPC or a DIC in its last tax year. Also, use this part for a corporation becoming a CCPC. In the calculation below, **corporation** means a corporation becoming a CCPC, a predecessor, or a subsidiary.

For a post-wind-up, include the GRIP addition in calculating the parent's GRIP at the end of its tax year that immediately follows the tax year during which it receives the assets of the subsidiary.

Complete a separate worksheet for **each** predecessor and **each** subsidiary that was not a CCPC or a DIC in its last tax year. Keep a copy of this calculation for your records, in case we ask to see it later.

| | | | |
|---|---|---|---|
| Cost amount to the corporation of all property immediately before the end of its previous/last tax year | | | FF |
| The corporation's money on hand immediately before the end of its previous/last tax year | | | GG |
| Unused and unexpired losses at the end of the corporation's previous/last tax year: | | | |
| Non-capital losses | | | |
| Net capital losses | | | |
| Farm losses | | | |
| Restricted farm losses | | | |
| Limited partnership losses | | | |
| Subtotal | | ► | HH |
| Subtotal (**add** lines FF, GG, and HH) | | | II |
| All the corporation's debts and other obligations to pay that were outstanding immediately before the end of its previous/last tax year | | JJ | |
| Paid-up capital of all the corporation's issued and outstanding shares of capital stock immediately before the end of its previous/last tax year | | KK | |
| All the corporation's reserves deducted in its previous/last tax year | | LL | |
| The corporation's capital dividend account immediately before the end of its previous/last tax year | | MM | |
| The corporation's low rate income pool immediately before the end of its previous/last tax year | | NN | |
| Subtotal (**add** lines JJ, KK, LL, MM, and NN) | | ► | OO |
| **GRIP addition post-amalgamation or post-wind-up (predecessor or subsidiary was not a CCPC or a DIC in its last tax year), or the corporation is becoming a CCPC** (line II **minus** line OO) (if negative, enter "0") | | | PP |

After you complete this worksheet for each predecessor and each subsidiary, calculate the total of all the PP lines. Enter this total amount on:

- line 220 for a corporation becoming a CCPC;
- line 230 for post-amalgamation; or
- line 240 for post-wind-up.

## Part 5 – General rate factor for the tax year

Complete this part to calculate the general rate factor for the tax year.

| Rate | | Fraction | Days | | Result | Line |
|---|---|---|---|---|---|---|
| 0.68 | x | number of days in the tax year before January 1, 2010 / number of days in the tax year | / 365 | = | | QQ |
| 0.69 | x | number of days in the tax year in 2010 / number of days in the tax year | / 365 | = | | RR |
| 0.7 | x | number of days in the tax year in 2011 / number of days in the tax year | / 365 | = | | SS |
| 0.72 | x | number of days in the tax year after December 31, 2011 / number of days in the tax year | 365 / 365 | = | 0.720000000 | TT |

**General rate factor for the tax year** (total of lines QQ to TT) . . . . . . . . . . . . . . . . . . . . . 0.72000 UU

Canada Revenue Agency / Agence du revenu du Canada

**Schedule 510**

# Ontario Corporate Minimum Tax

| Corporation's name | Business number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- File this schedule if the corporation is subject to Ontario corporate minimum tax (CMT). CMT is levied under section 55 of the *Taxation Act, 2007* (Ontario), referred to as the "Ontario Act".
- Complete Part 1 to determine if the corporation is subject to CMT for the tax year.
- A corporation not subject to CMT in the tax year is still required to file this schedule if it is deducting a CMT credit, has a CMT credit carryforward, or has a CMT loss carryforward or a current year CMT loss.
- A corporation that has Ontario special additional tax on life insurance corporations (SAT) payable in the tax year must complete Part 4 of this schedule even if it is not subject to CMT for the tax year.
- A corporation is exempt from CMT if, throughout the tax year, it was one of the following:
  1) a corporation exempt from income tax under section 149 of the federal *Income Tax Act*;
  2) a mortgage investment corporation under subsection 130.1(6) of the federal Act;
  3) a deposit insurance corporation under subsection 137.1(5) of the federal Act;
  4) a congregation or business agency to which section 143 of the federal Act applies;
  5) an investment corporation as referred to in subsection 130(3) of the federal Act; or
  6) a mutual fund corporation under subsection 131(8) of the federal Act.
- File this schedule with the *T2 Corporation Income Tax Return*.

## Part 1 – Determination of CMT applicability

| | | |
|---|---|---|
| Total assets of the corporation at the end of the tax year * | 112 | 73,695,000 |
| Share of total assets from partnership(s) and joint venture(s) * | 114 | |
| Total assets of associated corporations (amount from line 450 on Schedule 511) | 116 | 33,431,225,104 |
| Total assets (total of lines 112 to 116) | | 33,504,920,104 |
| Total revenue of the corporation for the tax year ** | 142 | 50,035,000 |
| Share of total revenue from partnership(s) and joint venture(s) ** | 144 | |
| Total revenue of associated corporations (amount from line 550 on Schedule 511) | 146 | 6,702,002,000 |
| Total revenue (total of lines 142 to 146) | | 6,752,037,000 |

The corporation is subject to CMT if:
– for tax years ending before July 1, 2010, the total assets at the end of the year of the corporation or the associated group of corporations are more than $5,000,000, or the total revenue for the year of the corporation or the associated group of corporations is more than $10,000,000.
– for tax years ending after June 30, 2010, the total assets at the end of the year of the corporation or the associated group of corporations are equal to or more than $50,000,000, and the total revenue for the year of the corporation or the associated group of corporations is equal to or more than $100,000,000.
If the corporation is not subject to CMT, do not complete the remaining parts unless the corporation is deducting a CMT credit, or has a CMT credit carryforward, a CMT loss carryforward, a current year CMT loss, or SAT payable in the year.

* **Rules for total assets**
– Report total assets according to generally accepted accounting principles, adjusted so that consolidation and equity methods are not used.
– Do not include unrealized gains and losses on assets and foreign currency gains and losses on assets that are included in net income for accounting purposes but not in income for corporate income tax purposes.
– The amount on line 114 is determined at the end of the last fiscal period of the partnership or joint venture that ends in the tax year of the corporation. Add the proportionate share of the assets of the partnership(s) and joint venture(s), and deduct the recorded asset(s) for the investment in partnerships and joint ventures.
– A corporation's share in a partnership or joint venture is determined under paragraph 54(5)(b) of the Ontario Act and, if the partnership or joint venture had no income or loss, is calculated as if the partnership's or joint venture's income were $1 million. For a corporation with an indirect interest in a partnership or joint venture, determine the corporation's share according to paragraph 54(5)(c) of the Ontario Act.

** **Rules for total revenue**
– Report total revenue in accordance with generally accepted accounting principles, adjusted so that consolidation and equity methods are not used.
– If the tax year is less than 51 weeks, **multiply** the total revenue of the corporation or the partnership, whichever applies, by 365 and **divide** by the number of days in the tax year.
– The amount on line 144 is determined for the partnership or joint venture fiscal period that ends in the tax year of the corporation. If the partnership or joint venture has 2 or more fiscal periods ending in the filing corporation's tax year, **multiply** the sum of the total revenue for each of the fiscal periods by 365 and **divide** by the total number of days in all the fiscal periods.
– A corporation's share in a partnership or joint venture is determined under paragraph 54(5)(b) of the Ontario Act and, if the partnership or joint venture had no income or loss, is calculated as if the partnership's or joint venture's income were $1 million. For a corporation with an indirect interest in a partnership or joint venture, determine the corporation's share according to paragraph 54(5)(c) of the Ontario Act.

## Part 2 – Adjusted net income/loss for CMT purposes

| | Line | Amount | | Line | Amount | |
|---|---|---|---|---|---|---|
| Net income/loss per financial statements * | | | | 210 | 13,000 | |
| **Add** (to the extent reflected in income/loss): | | | | | | |
| Provision for current income taxes/cost of current income taxes | 220 | | | | | |
| Provision for deferred income taxes (debits)/cost of future income taxes | 222 | | | | | |
| Equity losses from corporations | 224 | | | | | |
| Financial statement loss from partnerships and joint ventures | 226 | | | | | |
| Dividends deducted on financial statements (subsection 57(2) of the Ontario Act), excluding dividends paid by credit unions under subsection 137(4.1) of the federal Act | 230 | | | | | |
| **Other additions** (see note below): | | | | | | |
| Share of adjusted net income of partnerships and joint ventures ** | 228 | | | | | |
| Total patronage dividends received, not already included in net income/loss | 232 | | | | | |
| 281 | 282 | | | | | |
| 283 | 284 | | | | | |
| Subtotal | | | ► | | | A |
| **Deduct** (to the extent reflected in income/loss): | | | | | | |
| Provision for recovery of current income taxes/benefit of current income taxes | 320 | 1,091,000 | | | | |
| Provision for deferred income taxes (credits)/benefit of future income taxes | 322 | | | | | |
| Equity income from corporations | 324 | | | | | |
| Financial statement income from partnerships and joint ventures | 326 | | | | | |
| Dividends deductible under section 112, section 113, or subsection 138(6) of the federal Act | 330 | | | | | |
| Dividends not taxable under section 83 of the federal Act (from Schedule 3) | 332 | | | | | |
| Gain on donation of listed security or ecological gift | 340 | | | | | |
| Accounting gain on transfer of property to a corporation under section 85 or 85.1 of the federal Act *** | 342 | | | | | |
| Accounting gain on transfer of property to/from a partnership under section 85 or 97 of the federal Act **** | 344 | | | | | |
| Accounting gain on disposition of property under subsection 13(4), subsection 14(6), or section 44 of the federal Act ***** | 346 | | | | | |
| Accounting gain on a windup under subsection 88(1) of the federal Act or an amalgamation under section 87 of the federal Act | 348 | | | | | |
| **Other deductions** (see note below): | | | | | | |
| Share of adjusted net loss of partnerships and joint ventures ** | 328 | | | | | |
| Tax payable on dividends under subsection 191.1(1) of the federal Act **multiplied** by 3 | 334 | | | | | |
| Interest deducted/deductible under paragraph 20(1)(c) or (d) of the federal Act, not already included in net income/loss | 336 | | | | | |
| Patronage dividends paid (from Schedule 16) not already included in net income/loss | 338 | | | | | |
| 381 Other comprehensive income included in income | 382 | 13,000 | | | | |
| 383 | 384 | | | | | |
| 385 | 386 | | | | | |
| 387 | 388 | | | | | |
| 389 | 390 | | | | | |
| Subtotal | | 1,104,000 | ► | | 1,104,000 | B |
| Adjusted net income/loss for CMT purposes (line 210 **plus** amount A **minus** amount B) | | | | 490 | -1,091,000 | |

If the amount on line 490 is positive and the corporation is subject to CMT as determined in Part 1, enter the amount on line 515 in Part 3.

If the amount on line 490 is negative, enter the amount on line 760 in Part 7 (enter as a positive amount).

**Note**

In accordance with *Ontario Regulation 37/09*, when calculating net income for CMT purposes, accounting income should be adjusted to:

- exclude unrealized gains and losses due to mark-to-market changes or foreign currency changes on specified mark-to-market property (assets only);
- include realized gains and losses on the disposition of specified mark-to-market property not already included in the accounting income, if the property is not a capital property or is a capital property disposed in the year or in a previous tax year ended after March 22, 2007.

"Specified mark-to-market property" is defined in subsection 54(1) of the Ontario Act.

These rules also apply to partnerships. A corporate partner's share of a partnership's adjusted income flows through on a proportionate basis to the corporate partner.

* **Rules for net income/loss**

- Banks must report net income/loss as per the report accepted by the Superintendent of Financial Institutions under the federal *Bank Act*, adjusted so consolidation and equity methods are not used.

## Part 2 – Adjusted net income/loss for CMT purposes (continued)

- Life insurance corporations must report net income/loss as per the report accepted by the federal Superintendent of Financial Institutions or equivalent provincial insurance regulator, before SAT and adjusted so consolidation and equity methods are not used. If the life insurance corporation is resident in Canada and carries on business in and outside of Canada, **multiply** the net income/loss by the ratio of the Canadian reserve liabilities **divided** by the total reserve liability. The reserve liabilities are calculated in accordance with Regulation 2405(3) of the federal Act.
- Other corporations must report net income/loss in accordance with generally accepted accounting principles, except that consolidation and equity methods must not be used. When the equity method has been used for accounting purposes, equity losses and equity income are removed from book income/loss on lines 224 and 324 respectively.
- Corporations, other than insurance corporations, should report net income from line 9999 of the GIFI (Schedule 125) on line 210.

** The share of the adjusted net income of a partnership or joint venture is calculated as if the partnership or joint venture were a corporation and the tax year of the partnership or joint venture were its fiscal period. For a corporation with an indirect interest in a partnership through one or more partnerships, determine the corporation's share according to clause 54(5)(c) of the Ontario Act.

*** A joint election will be considered made under subsection 60(1) of the Ontario Act if there is an entry on line 342, and an election has been made for transfer of property to a corporation under subsection 85(1) of the federal Act.

**** A joint election will be considered made under subsection 60(2) of the Ontario Act if there is an entry on line 344, and an election has been made under subsection 85(2) or 97(2) of the federal Act.

***** A joint election will be considered made under subsection 61(1) of the Ontario Act if there is an entry on line 346, and an election has been made under subsection 13(4) or 14(6) and/or section 44 of the federal Act.

For more information on how to complete this part, see the *T2 Corporation – Income Tax Guide*.

## Part 3 – CMT payable

| | | | | |
|---|---|---|---|---|
| Adjusted net income for CMT purposes (line 490 in Part 2, if positive) | | **515** | | |
| **Deduct:** | | | | |
| CMT loss available (amount R from Part 7) | 1,551,765 | | | |
| **Minus:** Adjustment for an acquisition of control * | **518** | | | |
| Adjusted CMT loss available | 1,551,765 ▶ | | 1,551,765 | C |
| Net income subject to CMT calculation (if negative, enter "0") | | **520** | | |

Amount from line 520 ______ x (Number of days in the tax year before July 1, 2010 ______ / Number of days in the tax year 365) x 4 % = ______ 1

Amount from line 520 ______ x (Number of days in the tax year after June 30, 2010 365 / Number of days in the tax year 365) x 2.7 % = ______ 2

Subtotal (amount 1 **plus** amount 2) ______ 3

| | | | |
|---|---|---|---|
| Gross CMT: amount on line 3 above x OAF ** | **540** | | |
| **Deduct:** | | | |
| Foreign tax credit for CMT purposes *** | **550** | | |
| CMT after foreign tax credit deduction (line 540 **minus** line 550) (if negative, enter "0") | | | D |
| **Deduct:** | | | |
| Ontario corporate income tax payable before CMT credit (amount F6 from Schedule 5) | | | |
| Net CMT payable (if negative, enter "0") | | | E |

Enter amount E on line 278 of Schedule 5, *Tax Calculation Supplementary – Corporations*, and complete Part 4.

* Enter the portion of CMT loss available that exceeds the adjusted net income for the tax year from carrying on a business before the acquisition of control. See subsection 58(3) of the Ontario Act.

*** Enter "0" on line 550 for life insurance corporations as they are not eligible for this deduction. For all other corporations, enter the cumulative total of amount J for the province of Ontario from Part 9 of Schedule 21 on line 550.

**** Calculation of the Ontario allocation factor (OAF):**

If the provincial or territorial jurisdiction entered on line 750 of the T2 return is "Ontario," enter "1" on line F.

If the provincial or territorial jurisdiction entered on line 750 of the T2 return is "multiple," complete the following calculation, and enter the result on line F:

Ontario taxable income **** / Taxable income ***** ______ = ______

**Ontario allocation factor** 1.00000 F

**** Enter the amount allocated to Ontario from column F in Part 1 of Schedule 5. If the taxable income is nil, calculate the amount in column F as if the taxable income were $1,000.

***** Enter the taxable income amount from line 360 or amount Z of the T2 return, whichever applies. If the taxable income is nil, enter "1,000."

## Part 4 – CMT credit carryforward

| | | | | |
|---|---|---|---|---|
| CMT credit carryforward at the end of the previous tax year * | | | G | |
| **Deduct:** | | | | |
| CMT credit expired * | 600 | | | |
| CMT credit carryforward at the beginning of the current tax year * (see note below) | | | ▶ 620 | |
| **Add:** | | | | |
| CMT credit carryforward balances transferred on an amalgamation or the windup of a subsidiary (see note below) | | | 650 | |
| CMT credit available for the tax year (amount on line 620 **plus** amount on line 650) | | | | H |
| **Deduct:** | | | | |
| CMT credit deducted in the current tax year (amount P from Part 5) | | | | I |
| Subtotal (amount H **minus** amount I) | | | | J |
| **Add:** | | | | |
| Net CMT payable (amount E from Part 3) | | | | |
| SAT payable (amount O from Part 6 of Schedule 512) | | | | |
| Subtotal | | | ▶ | K |
| CMT credit carryforward at the end of the tax year (amount J **plus** amount K) | | | 670 | L |

* For the first harmonized T2 return filed with a tax year that includes days in 2009:

- do not enter an amount on line G or line 600;
- for line 620, enter the amount from line 2336 of Ontario CT23 Schedule 101, *Corporate Minimum Tax (CMT)*, for the last tax year that ended in 2008.

For other tax years, enter on line G the amount from line 670 of Schedule 510 from the previous tax year.

**Note:** If you entered an amount on line 620 or line 650, complete Part 6.

## Part 5 – CMT credit deducted from Ontario corporate income tax payable

| | | | | |
|---|---|---|---|---|
| CMT credit available for the tax year (amount H from Part 4) | | | | M |
| Ontario corporate income tax payable before CMT credit (amount F6 from Schedule 5) | | | 1 | |
| For a corporation that is not a life insurance corporation: | | | | |
| CMT after foreign tax credit deduction (amount D from Part 3) | | 2 | | |
| For a life insurance corporation: | | | | |
| Gross CMT (line 540 from Part 3) | | 3 | | |
| Gross SAT (line 460 from Part 6 of Schedule 512) | | 4 | | |
| The **greater** of amounts 3 and 4 | | 5 | | |
| **Deduct:** line 2 or line 5, whichever applies: | | | 6 | |
| Subtotal (if negative, enter "0") | | | ▶ | N |
| Ontario corporate income tax payable before CMT credit (amount F6 from Schedule 5) | | | | |
| **Deduct:** | | | | |
| Total refundable tax credits excluding Ontario qualifying environmental trust tax credit (amount J6 **minus** line 450 from Schedule 5) | | | 30,604 | |
| Subtotal (if negative, enter "0") | | | ▶ | O |
| CMT credit deducted in the current tax year (least of amounts M, N, and O) | | | | P |

Enter amount P on line 418 of Schedule 5 and on line I in Part 4 of this schedule.

Is the corporation claiming a CMT credit earned before an acquisition of control? 675 1 Yes ☐ 2 No ☒

If you answered **yes** to the question at line 675, the CMT credit deducted in the current tax year may be restricted. For information on how the deduction may be restricted, see subsections 53(6) and (7) of the Ontario Act.

## Part 6 – CMT credit available for carryforward by year of origin

Complete this part if:

- the tax year includes January 1, 2009; or
- the previous tax year-end is deemed to be December 31, 2008, under subsection 249(3) of the federal Act.

| Year of origin | CMT credit balance * |
|---|---|
| 10th previous tax year | 680 |
| 9th previous tax year | 681 |
| 8th previous tax year | 682 |
| 7th previous tax year | 683 |
| 6th previous tax year | 684 |
| 5th previous tax year | 685 |
| 4th previous tax year | 686 |
| 3rd previous tax year | 687 |
| 2nd previous tax year | 688 |
| 1st previous tax year | 689 |
| Total ** | |

* CMT credit that was earned (by the corporation, predecessors of the corporation, and subsidiaries wound up into the corporation) in each of the previous 10 tax years and has not been deducted.

** Must equal the total of the amounts entered on lines 620 and 650 in Part 4.

## Part 7 – CMT loss carryforward

| | | | | |
|---|---|---|---|---|
| CMT loss carryforward at the end of the previous tax year * | | 1,551,765 Q | | |
| **Deduct:** | | | | |
| CMT loss expired * | 700 | | | |
| CMT loss carryforward at the beginning of the tax year * (see note below) | | 1,551,765 ▶ | 720 | 1,551,765 |
| **Add:** | | | | |
| CMT loss transferred on an amalgamation under section 87 of the federal Act ** (see note below) | | | 750 | |
| CMT loss available (line 720 **plus** line 750) | | | | 1,551,765 R |
| **Deduct:** | | | | |
| CMT loss deducted against adjusted net income for the tax year (lesser of line 490 (if positive) and line C in Part 3) | | | | |
| Subtotal (if negative, enter "0") | | | | 1,551,765 S |
| **Add:** | | | | |
| Adjusted net loss for CMT purposes (amount from line 490 in Part 2, if **negative**) (enter as a positive amount) | | | 760 | 1,091,000 |
| CMT loss carryforward balance at the end of the tax year (amount S **plus** line 760) | | | 770 | 2,642,765 T |

* For the first harmonized T2 return filed with a tax year that includes days in 2009:

- do not enter an amount on line Q or line 700;
- for line 720, enter the amount from line 2214 of Ontario CT23 Schedule 101, *Corporate Minimum Tax (CMT)*, for the last tax year that ended in 2008.

For other tax years, enter on line Q the amount from line 770 of Schedule 510 from the previous tax year.

** Do not include an amount from a predecessor corporation if it was controlled at any time before the amalgamation by any of the other predecessor corporations.

**Note:** If you entered an amount on line 720 or line 750, complete Part 8.

## Part 8 – CMT loss available for carryforward by year of origin

Complete this part if:

- the tax year includes January 1, 2009; or
- the previous tax year-end is deemed to be December 31, 2008, under subsection 249(3) of the federal Act.

| Year of origin | Balance earned in a tax year ending before March 23, 2007 * | Balance earned in a tax year ending after March 22, 2007 ** |
|---|---|---|
| 10th previous tax year | 810 | 820 |
| 9th previous tax year | 811 | 821 |
| 8th previous tax year | 812 | 822 |
| 7th previous tax year | 813 | 823 |
| 6th previous tax year | 814 | 824 |
| 5th previous tax year | 815 | 825 |
| 4th previous tax year | 816 | 826 |
| 3rd previous tax year | 817 | 827 |
| 2nd previous tax year | 818 | 828 |
| 1st previous tax year | | 829 |
| Total *** | | |

* Adjusted net loss for CMT purposes that was earned (by the corporation, by subsidiaries wound up into or amalgamated with the corporation before March 22, 2007, and by other predecessors of the corporation) in each of the previous 10 tax years that ended before March 23, 2007, and has not been deducted.

** Adjusted net loss for CMT purposes that was earned (by the corporation and its predecessors, but not by a subsidiary predecessor) in each of the previous 20 tax years that ended after March 22, 2007, and has not been deducted.

*** The total of these two columns must equal the total of the amounts entered on lines 720 and 750.

Canada Revenue Agency Agence du revenu du Canada

**SCHEDULE 511**

# ONTARIO CORPORATE MINIMUM TAX – TOTAL ASSETS AND REVENUE FOR ASSOCIATED CORPORATIONS

| Name of corporation | Business Number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- For use by corporations to report the total assets and total revenue of all the Canadian or foreign corporations with which the filing corporation was associated at any time during the tax year. These amounts are required to determine if the filing corporation is subject to corporate minimum tax.
- Total assets and total revenue include the associated corporation's share of any partnership(s)/joint venture(s) total assets and total revenue.
- Attach additional schedules if more space is required.
- File this schedule with the *T2 Corporation Income Tax Return.*

| | Names of associated corporations 200 | Business number (Canadian corporation only) (see Note 1) 300 | Total assets* (see Note 2) 400 | Total revenue** (see Note 2) 500 |
|---|---|---|---|---|
| 1 | Hydro One Inc. | 86999 4731 RC0001 | 13,247,000,000 | 650,000,000 |
| 2 | Hydro One Networks Inc. | 87086 5821 RC0001 | 19,698,000,000 | 5,502,000,000 |
| 3 | Hydro One Telecom Inc. | 86800 1066 RC0001 | 76,876,000 | 80,880,000 |
| 4 | Hydro One Telecom Link Limited | 88786 7513 RC0001 | 1,111,000 | 442,000 |
| 5 | Hydro One Brampton Networks Inc. | 86486 7635 RC0001 | 403,229,000 | 468,680,000 |
| 6 | Hydro One Lake Erie Link Management Inc | 87892 1519 RC0001 | 4,990,000 | 0 |
| 7 | Hydro One Lake Erie Link Company Inc. | 87560 6519 RC0001 | 18,000 | 0 |
| 8 | Hydro One B2M LP Inc. | 81838 2046 RC0001 | 1 | 0 |
| 9 | B2M GP Inc. | 81838 1840 RC0001 | 999 | 0 |
| 10 | Hydro One B2M Holdings Inc. | 82217 7531 RC0001 | 100 | 0 |
| 11 | 1908872 Ontario Inc. | 82581 6838 RC0001 | 1 | 0 |
| 12 | 1908873 Ontario Inc. | 83392 0978 RC0001 | 1 | 0 |
| 13 | 1893080 Ontario Inc. | 82217 7333 RC0001 | 2 | 0 |
| | | **Total** | 450 33,431,225,104 | 550 6,702,002,000 |

Enter the total assets from line 450 on line 116 in Part 1 of Schedule 510, *Ontario Corporate Minimum Tax*.
Enter the total revenue from line 550 on line 146 in Part 1 of Schedule 510.

Note 1: Enter "NR" if a corporation is not registered.

Note 2: If the associated corporation does not have a tax year that ends in the filing corporation's current tax year but was associated with the filing corporation in the previous tax year of the filing corporation, enter the total revenue and total assets from the tax year of the associated corporation that ends in the previous tax year of the filing corporation.

*** Rules for total assets**

- Report total assets in accordance with generally accepted accounting principles, adjusted so that consolidation and equity methods are not used.
- Include the associated corporation's share of the total assets of partnership(s) and joint venture(s) but exclude the recorded asset(s) for the investment in partnerships and joint ventures.
- Exclude unrealized gains and losses on assets that are included in net income for accounting purposes but not in income for corporate income tax purposes.

** **Rules for total revenue**

- Report total revenue in accordance with generally accepted accounting principles, adjusted so that consolidation and equity methods are not used.
- If the associated corporation has 2 or more tax years ending in the filing corporation's tax year, **multiply** the sum of the total revenue for each of those tax years by 365 and **divide** by the total number of days in all of those tax years.
- If the associated corporation's tax year is less than 51 weeks and is the only tax year of the associated corporation that ends in the filing corporation's tax year, **multiply** the associated corporation's total revenue by 365 and **divide** by the number of days in the associated corporation's tax year.
- Include the associated corporation's share of the total revenue of partnerships and joint ventures.
- If the partnership or joint venture has 2 or more fiscal periods ending in the associated corporation's tax year, **multiply** the sum of the total revenue for each of the fiscal periods by 365 and **divide** by the total number of days in all the fiscal periods.

**SCHEDULE 546**

# *CORPORATIONS INFORMATION ACT* ANNUAL RETURN FOR ONTARIO CORPORATIONS

| Name of corporation | Business Number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- This schedule should be completed by a corporation that is incorporated, continued, or amalgamated in Ontario and subject to the Ontario *Business Corporations Act* (BCA) or Ontario *Corporations Act* (CA), except for registered charities under the federal *Income Tax Act*. This completed schedule serves as a *Corporations Information Act* Annual Return under the *Ontario Corporations Information Act*.
- Complete parts 1 to 4. Complete parts 5 to 7 only to report change(s) in the information recorded on the Ontario Ministry of Government Services (MGS) public record.
- This schedule must set out the required information for the corporation as of the date of delivery of this schedule.
- A completed Ontario *Corporations Information Act* Annual Return must be delivered within six months after the end of the corporation's tax year-end. The MGS considers this return to be delivered on the date that it is filed with the Canada Revenue Agency (CRA) together with the corporation's income tax return.
- It is the corporation's responsibility to ensure that the information shown on the MGS public record is accurate and up-to-date. To review the information shown for the corporation on the public record maintained by the MGS, obtain a Corporation Profile Report. Visit **www.ServiceOntario.ca** for more information.
- This schedule contains non-tax information collected under the authority of the Ontario *Corporations Information Act*. This information will be sent to the MGS for the purposes of recording the information on the public record maintained by the MGS.

## Part 1 – Identification

**100** Corporation's name (exactly as shown on the MGS public record)
Hydro One Remote Communities Inc.

| Jurisdiction incorporated, continued, or amalgamated, whichever is the most recent | **110** Date of incorporation or amalgamation, whichever is the most recent | Year Month Day | **120** Ontario Corporation No. |
|---|---|---|---|
| **Ontario** | | 1998-08-18 | 1310735 |

## Part 2 – Head or registered office address (P.O. box not acceptable as stand-alone address)

**200** Care of (if applicable)

| **210** Street number | **220** Street name/Rural route/Lot and Concession number | **230** Suite number |
|---|---|---|
| 483 | Bay Street 8th Floor | |

**240** Additional address information if applicable (line 220 must be completed first)
South Tower

| **250** Municipality (e.g., city, town) | **260** Province/state | **270** Country | **280** Postal/zip code |
|---|---|---|---|
| Toronto | ON | CA | M5G 2P5 |

## Part 3 – Change identifier

Have there been any changes in any of the information most recently filed for the public record maintained by the MGS for the corporation with respect to names, addresses for service, and the date elected/appointed and, if applicable, the date the election/appointment ceased of the directors and five most senior officers, or with respect to the corporation's mailing address or language of preference? To review the information shown for the corporation on the public record maintained by the MGS, obtain a Corporation Profile Report. For more information, visit **www.ServiceOntario.ca**.

**300** [ 1 ] If there have been no changes, enter **1** in this box and then go to "Part 4 – Certification."
If there are changes, enter **2** in this box and complete the applicable parts on the next page, and then go to "Part 4 – Certification."

## Part 4 – Certification

I certify that all information given in this *Corporations Information Act* Annual Return is true, correct, and complete.

**450** BARAGETTI (Last name) **451** GIOVANNA (First name)

**454** ____________________, (Middle name(s))

**460** [ 3 ] Please enter one of the following numbers in this box for the above-named person: **1** for director, **2** for officer, or **3** for other individual having knowledge of the affairs of the corporation. If you are a director and officer, enter **1** or **2**.

Note: Sections 13 and 14 of the Ontario *Corporations Information Act* provide penalties for making false or misleading statements or omissions.

**Complete the applicable parts to report changes in the information recorded on the MGS public record.**

## Part 5 – Mailing address

500 [ ] Please enter one of the following numbers in this box:

1 - Show no mailing address on the MGS public record.
2 - The corporation's mailing address is the same as the head or registered office address in Part 2 of this schedule.
3 - The corporation's complete mailing address is as follows:

510 Care of (if applicable)

520 Street number | 530 Street name/Rural route/Lot and Concession number | 540 Suite number

550 Additional address information if applicable (line 530 must be completed first)

560 Municipality (e.g., city, town) | 570 Province/state | 580 Country | 590 Postal/zip code

## Part 6 – Language of preference

600 [ ] Indicate your language of preference by entering **1** for English or **2** for French. This is the language of preference recorded on the MGS public record for communications with the corporation. It may be different from line 990 on the T2 return.

Canada Revenue Agency / Agence du revenu du Canada

**SCHEDULE 550**

# ONTARIO CO-OPERATIVE EDUCATION TAX CREDIT

| Name of corporation | Business Number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- Use this schedule to claim an Ontario co-operative education tax credit (CETC) under section 88 of the *Taxation Act, 2007* (Ontario).
- The CETC is a refundable tax credit that is equal to an eligible percentage (10% to 30%) of the eligible expenditures incurred by a corporation for a qualifying work placement. The maximum credit amount is $1,000 for each qualifying work placement ending before March 27, 2009, and $3,000 for each qualifying work placement beginning after March 26, 2009. For a qualifying work placement that straddles March 26, 2009, the maximum credit amount is prorated.
- Eligible expenditures are salaries and wages (including taxable benefits) paid or payable to a student in a qualifying work placement, or fees paid or payable to an employment agency for services performed by the student in a qualifying work placement. These expenditures must be paid on account of employment or services, as applicable, at a permanent establishment of the corporation in Ontario. Expenditures for a work placement (WP) are not eligible expenditures if they are greater than the amounts that would be paid to an arm's length employee.
- A WP must meet all of the following conditions to be a qualifying work placement:
  - the student performs employment duties for a corporation under a qualifying co-operative education program (QCEP);
  - the WP has been developed or approved by an eligible educational institution as a suitable learning situation;
  - the terms of the WP require the student to engage in productive work;
  - the WP is for a period of at least 10 consecutive weeks or, in the case of an internship program, not less than 8 consecutive months and not more than 16 consecutive months;
  - the student is paid for the work performed in the WP;
  - the corporation is required to supervise and evaluate the job performance of the student in the WP;
  - the institution monitors the student's performance in the WP; and
  - the institution has certified the WP as a qualifying work placement.
- Make sure you keep a copy of the letter of certification from the Ontario eligible educational institution containing the name of the student, the employer, the institution, the term of the WP, and the name/discipline of the QCEP to support the claim. Do not submit the letter of certification with the *T2 Corporation Income Tax Return.*
- File this schedule with the *T2 Corporation Income Tax Return.*

## Part 1 – Corporate information

| 110 Name of person to contact for more information | 120 Telephone number including area code |
|---|---|
| SELMA YAM | (416) 345-6827 |

Is the claim filed for a CETC earned through a partnership?* . . . . . **150** 1 Yes [ ] 2 No [X]

If you answered **yes** to the question at line 150, what is the name of the partnership? . . . . . **160** ______

Enter the percentage of the partnership's CETC allocated to the corporation . . . . . **170** ______ %

* When a corporate member of a partnership is claiming an amount for eligible expenditures incurred by a partnership, complete a Schedule 550 for the partnership as if the partnership were a corporation. Each corporate partner, other than a limited partner, should file a separate Schedule 550 to claim the partner's share of the partnership's CETC. The allocated amounts can not exceed the amount of the partnership's CETC.

## Part 2 – Eligibility

1. Did the corporation have a permanent establishment in Ontario in the tax year? . . . . . **200** 1 Yes [X] 2 No [ ]
2. Was the corporation exempt from tax under Part III of the *Taxation Act*, 2007 (Ontario)? . . . . . **210** 1 Yes [ ] 2 No [X]

If you answered **no** to question 1 or **yes** to question 2, then the corporation is **not eligible** for the CETC.

## Part 3 – Eligible percentage for determining the eligible amount

Corporation's salaries and wages paid in the previous tax year * . . . . . **300** 9,723,581

For eligible expenditures incurred before March 27, 2009:

- If line 300 is $400,000 or less, enter 15% on line 310.
- If line 300 is $600,000 or more, enter 10% on line 310.
- If line 300 is more than $400,000 and less than $600,000, enter the percentage on line 310 using the following formula:

$$\text{Eligible percentage} = 15\,\% - \left[ 5\,\% \times \left( \frac{\text{amount on line 300} \textbf{ minus } \$\ 400{,}000}{\$\ 200{,}000} \right) \right]$$

**Eligible percentage for determining the eligible amount** . . . . . **310** 10.000 %

For eligible expenditures incurred after March 26, 2009:

- If line 300 is $400,000 or less, enter 30% on line 312.
- If line 300 is $600,000 or more, enter 25% on line 312.
- If line 300 is more than $400,000 and less than $600,000, enter the percentage on line 312 using the following formula:

$$\text{Eligible percentage} = 30\,\% - \left[ 5\,\% \times \left( \frac{\text{amount on line 300} \textbf{ minus } \$\ 400{,}000}{\$\ 200{,}000} \right) \right]$$

**Eligible percentage for determining the eligible amount** . . . . . **312** 25.000 %

* If this is the first tax year of an amalgamated corporation and subsection 88(9) of the *Taxation Act, 2007* (Ontario) applies, enter the salaries and wages paid in the previous tax year by the predecessor corporations.

## Part 4 – Calculation of the Ontario co-operative education tax credit

Complete a separate entry for each student for each qualifying work placement that ended in the corporation's tax year. If a qualifying work placement would otherwise exceed four consecutive months, divide the WP into periods of four consecutive months and enter each full period of four consecutive months as a separate WP. If the WP does not divide equally into four-month periods and if the period that is less than 4 months is 10 or more consecutive weeks, then enter that period as a separate WP. If that period is less than 10 consecutive weeks, then include it with the WP for the last period of 4 consecutive months. Consecutive WPs with two or more associated corporations are deemed to be with only one corporation, as designated by the corporations.

| | A<br>Name of university, college, or other eligible educational institution<br>**400** | B<br>Name of qualifying co-operative education program<br>**405** |
|---|---|---|
| 1. | Carelton | Mechanical Engineering |
| 2. | Carelton | Mechanical Engineering |
| 3. | Toronto | Mechanical Engineering |
| 4. | Toronto | Mechanical Engineering |
| 5. | | |

| | C<br>Name of student<br>**410** | D<br>Start date of WP<br>(see note 1 below)<br>**430** | E<br>End date of WP<br>(see note 2 below)<br>**435** |
|---|---|---|---|
| 1. | [redacted] | 2013-05-06 | 2013-08-31 |
| 2. | | 2013-09-01 | 2013-12-31 |

| 5. | | | | | |

**Ontario co-operative education tax credit** (total of amounts in column K) 500 12,000 L

or, if the corporation answered **yes** at line 150 in Part 1, determine the partner's share of amount L:

Amount L ________ x percentage on line 170 in Part 1 ________ % = . . . . . . . . . . . . . . . . . . . . . . ________ M

Enter amount L or M, whichever applies, on line 452 of Schedule 5, *Tax Calculation Supplementary – Corporations*. If you are filing more than one Schedule 550, add the amounts from line L or M, whichever applies, on all the schedules and enter the total amount on line 452 of Schedule 5.

Note 1: Reduce eligible expenditures by all government assistance, as defined under subsection 88(21) of the *Taxation Act, 2007* (Ontario), that the corporation has received, is entitled to receive, or may reasonably expect to receive, for the eligible expenditures, on or before the filing due date of the *T2 Corporation Income Tax Return* for the tax year.

Note 2: Calculate the eligible amount (Column G) using the following formula:

Column G = (column F1 x percentage on line 310) + (column F2 x percentage on line 312)

Note 3: If the WP ends before March 27, 2009, the maximum credit amount for the WP is $1,000.
If the WP begins after March 26, 2009, the maximum credit amount for the WP is $3,000.
If the WP begins before March 27, 2009, and ends after March 26, 2009, calculate the maximum credit amount using the following formula:

($1,000 x X/Y) + [$3,000 x (Y – X)/Y]

where "X" is the number of consecutive weeks of the WP completed by the student before March 27, 2009, and "Y" is the total number of consecutive weeks of the student's WP.

Note 4: When claiming a CETC for repayment of government assistance, complete a **separate entry** for each repayment and complete columns A to E and J and K with the details for the previous year WP in which the government assistance was received. Include the amount of government assistance repaid in the tax year multiplied by the eligible percentage for the tax year in which the government assistance was received, to the extent that the government assistance reduced the CETC in that tax year.

Canada Revenue Agency / Agence du revenu du Canada

**SCHEDULE 552**

# ONTARIO APPRENTICESHIP TRAINING TAX CREDIT

| Name of corporation | Business Number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- Use this schedule to claim an Ontario apprenticeship training tax credit (ATTC) under section 89 of the *Taxation Act, 2007* (Ontario).
- The ATTC is a refundable tax credit that is equal to a specified percentage (25% to 45%) of the eligible expenditures incurred by a corporation for a qualifying apprenticeship. Before March 27, 2009, the maximum credit for each apprentice is $5,000 per year to a maximum credit of $15,000 over the first 36-month period of the qualifying apprenticeship. After March 26, 2009, the maximum credit for each apprentice is $10,000 per year to a maximum credit of $40,000 over the first 48-month period of the qualifying apprenticeship. The maximum credit amount is prorated for an employment period of an apprentice that straddles March 26, 2009.
- Eligible expenditures are salaries and wages (including taxable benefits) paid to an apprentice in a qualifying apprenticeship or fees paid to an employment agency for the provision of services performed by the apprentice in a qualifying apprenticeship. These expenditures must be:
  - paid on account of employment or services, as applicable, at a permanent establishment of the corporation in Ontario;
  - for services provided by the apprentice during the first 36 months of the apprenticeship program, if incurred before March 27, 2009; and
  - for services provided by the apprentice during the first 48 months of the apprenticeship program, if incurred after March 26, 2009.
- An expenditure is not eligible for an ATTC if:
  - the same expenditure was used, or will be used, to claim a co-operative education tax credit; or
  - it is more than an amount that would be paid to an arm's length apprentice.
- An apprenticeship must meet the following conditions to be a qualifying apprenticeship:
  - the apprenticeship is in a qualifying skilled trade approved by the Ministry of Training, Colleges and Universities (Ontario); and
  - the corporation and the apprentice must be participating in an apprenticeship program in which the training agreement has been registered under the *Ontario College of Trades and Apprenticeship Act, 2009 or* the *Apprenticeship and Certification Act, 1998* or in which the contract of apprenticeship has been registered under the *Trades Qualification and Apprenticeship Act.*
- Make sure you keep a copy of the training agreement or contract of apprenticeship to support your claim. Do not submit the training agreement or contract of apprenticeship with your *T2 Corporation Income Tax Return.*
- File this schedule with your *T2 Corporation Income Tax Return.*

## Part 1 – Corporate information (please print)

| 110 Name of person to contact for more information | 120 Telephone number including area code |
|---|---|
| SELMA YAM | (416) 345-6827 |

Is the claim filed for an ATTC earned through a partnership? * . . . . . **150** 1 Yes [ ] 2 No [X]

If **yes** to the question at line 150, what is the name of the partnership? . . . . . **160** ______

Enter the percentage of the partnership's ATTC allocated to the corporation . . . . . **170** ______ %

* When a corporate member of a partnership is claiming an amount for eligible expenditures incurred by a partnership, complete a Schedule 552 for the partnership as if the partnership were a corporation. Each corporate partner, other than a limited partner, should file a separate Schedule 552 to claim the partner's share of the partnership's ATTC. The total of the partners' allocated amounts can never exceed the amount of the partnership's ATTC.

## Part 2 – Eligibility

1. Did the corporation have a permanent establishment in Ontario in the tax year? . . . . . **200** 1 Yes [X] 2 No [ ]
2. Was the corporation exempt from tax under Part III of the *Taxation Act, 2007* (Ontario)? . . . . . **210** 1 Yes [ ] 2 No [X]

If you answered **no** to question 1 or **yes** to question 2, then you are **not eligible** for the ATTC.

## Part 3 – Specified percentage

Corporation's salaries and wages paid in the previous tax year * . . . . . **300** 9,723,581

For eligible expenditures incurred before March 27, 2009:
- If line 300 is $400,000 or less, enter 30% on line 310.
- If line 300 is $600,000 or more, enter 25% on line 310.
- If line 300 is more than $400,000 and less than $600,000, enter the percentage on line 310 using the following formula:

$$\text{Specified percentage} = 30\,\% - \left[ 5\,\% \times \frac{(\text{amount on line 300} \text{ minus } 400{,}000)}{200{,}000} \right]$$

**Specified percentage** . . . . . **310** 25.000 %

For eligible expenditures incurred after March 26, 2009:
- If line 300 is $400,000 or less, enter 45% on line 312.
- If line 300 is $600,000 or more, enter 35% on line 312.
- If line 300 is more than $400,000 and less than $600,000, enter the percentage on line 312 using the following formula:

$$\text{Specified percentage} = 45\,\% - \left[ 10\,\% \times \frac{(\text{amount on line 300} \text{ minus } 400{,}000)}{200{,}000} \right]$$

**Specified percentage** . . . . . **312** 35.000 %

* If this is the first tax year of an amalgamated corporation and subsection 89(6) of the *Taxation Act, 2007* (Ontario) applies, enter salaries and wages paid in the previous tax year by the predecessor corporations.

## Part 4 – Calculation of the Ontario apprenticeship training tax credit

Complete a **separate entry** for each apprentice that is in a qualifying apprenticeship with the corporation. When claiming an ATTC for repayment of government assistance, complete a **separate entry** for each repayment, and complete columns A to G and M and N with the details for the employment period in the previous tax year in which the government assistance was received.

|---|---|---|---|
| 1. | 137 | | 137 |
| 2. | 1,973 | | 1,973 |
| 3. | 1,452 | | 1,452 |
| 4. | 5,644 | | 5,644 |
| 5. | 4,466 | | 4,466 |
| 6. | 4,932 | | 4,932 |
| 7. | | | |

**Ontario apprenticeship training tax credit** (total of amounts in column N) 500 18,604 O or, if the corporation answered **yes** at line 150 in Part 1, determine the partner's share of amount O:

Amount O ______________ x percentage on line 170 in Part 1 ________ % = . . . . . . . . . . . . . . . . ______________ **P**

Enter amount O or P, whichever applies, on line 454 of Schedule 5, *Tax Calculation Supplementary – Corporations*. If you are filing more than one Schedule 552, add the amounts from line O or P, whichever applies, on all the schedules, and enter the total amount on line 454 of Schedule 5.

Note 1: When there are multiple employment periods as an apprentice in the tax year with the corporation, do not include days in which the individual was not employed as an apprentice.
For H1: The days employed as an apprentice must be within 36 months of the registration date provided in column E.
For H2: The days employed as an apprentice must be within 48 months of the registration date provided in column E.

Note 2: Maximum credit = ($5,000 x H1/365*) + ($10,000 x H2/365*)
* 366 days, if the tax year includes February 29

Note 3: Reduce eligible expenditures by all government assistance, as defined under subsection 89(19) of the *Taxation Act, 2007* (Ontario), that the corporation has received, is entitled to receive, or may reasonably expect to receive, in respect of the eligible expenditures, on or before the filing due date of the *T2 Corporation Income Tax Return* for the tax year.
For J1: Eligible expenditures before March 27, 2009, must be for services provided by the apprentice during the first 36 months of the apprenticeship program.
For J2: Eligible expenditures after March 26, 2009, must be for services provided by the apprentice during the first 48 months of the apprenticeship program.

Note 4: Calculate the amount in column K as follows:
Column K = (J1 x line 310) + (J2 x line 312)

Note 5: Include the amount of government assistance repaid in the tax year multiplied by the specified percentage for the tax year in which the government assistance was received, to the extent that the government assistance reduced the ATTC in that tax year.
Complete a **separate entry** for each repayment of government assistance.

# T2 Corporation Income Tax Return

**055** **Do not use this area**

Filed: 2017-08-28
EB-2017-0051
Exhibit D2-09-01
Attachment 2
Page 1 of 100

This form serves as a federal, provincial, and territorial corporation income tax return, unless the corporation is located in Quebec or Alberta. If the corporation is located in one of these provinces, you have to file a separate provincial corporation return.

All legislative references on this return are to the federal *Income Tax Act* and *Income Tax Regulations*. This return may contain changes that had not yet become law at the time of publication.

Send one completed copy of this return, including schedules and the *General Index of Financial Information* (GIFI), to your tax centre or tax services office. You have to file the return within six months after the end of the corporation's tax year.

For more information see **www.cra.gc.ca** or Guide T4012, *T2 Corporation – Income Tax Guide*.

## Identification

**Business number (BN)** . . . . . . . . . . **001** 87083 6269 RC0001

**002** Hydro One Remote Communities Inc.

**Address of head office**
Has this address changed since the last time we were notified? . . . . . . . . . . . . **010** 1 Yes [X] 2 No [ ]
(If **yes**, complete lines 011 to 018.)
**011** 680 Beaverhall Place
**012**
City: **015** Thunder Bay
Province, territory, or state: **016** ON
Country (other than Canada): **017**
Postal code/Zip code: **018** P7E 6G9

**Mailing address** (if different from head office address)
Has this address changed since the last time we were notified? . . . . . . . . . . . **020** 1 Yes [ ] 2 No [X]
(If **yes**, complete lines 021 to 028.)
**021** c/o Selma Yam
**022** 483 Bay Street 7th Floor
**023** South Tower
City: **025** Toronto
Province, territory, or state: **026** ON
Country (other than Canada): **027**
Postal code/Zip code: **028** M5G 2P5

**Location of books and records** (if different from head office address)
Has the location of books and records changed since the last time we were notified? . . . . . . . . . . . . . . . . . . . . **030** 1 Yes [ ] 2 No [X]
(If **yes**, complete lines 031 to 038.)
**031** 483 Bay Street 7th Floor
**032** South Tower
City: **035** Toronto
Province,territory, or state: **036** ON
Country (other than Canada): **037**
Postal code/Zip code: **038** M5G 2P5

**040** **Type of corporation at the end of the tax year**
1 [X] Canadian-controlled private corporation (CCPC)
2 [ ] Other private corporation
3 [ ] Public corporation
4 [ ] Corporation controlled by a public corporation
5 [ ] Other corporation (specify, below)

If the type of corporation changed during the tax year, provide the effective date of the change . . . . . . . . . . . . . . **043** ____ YYYY MM DD

**To which tax year does this return apply?**
Tax year start **060** 2014-01-01 (YYYY MM DD)
Tax year-end **061** 2014-12-31 (YYYY MM DD)

Has there been an acquisition of control to which subsection 249(4) applies since the tax year start on line 060? . . . . . . . . **063** 1 Yes [ ] 2 No [X]
If **yes**, provide the date control was acquired . . . . . . . . . . . . . **065** ____ YYYY MM DD

**Is the date on line 061 a deemed tax year-end according to subsection 249(3.1)?** . . . . . . . . . . . . **066** 1 Yes [ ] 2 No [X]

**Is the corporation a professional corporation that is a member of a partnership?** . . . . . . . . . . . . . . . . . **067** 1 Yes [ ] 2 No [X]

**Is this the first year of filing after:**
Incorporation? . . . . . . . . . . . . . . . **070** 1 Yes [ ] 2 No [X]
Amalgamation? . . . . . . . . . . . . . . . **071** 1 Yes [ ] 2 No [X]
If **yes**, complete lines 030 to 038 and attach Schedule 24.

**Has there been a wind-up of a subsidiary under section 88 during the current tax year?** . . . . . . . . . . . . . . . **072** 1 Yes [ ] 2 No [X]
If **yes**, complete and attach Schedule 24.

**Is this the final tax year before amalgamation?** . . . . . . . . . . **076** 1 Yes [ ] 2 No [X]

**Is this the final return up to dissolution?** . . . . . . . . . . . . . . . . . . **078** 1 Yes [ ] 2 No [X]

**If an election was made under section 261, state the functional currency used** . . . . . . . . . . . . . . . . **079** ____

**Is the corporation a resident of Canada?**
**080** 1 Yes [X] 2 No [ ] If **no**, give the country of residence on line 081 and complete and attach Schedule 97.
**081** ____

**Is the non-resident corporation claiming an exemption under an income tax treaty?** . . . . . . . . . . . **082** 1 Yes [ ] 2 No [X]
If **yes**, complete and attach Schedule 91.

**If the corporation is exempt from tax under section 149, tick one of the following boxes:**
**085**
1 [ ] Exempt under paragraph 149(1)(e) or (l)
2 [ ] Exempt under paragraph 149(1)(j)
3 [ ] Exempt under paragraph 149(1)(t)
4 [ ] Exempt under other paragraphs of section 149

## Attachments

**Financial statement information:** Use GIFI schedules 100, 125, and 141.
**Schedules** – Answer the following questions. For each **yes** response, **attach** the schedule to the T2 return, unless otherwise instructed.

| Question | Line | Yes | Schedule |
|---|---|---|---|
| Is the corporation related to any other corporations? | 150 | X | 9 |
| Is the corporation an associated CCPC? | 160 | X | 23 |
| Is the corporation an associated CCPC that is claiming the expenditure limit? | 161 | | 49 |
| Does the corporation have any non-resident shareholders who own voting shares? | 151 | | 19 |
| Has the corporation had any transactions, including section 85 transfers, with its shareholders, officers, or employees, other than transactions in the ordinary course of business? Exclude non-arm's length transactions with non-residents | 162 | | 11 |
| If you answered **yes** to the above question, and the transaction was between corporations not dealing at arm's length, were all or substantially all of the assets of the transferor disposed of to the transferee? | 163 | | 44 |
| Has the corporation paid any royalties, management fees, or other similar payments to residents of Canada? | 164 | X | 14 |
| Is the corporation claiming a deduction for payments to a type of employee benefit plan? | 165 | X | 15 |
| Is the corporation claiming a loss or deduction from a tax shelter? | 166 | | T5004 |
| Is the corporation a member of a partnership for which a partnership account number has been assigned? | 167 | | T5013 |
| Did the corporation, a foreign affiliate controlled by the corporation, or any other corporation or trust that did not deal at arm's length with the corporation have a beneficial interest in a non-resident discretionary trust (without reference to section 94)? | 168 | | 22 |
| Did the corporation own any shares in one or more foreign affiliates in the tax year? | 169 | | 25 |
| Has the corporation made any payments to non-residents of Canada under subsections 202(1) and/or 105(1) of the federal *Income Tax Regulations*? | 170 | | 29 |
| Did the corporation have a total amount over $1 million of reportable transactions with non-arm's length non-residents? | 171 | | T106 |
| For private corporations: Does the corporation have any shareholders who own 10% or more of the corporation's common and/or preferred shares? | 173 | X | 50 |
| Has the corporation made payments to, or received amounts from, a retirement compensation plan arrangement during the year? | 172 | | ——— |
| Does the corporation earn income from one or more Internet webpages or websites? | 180 | X | 88 |
| Is the net income/loss shown on the financial statements different from the net income/loss for income tax purposes? | 201 | X | 1 |
| Has the corporation made any charitable donations; gifts to Canada, a province, or a territory; gifts of cultural or ecological property; or gifts of medicine? | 202 | | 2 |
| Has the corporation received any dividends or paid any taxable dividends for purposes of the dividend refund? | 203 | | 3 |
| Is the corporation claiming any type of losses? | 204 | X | 4 |
| Is the corporation claiming a provincial or territorial tax credit or does it have a permanent establishment in more than one jurisdiction? | 205 | X | 5 |
| Has the corporation realized any capital gains or incurred any capital losses during the tax year? | 206 | | 6 |
| i) Is the corporation claiming the small business deduction and reporting income from: a) property (other than dividends deductible on line 320 of the T2 return), b) a partnership, c) a foreign business, or d) a personal services business; or ii) does the corporation have aggregate investment income at line 440? | 207 | | 7 |
| Does the corporation have any property that is eligible for capital cost allowance? | 208 | X | 8 |
| Does the corporation have any property that is eligible capital property? | 210 | | 10 |
| Does the corporation have any resource-related deductions? | 212 | | 12 |
| Is the corporation claiming deductible reserves (other than transitional reserves under section 34.2)? | 213 | | 13 |
| Is the corporation claiming a patronage dividend deduction? | 216 | | 16 |

| Has the corporation entered into an agreement to allocate assistance for SR&ED carried out in Canada? | 262 | | T1145 |
| Has the corporation entered into an agreement to transfer qualified expenditures incurred in respect of SR&ED contracts? | 263 | | T1146 |
| Has the corporation entered into an agreement with other associated corporations for salary or wages of specified employees for SR&ED? | 264 | | T1174 |
| Did the corporation pay taxable dividends (other than capital gains dividends) in the tax year? | 265 | | 55 |
| Has the corporation made an election under subsection 89(11) not to be a CCPC? | 266 | | T2002 |
| Has the corporation revoked any previous election made under subsection 89(11)? | 267 | | T2002 |
| Did the corporation (CCPC or deposit insurance corporation (DIC)) pay eligible dividends, or did its general rate income pool (GRIP) change in the tax year? | 268 | | 53 |
| Did the corporation (other than a CCPC or DIC) pay eligible dividends, or did its low rate income pool (LRIP) change in the tax year? | 269 | | 54 |

## Additional information

| | | | |
|---|---|---|---|
| Did the corporation use the International Financial Reporting Standards (IFRS) when it prepared its financial statements? | 270 | 1 Yes | 2 No X |
| Is the corporation inactive? | 280 | 1 Yes | 2 No X |

What is the corporation's main revenue-generating business activity? 221122 Electric Power Distribution

Specify the principal product(s) mined, manufactured, sold, constructed, or services provided, giving the approximate percentage of the total revenue that each product or service represents.

| | | | |
|---|---|---|---|
| 284 | Electricity generation and distribution | 285 | 100.000 % |
| 286 | | 287 | % |
| 288 | | 289 | % |

| | | | |
|---|---|---|---|
| Did the corporation immigrate to Canada during the tax year? | 291 | 1 Yes | 2 No X |
| Did the corporation emigrate from Canada during the tax year? | 292 | 1 Yes | 2 No X |
| Do you want to be considered as a quarterly instalment remitter if you are eligible? | 293 | 1 Yes | 2 No |
| If the corporation was eligible to remit instalments on a quarterly basis for part of the tax year, provide the date the corporation ceased to be eligible | 294 | YYYY MM DD | |
| If the corporation's major business activity is construction, did you have any subcontractors during the tax year? | 295 | 1 Yes | 2 No |

## Taxable income

| | | | | |
|---|---|---|---|---|
| Net income or (loss) for income tax purposes from Schedule 1, financial statements, or GIFI. | 300 | | -2,858,863 | A |
| **Deduct:** Charitable donations from Schedule 2 | 311 | | | |
| Gifts to Canada, a province, or a territory from Schedule 2 | 312 | | | |
| Cultural gifts from Schedule 2 | 313 | | | |
| Ecological gifts from Schedule 2 | 314 | | | |
| Gifts of medicine from Schedule 2 | 315 | | | |
| Taxable dividends deductible under section 112 or 113, or subsection 138(6) from Schedule 3 | 320 | | | |
| Part VI.1 tax deduction* | 325 | | | |
| Non-capital losses of previous tax years from Schedule 4 | 331 | | | |
| Net capital losses of previous tax years from Schedule 4 | 332 | | | |
| Restricted farm losses of previous tax years from Schedule 4 | 333 | | | |
| Farm losses of previous tax years from Schedule 4 | 334 | | | |
| Limited partnership losses of previous tax years from Schedule 4 | 335 | | | |
| Taxable capital gains or taxable dividends allocated from a central credit union | 340 | | | |
| Prospector's and grubstaker's shares | 350 | | | |
| Subtotal | | | | B |
| Subtotal (amount A **minus** amount B) (if negative, enter "0") | | | | C |
| **Add:** Section 110.5 additions or subparagraph 115(1)(a)(vii) additions | 355 | | | D |
| **Taxable income** (amount C **plus** amount D) | 360 | | | |
| Income exempt under paragraph 149(1)(t) | 370 | | | |
| **Taxable income** for a corporation with exempt income under paragraph 149(1)(t) (line 360 **minus** line 370) | | | | Z |

* This amount is equal to 3.5 times the Part VI.1 tax payable at line 724 on page 8.

## Small business deduction

**Canadian-controlled private corporations (CCPCs) throughout the tax year**

| | | | |
|---|---|---|---|
| Income from active business carried on in Canada from Schedule 7 | 400 | | A |
| Taxable income from line 360 on page 3, **minus** 100/28 3.57143 of the amount on line 632* on page 7, **minus** 4 times the amount on line 636** on page 7, and **minus** any amount that, because of federal law, is exempt from Part I tax | 405 | | B |
| Business limit (see notes 1 and 2 below) | 410 | | C |

**Notes:**

1. For CCPCs that are not associated, enter $ 500,000 on line 410. However, if the corporation's tax year is less than 51 weeks, prorate this amount by the number of days in the tax year divided by 365, and enter the result on line 410.
2. For associated CCPCs, use Schedule 23 to calculate the amount to be entered on line 410.

**Business limit reduction:**

Amount C ____ x (415 *** ____ / 11,250) D = ____ E

Reduced business limit (amount C **minus** amount E) (if negative, enter "0") 425 ____ F

**Small business deduction**

Amount A, B, C, or F, whichever is the least ____ x 17 % = 430 ____ G

Enter amount G on line I on page 7.

* Calculate the amount of foreign non-business income tax credit deductible on line 632 without reference to the refundable tax on the CCPC's investment income (line 604) and without reference to the corporate tax reductions under section 123.4.

** Calculate the amount of foreign business income tax credit deductible on line 636 without reference to the corporation tax reductions under section 123.4.

*** **Large corporations**

- If the corporation is not associated with any corporations in both the current and previous tax years, the amount to be entered on line 415 is: (total taxable capital employed in Canada for the **prior year** minus $10,000,000) x 0.225%.
- If the corporation is not associated with any corporations in the current tax year, but was associated in the previous tax year, the amount to be entered on line 415 is: (total taxable capital employed in Canada for the **current year** minus $10,000,000) x 0.225%.
- For corporations associated in the current tax year, see Schedule 23 for the special rules that apply.

## General tax reduction for Canadian-controlled private corporations

**Canadian-controlled private corporations throughout the tax year**

| | | | | |
|---|---|---|---|---|
| Taxable income from page 3 (line 360 or amount Z, whichever applies) | | | | A |
| Lesser of amounts V and Y (line Z1) from Part 9 of Schedule 27 | | B | | |
| Amount QQ from Part 13 of Schedule 27 | | C | | |
| Personal service business income | 432 | D | | |
| Amount used to calculate the credit union deduction (amount F from Schedule 17) | | E | | |
| Amount from line 400, 405, 410, or 425 on page 4, whichever is the least | | F | | |
| Aggregate investment income from line 440 on page 6* | | G | | |
| Subtotal (**add** amounts B to G) | | | | H |
| Amount A **minus** amount H (if negative, enter "0") | | | | I |
| **General tax reduction for Canadian-controlled private corporations** – Amount I **multiplied** by 13 % | | | | J |

Enter amount J on line 638 on page 7.

* Except for a corporation that is, throughout the year, a cooperative corporation (within the meaning assigned by subsection 136(2)) or a credit union.

## General tax reduction

**Do not complete this area if you are a Canadian-controlled private corporation, an investment corporation, a mortgage investment corporation, a mutual fund corporation, or any corporation with taxable income that is not subject to the corporation tax rate of 38%.**

| | | | | |
|---|---|---|---|---|
| Taxable income from page 3 (line 360 or amount Z, whichever applies) | | | | K |
| Lesser of amounts V and Y (line Z1) from Part 9 of Schedule 27 | | L | | |
| Amount QQ from Part 13 of Schedule 27 | | M | | |
| Personal service business income | 434 | N | | |
| Amount used to calculate the credit union deduction (amount F from Schedule 17) | | O | | |
| Subtotal (**add** amounts L to O) | | | | P |
| Amount K **minus** amount P (if negative, enter "0") | | | | Q |
| **General tax reduction** – Amount Q **multiplied** by 13 % | | | | R |

Enter amount R on line 639 on page 7.

## FINANCIAL STATEMENTS

## DECEMBER 31, 2014

**HYDRO ONE REMOTE COMMUNITIES INC.**
**INDEPENDENT AUDITORS' REPORT**

To Directors of Hydro One Remote Communities Inc.

We have audited the accompanying financial statements of Hydro One Remote Communities Inc., which comprise the balance sheet as at December 31, 2014, the statements of operations and comprehensive income, changes in shareholder's deficit and cash flows for the year then ended, and notes, comprising a summary of significant accounting policies and other explanatory information.

*Management's Responsibility for the Financial Statements*

Management is responsible for the preparation and fair presentation of these financial statements in accordance with United States Generally Accepted Accounting Principles, and for such internal control as management determines is necessary to enable the preparation of financial statements that are free from material misstatement, whether due to fraud or error.

*Auditors' Responsibility*

Our responsibility is to express an opinion on these financial statements based on our audit. We conducted our audit in accordance with Canadian generally accepted auditing standards. Those standards require that we comply with ethical requirements and plan and perform the audit to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on our judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, we consider internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

*Opinion*

In our opinion, the financial statements present fairly, in all material respects, the financial position of Hydro One Remote Communities Inc. as at December 31, 2014, and its results of operations and its cash flows for the year then ended in accordance with United States Generally Accepted Accounting Principles.

## 1. DESCRIPTION OF THE BUSINESS

Hydro One Inc. (Hydro One) was incorporated on December 1, 1998, under the *Business Corporations Act* (Ontario) and is wholly owned by the Province of Ontario (Province). The principal businesses of Hydro One are the transmission and distribution of electricity to customers within Ontario.

Hydro One Remote Communities Inc. (Hydro One Remote Communities or the Company) was incorporated on August 18, 1998 under the *Business Corporations Act* (Ontario), and is a wholly owned subsidiary of Hydro One. Hydro One Remote Communities operates 19 small electrical, generation and distribution systems in remote communities in northern Ontario that are not connected to the Province's electricity grid. The Company's business is regulated by the Ontario Energy Board (OEB).

## 2. SIGNIFICANT ACCOUNTING POLICIES

### Basis of Accounting

These Financial Statements are prepared and presented in accordance with United States (US) Generally Accepted Accounting Principles (GAAP) and in Canadian dollars.

The Company uses a cost recovery model applied to achieve breakeven net income and the financial statements are prepared for the use of the OEB. Certain amounts presented in these Financial Statements represent allocations from Hydro One that are subject to review and approval by the OEB. Consolidated Financial Statements of Hydro One for the year ended December 31, 2014 have been prepared and are publicly available.

Hydro One Remote Communities performed an evaluation of subsequent events through to March 24, 2015, the date these Financial Statements were available to be issued, to determine whether any events or transactions warranted recognition and disclosure in these Financial Statements. No such events or transactions were identified.

### Use of Management Estimates

The preparation of financial statements requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities at the date of the financial statements and the reported amounts of revenues and expenses during the reporting periods. Management evaluates these estimates on an on-going basis based upon: historical experience; current conditions; and assumptions believed to be reasonable at the time the assumption is made with any adjustments being recognized in results of operations in the period they arise. Significant estimates relate to regulatory assets and regulatory liabilities, environmental liabilities, post-retirement and post-employment benefits, asset impairment, contingencies, unbilled revenue, allowance for doubtful accounts and deferred income tax assets and liabilities. Actual results may differ significantly from these estimates, which may be impacted by future decisions made by the OEB or the Province.

### Rate Setting

In October 2013, Hydro One Remote Communities filed an IRM application with the OEB for 2014 distribution rates, seeking approval for a rate increase of approximately 0.48%. On March 13, 2014, the OEB approved an increase of approximately 1.7% to basic rates for the distribution and generation of electricity, with an effective date of May 1, 2014. The final rate increase was adjusted by the OEB's updated rate adjustment parameters and Hydro One Remote Communities' IRM stretch factor.

In 2012, Hydro One Remote Communities filed a cost-of-service application for 2013 distribution rates. The application requested an increase of 3.45% to customer rates for generation and distribution and an increase of approximately $7 million to annual Rural and Remote Rate Protection (RRRP). In 2013, the OEB approved the proposed rate increase and annual RRRP of approximately $32 million.

### Regulatory Accounting

The OEB has the general power to include or exclude costs, revenues, losses or gains in the rates of a specific period, resulting in a change in the timing of accounting recognition from that which would have applied in an unregulated company. Such change in timing involves the application of rate-regulated accounting, giving rise to the recognition of regulatory assets and liabilities. The Company's regulatory assets represent certain amounts receivable from future customers and costs that have been deferred for accounting purposes because it is probable that they will be recovered in future rates. In addition, the Company has recorded regulatory liabilities that generally represent amounts that are refundable to future electricity customers. The Company continually assesses the likelihood of recovery of each of its regulatory assets and continues to believe that it is probable that the OEB will factor its regulatory assets and liabilities into the setting of future rates. If, at some future date, the Company judges that it is no longer probable that the OEB will include a regulatory asset or liability in setting future rates, the appropriate carrying amount will be reflected in results of operations in the period that the assessment is made.

Hydro One Remote Communities is regulated under a cost recovery model applied to achieve breakeven net income, after consideration of the recovery of / provision for payments in lieu of corporate income taxes (PILs). Any excess or deficiency in RRRP amounts necessary to lead to breakeven net income is added to, or drawn from, the Remote Rate Protection Revenue (RRPR) variance account. The balance in the RRPR variance account is subject to future review and disposition by the OEB.

### Revenue Recognition

Revenues are recognized on an accrual basis and include billed and unbilled revenues. Revenues attributable to the generation and delivery of electricity are based on OEB-approved distribution rates and are recognized as electricity is delivered to customers. The Company estimates monthly revenue for a period based on wholesale electricity purchases because customer meters are not generally read at the end of each month. At the end of each month, the electricity delivered to customers, but not billed, is estimated and revenue is recognized. The unbilled revenue estimate is affected by energy demand, weather, line losses and changes in the composition of customer classes.

Distribution revenue also includes RRRP which is an amount relating to rate protection for remote customers received from the Independent Electricity System Operator (IESO) based on a standardized customer rate that is approved by the OEB. Current legislation provides RRRP for prescribed classes of rural, residential and remote consumers by reducing the electricity rates that would otherwise apply.

Revenues are recorded net of indirect taxes.

### Accounts Receivable and Allowance for Doubtful Accounts

Billed accounts receivable are recorded at the invoiced amount and overdue amounts related to regulated billings bear interest at OEB approved rates. The allowance for doubtful accounts reflects the Company's best estimate of losses on accounts receivable balances. The allowance is based on accounts receivable aging, historical experience and other currently available information. The Company estimates the allowance for doubtful accounts on customer receivables by applying internally developed loss rates to the outstanding receivable balances by risk segment. Risk segments represent groups of customers with similar credit quality indicators and are computed based on various attributes, including number of days receivables are past due, delinquency of balances and payment history. Loss rates applied to the accounts receivable balances are based on historical average write-offs as a percentage of accounts receivable in each risk segment. An account is considered delinquent if the amount billed is not received within 120 days from the bill due date. Accounts receivable are written off against the allowance when they are deemed uncollectible. The existing allowance for uncollectible accounts will continue to be affected by changes in volume, prices and economic conditions.

Long-term accounts receivable are recorded at their invoiced amount and represent amounts due from specified First Nations. The component of long-term accounts receivable that is energy-related does not bear interest. These amounts are reduced by fixed-interval payments, received monthly throughout the term of the agreement. Provision for uncollectible amounts for this component is set at the inception of the balance and is maintained until settlement of those amounts. The provision for this component is monitored and adjusted only if required with management discretion. The component of long-term accounts

receivable that is non-energy related is reduced annually by a fixed incremental amount which is expensed through performance of the associated contract. There is no provision associated with these amounts.

**Corporate Income Taxes**

Under the *Electricity Act, 1998*, Hydro One Remote Communities is required to make (recover) PILs to (from) the Ontario Electricity Financial Corporation (OEFC). These payments are calculated in accordance with the rules for computing income and other relevant amounts contained in the *Income Tax Act* (Canada) and the *Taxation Act, 2007* (Ontario), as modified by the *Electricity Act, 1998*, and related regulations.

Current and deferred income taxes are computed based on the tax rates and tax laws enacted at the balance sheet date. Tax benefits associated with income tax positions taken, or expected to be taken, in a tax return are recorded only when the "more-likely-than-not" recognition threshold is satisfied and are measured at the largest amount of benefit that has a greater than 50% likelihood of being realized upon settlement. Management evaluates each position based solely on the technical merits and facts and circumstances of the position, assuming the position will be examined by a taxing authority having full knowledge of all relevant information. Significant management judgment is required to determine recognition thresholds and the related amount of tax benefits to be recognized in the Financial Statements. Management re-evaluates tax positions each period in which new information about recognition or measurement becomes available.

***Current Income Taxes***

The recovery of or the provision for current taxes and the assets and liabilities recognized for the current and prior periods are measured at the amounts receivable from, or payable to, the OEFC.

***Deferred Income Taxes***

Deferred income taxes are provided for using the liability method. Deferred income taxes are recognized based on the estimated future tax consequences attributable to temporary differences between the carrying amount of assets and liabilities in the Financial Statements and their corresponding tax bases.

Deferred income tax liabilities are generally recognized on all taxable temporary differences. Deferred tax assets are recognized to the extent that it is more-likely-than-not that these assets will be realized from taxable income available against which deductible temporary differences can be utilized.

Deferred income taxes are calculated at the tax rates that are expected to apply in the period when the liability is settled or the asset is realized, based on the tax rates and tax laws that have been enacted at the balance sheet date. Deferred income taxes that are not included in the rate-setting process are charged or credited to the Statements of Operations and Comprehensive Income.

If management determines that it is more-likely-than-not that some or all of a deferred income tax asset will not be realized, a valuation allowance is recorded against the deferred income tax asset to report the net balance at the amount expected to be realized. Previously unrecognized deferred income tax assets are reassessed at each balance sheet date and are recognized to the extent that it has become more-likely-than-not that the tax benefit will be realized.

The Company records regulatory assets and liabilities associated with deferred income taxes that will be included in the rate-setting process.

The Company uses the flow-through method to account for investment tax credits (ITCs) earned on eligible scientific research and experimental development expenditures, and apprenticeship job creation. Under this method, only non-refundable ITCs are recognized as a reduction to income tax expense.

**Inter-company Demand Facility**

Hydro One maintains pooled bank accounts for its use and for the use of its subsidiaries, including Hydro One Remote Communities. The balance in the inter-company demand facility represents the cumulative net effect of all deposits and

withdrawals made by the Company to and from the pooled cash accounts. Interest is earned on positive inter-company balances based on the average of the bankers' acceptance rate at the beginning and end of the month, less 0.02%. Interest is charged on overdraft inter-company balances based on the same bankers' acceptance rate, plus 0.15%.

**Fuel, Materials and Supplies**

Fuel is used in the generation of electricity. Materials and supplies represent consumables, small spare parts and construction materials held for internal construction and maintenance of property, plant and equipment. These assets are carried at average cost less any impairments recorded.

**Property, Plant and Equipment**

Property, plant and equipment is recorded at original cost, net of customer contributions received in aid of construction and any accumulated impairment losses. The cost of additions, including betterments and replacements of asset components, is included on the Balance Sheets as property, plant and equipment.

The original cost of property, plant and equipment includes direct materials, direct labour (including employee benefits), contracted services, attributable capitalized financing costs, and direct and indirect overheads that are related to the capital project or program. Indirect overheads include a portion of corporate costs such as finance, treasury, human resources, information technology and executive costs. Overhead costs, including corporate functions and field services costs, are capitalized on a fully allocated basis, consistent with an OEB-approved methodology.

Property, plant and equipment in service consists of generation, distribution, and administration and service assets. Property, plant and equipment also includes future use assets, such as major components and spare parts and capitalized project development costs associated with deferred capital projects.

***Generation***

Generation assets are used in the generation of electricity, including hydroelectric equipment, wind turbines, diesel generators, and tank farms.

***Distribution***

Distribution assets include assets related to the distribution of low-voltage electricity, including lines, poles, switches, transformers, protective devices, and metering systems.

***Administration and Service***

Administration and service assets include administrative buildings, personal computers, tools, and other minor assets.

**Capitalized Financing Costs**

Capitalized financing costs represent interest costs attributable to the construction of property, plant and equipment. The financing cost of attributable borrowed funds is capitalized as part of the acquisition cost of such assets. The capitalized portion of financing costs is a reduction to financing charges recognized in the Statements of Operations and Comprehensive Income. Capitalized financing costs are calculated using the Company's weighted average effective cost of debt.

**Construction in Progress**

Construction in progress consists of the capitalized cost of constructed assets that are not yet complete and which have not yet been placed in service.

### Depreciation

The cost of property, plant and equipment is depreciated on a straight-line basis based on the estimated remaining service life of each asset category.

The Company periodically initiates an external independent review of its property, plant and equipment depreciation rates, as required by the OEB. Any changes arising from such a review are implemented on a remaining service life basis, consistent with their inclusion in electricity rates. The last review resulted in changes to rates effective January 1, 2013.

A summary of average service lives and depreciation and amortization rates for the various classes of assets is included below:

| | Average Service Life | Rate (%) Range | Average |
|---|---|---|---|
| Generation | 22 years | 3% – 7% | 5% |
| Distribution | 48 years | 1% – 7% | 2% |
| Administration and service | 45 years | 2% – 20% | 4% |

In accordance with group depreciation practices, the original cost of property, plant and equipment, or major components thereof, that are normally retired, is charged to accumulated depreciation with no gain or loss being reflected in results of operations. Where a disposition of property, plant and equipment occurs through sale, a gain or loss is calculated based on proceeds and such gain or loss is included in depreciation expense. Depreciation expense also includes the costs incurred to remove property, plant and equipment assets where no asset retirement obligation has been recorded.

### Long-Lived Asset Impairment

When circumstances indicate the carrying value of long-lived assets may not be recoverable, the Company evaluates whether the carrying value of such assets has been impaired. For such long-lived assets, impairment exists when the carrying value exceeds the sum of the future estimated undiscounted cash flows expected to result from the use and eventual disposition of the asset. When alternative courses of action to recover the carrying amount of a long-lived asset are under consideration, a probability-weighted approach is used to develop estimates of future undiscounted cash flows. If the carrying value of the long-lived asset is not recoverable based on the estimated future undiscounted cash flows, an impairment loss is recorded, measured as the excess of the carrying value of the asset over its fair value. As a result, the asset's carrying value is adjusted to its estimated fair value. As at December 31, 2014, no asset impairment had been recorded.

### Costs of Arranging Debt Financing

For financial liabilities classified as other than held-for-trading, the Company defers the external transaction costs related to obtaining debt financing and presents such amounts as deferred debt issuance costs on the Balance Sheets. Deferred debt issuance costs are amortized over the contractual life of the related debt on an effective-interest rate basis and the amortization is included within financing charges in the Statements of Operations and Comprehensive Income. Transaction costs for items classified as held-for-trading are expensed immediately.

### Comprehensive Income

Comprehensive income is comprised of net income and other comprehensive income (OCI). OCI includes the amortization of net unamortized hedging losses on the Company's proportionate share of Hydro One's discontinued cash flow hedges. The Company amortizes its net unamortized hedging losses on discontinued cash flow hedges to financing charges using the effective interest method over the term of the associated hedged debt. Hydro One Remote Communities presents OCI and net income in a single continuous Statement of Operations and Comprehensive Income.

### Financial Assets and Liabilities

All financial assets and liabilities are classified into one of the following five categories: held-to-maturity investments; loans and receivables; held-for-trading; other liabilities; or available-for-sale. Financial assets and liabilities classified as held-for-

trading are measured at fair value. All other financial assets and liabilities are measured at amortized cost, except accounts receivable which are measured at the lower of cost or fair value. Accounts receivable are classified as loans and receivables. The Company considers the carrying amount of accounts receivable to be a reasonable estimate of fair value because of the short time to maturity of these instruments. Provisions for impaired accounts receivable are recognized as adjustments to the allowance for doubtful accounts and are recognized when there is objective evidence that the Company will not be able to collect amounts according to the original terms.

The Company determines the classification of its financial assets and liabilities at the date of initial recognition. The Company designates certain of its financial assets and liabilities to be held at fair value, when it is consistent with the Company's risk management policy disclosed in Note 11 – Fair Value of Financial Instruments and Risk Management.

Transaction costs associated with financial assets and liabilities that are designated as held-for-trading are recognized immediately in results of operations. All financial instrument transactions are recorded at trade date.

### Derivative Instruments and Hedge Accounting

The Company currently does not engage in derivative trading or speculative activities and had no derivative instruments outstanding at December 31, 2014. OCI includes the amortization of net unamortized hedging losses on the Company's proportionate share of Hydro One's discontinued cash flow hedges.

### Employee Future Benefits

Employee future benefits provided by Hydro One include pension, post-retirement and post-employment benefits. The costs of Hydro One's pension, post-retirement and post-employment benefit plans are recorded over the periods during which employees render service.

Hydro One recognizes the funded status of its pension, post-retirement and post-employment plans on its Consolidated Balance Sheets and subsequently recognizes the changes in funded status at the end of each reporting year. Pension, post-retirement and post-employment plans are considered to be underfunded when the projected benefit obligation exceeds the fair value of the plan assets. Liabilities are recognized in the Consolidated Balance Sheets of Hydro One for any net underfunded projected benefit obligation. The net underfunded projected benefit obligation may be disclosed as a current liability, long-term liability, or both. The current portion is the amount by which the actuarial present value of benefits included in the benefit obligation payable in the next 12 months exceeds the fair value of plan assets. If the fair value of plan assets exceeds the projected benefit obligation of the plan, an asset is recognized equal to the net overfunded projected benefit obligation. The post-retirement and post-employment benefit plans are unfunded because there are no related plan assets. For the year ended December 31, 2014, the measurement date for all plans was December 31.

#### *Pension benefits*

Hydro One has a contributory defined benefit pension plan covering all regular employees of Hydro One and its subsidiaries, including Hydro One Remote Communities, but not including Hydro One Brampton Inc and Norfolk Power Inc. The Hydro One pension plan does not segregate assets in a separate account for individual subsidiaries, nor is the obligation of the pension plan allocated to, or funded separately by, entities within the consolidated group. Accordingly, for purposes of these Financial Statements, the pension plan is accounted for as a defined contribution plan and no pension benefit asset or liability is recorded.

A detailed description of Hydro One pension benefits is provided in Note 15 – Pension and Post-Retirement and Post-Employment Benefits, to the Consolidated Financial Statements of Hydro One for the year ended December 31, 2014.

#### *Post-retirement and post-employment benefits*

Hydro One has post-retirement and post-employment benefit plans covering all regular employees of Hydro One and its subsidiaries, including Hydro One Remote Communities. The benefit obligations of the these post-retirement and post-employment benefit plans are not segregated, or funded separately, for Hydro One Remote Communities. Accordingly, for

purposes of these Financial Statements, the post-retirement and post-employment benefit obligations are allocated to the Company based on base pensionable earnings.

The Company records a regulatory asset equal to its allocated share of Hydro One's incremental net unfunded projected benefit obligation for post-retirement and post-employment plans at each year end based on annual actuarial reports. The regulatory asset for the incremental net unfunded projected benefit obligation for post-retirement and post-employment plans, in absence of regulatory accounting, would be recognized in accumulated OCI (AOCI). A regulatory asset is recognized because management considers it to be probable that post-retirement and post-employment benefit costs will be recovered in the future through the rate-setting process.

Post-retirement and post-employment benefits, are recorded and included in rates on an accrual basis. Costs are determined by independent actuaries using the projected benefit method prorated on service and based on assumptions that reflect management's best estimates. Past service costs from plan amendments are amortized to results of operations based on the expected average remaining service period.

For post-retirement benefits, all actuarial gains or losses are deferred using the "corridor" approach. The amount calculated above the "corridor" is amortized to results of operations on a straight-line basis over the expected average remaining service lives of active Hydro One employees in the plan and over the remaining life expectancy of inactive Hydro One employees in the plan. The post-retirement benefit obligation is remeasured to its fair value at each year end based on an annual actuarial report, with an offset to associated regulatory asset, to the extent of the remeasurement adjustment.

For post-employment obligations, the actuarial gains and losses that are incurred during the year are recognized immediately to results of operations. The post-employment benefit obligation is remeasured to its fair value at each year end based on an annual actuarial report, with an offset to associated regulatory asset, to the extent of the remeasurement adjustment.

All post-retirement and post-employment future benefit costs are attributed to labour and are either charged to results of operations or capitalized as part of the cost of property, plant and equipment and intangible assets.

A detailed description of Hydro One post-retirement and post-employment benefits is provided in Note 15 – Pension and Post-Retirement and Post-Employment Benefits, to the Consolidated Financial Statements of Hydro One for the year ended December 31, 2014.

**Loss Contingencies**

Hydro One Remote Communities is involved in certain legal and environmental matters that arise in the normal course of business. In the preparation of its Financial Statements, management makes judgements regarding the future outcome of contingent events and records a loss for a contingency based on its best estimate when it is determined that such loss is probable and the amount of the loss can be reasonably estimated. When a range estimate for the probable loss exists and no amount within the range is a better estimate than any other amount, the Company records a loss at the minimum amount within the range.

Management regularly reviews current information available to determine whether recorded provisions should be adjusted and whether new provisions are required. Estimating probable losses may require analysis of multiple forecasts and scenarios that often depend on judgements about potential actions by third parties, such as federal, provincial and local courts or regulators. Contingent liabilities are often resolved over long periods of time. Amounts recorded in the Financial Statements may differ from the actual outcome once the contingency is resolved. Such differences could have a material impact on future results of operations, financial position and cash flows of the Company.

Provisions are based upon current estimates and are subject to greater uncertainty the longer the projection period. A significant upward or downward trend in the number of claims filed, the nature of the alleged injury, and the average cost of resolving each such claim could change the estimated provision, as could any substantial adverse or favorable verdict at trial. A federal or provincial legislative outcome or structured settlement could also change the estimated liability. Legal fees are expensed as incurred.

**Environmental Liabilities**

Environmental liabilities are recorded in respect of past contamination when it is determined that future environmental remediation expenditures are probable under existing statute or regulation and the amount of the future expenditures can be reasonably estimated. Hydro One Remote Communities records a liability for the estimated future expenditures associated with the contaminated land assessment and remediation (LAR) based on the present value of these estimated future expenditures. The Company determines the present value with a discount rate equal to its credit-adjusted risk-free interest rate on financial instruments with comparable maturities to the pattern of future environmental expenditures. As the Company anticipates that the future expenditures will continue to be recoverable in future rates, an offsetting regulatory asset has been recorded to reflect the future recovery of these environmental expenditures from customers. Hydro One Remote Communities reviews its estimates of future environmental expenditures annually or more frequently if there are indications that circumstances have changed.

## 3. NEW ACCOUNTING PRONOUNCEMENTS

**Recently Adopted Accounting Pronouncements**

In July 2013, the Financial Accounting Standards Board (FASB) issued Accounting Standards Update (ASU) 2013-11, Income Taxes (Topic 740): Presentation of an Unrecognized Tax Benefit When a Net Operating Loss Carryforward, a Similar Tax Loss, or a Tax Credit Carryforward Exists. This ASU provides guidance on the presentation of unrecognized tax benefits. This ASU is effective for fiscal years, and interim periods within those years, beginning after December 15, 2013, and should be applied prospectively to all unrecognized tax benefits that exist at the effective date. The adoption of this ASU did not have a significant impact on the Company's financial statements.

**Recent Accounting Guidance Not Yet Adopted**

In May 2014, the FASB issued ASU 2014-09, Revenue from Contracts with Customers (Topic 606). This ASU provides guidance on revenue recognition that depicts the transfer of promised goods or services to customers in an amount that reflects the consideration to which the entity expects to be entitled in exchange for those goods and services. This ASU is required to be applied retrospectively and is effective for fiscal years, and interim periods within those years, beginning after December 15, 2016. The Company is currently assessing the impact of adoption of ASU 2014-09 on its financial statements.

In August 2014, the FASB issued ASU 2014-15, Presentation of Financial Statements – Going Concern (Subtopic 205-40): Disclosure of Uncertainties about an Entity's Ability to Continue as a Going Concern. This ASU provides guidance about management's responsibility to evaluate whether there is substantial doubt about an entity's ability to continue as a going concern and related disclosures. This ASU is effective for the annual period ending December 31, 2016, and for annual and interim periods thereafter. The adoption of this ASU is not anticipated to have a significant impact on the Company's financial statements.

## 4. DEPRECIATION AND AMORTIZATION

| *Year ended December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Depreciation of property, plant and equipment | 2,594 | 2,564 |
| Asset removal costs | 430 | 589 |
| Amortization of regulatory assets | 1,599 | 1,656 |
| | 4,623 | 4,809 |

## 5. FINANCING CHARGES

| *Year ended December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Interest on long-term debt | 1,477 | 1,237 |
| Interest on inter-company demand facility | 187 | 216 |
| Amortization of hedging losses | 13 | 13 |
| Other | 28 | 14 |
| Less: Interest capitalized on construction in progress | (146) | (376) |
| | 1,559 | 1,104 |

## 6. PROVISION FOR PILS

The provision for PILs differs from the amount that would have been recorded using the combined Canadian Federal and Ontario statutory income tax rate. The reconciliation between the statutory and the effective tax rates is provided as follows:

| *Year ended December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Income (loss) before provision for (recovery of) PILs | 10 | (1,091) |
| Canadian Federal and Ontario statutory income tax rate | 26.50% | 26.50% |
| Provision for (recovery of) PILs at statutory rate | 3 | (289) |
| | | |
| Increase (decrease) resulting from: | | |
| | | |
| Net temporary differences included in amounts charged to customers: | | |
| RRPR variance account | (687) | (318) |
| Environmental expenditures | (424) | (439) |
| Pension contribution in excess of pension expense | (132) | (90) |
| Overheads capitalized for accounting but deducted for tax purposes | (93) | (82) |
| Interest capitalized for accounting but deducted for tax purposes | (39) | (100) |
| Losses carryforward | 846 | – |
| Depreciation and amortization in excess of capital cost allowance | 338 | 469 |
| Post-retirement and post-employment benefit expense in excess of cash payments | 189 | 135 |
| Other | – | 56 |
| Net temporary differences | (2) | (369) |
| Prior year adjustments | 10 | (332) |
| Rate difference on loss carryback | – | (110) |
| Other permanent differences | (1) | 9 |
| Total provision for (recovery of) PILs | 10 | (1,091) |
| | | |
| Current provision for (recovery of) PILs | 10 | (1,091) |
| Deferred provision for (recovery of) PILs | – | – |
| Total provision for (recovery of) PILs | 10 | (1,091) |
| | | |
| Effective income tax rate | 100% | 100% |

The current provision for PILs is remitted to, or received from, the OEFC. At December 31, 2014, the amount receivable from the OEFC was $2,683 thousand (2013 – $2,697 thousand).

### Deferred Income Tax Assets

Deferred income tax assets and liabilities arise from differences between the carrying amounts and tax bases of the Company's assets and liabilities. At December 31, 2014 and 2013, deferred income tax assets and liabilities consisted of the following:

| *December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| **Deferred income tax assets** | | |
| Post-retirement and post-employment benefits expense in excess of cash payments | 4,762 | 4,466 |
| Environmental expenditures | 4,459 | 4,840 |
| Depreciation and amortization in excess of capital cost allowance | 1,231 | 1,845 |
| Non capital losses | 1,183 | – |
| Regulatory amounts not recognized for tax | (7,060) | (6,615) |
| Other | (242) | (189) |
| Total deferred income tax assets | 4,333 | 4,347 |
| Less: current portion | 120 | 108 |
| | 4,213 | 4,239 |

During 2014 and 2013, there was no change in the rate applicable to future taxes.

## 7. ACCOUNTS RECEIVABLE

| *December 31 (thousands of Canadian dollars)* | Current accounts receivable | Long-term accounts receivable | Total |
|---|---|---|---|
| **2014** | | | |
| Accounts receivable – billed | 3,214 | 1,409 | 4,623 |
| Accounts receivable – unbilled | 1,385 | – | 1,385 |
| Accounts receivable, gross | 4,599 | 1,409 | 6,008 |
| Allowance for doubtful accounts | (145) | (159) | (304) |
| Accounts receivable, net | 4,454 | 1,250 | 5,704 |
| | | | |
| **2013** | | | |
| Accounts receivable – billed | 3,887 | 674 | 4,561 |
| Accounts receivable – unbilled | 1,404 | – | 1,404 |
| Accounts receivable, gross | 5,291 | 674 | 5,965 |
| Allowance for doubtful accounts | (296) | – | (296) |
| Accounts receivable, net | 4,995 | 674 | 5,669 |

The following table shows the movements in the total allowance for doubtful accounts for the years ended December 31, 2014 and 2013:

| *Year ended December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Allowance for doubtful accounts – January 1 | (296) | (302) |
| Write-offs | 77 | 95 |
| Adjustments to allowance for doubtful accounts | (85) | (89) |
| Allowance for doubtful accounts – December 31 | (304) | (296) |

## 8. PROPERTY, PLANT AND EQUIPMENT

| *December 31 (thousands of Canadian dollars)* | Costs | Accumulated Depreciation | Construction in Progress | Total |
|---|---|---|---|---|
| **2014** | | | | |
| Generation | 44,770 | 20,385 | 1,742 | 26,127 |
| Distribution | 9,488 | 1,906 | 99 | 7,681 |
| Administration and Service | 11,110 | 2,297 | 297 | 9,110 |
| | 65,368 | 24,588 | 2,138 | 42,918 |
| **2013** | | | | |
| Generation | 41,616 | 19,517 | 2,716 | 24,815 |
| Distribution | 8,394 | 1,748 | 596 | 7,242 |
| Administration and Service | 10,545 | 1,991 | 161 | 8,715 |
| | 60,555 | 23,256 | 3,473 | 40,772 |

Financing charges capitalized on property, plant and equipment under construction were $146 thousand in 2014 (2013 – $376 thousand).

## 9. REGULATORY ASSETS AND LIABILITIES

Regulatory assets and liabilities arise as a result of the rate-making process. Hydro One Remote Communities has recorded the following regulatory assets and liabilities:

| *December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| **Regulatory assets:** | | |
| Environmental | 12,369 | 13,426 |
| RRPR variance account | 4,578 | 1,985 |
| Post-retirement and post-employment benefits | 2,637 | 2,939 |
| Total regulatory assets | 19,584 | 18,350 |
| Less: current portion | 1,301 | 2,427 |
| | 18,283 | 15,923 |
| **Regulatory liabilities:** | | |
| Deferred income tax regulatory liability | 4,333 | 4,347 |
| Total regulatory liabilities | 4,333 | 4,347 |
| Less: current portion | 120 | 109 |
| | 4,213 | 4,238 |

### Environmental

The Company records a liability for the estimated future expenditures required to remediate environmental contamination. Management considers it probable that such expenditures will be recovered in the future through the rate-setting process, and as such, the Company has recorded an equivalent amount as a regulatory asset. In 2014, this regulatory asset increased by $180 thousand (2013 – $2,872 thousand) to reflect related changes in the Company's environmental liabilities. The environmental regulatory asset is amortized to results of operations based on the pattern of actual expenditures incurred and charged to environmental liabilities. The OEB has the discretion to examine and assess the prudency and the timing of recovery of all of the Company's actual environmental expenditures. In the absence of rate-regulated accounting, 2014 operation, maintenance and administration expenses would have been higher by $180 thousand (2013 – $2,872 thousand). In addition, 2014 amortization expense would have been lower by $1,598 thousand (2013 – $1,656 thousand), and 2014 financing charges would have been higher by $361 thousand (2013 – $330 thousand).

**RRPR Variance Account**

Hydro One Remote Communities receives RRRP amounts from the IESO. At December 31, 2014, the Company has recognized a regulatory asset representing the amounts required to achieve breakeven net income, as regulated under the cost recovery model, in excess of net RRRP amounts received. At December 31, 2013, net RRRP amounts received were also lower than amounts required to achieve breakeven net income, and as such, a regulatory asset was also recognized. In the absence of rate-regulated accounting, 2014 revenue would have been lower by $2,593 thousand (2013 – $1,198 thousand).

**Post-Retirement and Post-Employment Benefits**

The Company recognizes the net unfunded status of post-retirement and post-employment obligations on the Balance Sheets with an incremental offset to the associated regulatory assets. A regulatory asset is recognized because management considers it to be probable that post-retirement and post-employment benefit costs will be recovered in the future through the rate-setting process. The post-retirement and post-employment benefit obligation is remeasured to its fair value at each year end based on an annual actuarial report, with an offset to the associated regulatory asset, to the extent of the remeasurement adjustment. In the absence of rate-regulated accounting, 2014 OCI would have been higher by $302 thousand (2013 – $205 thousand).

**Deferred Income Tax Regulatory Liability**

Deferred income taxes are recognized on temporary differences between the carrying amount of assets and liabilities in the financial statements and the corresponding tax bases used in the computation of taxable profit. The Company has recognized regulatory assets and liabilities that correspond to deferred income taxes that flow through the rate-setting process. In the absence of rate-regulated accounting, the Company's provision for PILs would have been recognized using the liability method and there would be no regulatory accounts established for taxes to be recovered through future rates. As a result, the 2014 recovery of PILs would have been lower by approximately $2 thousand (2013 – $367 thousand).

## 10. LONG-TERM DEBT

Long-term debt totalling $33,000 thousand is payable to Hydro One and consists of a $23,000 thousand note maturing in 2036 and a $10,000 thousand note maturing in 2044.

The $23,000 thousand note was issued on May 19, 2005, with an interest rate of 5.38% per annum and a maturity date of May 20, 2036. The note was issued on maturity of a previous note in the same principal amount that was issued on April 1, 1999 in consideration of the purchase price of Hydro One Remote Communities' net assets. On issuance of this note, $115 thousand of transaction costs and a $31 thousand debt discount incurred by Hydro One were allocated to Hydro One Remote Communities, based on its proportionate share of Hydro One's related debt issue.

The $10,000 thousand note was issued on June 6, 2014, with an interest rate of 4.19% per annum and a maturity date of June 6, 2044. On issuance of this note, $50 thousand of transaction costs and a $10 thousand debt discount incurred by Hydro One were allocated to Hydro One Remote Communities, based on its proportionate share of Hydro One's related debt issue.

## 11. FAIR VALUE OF FINANCIAL INSTRUMENTS AND RISK MANAGEMENT

Fair value is considered to be the exchange price in an orderly transaction between market participants to sell an asset or transfer a liability at the measurement date. The fair value definition focuses on an exit price, which is the price that would be received in the sale of an asset or the amount that would be paid to transfer a liability.

Hydro One Remote Communities classifies its fair value measurements based on the following hierarchy, as prescribed by the accounting guidance for fair value, which prioritizes the inputs to valuation techniques used to measure fair value into three levels:

Level 1 inputs are unadjusted quoted prices in active markets for identical assets or liabilities that Hydro One Remote Communities has the ability to access. An active market for the asset or liability is one in which transactions for the asset or liability occurs with sufficient frequency and volume to provide ongoing pricing information.

Level 2 inputs are those other than quoted market prices that are observable, either directly or indirectly, for an asset or liability. Level 2 inputs include, but are not limited to, quoted prices for similar assets or liabilities in an active market, quoted prices for identical or similar assets or liabilities in markets that are not active and inputs other than quoted market prices that are observable for the asset or liability, such as interest rate curves and yield curves observable at commonly quoted intervals, volatilities, credit risk and default rates. A Level 2 measurement cannot have more than an insignificant portion of the valuation based on unobservable inputs.

Level 3 inputs are any fair value measurements that include unobservable inputs for the asset or liability for more than an insignificant portion of the valuation. A Level 3 measurement may be based primarily on Level 2 inputs.

**Non-Derivative Financial Assets and Liabilities**

At December 31, 2014 and 2013, the Company's carrying amounts of accounts receivable, inter-company demand facility, and accounts payable are representative of fair value because of the short-term nature of these instruments.

**Fair Value Hierarchy**

The fair value hierarchy of financial assets and liabilities at December 31, 2014 and 2013 are as follows:

| *December 31, 2014 (thousands of Canadian dollars)* | Carrying Value | Fair Value | Level 1 | Level 2 | Level 3 |
|---|---|---|---|---|---|
| **Liabilities:** | | | | | |
| Inter-company demand facility | 6,806 | 6,806 | 6,806 | – | – |
| Long-term debt | 33,000 | 39,226 | – | 39,226 | – |
| | 39,806 | 46,032 | 6,806 | 39,226 | – |

| *December 31, 2013 (thousands of Canadian dollars)* | Carrying Value | Fair Value | Level 1 | Level 2 | Level 3 |
|---|---|---|---|---|---|
| **Liabilities:** | | | | | |
| Inter-company demand facility | 18,031 | 18,031 | 18,031 | – | – |
| Long-term debt | 23,000 | 25,450 | – | 25,450 | – |
| | 41,031 | 43,481 | 18,031 | 25,450 | – |

The fair value of the long-term debt is based on unadjusted period-end market prices for the same or similar debt of the same remaining maturities.

There were no significant transfers between any of the levels during the years ended December 31, 2014 and 2013.

**Risk Management**

Exposure to market risk, credit risk and liquidity risk arises in the normal course of the Company's business.

***Market Risk***

Market risk refers primarily to the risk of loss that results from changes in commodity prices, foreign exchange rates and interest rates. The Company does not have commodity risk. The foreign exchange risk is currently not significant, although Hydro One could in the future decide to issue and allocate foreign currency-denominated debt to the Company, along with an allocation of the resulting foreign exchange gains and losses. The Company is exposed to fluctuations in interest rates related to the interest charges passed on by Hydro One on the outstanding inter-company demand facility. The Company is charged interest on overdraft inter-company balances based on the one-month bankers' acceptance rate, plus 0.15%.

***Credit Risk***

Financial assets create a risk that a counterparty will fail to discharge an obligation, causing a financial loss. At December 31, 2014 and 2013, there were no significant concentrations of credit risk with respect to any class of financial assets. The Company's revenue is earned from a broad base of customers. As a result, Hydro One Remote Communities did not earn a significant amount of revenue from any individual customer. At December 31, 2014 and 2013, there was no significant accounts receivable balance due from any single customer.

At December 31, 2014, the Company's total provision for bad debts was $304 thousand (2013 – $296 thousand). Adjustments and write-offs are determined on the basis of a review of overdue accounts, taking into consideration historical experience. At December 31, 2014, approximately 36% of the Company's current accounts receivable were aged more than 60 days (2013 – 47%). Sufficient allowances have been recorded to reflect the risk of potential credit losses.

***Liquidity Risk***

Liquidity risk refers to the Company's ability to meet its financial obligations as they come due. Hydro One Remote Communities meets its short-term liquidity requirements through the inter-company demand facility with Hydro One and funds from operations. The short-term liquidity available to the Company should be sufficient to fund normal operating requirements.

At December 31, 2014, accounts payable and accrued liabilities in the amount of $9,812 thousand (2013 – $5,657 thousand) are expected to be settled in cash at their carrying amounts within the next year.

At December 31, 2014, Hydro One Remote Communities had long-term debt in the principal amount of $33,000 thousand (2013 – $23,000 thousand). No long-term debt matures during the next year. Interest payments for the next 12 months on the Company's outstanding long-term debt amount to $1,656 thousand (2013 – $1,237 thousand). Principal repayments and interest payments are summarized by the number of years to maturity in the following table.

| **Years to Maturity** | **Principal Repayments on Long-term Debt** *(thousands of Canadian dollars)* | **Interest Payments** *(thousands of Canadian dollars)* | **Weighted Average Interest Rate** *(%)* |
|---|---|---|---|
| 1 year | – | 1,656 | 5.019 |
| 2 years | – | 1,656 | 5.019 |
| 3 years | – | 1,656 | 5.019 |
| 4 years | – | 1,656 | 5.019 |
| 5 years | – | 1,656 | 5.019 |
| | – | 8,280 | 5.019 |
| 6 – 10 years | – | 8,280 | 5.019 |
| Over 10 years | 33,000 | 22,405 | 5.019 |
| | 33,000 | 38,965 | 5.019 |

## 12. PENSION AND POST-RETIREMENT AND POST-EMPLOYMENT BENEFITS

Hydro One has a defined benefit pension plan, a supplementary pension plan, and post-retirement and post-employment benefit plans. The defined benefit pension plan (Pension Plan) is contributory and covers all regular employees of Hydro One and its subsidiaries, except Hydro One Brampton Networks. The supplementary pension plan provides members of the Pension Plan with benefits that would have been earned and payable under the Pension Plan but for the limitations imposed by the *Income Tax Act* (Canada). The supplementary pension plan obligation is included with other post-retirement and post-employment benefit obligations on the Balance Sheets.

**Pension Benefits**

The Pension Plan provides benefits based on highest three-year average pensionable earnings. For new management employees who commenced employment on or after January 1, 2004, and for new Society of Energy Professionals

represented staff hired after November 17, 2005, benefits are based on highest five-year average pensionable earnings. After retirement, pensions are indexed to inflation.

Company and employees' contributions to the Pension Plan are based on actuarial valuations performed at least every three years. Hydro One's annual Pension Plan contributions for 2014 of $174 million (2013 – $160 million) were based on an actuarial valuation effective December 31, 2013 (2013 – effective December 31, 2011) and the level of 2014 pensionable earnings. Estimated annual Pension Plan contributions for 2015 and 2016 are approximately $174 million and $175 million, respectively, based on an actuarial valuation as at December 31, 2013 and projected levels of pensionable earnings. Future minimum contributions beyond 2016 will be based on an actuarial valuation effective no later than December 31, 2016. Contributions are payable one month in arrears. All of the contributions are expected to be in the form of cash.

At December 31, 2014, based on the December 31, 2013 actuarial valuation, the present value of Hydro One's projected pension benefit obligation was estimated to be $7,535 million (2013 – $6,576 million). The fair value of pension plan assets available for these benefits was $6,299 million (2013 – $5,731 million).

**Post-Retirement and Post-Employment Benefits**

During the year ended December 31, 2014, Hydro One Remote Communities charged $941 thousand (2013 – $775 thousand) of post-retirement and post-employment benefit costs to results of operations, and capitalized $272 thousand (2013 – $250 thousand) as part of the cost of property, plant and equipment. Benefits paid by the Company in 2014 were $91 thousand (2013 – $264 thousand). In addition, the incremental offset to decrease the associated post-retirement and post-employment benefits regulatory assets by $302 thousand (2013 – $205 thousand) was recorded on the Company's Balance Sheets to reflect the expected regulatory inclusion of this amount in future rates, which would otherwise be recorded in OCI.

The Company presents its post-retirement and post-employment benefit liability on the Balance Sheets within the following line items:

| *December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Accrued liabilities | 346 | 300 |
| Post-retirement and post-employment benefit liability | 12,862 | 12,088 |
| | 13,208 | 12,388 |

## 13. ENVIRONMENTAL LIABILITIES

The Company has accrued the following discounted amounts for environmental liabilities on the Balance Sheets at December 31, 2014 and 2013:

| *December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Environmental liabilities, January 1 | 13,426 | 11,880 |
| Interest accretion | 361 | 330 |
| Expenditures | (1,598) | (1,656) |
| Revaluation adjustment | 180 | 2,872 |
| Environmental liabilities, December 31 | 12,369 | 13,426 |
| Less: current portion | 1,301 | 2,427 |
| | 11,068 | 10,999 |

The following table illustrates the reconciliation between the undiscounted basis of the environmental liabilities and the amount recognized on the Balance Sheets after factoring in the discount rate:

| *December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Undiscounted environmental liabilities, December 31 | 12,881 | 14,014 |
| Less: discounting accumulated liabilities to present value | 512 | 588 |
| Discounted environmental liabilities, December 31 | 12,369 | 13,426 |

At December 31, 2014, the estimated future environmental expenditures were as follows:

| *(thousands of Canadian dollars)* | |
|---|---|
| 2015 | 1,301 |
| 2016 | 2,619 |
| 2017 | 2,717 |
| 2018 | 1,851 |
| 2019 | 1,657 |
| Thereafter | 2,736 |
| | 12,881 |

The Company records a liability for the estimated future expenditures for the contaminated LAR when it is determined that future environmental remediation expenditures are probable under existing statute or regulation and the amount of the future expenditures can be reasonably estimated.

There are uncertainties in estimating future environmental costs due to potential external events such as changes in legislation or regulations, and advances in remediation technologies. In determining the amounts to be recorded as environmental liabilities, the Company estimates the current cost of completing required work and makes assumptions as to when the future expenditures will actually be incurred, in order to generate future cash flow information. A long-term inflation rate assumption of approximately 2% has been used to express these current cost estimates as estimated future expenditures. Future expenditures have been discounted using factors ranging from approximately 3.6% to 4.9%, depending on the appropriate rate for the period when expenditures are expected to be incurred. All factors used in estimating the Company's environmental liabilities represent management's best estimates of the present value of costs required to meet existing legislation or regulations. However, it is reasonably possible that numbers or volumes of contaminated assets, cost estimates to perform work, inflation assumptions and the assumed pattern of annual cash flows may differ significantly from the Company's current assumptions.

The Company's best estimate of the total estimated future expenditures to complete its LAR program is $12,881 thousand. These expenditures are expected to be incurred over the period from 2015 to 2020. As a result of its annual review of environmental liabilities, the Company recorded a revaluation adjustment in 2014 to increase the LAR environmental liability by $180 thousand (2013 – $2,872 thousand).

## 14. SHARE CAPITAL

### Common Shares

The Company has 2 issued and outstanding common shares. The Company is authorized to issue an unlimited number of common shares.

### Dividends

The Company has no retained earnings and does not pay dividends under its breakeven business model.

## 15. RELATED PARTY TRANSACTIONS

Hydro One Remote Communities is a subsidiary of Hydro One, and Hydro One is owned by the Province. The OEFC, IESO, Ontario Power Authority (OPA), Ontario Power Generation Inc. (OPG) and the OEB are related parties to Hydro One Remote Communities because they are controlled or significantly influenced by the Province. Transactions between these parties and Hydro One Remote Communities are described below.

Hydro One Remote Communities receives amounts for RRRP from the IESO. RRRP amounts received for the year ended December 31, 2014 were $32,259 thousand (2013 – $33,046 thousand). Consistent with its breakeven business model, the Company recognized $34,852 thousand as RRRP revenue in 2014 (2013 – $34,245 thousand). This 2014 revenue exceeded amounts received by $2,593 thousand (2013 – $1,199 thousand) and the RRPR variance account balance was adjusted by this amount.

PILs are paid to or received from the OEFC.

The amounts due to and from related parties as a result of the transactions referred to above are as follows:

| *December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Accounts receivable | 106 | 97 |
| Income tax receivable | 2,683 | 2,697 |

Transactions with related parties occur at normal market prices or at a proxy for fair value based on the requirements of the OEB's Affiliate Relationships Code. Outstanding balances at period end are interest free and settled in cash.

### Hydro One and Subsidiaries

The Company provides services to, and receives services from, Hydro One and its other subsidiaries. Amounts due to and from Hydro One and its other subsidiaries are settled through the inter-company demand facility.

The Company has entered into various agreements with Hydro One and its other subsidiaries related to the provision of corporate functions and services, such as legal, financial and human resources services, and operational services, such as environmental, forestry, and line services. 2014 revenues include $109 thousand (2013 – $195 thousand) related to the provision of services to Hydro One and its other subsidiaries. 2014 operation, maintenance and administration costs include $2,958 thousand (2013 – $3,475 thousand) related to the purchase of services from Hydro One and its other subsidiaries.

The Company's long-term debt is due to Hydro One. In addition, balances payable or receivable under the inter-company demand facility are due to or from Hydro One and its other subsidiaries. Financing charges include interest expense on the long-term debt in the amount of $1,477 thousand (2013 – $1,237 thousand), and interest expense on the inter-company demand facility in the amount of $187 thousand (2013 – $216 thousand). At December 31, 2014, the Company had accrued interest payable to Hydro One totaling $172 thousand (2013 – $142 thousand).

## 16. STATEMENTS OF CASH FLOWS

The changes in non-cash balances related to operations consist of the following:

| *Year ended December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Accounts receivable | 541 | (802) |
| Materials and supplies | (356) | 443 |
| Income taxes receivable | 14 | (1,108) |
| Long-term accounts receivable | (576) | (256) |
| Accounts payable | 173 | (284) |
| Accrued liabilities | 5,105 | (1,526) |
| Accrued interest | 30 | – |
| Post-retirement and post-employment benefit liability | 1,076 | 760 |
| | 6,007 | (2,773) |
| **Supplementary information:** | | |
| Net interest paid | 1,447 | 1,453 |

As a result of using the cost recovery model applied to achieve after tax breakeven net income, any PILs paid are fully recovered.

## 17. CONTINGENCIES

### Legal Proceedings

Hydro One Remote Communities is involved in various lawsuits, claims and regulatory proceedings in the normal course of business. In the opinion of management, the outcome of such matters will not have a material adverse effect on the Company's financial position, results of operations or cash flows.

### Transfer of Assets

The transfer orders by which Hydro One acquired certain of Ontario Hydro's businesses as of April 1, 1999 did not transfer title to some assets located on Reserves (as defined in the *Indian Act* (Canada)). Currently, the OEFC holds these assets. Under the terms of the transfer orders, Hydro One is required to manage these assets until it has obtained all consents necessary to complete the transfer of title of these assets to itself. Hydro One cannot predict the aggregate amount that it may have to pay, either on an annual or one-time basis, to obtain the required consents. In 2014, Hydro One paid approximately $1 million (2013 – $2 million) in respect of these consents. If Hydro One or the Company cannot obtain the required consents, the OEFC will continue to hold these assets for an indefinite period of time. If Hydro One cannot reach a satisfactory settlement, it may have to relocate these assets to other locations at a cost that could be substantial or, in a limited number of cases, to abandon a line and replace it with diesel-generation facilities. The costs relating to these assets could have a material adverse effect on Hydro One's and the Company's results of operations if Hydro One is not able to recover them in future rate orders.

## 18. COMMITMENTS

### Operating Lease

Hydro One Remote Communities is committed as lessee to an operating lease agreement for use of reserve land to operate a hydro facility for a period of 10 years.

During the year ended December 31, 2014, the Company made lease payments totalling $120 thousand (2013 – $1 million). At December 31, 2014, the future minimum lease payments under non-cancellable operating leases were as follows: 2015 – $120 thousand; 2016 – $120 thousand; 2017 – $120 thousand; 2018 – $150 thousand; 2019 – $150 thousand; and thereafter – $450 thousand.

# Notes checklist

| Corporation's name | Business number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2014-12-31 |

- Parts 1, 2, and 3 of this schedule must be completed from the perspective of the person (referred to in these parts as the **accountant**) who prepared or reported on the financial statements. If the person preparing the tax return is not the accountant referred to above, they must still complete Parts 1, 2, 3, and 4, as applicable.
- For more information, see Guide RC4088, *General Index of Financial Information (GIFI)* and Guide T4012, *T2 Corporation – Income Tax Guide*.
- Complete this schedule and include it with your T2 return along with the other GIFI schedules.

## Part 1 – Information on the accountant who prepared or reported on the financial statements

| Question | Line | 1 Yes | 2 No |
|---|---|---|---|
| Does the accountant have a professional designation? | 095 | X | |
| Is the accountant connected* with the corporation? | 097 | | X |

* A person connected with a corporation can be: (i) a shareholder of the corporation who owns more than 10% of the common shares; (ii) a director, an officer, or an employee of the corporation; or (iii) a person not dealing at arm's length with the corporation.

**Note**
If the accountant does not have a professional designation **or** is connected to the corporation, you do not have to complete Parts 2 and 3 of this schedule. However, you **do have** to complete Part 4, as applicable.

## Part 2 – Type of involvement with the financial statements

Choose the option that represents the highest level of involvement of the accountant: **198**

| Option | No. | |
|---|---|---|
| Completed an auditor's report | 1 | X |
| Completed a review engagement report | 2 | |
| Conducted a compilation engagement | 3 | |

## Part 3 – Reservations

If you selected option **1** or **2** under **Type of involvement with the financial statements** above, answer the following question:

| Question | Line | 1 Yes | 2 No |
|---|---|---|---|
| Has the accountant expressed a reservation? | 099 | | X |

## Part 4 – Other information

If you have a professional designation and are not the accountant associated with the financial statements in Part 1 above, choose one of the following options: **110**

| Option | No. | |
|---|---|---|
| Prepared the tax return (financial statements prepared by client) | 1 | X |
| Prepared the tax return and the financial information contained therein (financial statements have not been prepared) | 2 | |

| Question | Line | 1 Yes | 2 No |
|---|---|---|---|
| Were notes to the financial statements prepared? | 101 | X | |

If **yes**, complete lines 104 to 107 below:

| Question | Line | 1 Yes | 2 No |
|---|---|---|---|
| Are subsequent events mentioned in the notes? | 104 | | X |
| Is re-evaluation of asset information mentioned in the notes? | 105 | | X |
| Is contingent liability information mentioned in the notes? | 106 | X | |
| Is information regarding commitments mentioned in the notes? | 107 | X | |
| Does the corporation have investments in joint venture(s) or partnership(s)? | 108 | | X |

## Part 4 – Other information (continued)

**Impairment and fair value changes**

In any of the following assets, was an amount recognized in net income or other comprehensive income (OCI) as a result of an impairment loss in the tax year, a reversal of an impairment loss recognized in a previous tax year, or a change in fair value during the tax year? . . . . . **200** 1 Yes [ ] 2 No [X]

If **yes**, enter the amount recognized:

| | | In net income Increase (decrease) | | In OCI Increase (decrease) |
|---|---|---|---|---|
| Property, plant, and equipment | 210 | | 211 | |
| Intangible assets | 215 | | 216 | |
| Investment property | 220 | | | |
| Biological assets | 225 | | | |
| Financial instruments | 230 | | 231 | |
| Other | 235 | | 236 | |

**Financial instruments**

Did the corporation derecognize any financial instrument(s) during the tax year (other than trade receivables)? . . . . . **250** 1 Yes [ ] 2 No [X]

Did the corporation apply hedge accounting during the tax year? . . . . . **255** 1 Yes [ ] 2 No [X]

Did the corporation discontinue hedge accounting during the tax year? . . . . . **260** 1 Yes [ ] 2 No [X]

**Adjustments to opening equity**

Was an amount included in the opening balance of retained earnings or equity, in order to correct an error, to recognize a change in accounting policy, or to adopt a new accounting standard in the current tax year? . . . . . **265** 1 Yes [ ] 2 No [X]

If **yes**, you have to maintain a separate reconciliation.

## 8. PROPERTY, PLANT AND EQUIPMENT

| *December 31 (thousands of dollars)* | Costs | Accumulated Depreciation | Construction in Progress | Total |
|---|---|---|---|---|
| **2013** | | | | |
| Generation | 41,616 | 19,517 | 2,716 | 24,815 |
| Distribution | 8,394 | 1,748 | 596 | 7,242 |
| Administration and Service | 10,545 | 1,991 | 161 | 8,715 |
| | 60,555 | 23,256 | 3,473 | 40,772 |
| **2012** | | | | |
| Generation | 38,803 | 22,056 | 6,764 | 23,511 |
| Distribution | 7,757 | 1,785 | 315 | 6,287 |
| Administration and Service | 9,803 | 1,938 | 171 | 8,036 |
| | 56,363 | 25,779 | 7,250 | 37,834 |

Financing charges capitalized on property, plant and equipment under construction were $376 thousand in 2013 (2012 – $321 thousand).

## 9. REGULATORY ASSETS AND LIABILITIES

Regulatory assets and liabilities arise as a result of the rate-making process. Hydro One Remote Communities has recorded the following regulatory assets and liabilities:

| *December 31 (thousands of dollars)* | 2013 | 2012 |
|---|---|---|
| **Regulatory assets:** | | |
| Environmental | 13,426 | 11,880 |
| Post-retirement and post-employment benefits | 2,939 | 3,144 |
| RRPR variance account | 1,985 | 787 |
| IFRS transition cost variance | – | 72 |
| Total regulatory assets | 18,350 | 15,883 |
| Less: current portion | 2,427 | 1,823 |
| | 15,923 | 14,060 |
| **Regulatory liabilities:** | | |
| Deferred income tax regulatory liability | 4,347 | 4,841 |
| Total regulatory liabilities | 4,347 | 4,841 |
| Less: current portion | 108 | 108 |
| | 4,239 | 4,733 |

### Environmental

The Company records a liability for the estimated future expenditures required to remediate environmental contamination. Management considers it probable that such expenditures will be recovered in the future through the rate-setting process, and as such, the Company has recorded an equivalent amount as a regulatory asset. In 2013, this regulatory asset increased by $2,872 thousand (2012 – decreased by $583 thousand) to reflect related changes in the Company's environmental liabilities. The environmental regulatory asset is amortized to results of operations based on the pattern of actual expenditures incurred and charged to environmental liabilities. The OEB has the discretion to examine and assess the prudency and the timing of recovery of all of the Company's actual environmental expenditures. In the absence of rate-regulated accounting, 2013 operation, maintenance and administration expenses would have been higher by $2,872 thousand (2012 – lower by $583 thousand). In addition, 2013 amortization expense would have been lower by $1,656 thousand (2012 – $2,515 thousand), and 2013 financing charges would have been higher by $330 thousand (2012 – $399 thousand).

**Post-Retirement and Post-Employment Benefits**

The Company recognizes the net unfunded status of post-retirement and post-employment obligations on the Balance Sheets with an incremental offset to the associated regulatory assets. A regulatory asset is recognized because management considers it to be probable that post-retirement and post-employment benefit costs will be recovered in the future through the rate-setting process. The post-retirement and post-employment benefit obligation is remeasured to its fair value at each year end based on an annual actuarial report, with an offset to the associated regulatory asset, to the extent of the remeasurement adjustment. In the absence of rate-regulated accounting, 2013 OCI would have been higher by $205 thousand (2012 – lower by $1,941 thousand).

**RRPR Variance Account**

Hydro One Remote Communities receives RRRP amounts from the IESO. At December 31, 2013, the Company has recognized a regulatory asset representing the amounts required to achieve breakeven net income, as regulated under the cost recovery model, in excess of net RRRP amounts received. At December 31, 2012, net RRRP amounts received were also lower than amounts required to achieve breakeven net income, and as such, a regulatory asset was also recognized. In the absence of rate-regulated accounting, 2013 revenue would have been lower by $1,198 thousand (2012 – $3,957 thousand).

**IFRS Transition Costs Variance**

Hydro One Remote Communities recorded an asset for the variance between its one-time incremental costs incurred in its uncompleted transition to IFRS and amounts included in rates in respect of this project. In 2013, the company decided not to seek recovery of this amount from rate payers and it was included in the Statement of Operations.

**Deferred Income Tax Regulatory Liability**

Deferred income taxes are recognized on temporary differences between the carrying amount of assets and liabilities in the financial statements and the corresponding tax bases used in the computation of taxable profit. The Company has recognized regulatory assets and liabilities that correspond to deferred income taxes that flow through the rate-setting process. In the absence of rate-regulated accounting, the Company's provision for PILs would have been recognized using the liability method and there would be no regulatory accounts established for taxes to be recovered through future rates. As a result, the 2013 recovery of PILs would have been lower by approximately $367 thousand (2012 – $771 thousand).

## 10. LONG-TERM DEBT

Long-term debt represents a note payable to Hydro One. The note was issued on May 19, 2005, with a carrying value of $23,000 thousand and interest at a rate of 5.38% per annum. The note matures on May 20, 2036. The note was issued on maturity of a previous note in the same principal amount that was issued on April 1, 1999 in consideration of the purchase price of Hydro One Remote Communities' net assets.

On issuance of this note, $115 thousand of transaction costs and a $31 thousand debt discount incurred by Hydro One were allocated to Hydro One Remote Communities, based on its proportionate share of Hydro One's related debt issue.

## 11. FAIR VALUE OF FINANCIAL INSTRUMENTS AND RISK MANAGEMENT

Fair value is considered to be the exchange price in an orderly transaction between market participants to sell an asset or transfer a liability at the measurement date. The fair value definition focuses on an exit price, which is the price that would be received in the sale of an asset or the amount that would be paid to transfer a liability.

Hydro One Remote Communities classifies its fair value measurements based on the following hierarchy, as prescribed by the accounting guidance for fair value, which prioritizes the inputs to valuation techniques used to measure fair value into three levels:

Level 1 inputs are unadjusted quoted prices in active markets for identical assets or liabilities that Hydro One Remote Communities has the ability to access. An active market for the asset or liability is one in which transactions for the asset or liability occurs with sufficient frequency and volume to provide ongoing pricing information.

Level 2 inputs are those other than quoted market prices that are observable, either directly or indirectly, for an asset or liability. Level 2 inputs include, but are not limited to, quoted prices for similar assets or liabilities in an active market, quoted prices for identical or similar assets or liabilities in markets that are not active and inputs other than quoted market prices that are observable for the asset or liability, such as interest rate curves and yield curves observable at commonly quoted intervals, volatilities, credit risk and default rates. A Level 2 measurement cannot have more than an insignificant portion of the valuation based on unobservable inputs.

Level 3 inputs are any fair value measurements that include unobservable inputs for the asset or liability for more than an insignificant portion of the valuation. A Level 3 measurement may be based primarily on Level 2 inputs.

**Non-Derivative Financial Assets and Liabilities**

At December 31, 2013 and 2012, the Company's carrying amounts of accounts receivable, inter-company demand facility, and accounts payable are representative of fair value because of the short-term nature of these instruments.

**Fair Value Hierarchy**

The fair value hierarchy of financial assets and liabilities at December 31, 2013 and 2012 are as follows:

| *December 31, 2013 (thousands of dollars)* | Carrying Value | Fair Value | Level 1 | Level 2 | Level 3 |
|---|---|---|---|---|---|
| **Liabilities:** | | | | | |
| Inter-company demand facility | 18,031 | 18,031 | 18,031 | – | – |
| Long-term debt | 23,000 | 25,450 | – | 25,450 | – |
| | 41,031 | 43,481 | 18,031 | 25,450 | – |

| *December 31, 2012 (thousands of dollars)* | Carrying Value | Fair Value | Level 1 | Level 2 | Level 3 |
|---|---|---|---|---|---|
| **Liabilities:** | | | | | |
| Inter-company demand facility | 11,212 | 11,212 | 11,212 | – | – |
| Long-term debt | 23,000 | 28,486 | – | 28,486 | – |
| | 34,212 | 39,698 | 11,212 | 28,486 | – |

The fair value of the long-term debt is based on unadjusted period-end market prices for the same or similar debt of the same remaining maturities.

There were no significant transfers between any of the levels during the years ended December 31, 2013 and 2012.

**Risk Management**

Exposure to market risk, credit risk and liquidity risk arises in the normal course of the Company's business.

***Market Risk***

Market risk refers primarily to the risk of loss that results from changes in commodity prices, foreign exchange rates and interest rates. The Company does not have commodity risk. The foreign exchange risk is currently not significant, although Hydro One could in the future decide to issue and allocate foreign currency-denominated debt to the Company, along with an allocation of the resulting foreign exchange gains and losses. The Company is exposed to fluctuations in interest rates related

to the interest charges passed on by Hydro One on the outstanding inter-company demand facility. The Company is charged interest on overdraft inter-company balances based on the bankers' acceptance rate, plus 0.15%.

*Credit Risk*

Financial assets create a risk that a counterparty will fail to discharge an obligation, causing a financial loss. At December 31, 2013 and 2012, there were no significant concentrations of credit risk with respect to any class of financial assets. The Company's revenue is earned from a broad base of customers. As a result, Hydro One Remote Communities did not earn a significant amount of revenue from any individual customer. At December 31, 2013 and 2012, there was no significant accounts receivable balance due from any single customer.

At December 31, 2013, the Company's total provision for bad debts was $296 thousand (2012 – $302 thousand). Adjustments and write-offs are determined on the basis of a review of overdue accounts, taking into consideration historical experience. At December 31, 2013, approximately 47% of the Company's current accounts receivable were aged more than 60 days (2012 – 34%). Sufficient allowances have been recorded to reflect the risk of potential credit losses.

*Liquidity Risk*

Liquidity risk refers to the Company's ability to meet its financial obligations as they come due. Hydro One Remote Communities meets its short-term liquidity requirements through the inter-company demand facility with Hydro One and funds from operations. The short-term liquidity available to the Company should be sufficient to fund normal operating requirements.

At December 31, 2013, accounts payable and accrued liabilities in the amount of $5,657 thousand (2012 – $6,863 thousand) are expected to be settled in cash at their carrying amounts within the next year.

At December 31, 2013, Hydro One Remote Communities had long-term debt in the principal l amount of $23,000 thousand (2012 – $23,000 thousand). No long-term debt matures during the next year. Interest payments for the next 12 months on the Company's outstanding long-term debt amount to $1,237 thousand (2012 – $1,237 thousand). Principal repayments and interest payments are summarized by the number of years to maturity in the following table.

| Years to Maturity | Principal Outstanding on Long-term Debt *(thousands of dollars)* | Interest Payments *(thousands of dollars)* |
|---|---|---|
| 1 year | – | 1,237 |
| 2 years | – | 1,237 |
| 3 years | – | 1,237 |
| 4 years | – | 1,237 |
| 5 years | – | 1,237 |
| | – | 6,185 |
| 6 – 10 years | – | 6,185 |
| Over 10 years | 23,000 | 15,468 |
| | 23,000 | 27,838 |

## 12. PENSION AND POST-RETIREMENT AND POST-EMPLOYMENT BENEFITS

Hydro One has a defined benefit pension plan, a supplementary pension plan, and post-retirement and post-employment benefit plans. The defined benefit pension plan (Pension Plan) is contributory and covers all regular employees of Hydro One and its subsidiaries, except Hydro One Brampton Networks. The supplementary pension plan provides members of the Pension Plan with benefits that would have been earned and payable under the Pension Plan but for the limitations imposed by the *Income Tax Act* (Canada). The supplementary pension plan obligation is included with other post-retirement and post-employment benefit obligations on the Balance Sheets.

**Pension Benefits**

The Pension Plan provides benefits based on highest three-year average pensionable earnings. For new management employees who commenced employment on or after January 1, 2004, and for new Society of Energy Professionals represented staff hired after November 17, 2005, benefits are based on highest five-year average pensionable earnings. After retirement, pensions are indexed to inflation.

Company and employees' contributions to the Pension Plan are based on actuarial valuations performed at least every three years. Hydro One's annual Pension Plan contributions for 2013 of $160 million (2012 – $163 million) were based on an actuarial valuation effective December 31, 2011 and the level of 2013 pensionable earnings. Hydro One's estimated annual Pension Plan contributions for 2014 are approximately $160 million, based on the December 31, 2011 valuation and the projected level of pensionable earnings.

At December 31, 2013, based on the December 31, 2011 actuarial valuation, the present value of Hydro One's projected pension benefit obligation was estimated to be $6,576 million (2012 – $6,507 million). The fair value of pension plan assets available for these benefits was $5,731 million (2012 – $4,992 million).

**Post-Retirement and Post-Employment Benefits**

During the year ended December 31, 2013, Hydro One Remote Communities charged $775 thousand (2012 – $537 thousand) of post-retirement and post-employment benefit costs to results of operations, and capitalized $250 thousand (2012 – $223 thousand) as part of the cost of property, plant and equipment. Benefits paid by the Company in 2013 were $264 thousand (2012 – $259 thousand). In addition, the associated post-retirement and post-employment benefits regulatory asset was decreased by $205 thousand (2012 – increased by $1,941 thousand) and recorded on the Company's Balance Sheets to reflect the expected regulatory inclusion of this amount in future rates, which would otherwise be recorded in OCI.

The Company presents its post-retirement and post-employment benefit liability on the Balance Sheets within the following line items:

| *December 31 (thousands of dollars)* | **2013** | **2012** |
|---|---|---|
| Accrued liabilities | 300 | 300 |
| Post-retirement and post-employment benefit liability | 12,088 | 11,532 |
| | 12,388 | 11,832 |

## 13. ENVIRONMENTAL LIABILITIES

The Company has accrued the following discounted amounts for environmental liabilities on the Balance Sheets at December 31, 2013 and 2012:

| *December 31 (thousands of dollars)* | **2013** | **2012** |
|---|---|---|
| Environmental liabilities, January 1 | 11,880 | 14,579 |
| Interest accretion | 330 | 399 |
| Expenditures | (1,656) | (2,515) |
| Revaluation adjustment | 2,872 | (583) |
| Environmental liabilities, December 31 | 13,426 | 11,880 |
| Less: current portion | 2,427 | 1,823 |
| | 10,999 | 10,057 |

The following table illustrates the reconciliation between the undiscounted basis of the environmental liabilities and the amount recognized on the Balance Sheets after factoring in the discount rate:

| *December 31 (thousands of dollars)* | **2013** | **2012** |
|---|---|---|
| Undiscounted environmental liabilities, December 31 | 14,014 | 12,503 |
| Less: discounting accumulated liabilities to present value | 588 | 623 |
| Discounted environmental liabilities, December 31 | 13,426 | 11,880 |

Estimated future environmental expenditures for each of the five years subsequent to December 31, 2013 and in total thereafter are as follows: 2014 – $2,427 thousand; 2015 – $2,175 thousand; 2016 – $2,844 thousand; 2017 – $1,261 thousand; 2018 – $1,651 thousand; and thereafter – $3,653 thousand. These expenditures are expected to be incurred over the period from 2014 to 2020.

There are uncertainties in estimating future environmental costs due to potential external events such as changes in legislation or regulations and advances in remediation technologies. All factors used in estimating the Company's environmental liabilities represent management's best estimates of the present value of the cost required to meet existing legislation or regulations. However, it is reasonably possible that numbers or volumes of contaminated assets, cost estimates to perform work, inflation assumptions and the assumed pattern of annual cash flows may differ significantly from the Company's current assumptions. Estimated environmental liabilities are reviewed annually or more frequently if significant changes in regulation or other relevant factors occur. Estimate changes are accounted for prospectively. The Company records a regulatory asset reflecting its expectation that future environmental costs will be recoverable in rates.

In determining the amounts to be recorded as environmental liabilities, the Company estimates the current cost of completing required work and makes assumptions as to when the future expenditures will actually be incurred, in order to generate future cash flow information. A long-term inflation assumption of approximately 2% has been used to express these current cost estimates as estimated future expenditures. Future environmental expenditures have been discounted using factors ranging from 3.57% to 4.87%, depending on the appropriate rate for the period when increases in the obligations were first recorded.

As a result of its annual review of the environmental liabilities, the Company recorded a revaluation adjustment to increase the LAR environmental liability by $2,872 thousand (2012 – decrease by $583 thousand).

## 14. SHARE CAPITAL

### Common Shares

The Company has 2 issued and outstanding common shares. The Company is authorized to issue an unlimited number of common shares.

### Dividends

The Company has no retained earnings and does not pay dividends under its breakeven business model.

## 15. RELATED PARTY TRANSACTIONS

Hydro One Remote Communities is a subsidiary of Hydro One, and Hydro One is owned by the Province. The OEFC, IESO, Ontario Power Authority (OPA), Ontario Power Generation Inc. (OPG) and the OEB are related parties to Hydro One Remote Communities because they are controlled or significantly influenced by the Province. Transactions between these parties and Hydro One Remote Communities are described below.

Hydro One Remote Communities receives amounts for RRRP from the IESO. RRRP amounts received for the year ended December 31, 2013 were $33,046 thousand (2012 – $27,549 thousand). Consistent with its breakeven business model, the Company recognized $34,245 thousand as RRRP revenue in 2013 (2012 – $31,506 thousand). This 2013 revenue exceeded

amounts received by $1,199 thousand (2012 – $3,957 thousand) and the RRPR variance account balance was adjusted by this amount.

The recovery of PILs was received or receivable from the OEFC.

The amounts due to and from related parties as a result of the transactions referred to above are as follows:

| *December 31 (thousands of dollars)* | 2013 | 2012 |
|---|---|---|
| Accounts receivable | 97 | 88 |
| Income tax receivable | 2,697 | 1,589 |

Transactions with related parties occur at normal market prices or at a proxy for fair value based on the requirements of the OEB's Affiliate Relationships Code. Outstanding balances at period end are interest free and settled in cash.

**Hydro One and Subsidiaries**

The Company provides services to, and receives services from, Hydro One and its other subsidiaries. Amounts due to and from Hydro One and its other subsidiaries are settled through the inter-company demand facility.

The Company has entered into various agreements with Hydro One and its other subsidiaries related to the provision of corporate functions and services, such as legal, financial and human resources services, and operational services, such as environmental, forestry, and line services. 2013 revenues include $195 thousand (2012 – $130 thousand) related to the provision of services to Hydro One and its other subsidiaries. 2013 operation, maintenance and administration costs include $3,475 thousand (2012 – $2,607 thousand) related to the purchase of services from Hydro One and its other subsidiaries.

The Company's long-term debt is due to Hydro One. In addition, balances payable or receivable under the inter-company demand facility are due to or from Hydro One and its other subsidiaries. Financing charges include interest expense on the long-term debt in the amount of $1,237 thousand (2012 – $1,237 thousand), and interest expense on the inter-company demand facility in the amount of $216 thousand (2012 – $83 thousand). At December 31, 2013, the Company had accrued interest payable to Hydro One totaling $142 thousand (2012 – $142 thousand).

## 16. STATEMENTS OF CASH FLOWS

The changes in non-cash balances related to operations consist of the following:

| *Year ended December 31 (thousands of dollars)* | 2013 | 2012 |
|---|---|---|
| Accounts receivable | (802) | (258) |
| Materials and supplies | 443 | 638 |
| Income taxes receivable | (1,108) | (1,426) |
| Long-term accounts receivable | (256) | (49) |
| Accounts payable | (284) | (443) |
| Accrued liabilities | (1,526) | 91 |
| Post-retirement and post-employment benefit liability | 760 | 500 |
| | (2,773) | (947) |
| **Supplementary information:** | | |
| Net interest paid | 1,453 | 1,320 |

As a result of using the cost recovery model applied to achieve after tax breakeven net income, any PILs paid are fully recovered.

## 17. CONTINGENCIES

### Legal Proceedings

Hydro One Remote Communities is involved in various lawsuits, claims and regulatory proceedings in the normal course of business. In the opinion of management, the outcome of such matters will not have a material adverse effect on the Company's financial position, results of operations or cash flows.

### Transfer of Assets

The transfer orders by which the Company acquired Ontario Hydro's remote communities business on April 1, 1999 did not transfer title to some assets located on lands held for First Nation bands under the *Indian Act* (Canada). Currently, OEFC holds legal title to these assets and the Company manages them until the Company has obtained necessary authorizations to complete the title transfer. To occupy reserve land, the Company must have valid permits issued by Her Majesty the Queen in the Right of Canada. For each permit, the Company must negotiate an agreement (in the form of a Memorandum of Understanding) with the band, OEFC and any First Nation individuals who have occupancy rights. The agreement includes provisions whereby the First Nation band consents to the federal Department of Aboriginal Affairs and Northern Development issuing a permit. It is difficult to predict the aggregate amount that the Company may have to pay, either on an annual or one-time basis, to obtain the required agreements from the First Nation bands. In 2013, the Company paid approximately $2 million (2012 – $1 million) in respect of these consents. OEFC will continue to hold these assets until the Company is able to negotiate agreements with the First Nation bands and occupants. If the Company cannot reach satisfactory agreements and obtain federal permits, the Company may have to relocate these assets from the reserve lands to other locations at a cost that could be substantial. In a limited number of cases, it may be necessary to abandon a line and replace it with diesel generation facilities. The costs relating to these assets could have a material adverse effect on the Company's net income if the Company is not able to recover them in future rate orders.

## 18. COMMITMENTS

### Operating Lease

Hydro One Remote Communities is committed as lessee to an operating lease agreement for use of reserve land to operate a hydro facility for a period of 10 years.

At December 31, 2013, the future minimum lease payments under this operating lease are as follows:

| *Year ended December 31 (thousands of dollars)* | **2013** |
|---|---|
| Within one year | 120 |
| After one year but not more than five years | 510 |
| More than five years | 600 |
| | 1,230 |

During the year ended December 31, 2013, the Company made upfront lease payments totalling $1 million which is being amortized based over the contractual term of the lease.

# Notes checklist

| Corporation's name | Business number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- Parts 1, 2, and 3 of this schedule must be completed from the perspective of the person (referred to in these parts as the **accountant**) who prepared or reported on the financial statements. If the person preparing the tax return is not the accountant referred to above, they must still complete Parts 1, 2, 3, and 4, as applicable.
- For more information, see Guide RC4088, *General Index of Financial Information (GIFI)* and Guide T4012, *T2 Corporation – Income Tax Guide.*
- Complete this schedule and include it with your T2 return along with the other GIFI schedules.

## Part 1 – Information on the accountant who prepared or reported on the financial statements

Does the accountant have a professional designation? . . . **095** 1 Yes [X] 2 No [ ]

Is the accountant connected* with the corporation? . . . **097** 1 Yes [ ] 2 No [X]

* A person connected with a corporation can be: (i) a shareholder of the corporation who owns more than 10% of the common shares; (ii) a director, an officer, or an employee of the corporation; or (iii) a person not dealing at arm's length with the corporation.

**Note**

If the accountant does not have a professional designation **or** is connected to the corporation, you do not have to complete Parts 2 and 3 of this schedule. However, you **do have** to complete Part 4, as applicable.

## Part 2 – Type of involvement with the financial statements

Choose the option that represents the highest level of involvement of the accountant: . . . **198**

Completed an auditor's report . . . 1 [X]

Completed a review engagement report . . . 2 [ ]

Conducted a compilation engagement . . . 3 [ ]

## Part 3 – Reservations

If you selected option **1** or **2** under **Type of involvement with the financial statements** above, answer the following question:

Has the accountant expressed a reservation? . . . **099** 1 Yes [ ] 2 No [X]

## Part 4 – Other information

If you have a professional designation and are not the accountant associated with the financial statements in Part 1 above, choose one of the following options: . . . **110**

Prepared the tax return (financial statements prepared by client) . . . 1 [X]

Prepared the tax return and the financial information contained therein (financial statements have not been prepared) . . . 2 [ ]

Were notes to the financial statements prepared? . . . **101** 1 Yes [X] 2 No [ ]

If **yes**, complete lines 104 to 107 below:

Are subsequent events mentioned in the notes? . . . **104** 1 Yes [ ] 2 No [X]

Is re-evaluation of asset information mentioned in the notes? . . . **105** 1 Yes [ ] 2 No [X]

Is contingent liability information mentioned in the notes? . . . **106** 1 Yes [X] 2 No [ ]

Is information regarding commitments mentioned in the notes? . . . **107** 1 Yes [X] 2 No [ ]

Does the corporation have investments in joint venture(s) or partnership(s)? . . . **108** 1 Yes [ ] 2 No [X]

## Part 4 – Other information (continued)

**Impairment and fair value changes**

In any of the following assets, was an amount recognized in net income or other comprehensive income (OCI) as a result of an impairment loss in the tax year, a reversal of an impairment loss recognized in a previous tax year, or a change in fair value during the tax year? . . . . . 200 1 Yes [ ] 2 No [X]

If **yes**, enter the amount recognized:

| | | In net income Increase (decrease) | | In OCI Increase (decrease) |
|---|---|---|---|---|
| Property, plant, and equipment | 210 | | 211 | |
| Intangible assets | 215 | | 216 | |
| Investment property | 220 | | | |
| Biological assets | 225 | | | |
| Financial instruments | 230 | | 231 | |
| Other | 235 | | 236 | |

**Financial instruments**

Did the corporation derecognize any financial instrument(s) during the tax year (other than trade receivables)? . . . . . 250 1 Yes [ ] 2 No [X]

Did the corporation apply hedge accounting during the tax year? . . . . . 255 1 Yes [X] 2 No [ ]

Did the corporation discontinue hedge accounting during the tax year? . . . . . 260 1 Yes [ ] 2 No [X]

**Adjustments to opening equity**

Was an amount included in the opening balance of retained earnings or equity, in order to correct an error, to recognize a change in accounting policy, or to adopt a new accounting standard in the current tax year? . . . . . 265 1 Yes [ ] 2 No [X]

If **yes**, you have to maintain a separate reconciliation.

**SCHEDULE 100**

# Corporation Loss Continuity and Application

| Corporation's name | Business number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- Use this form to determine the continuity and use of available losses; to determine a current-year non-capital loss, farm loss, restricted farm loss, or limited partnership loss; to determine the amount of restricted farm loss and limited partnership loss that can be applied in a year; and to ask for a loss carryback to previous years.
- A corporation can choose whether or not to deduct an available loss from income in a tax year. The corporation can deduct losses in any order. However, for each type of loss, deduct the oldest loss first.
- According to subsection 111(4) of the *Income Tax Act*, when control has been acquired, no amount of capital loss incurred for a tax year ending before that time is deductible in computing taxable income in a tax year ending after that time. Also, no amount of capital loss incurred in a tax year ending after that time is deductible in computing taxable income of a tax year ending before that time.
- When control has been acquired, subsection 111(5) provides for similar treatment of non-capital and farm losses, except as listed in paragraphs 111(5)(a) and (b).
- For information on these losses, see the *T2 Corporation – Income Tax Guide.*
- File one completed copy of this schedule with the T2 return, or send the schedule by itself to the tax centre where the return is filed.
- All legislative references are to the federal *Income Tax Act.*

## Part 1 – Non-capital losses

**Determination of current-year non-capital loss**

| | | | | |
|---|---|---|---|---|
| Net income (loss) for income tax purposes | | | -2,524,507 | A |
| **Deduct:** (increase a loss) | | | | |
| Net capital losses deducted in the year (enter as a positive amount) | | a | | |
| Taxable dividends deductible under section 112 or subsection 113(1) or 138(6) | | b | | |
| Amount of Part VI.1 tax deductible | | c | | |
| Amount deductible as prospector's and grubstaker's shares – Paragraph 110(1)(d.2) | | d | | |
| Subtotal (total of amounts a to d) | | ▶ | | B |
| Subtotal (amount A **minus** amount B; if positive, enter "0") | | | -2,524,507 | C |
| **Deduct:** (increase a loss) | | | | |
| Section 110.5 or subparagraph 115(1)(a)(vii) – Addition for foreign tax deductions | | | | D |
| Subtotal (amount C **minus** amount D) | | | -2,524,507 | E |
| **Add:** (decrease a loss) | | | | |
| Current-year farm loss (whichever is less: the net loss from farming or fishing included in the income, or the non-capital loss before deducting the farm loss) | | | | F |
| Current-year non-capital loss (amount E **plus** amount F; if positive, enter "0") | | | -2,524,507 | G |

If amount G is negative, enter it on line 110 as a positive.

**Continuity of non-capital losses and request for a carryback**

| | | | | | |
|---|---|---|---|---|---|
| Non-capital loss at the end of the previous tax year | | | e | | |
| **Deduct:** Non-capital loss expired* | 100 | | f | | |
| Non-capital losses at the beginning of the tax year (amount e **minus** amount f) | 102 | | ▶ | | H |
| **Add:** | | | | | |
| Non-capital losses transferred on an amalgamation or the wind-up of a subsidiary corporation | 105 | | g | | |
| Current-year non-capital loss (from amount G) | 110 | 2,524,507 | h | | |
| Subtotal (amount g **plus** amount h) | | 2,524,507 | ▶ | 2,524,507 | I |
| Subtotal (amount H **plus** amount I) | | | | 2,524,507 | J |

* A non-capital loss expires as follows:
- after **7** tax years if it arose in a tax year ending before March 23, 2004;
- after **10** tax years if it arose in a tax year ending after March 22, 2004, and before 2006; and
- after **20** tax years if it arose in a tax year ending after 2005.

An allowable business investment loss becomes a net capital loss as follows:
- after **7** tax years if it arose in a tax year ending before March 23, 2004; and
- after **10** tax years if it arose in a tax year ending after March 22, 2004.

## Part 1 – Non-capital losses (continued)

| Subsection 111(10) – Adjustments for fuel tax rebate | | | j.1 | | |
| Non-capital losses of previous tax years applied in the current tax year<br>Enter amount k on line 331 of the T2 return. | 130 | | k | | |
| Current and previous year non-capital losses applied against current-year taxable dividends subject to Part IV tax** | 135 | | l | | |
| Subtotal (total of amounts i to l) | | | ▶ | | K |
| Non-capital losses before any request for a carryback (amount J **minus** amount K) | | | | 2,524,507 | L |

**Deduct – Request to carry back non-capital loss to:**

| | | | | | |
|---|---|---|---|---|---|
| First previous tax year to reduce taxable income | 901 | | m | | |
| Second previous tax year to reduce taxable income | 902 | | n | | |
| Third previous tax year to reduce taxable income | 903 | 2,435,715 | o | | |
| First previous tax year to reduce taxable dividends subject to Part IV tax | 911 | | p | | |
| Second previous tax year to reduce taxable dividends subject to Part IV tax | 912 | | q | | |
| Third previous tax year to reduce taxable dividends subject to Part IV tax | 913 | | r | | |
| Total of requests to carry back non-capital losses to previous tax years (total of amounts m to r) | | 2,435,715 | ▶ | 2,435,715 | M |
| Closing balance of non-capital losses to be carried forward to future tax years (amount L **minus** amount M) | 180 | | | 88,792 | N |

** Amount l is the total of lines 330 and 335 from Schedule 3, *Dividends Received, Taxable Dividends Paid, and Part IV Tax Calculation.*

## Part 2 – Capital losses

**Continuity of capital losses and request for a carryback**

| | | | | | |
|---|---|---|---|---|---|
| Capital losses at the end of the previous tax year | 200 | | a | | |
| Capital losses transferred on the amalgamation or the wind-up of a subsidiary corporation | 205 | | b | | |
| Subtotal (amount a **plus** amount b) | | | ▶ | | A |
| **Deduct:** | | | | | |
| Other adjustments (includes adjustments for an acquisition of control) | 250 | | c | | |
| Section 80 – Adjustments for forgiven amounts | 240 | | d | | |
| Subtotal (amount c **plus** amount d) | | | ▶ | | B |
| Subtotal (amount A **minus** amount B) | | | | | C |
| **Add:** Current-year capital loss (from the calculation on Schedule 6, *Summary of Dispositions of Capital Property*) | 210 | | | | D |
| Unused non-capital losses that expired in the tax year* | | | e | | |
| Allowable business investment losses (ABIL) that expired as non-capital losses in the tax year** | | | f | | |
| Enter amount e or f, whichever is less | 215 | | | | |
| ABILs expired as non-capital loss: line 215 **divided** by 0.500000 | 220 | | | | E |
| Subtotal (total of amounts C to E) | | | | | F |

**Note**
If there has been an amalgamation or a windup of a subsidiary, do a separate calculation of the ABIL expired as non-capital loss for each predecessor or subsidiary. Add all these amounts and enter the total on line 220 above.

* If the losses were incurred in a tax year ending before March 23, 2004, enter the losses from the 8th previous tax year. If the losses were incurred in a tax year ending after March 22, 2004, and before 2006, enter the losses from the 11th previous tax year. Enter the losses from the 21st previous tax year if the losses were incurred in a tax year ending after 2005. Enter the part that was not used in previous years and the current year on line e.

** If the losses were incurred in a tax year ending before March 23, 2004, enter the losses from the 8th previous tax year. If the losses were incurred in a tax year ending after March 22, 2004, enter the losses from the 11th previous tax year. Enter the full amount on line f.

## Part 2 – Capital losses (continued)

**Deduct:** Capital losses from previous tax years applied against the current-year net capital gain*** . . . 225 ______ G

Capital losses before any request for a carryback (amount F **minus** amount G) ______ H

**Deduct – Request to carry back capital loss to****:**

| | Capital gain (100%) | | Amount carried back (100%) | |
|---|---|---|---|---|
| First previous tax year | | 951 | | g |
| Second previous tax year | | 952 | | h |
| Third previous tax year | | 953 | | i |

Subtotal (total of amounts g to i) ______ ▶ ______ I

Closing balance of capital losses to be carried forward to future tax years (amount H **minus** amount I) 280 ______ J

*** To get the net capital losses required to reduce the taxable capital gain included in the net income (loss) for the purpose of current-year tax, enter the amount from line 225 **multiplied** by 50% on line 332 of the T2 return.

**** On line 225, 951, 952, or 953, whichever applies, enter the actual amount of the loss. When the loss is applied, **multiply** this amount by the 50% inclusion rate.

## Part 3 – Farm losses

**Continuity of farm losses and request for a carryback**

Farm losses at the end of the previous tax year . . . ______ a

**Deduct:** Farm loss expired* . . . 300 ______ b

Farm losses at the beginning of the tax year (amount a **minus** amount b) . . . 302 ______ ▶ ______ A

**Add:**

Farm losses transferred on the amalgamation or the windup of a subsidiary corporation . . . 305 ______ c

Current-year farm loss (amount F in Part 1) . . . 310 ______ d

Subtotal (amount c **plus** amount d) ______ ▶ ______ B

Subtotal (amount A **plus** amount B) ______ C

**Deduct:**

Other adjustments (includes adjustments for an acquisition of control) . . . 350 ______ e

Section 80 – Adjustments for forgiven amounts . . . 340 ______ f

Farm losses of previous tax years applied in the current tax year . . . 330 ______ g
Enter amount g on line 334 of the T2 return.

Current and previous year farm losses applied against current-year taxable dividends subject to Part IV tax** . . . 335 ______ h

Subtotal (total of amounts e to h) ______ ▶ ______ D

Farm losses before any request for a carryback (amount C **minus** amount D) ______ E

**Deduct – Request to carry back farm loss to:**

First previous tax year to reduce taxable income . . . 921 ______ i

Second previous tax year to reduce taxable income . . . 922 ______ j

Third previous tax year to reduce taxable income . . . 923 ______ k

First previous tax year to reduce taxable dividends subject to Part IV tax . . . 931 ______ l

Second previous tax year to reduce taxable dividends subject to Part IV tax . . . 932 ______ m

Third previous tax year to reduce taxable dividends subject to Part IV tax . . . 933 ______ n

Subtotal (total of amounts i to n) ______ ▶ ______ F

Closing balance of farm losses to be carried forward to future tax years (amount E **minus** amount F) 380 ______ G

* A farm loss expires as follows:
- after **10** tax years if it arose in a tax year ending before 2006; and
- after **20** tax years if it arose in a tax year ending after 2005.

** Amount h is the total of lines 340 and 345 from Schedule 3.

## Part 4 – Restricted farm losses

**Current-year restricted farm loss**

Total losses for the year from farming business . . . . . . **485** ______ A

**Minus** the deductible farm loss:

(amount A above ______ – $2,500) **divided** by 2 = ______ a

Amount a or $ 15,000 *, whichever is less . . . . . . ______ ▶ ______ b

**2,500** c

Subtotal (amount b **plus** amount c) 2,500 ▶ 2,500 B

Current-year restricted farm loss (amount A **minus** amount B) ______ C

**Continuity of restricted farm losses and request for a carryback**

Restricted farm losses at the end of the previous tax year . . . . . . ______ d

**Deduct:** Restricted farm loss expired** . . . . . . **400** ______ e

Restricted farm losses at the beginning of the tax year (amount d **minus** amount e) . . . . . . **402** ______ ▶ ______ D

**Add:**

Restricted farm losses transferred on the amalgamation or the wind-up of a subsidiary corporation . . . . . . **405** ______ f

Current-year restricted farm loss (from amount C) . . . . . . **410** ______ g

Enter amount g on line 233 of Schedule 1, *Net Income (Loss) for Income Tax Purposes.*

Subtotal (amount f **plus** amount g) ______ ▶ ______ E

Subtotal (amount D **plus** amount E) ______ F

**Deduct:**

Restricted farm losses from previous tax years applied against current farming income . . . . . **430** ______ h

Enter amount h on line 333 of the T2 return.

Section 80 – Adjustments for forgiven amounts . . . . . . **440** ______ i

Other adjustments . . . . . . **450** ______ j

Subtotal (total of amounts h to j) ______ ▶ ______ G

Restricted farm losses before any request for a carryback (amount F **minus** amount G) ______ H

**Deduct – Request to carry back restricted farm loss to:**

First previous tax year to reduce farming income . . . . . . **941** ______ k

Second previous tax year to reduce farming income . . . . . . **942** ______ l

Third previous tax year to reduce farming income . . . . . . **943** ______ m

Subtotal (total of amounts k to m) ______ ▶ ______ I

Closing balance of restricted farm losses to be carried forward to future tax years (amount H **minus** amount I) **480** ______ J

**Note**

The total losses for the year from all farming businesses are calculated without including scientific research expenses.

* For tax years that end before March 21, 2013, use $6,250 instead of $15,000.

** A restricted farm loss expires as follows:

- after **10** tax years if it arose in a tax year ending before 2006; and
- after **20** tax years if it arose in a tax year ending after 2005.

## Part 5 – Listed personal property losses

**Continuity of listed personal property loss and request for a carryback**

| | | | | |
|---|---|---|---|---|
| Listed personal property losses at the end of the previous tax year | | a | | |
| **Deduct:** Listed personal property loss expired after seven tax years | 500 | b | | |
| Listed personal property losses at the beginning of the tax year (amount a **minus** amount b) | 502 | ► | | A |
| **Add:** Current-year listed personal property loss (from Schedule 6) | | | 510 | B |
| Subtotal (amount A **plus** amount B) | | | | C |

**Deduct:**

| | | | | |
|---|---|---|---|---|
| Previous year personal property losses applied in the current tax year against listed personal property gains | 530 | c | | |
| Enter amount c on line 655 of Schedule 6. | | | | |
| Other adjustments | 550 | d | | |
| Subtotal (amount c **plus** amount d) | | ► | | D |
| Listed personal property losses remaining before any request for a carryback (amount C **minus** amount D) | | | | E |

**Deduct – Request to carry back listed personal property loss to:**

| | | | | |
|---|---|---|---|---|
| First previous tax year to reduce listed personal property gains | 961 | e | | |
| Second previous tax year to reduce listed personal property gains | 962 | f | | |
| Third previous tax year to reduce listed personal property gains | 963 | g | | |
| Subtotal (total of amounts e to g) | | ► | | F |
| Closing balance of listed personal property losses to be carried forward to future tax years (amount E **minus** amount F) | | | 580 | G |

## Part 7 – Limited partnership losses

### Current-year limited partnership losses

| 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|---|---|---|---|---|---|---|
| Partnership identifier 600 | Tax year ending YYYY/MM/DD 602 | Corporation's share of limited partnership loss 604 | Corporation's at-risk amount 606 | Total of corporation's share of partnership investment tax credit, farming losses, and resource expenses 608 | Column 4 **minus** column 5 (if negative, enter "0") | Current-year limited partnership losses (column 3 **minus** 6) 620 |
| | | | | | | |

**Total** (enter this amount on line 222 of Schedule 1)

### Limited partnership losses from previous tax years that may be applied in the current year

| 8 | 9 | 10 | 11 | 12 | 13 | 14 |
|---|---|---|---|---|---|---|
| Partnership identifier 630 | Tax year ending YYYY/MM/DD 632 | Limited partnership losses at the end of the previous tax year 634 | Corporation's at-risk amount 636 | Total of corporation's share of partnership investment tax credit, business or property losses, and resource expenses 638 | Column 11 **minus** column 12 (if negative, enter "0") | Limited partnership losses that may be applied in the year (the lesser of columns 10 and 13) 650 |
| | | | | | | |

### Continuity of limited partnership losses that can be carried forward to future tax years

| 15 | 16 | 17 | 18 | 19 | 20 |
|---|---|---|---|---|---|
| Partnership identifier 660 | Limited partnership losses at the end of the previous tax year 662 | Limited partnership losses transferred on an amalgamation or the windup of a subsidiary 664 | Current-year limited partnership losses (from column 7) 670 | Limited partnership losses applied in the current year (cannot be more than column 14) 675 | Current year limited partnership losses closing balance to be carried forward to future years (column 16 **plus** column 17 **plus** column 18 **minus** column 19) 680 |
| | | | | | |

**Total** (enter this amount on line 335 of the T2 return)

**Note**

If you have any current–or previous–year losses, enter your partnership identifier on line 600, 630, or 660.

## Part 8 – Election under paragraph 88(1.1)(f)

If you are making an election under paragraph 88(1.1)(f), check the box . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 190 Yes ☐

Further to a winding-up of a subsidiary, the portion of a non-capital loss, restricted farm loss, farm loss, or limited partnership loss from a wholly-owned subsidiary is deemed to be the loss of a parent from its tax year starting after the commencement of the winding-up.

**Note**

This election applies only for wind-ups under subsection 88(1) that are reported on Schedule 24, *First-Time Filer after Incorporation, Amalgamation, or Winding-up of a Subsidiary into a Parent*, and the deemed provision is only for tax years that begin after the start of the wind-up.

# Non-Capital Loss Continuity Workchart

## Part 6 – Analysis of balance of losses by year of origin

### Non-capital losses – losses that can be carried forward over 20 years

| Year of origin | Balance at beginning of year | Loss incurred in current year | Adjustments and transfers | Loss carried back Parts I & IV | Applied to reduce Taxable income | Applied to reduce Part IV tax | Balance at end of year |
|---|---|---|---|---|---|---|---|
| Current | N/A | 2,524,507 | | 2,435,715 | N/A | | 88,792 |
| 1st preceding taxation year 2012-12-31 | | N/A | | N/A | | | |
| 2nd preceding taxation year 2011-12-31 | | N/A | | N/A | | | |

**Schedule 5**

# TAX CALCULATION SUPPLEMENTARY – CORPORATIONS

| Corporation's name | Business Number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- Use this schedule if, during the tax year, the corporation:
  - had a permanent establishment in more than one jurisdiction (corporations that have no taxable income should only complete columns A, B and D in Part 1);
  - is claiming provincial or territorial tax credits or rebates (see Part 2); or
  - has to pay taxes, other than income tax, for Newfoundland and Labrador, or Ontario (see Part 2).
- Regulations mentioned in this schedule are from the *Income Tax Regulations*.
- For more information, see the *T2 Corporation – Income Tax Guide*.
- Enter the regulation number in field 100 of Part 1.

## Part 1 – Allocation of taxable income

100 ______ Enter the Regulation that applies (402 to 413).

| A<br>Jurisdiction<br>Tick yes if the corporation had a permanent establishment in the jurisdiction during the tax year. * | B<br>Total salaries and wages paid in jurisdiction | C<br>(B x taxable income**) / G | D<br>Gross revenue | E<br>(D x taxable income**) / H | F<br>Allocation of taxable income (C + E) x 1/2***<br>(where either G or H is nil, do not multiply by 1/2) |
|---|---|---|---|---|---|
| Newfoundland and Labrador 003 1 Yes ☐ | 103 | | 143 | | |
| Newfoundland and Labrador offshore 004 1 Yes ☐ | 104 | | 144 | | |
| Prince Edward Island 005 1 Yes ☐ | 105 | | 145 | | |
| Nova Scotia 007 1 Yes ☐ | 107 | | 147 | | |
| Nova Scotia offshore 008 1 Yes ☐ | 108 | | 148 | | |
| New Brunswick 009 1 Yes ☐ | 109 | | 149 | | |
| Quebec 011 1 Yes ☐ | 111 | | 151 | | |
| Ontario 013 1 Yes ☐ | 113 | | 153 | | |
| Manitoba 015 1 Yes ☐ | 115 | | 155 | | |
| Saskatchewan 017 1 Yes ☐ | 117 | | 157 | | |
| Alberta 019 1 Yes ☐ | 119 | | 159 | | |
| British Columbia 021 1 Yes ☐ | 121 | | 161 | | |
| Yukon 023 1 Yes ☐ | 123 | | 163 | | |
| Northwest Territories 025 1 Yes ☐ | 125 | | 165 | | |
| Nunavut 026 1 Yes ☐ | 126 | | 166 | | |
| Outside Canada 027 1 Yes ☐ | 127 | | 167 | | |
| **Total** | 129 G | | 169 H | | |

* "Permanent establishment" is defined in Regulation 400(2).

** If the corporation has income or loss from an international banking centre: the taxable income is the amount on line 360 or line Z of the T2 return **plus** the total amount not required to be included, or **minus** the total amount not allowed to be deducted, in calculating the corporation's income under section 33.1 of the federal *Income Tax Act*. This does not apply to tax years starting after March 20, 2013.

*** For corporations other than those described under Regulation 402, use the appropriate calculation described in the Regulations to allocate taxable income.

**Notes:**

1. After determining the allocation of taxable income, you have to calculate the corporation's provincial or territorial tax payable. For more information on how to calculate the tax for each province or territory, see the instructions for Schedule 5 in the *T2 Corporation – Income Tax Guide*.
2. If the corporation has provincial or territorial tax payable, complete Part 2.

## Part 2 – Ontario tax payable, tax credits, and rebates

| Total taxable income | Income eligible for small business deduction | Provincial or territorial allocation of taxable income | Provincial or territorial tax payable before credits |
|---|---|---|---|
| | | | |

| | Line | Amount | | Total | |
|---|---|---|---|---|---|
| **Ontario basic income tax** (from Schedule 500) | 270 | | | | |

| 15. | 50 | | 3,083 | | | 0 | | 3,083 | 55 | 0 | 0 | 1,696 | 1,387 |
| | | **Totals** | 35,496,432 | 8,305,011 | | 14 | 4,152,500 | 39,648,929 | | | | 2,826,199 | 40,975,230 |

**Note:** Class numbers followed by a letter indicate the basic rate of the class taking into account the additional deduction allowed.
Class 1a: 4% + 6% = 10% (class 1 to 10%), class 1b: 4% + 2% = 6% (class 1 to 6%).

* Include any property acquired in previous years that has now become available for use. This property would have been previously excluded from column 3. List separately any acquisitions that are not subject to the 50% rule, see Regulation 1100(2) and (2.2).

** Include amounts transferred under section 85, or on amalgamation and winding-up of a subsidiary. See the *T2 Corporation Income Tax Guide* for other examples of adjustments to include in column 4.

*** The net cost of acquisitions is the cost of acquisitions (column 3) **plus** or **minus** certain adjustments from column 4. For exceptions to the 50% rule, see Interpretation Bulletin IT-285, *Capital Cost Allowance – General Comments*.

**** Enter a rate only, if you are using the declining balance method. For any other method (for example the straignt-line method, where calculations are always based on the cost of acquisitions), enter N/A. Then enter the amount you are claiming in column 11.

***** If the tax year is shorter than 365 days, prorate the CCA claim. Some classes of property do not have to be prorated. See the *T2 Corporation Income Tax Guide* for more information.

**SCHEDULE 14**

## MISCELLANEOUS PAYMENTS TO RESIDENTS

| Name of corporation | Business Number | Tax year end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- This schedule must be completed by all corporations who made the following payments to residents of Canada: royalties for which the corporation has not filed a T5 slip; research and development fees; management fees; technical assistance fees; and similar payments.
- Please enter the name and address of the recipient and the amount of the payment in the applicable column. If several payments of the same type (i.e., management fees) were made to the same person, enter the total amount paid. If similar types of payments have been made, but do not fit into any of the categories, enter these amounts in the column entitled "Similar payments".

| | Name of recipient 100 | Address of recipient 200 | Royalties 300 | Research and development fees 400 | Management fees 500 | Technical assistance fees 600 | Similar payments 700 |

# Deferred Income Plans

| Corporation's name | Business number | Tax year end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- Complete the information below if the corporation deducted payments from its income made to a registered pension plan (RPP), a registered supplementary unemployment benefit plan (RSUBP), a deferred profit sharing plan (DPSP), a pooled registered pension plan (PRPP), or an employee profit sharing plan (EPSP).
- If the trust that governs an employee profit sharing plan is **not resident** in Canada, please indicate if the T4PS, *Statement of Employees Profit Sharing Plan Allocations and Payments*, Supplementary slip(s) were filed for the last calendar year, and whether they were filed by the trustee or the employer.

| | Type of plan (see note 1) 100 | Amount of contribution $ (see note 2) 200 | Registration number (RPP, RSUBP, PRPP, and DPSP only) 300 | Name of EPSP trust 400 | Address of EPSP trust 500 | T4PS slip(s) (see note 3) 600 |
|---|---|---|---|---|---|---|
| 1 | 1 | 1,401,481 | 1059104 | | | |

**Note 1**

Enter the applicable code number:

1 – RPP
2 – RSUBP
3 – DPSP
4 – EPSP
5 – PRPP

**Note 2**

You do not need to add to Schedule 1 any payments you made to deferred income plans. To reconcile such payments, calculate the following amount:

Total of all amounts indicated in column 200 of this schedule . . . . . . . . . . . . . . . . . . . 1,401,481 A

**Less:**

Total of all amounts for deferred income plans deducted in your financial statements . . . . . 1,401,481 B

**Deductible amount for contributions to deferred income plans**
(amount A **minus** amount B) (if negative, enter "0") . . . . . . . . . . . . . . . . . . . . . . . . . C

Enter amount C on line 417 of Schedule 1

**Note 3**

T4PS slip(s) filed by: 1 – Trustee
2 – Employer
(EPSP only)

Canada Revenue Agency / Agence du revenu du Canada

**SCHEDULE 23**

# AGREEMENT AMONG ASSOCIATED CANADIAN-CONTROLLED PRIVATE CORPORATIONS TO ALLOCATE THE BUSINESS LIMIT

- For use by a Canadian-controlled private corporation (CCPC) to identify all associated corporations and to assign a percentage for each associated corporation. This percentage will be used to allocate the business limit for purposes of the small business deduction. Information from this schedule will also be used to determine the date the balance of tax is due and to calculate the reduction to the business limit.
- An associated CCPC that has more than one tax year ending in a calendar year, is required to file an agreement for each tax year ending in that calendar year.

**Column 1:** Enter the legal name of each of the corporations in the associated group. Include non-CCPCs and CCPCs that have filed an election under subsection 256(2) of the *Income Tax Act* (ITA) not to be associated for purposes of the small business deduction.

**Column 2:** Provide the Business Number for each corporation (if a corporation is not registered, enter "NR").

**Column 3:** Enter the association code that applies to each corporation:

1 – Associated for purposes of allocating the business limit (unless code 5 applies)

2 – CCPC that is a "third corporation" that has elected under subsection 256(2) not to be associated for purposes of the small business deduction

3 – Non-CCPC that is a "third corporation" as defined in subsection 256(2)

4 – Associated non-CCPC

5 – Associated CCPC to which code 1 does not apply because of a subsection 256(2) election made by a "third corporation"

**Column 4:** Enter the business limit for the year of each corporation in the associated group. The business limit is computed at line 4 on page 4 of each respective corporation's T2 return.

**Column 5:** Assign a percentage to allocate the business limit to each corporation that has an association code 1 in column 3. The total of all percentages in column 5 cannot exceed 100%.

**Column 6:** Enter the business limit allocated to each corporation by multiplying the amount in column 4 by the percentage in column 5. Add all business limits allocated in column 6 and enter the total at line A. Ensure that the total at line A falls within the range for the calendar year to which the agreement applies:

| Calendar year | Acceptable range |
|---|---|
| 2006 | maximum $300,000 |
| 2007 | $300,001 to $400,000 |

| Calendar year | Acceptable range |
|---|---|
| 2008 | maximum $400,000 |
| 2009 | $400,001 to $500,000 |

If the calendar year to which this agreement applies is after 2009, ensure that the total at line A does not exceed $500,000.

## Allocating the business limit

Date filed (do not use this area) . . . . . **025** Year Month Day

Enter the calendar year to which the agreement applies . . . . . **050** Year 2013

Is this an amended agreement for the above-noted calendar year that is intended to replace an agreement previously filed by any of the associated corporations listed below? . . . . . **075** 1 Yes [ ] 2 No [X]

| | 1 Names of associated corporations 100 | 2 Business Number of associated corporations 200 | 3 Association code 300 | 4 Business limit for the year (before the allocation) $ | 5 Percentage of the business limit % 350 | 6 Business limit allocated* $ 400 |
|---|---|---|---|---|---|---|
| 1 | Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 1 | 500,000 | | |
| 2 | Hydro One Inc. | 86999 4731 RC0001 | 1 | 500,000 | | |
| 3 | Hydro One Networks Inc. | 87086 5821 RC0001 | 1 | 500,000 | 100.0000 | 500,000 |
| 4 | Hydro One Telecom Inc. | 86800 1066 RC0001 | 1 | 500,000 | | |
| 5 | Hydro One Telecom Link Limited | 88786 7513 RC0001 | 1 | 500,000 | | |
| 6 | Hydro One Brampton Networks Inc. | 86486 7635 RC0001 | 1 | 500,000 | | |
| 7 | Hydro One Lake Erie Link Management Inc | 87892 1519 RC0001 | 1 | 500,000 | | |
| 8 | Hydro One Lake Erie Link Company Inc. | 87560 6519 RC0001 | 1 | 500,000 | | |
| 9 | Hydro One B2M LP Inc. | 81838 2046 RC0001 | 1 | 500,000 | | |
| 10 | B2M GP Inc. | 81838 1840 RC0001 | 1 | 500,000 | | |
| 11 | Hydro One B2M Holdings Inc. | 82217 7531 RC0001 | 1 | 500,000 | | |
| 12 | 1908872 Ontario Inc. | 82581 6838 RC0001 | 1 | 500,000 | | |
| 13 | 1908873 Ontario Inc. | 83392 0978 RC0001 | 1 | 500,000 | | |

| | 1 Names of associated corporations 100 | 2 Business Number of associated corporations 200 | 3 Asso-ciation code 300 | 4 Business limit for the year (before the allocation) $ | 5 Percentage of the business limit % 350 | 6 Business limit allocated* $ 400 | |
|---|---|---|---|---|---|---|---|
| 14 | 1893080 Ontario Inc. | 82217 7333 RC0001 | 1 | 500,000 | | | |
| | | | | Total | 100.0000 | 500,000 | A |

**Business limit reduction under subsection 125(5.1) of the ITA**

The business limit reduction is calculated in the small business deduction area of the T2 return. One of the factors used in this calculation is the "Large corporation amount" at line 415 of the T2 return. If the corporation is a member of an associated group** of corporations in the current tax year, the amount at line 415 of the T2 return is equal to 0.225% x (A - $10,000,000) where, "A" is the total of taxable capital employed in Canada*** of each corporation in the associated group for its last tax year ending in the preceding calendar year.

* Each corporation will enter on line 410 of the T2 return, the amount allocated to it in column 6. However, if the corporation's tax year is less than 51 weeks, prorate the amount in column 6 by the number of days in the tax year divided by 365, and enter the result on line 410 of the T2 return.

Special rules apply if a CCPC has more than one tax year ending in a calendar year and is associated in more than one of those years with another CCPC that has a tax year ending in the same calendar year. If the tax year straddles January 1, 2009, the business limit for the second (or subsequent) tax year(s) will be equal to the lesser of the business limit that would have been determined for the first tax year ending in the calendar year, if $500,000 was used in allocating the amounts among associated corporations and the business limit determined for the second (or subsequent) tax year(s) ending in the same calendar year. Otherwise, the business limit for the second (or subsequent) tax year(s) will be equal to the lesser of the business limit determined for the first tax year ending in the calendar year and the business limit determined for the second (or subsequent) tax year(s) ending in the same calendar year.

** The associated group includes the corporation filing this schedule and each corporation that has an "association code" of 1 or 4 in column 3.

*** "Taxable capital employed in Canada" has the meaning assigned by subsection 181.2(1) or 181.3(1) or section 181.4 of the ITA.

# GENERAL RATE INCOME POOL (GRIP) CALCULATION

| Name of corporation | Business Number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

On: 2013-12-31

- If you are a Canadian-controlled private corporation (CCPC) or a deposit insurance corporation (DIC), use this schedule to determine the general rate income pool (GRIP).
- When an eligible dividend was paid in the tax year, file a completed copy of this schedule with your *T2 Corporation Income Tax Return*. Do not send your worksheets with your return, but keep them in your records in case we ask to see them later.
- Subsections referred to in this schedule are from the *Income Tax Act*.
- Subsection 89(1) defines the terms eligible dividend, excessive eligible dividend designation, general rate income pool, and low rate income pool.

## Eligibility for the various additions

Answer the following questions to determine the corporation's eligibility for the various additions:

**2006 addition**

1. Is this the corporation's first taxation year that includes January 1, 2006? ☐ Yes ☒ No
2. If not, what is the date of the taxation year end of the corporation's first year that includes January 1, 2006? Enter the date and go directly to question 4: 2006-12-31
3. During that first year, was the corporation a CCPC or would it have been a CCPC if not for the election of subsection 89(11) ITA? ☒ Yes ☐ No
   **If the answer to question 3 is yes, complete Part "GRIP addition for 2006".**

**Change in the type of corporation**

4. Was the corporation a CCPC during its preceding taxation year? ☒ Yes ☐ No
5. Corporations that become a CCPC or a DIC ☐ Yes ☒ No
   **If the answer to question 5 is yes, complete Part 4.**

**Amalgamation (first year of filing after amalgamation)**

6. Corporations that were formed as a result of an amalgamation ☐ Yes ☒ No
   **If the answer to question 6 is yes, answer questions 7 and 8. If the answer is no, go to question 9.**
7. Was one or more of the predecessor corporations neither a CCPC nor a DIC? ☐ Yes ☐ No
   **If the answer to question 7 is yes, complete Part 4.**
8. Was one or more of the predecessor corporation a CCPC or a DIC during the taxation year that ended immediately before amalgamation? ☐ Yes ☐ No
   **If the answer to question 8 is yes, complete Part 3.**

**Winding-up**

9. Has the corporation wound-up a subsidiary in the preceding taxation year? ☐ Yes ☒ No
   **If the answer to question 9 is yes, answer questions 10 and 11. If the answer is no, go to Part 1.**
10. Was the subsidiary neither a CCPC nor a DIC during its last taxation year? ☐ Yes ☐ No
    **If the answer to question 10 is yes, complete Part 4.**
11. Was the subsidiary a CCPC or a DIC during its last taxation year? ☐ Yes ☐ No
    **If the answer to question 11 is yes, complete Part 3.**

## Part 1 – Calculation of general rate income pool (GRIP)

| | | | | |
|---|---|---|---|---|
| GRIP at the end of the previous tax year | | | 100 | 1,223,283 A |
| Taxable income for the year (DICs enter "0") * | | 110 | B | |
| Income for the credit union deduction * (amount E in Part 3 of Schedule 17) | 120 | | | |
| Amount on line 400, 405, 410, or 425 of the T2 return, whichever is less * | 130 | | | |
| For a CCPC, the lesser of aggregate investment income (line 440 of the T2 return) and taxable income * | 140 | | | |
| Subtotal (**add** lines 120, 130, and 140) | | ► | C | |
| Income taxable at the general corporate rate (line B **minus** line C) (if negative enter "0") | | 150 | | |
| After-tax income (line 150 x general rate factor for the tax year ** 0.72 ) | | | 190 | D |
| Eligible dividends received in the tax year | | 200 | | |
| Dividends deductible under section 113 received in the tax year | | 210 | | |
| Subtotal (**add** lines 200 and 210) | | | ► | E |
| GRIP addition: | | | | |
| Becoming a CCPC (line PP from Part 4) | | 220 | | |
| Post-amalgamation (total of lines EE from Part 3 and lines PP from Part 4) | | 230 | | |
| Post-wind-up (total of lines EE from Part 3 and lines PP from Part 4) | | 240 | | |
| Subtotal (**add** lines 220, 230, and 240) | | | ► 290 | F |
| Subtotal (**add** lines A, D, E, and F) | | | | 1,223,283 G |
| Eligible dividends paid in the previous tax year | | 300 | | |
| Excessive eligible dividend designations made in the previous tax year | | 310 | | |

**Note:** If becoming a CCPC (subsection 89(4) applies), enter "0" on lines 300 and 310.

| | | | |
|---|---|---|---|
| Subtotal (line 300 **minus** line 310) | | ► | H |
| GRIP before adjustment for specified future tax consequences (line G **minus** line H) (amount can be negative) | | 490 | 1,223,283 |
| Total GRIP adjustment for specified future tax consequences to previous tax years (amount W from Part 2) | | 560 | 1,503,909 |
| **GRIP at the end of the tax year** (line 490 **minus** line 560) | | 590 | -280,626 |

Enter this amount on line 160 of Schedule 55.

* For lines 110, 120, 130, and 140, the income amount is the amount before considering specified future tax consequences. This phrase is defined in subsection 248(1). It includes the deduction of a loss carryback from subsequent tax years, a reduction of Canadian exploration expenses and Canadian development expenses that were renounced in subsequent tax years (e.g., flow-through share renunciations), reversals of income inclusions where an option is exercised in subsequent tax years, and the effect of certain foreign tax credit adjustments.

** The **general rate factor** for a tax year is 0.68 for any portion of the tax year that falls before 2010, 0.69 for any portion of the tax year that falls in 2010, 0.70 for any portion of the tax year that falls in 2011, and 0.72 for any portion of the tax year that falls after 2011. Calculate the general rate factor in Part 5 for tax years that straddle these dates.

## Part 2 – GRIP adjustment for specified future tax consequences to previous tax years

Complete this part if the corporation's taxable income of any of the previous three tax years took into account the specified future tax consequences defined in subsection 248(1) from the current tax year. Otherwise, enter "0" on line 560.

**First previous tax year** 2012-12-31

| | | | |
|---|---|---|---|
| Taxable income before specified future tax consequences from the current tax year | | J1 | |
| Enter the following amounts before specified future tax consequences from the current tax year: | | | |
| Income for the credit union deduction (amount E in Part 3 of Schedule 17) | K1 | | |
| Amount on line 400, 405, 410, or 425 of the T2 return, whichever is less | L1 | | |
| Aggregate investment income (line 440 of the T2 return) | M1 | | |
| Subtotal (**add** lines K1, L1, and M1) | ► | N1 | |
| Subtotal (line J1 **minus** line N1) (if negative, enter "0") | | ► | O1 |

## Part 2 – GRIP adjustment for specified future tax consequences to previous tax years (continued)

| Future tax consequences that occur for the current year<br>Amount carried back from the current year to a prior year | | | | | |
|---|---|---|---|---|---|
| **Non-capital loss carry-back (paragraph 111 (1)(a) ITA)** | **Capital loss carry-back** | **Restricted farm loss carry-back** | **Farm loss carry-back** | **Other** | **Total carrybacks** |
| | | | | | |

Taxable income after specified future tax consequences . . . . . . . . ______ P1

Enter the following amounts after specified future tax consequences:

Income for the credit union deduction (amount E in Part 3 of Schedule 17) . . . ______ Q1

Amount on line 400, 405, 410, or 425 of the T2 return, whichever is less . . . . ______ R1

(line V3 **multiplied by** the general rate factor for the tax year 0.72 ) . . . . . . . . **540** 1,503,909

**Total GRIP adjustment for specified future tax consequences to previous tax years:**
(**add** lines 500, 520, and 540) (if negative, enter "0") . . . . . . . . 1,503,909 W

Enter amount W on line 560.

## Part 3 – Worksheet to calculate the GRIP addition post-amalgamation or post-wind-up (predecessor or subsidiary was a CCPC or a DIC in its last tax year)

**nb. 1** Post amalgamation . . . ☐ Post wind-up . . . . . . ☐

Complete this part when there has been an amalgamation (within the meaning assigned by subsection 87(1)) or a wind-up (to which subsection 88(1) applies) and the predecessor or subsidiary corporation was a CCPC or a DIC in its last tax year. In the calculation below, **corporation** means a predecessor or a subsidiary. The last tax year for a predecessor corporation was its tax year that ended immediately before the amalgamation and for a subsidiary corporation was its tax year during which its assets were distributed to the parent on the wind-up.

For a post-wind-up, include the GRIP addition in calculating the parent's GRIP at the end of its tax year that immediately follows the tax year during which it receives the assets of the subsidiary.

Complete a separate worksheet for **each** predecessor and **each** subsidiary that was a CCPC or a DIC in its last tax year. Keep a copy of this calculation for your records, in case we ask to see it later.

Corporation's GRIP at the end of its last tax year . . . . . . . . ______ AA

Eligible dividends paid by the corporation in its last tax year . . . . . . . . ______ BB

Excessive eligible dividend designations made by the corporation in its last tax year . . . . . . . . ______ CC

Subtotal (line BB **minus** line CC) ______ ▶ ______ DD

**GRIP addition post-amalgamation or post-wind-up (predecessor or subsidiary was a CCPC or a DIC in its last tax year)**
(line AA **minus** line DD) . . . . . . . . ______ EE

After you complete this calculation for each predecessor and each subsidiary, calculate the total of all the EE lines. Enter this total amount on:

- line 230 for post-amalgamation; or
- line 240 for post-wind-up.

## Part 4 – Worksheet to calculate the GRIP addition post-amalgamation, post-wind-up (predecessor or subsidiary was not a CCPC or a DIC in its last tax year), or the corporation is becoming a CCPC

**nb. 1** Corporation becoming a CCPC ☐ Post amalgamation ☐ Post wind-up ☐

Complete this part when there has been an amalgamation (within the meaning assigned by subsection 87(1)) or a wind-up (to which subsection 88(1) applies) and the predecessor or subsidiary was not a CCPC or a DIC in its last tax year. Also, use this part for a corporation becoming a CCPC. In the calculation below, **corporation** means a corporation becoming a CCPC, a predecessor, or a subsidiary.

For a post-wind-up, include the GRIP addition in calculating the parent's GRIP at the end of its tax year that immediately follows the tax year during which it receives the assets of the subsidiary.

Complete a separate worksheet for **each** predecessor and **each** subsidiary that was not a CCPC or a DIC in its last tax year. Keep a copy of this calculation for your records, in case we ask to see it later.

| | | | |
|---|---|---|---|
| Cost amount to the corporation of all property immediately before the end of its previous/last tax year | | | FF |
| The corporation's money on hand immediately before the end of its previous/last tax year | | | GG |
| Unused and unexpired losses at the end of the corporation's previous/last tax year: | | | |
| Non-capital losses | | | |
| Net capital losses | | | |
| Farm losses | | | |
| Restricted farm losses | | | |
| Limited partnership losses | | | |
| Subtotal | | ► | HH |
| Subtotal (**add** lines FF, GG, and HH) | | | II |
| All the corporation's debts and other obligations to pay that were outstanding immediately before the end of its previous/last tax year | | JJ | |
| Paid-up capital of all the corporation's issued and outstanding shares of capital stock immediately before the end of its previous/last tax year | | KK | |
| All the corporation's reserves deducted in its previous/last tax year | | LL | |
| The corporation's capital dividend account immediately before the end of its previous/last tax year | | MM | |
| The corporation's low rate income pool immediately before the end of its previous/last tax year | | NN | |
| Subtotal (**add** lines JJ, KK, LL, MM, and NN) | | ► | OO |
| **GRIP addition post-amalgamation or post-wind-up (predecessor or subsidiary was not a CCPC or a DIC in its last tax year), or the corporation is becoming a CCPC** (line II **minus** line OO) (if negative, enter "0") | | | PP |

After you complete this worksheet for each predecessor and each subsidiary, calculate the total of all the PP lines. Enter this total amount on:

- line 220 for a corporation becoming a CCPC;
- line 230 for post-amalgamation; or
- line 240 for post-wind-up.

## Part 5 – General rate factor for the tax year

Complete this part to calculate the general rate factor for the tax year.

| | | | | | | |
|---|---|---|---|---|---|---|
| 0.68 | x | number of days in the tax year before January 1, 2010 / number of days in the tax year | / 365 | . . . . . . . . . . . | = | QQ |
| 0.69 | x | number of days in the tax year in 2010 / number of days in the tax year | / 365 | . . . . . . . . . . . | = | RR |
| 0.7 | x | number of days in the tax year in 2011 / number of days in the tax year | / 365 | . . . . . . . . . . . | = | SS |
| 0.72 | x | number of days in the tax year after December 31, 2011 / number of days in the tax year | 365 / 365 | . . . . . . . . . . . | = 0.720000000 | TT |

**General rate factor for the tax year** (total of lines QQ to TT) . . . . . . . . . . . . . . . . . . . . . 0.72000 UU

Canada Revenue Agency / Agence du revenu du Canada

**Schedule 510**

# Ontario Corporate Minimum Tax

| Corporation's name | Business number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- File this schedule if the corporation is subject to Ontario corporate minimum tax (CMT). CMT is levied under section 55 of the *Taxation Act, 2007* (Ontario), referred to as the "Ontario Act".
- Complete Part 1 to determine if the corporation is subject to CMT for the tax year.
- A corporation not subject to CMT in the tax year is still required to file this schedule if it is deducting a CMT credit, has a CMT credit carryforward, or has a CMT loss carryforward or a current year CMT loss.
- A corporation that has Ontario special additional tax on life insurance corporations (SAT) payable in the tax year must complete Part 4 of this schedule even if it is not subject to CMT for the tax year.
- A corporation is exempt from CMT if, throughout the tax year, it was one of the following:
  1) a corporation exempt from income tax under section 149 of the federal *Income Tax Act*;
  2) a mortgage investment corporation under subsection 130.1(6) of the federal Act;
  3) a deposit insurance corporation under subsection 137.1(5) of the federal Act;
  4) a congregation or business agency to which section 143 of the federal Act applies;
  5) an investment corporation as referred to in subsection 130(3) of the federal Act; or
  6) a mutual fund corporation under subsection 131(8) of the federal Act.
- File this schedule with the *T2 Corporation Income Tax Return*.

## Part 1 – Determination of CMT applicability

| | | |
|---|---|---|
| Total assets of the corporation at the end of the tax year * | 112 | 73,695,000 |
| Share of total assets from partnership(s) and joint venture(s) * | 114 | |
| Total assets of associated corporations (amount from line 450 on Schedule 511) | 116 | 33,431,225,104 |
| Total assets (total of lines 112 to 116) | | 33,504,920,104 |
| Total revenue of the corporation for the tax year ** | 142 | 50,035,000 |
| Share of total revenue from partnership(s) and joint venture(s) ** | 144 | |
| Total revenue of associated corporations (amount from line 550 on Schedule 511) | 146 | 6,702,002,000 |
| Total revenue (total of lines 142 to 146) | | 6,752,037,000 |

The corporation is subject to CMT if:
- for tax years ending before July 1, 2010, the total assets at the end of the year of the corporation or the associated group of corporations are more than $5,000,000, or the total revenue for the year of the corporation or the associated group of corporations is more than $10,000,000.
- for tax years ending after June 30, 2010, the total assets at the end of the year of the corporation or the associated group of corporations are equal to or more than $50,000,000, and the total revenue for the year of the corporation or the associated group of corporations is equal to or more than $100,000,000.

If the corporation is not subject to CMT, do not complete the remaining parts unless the corporation is deducting a CMT credit, or has a CMT credit carryforward, a CMT loss carryforward, a current year CMT loss, or SAT payable in the year.

* **Rules for total assets**
- Report total assets according to generally accepted accounting principles, adjusted so that consolidation and equity methods are not used.
- Do not include unrealized gains and losses on assets and foreign currency gains and losses on assets that are included in net income for accounting purposes but not in income for corporate income tax purposes.
- The amount on line 114 is determined at the end of the last fiscal period of the partnership or joint venture that ends in the tax year of the corporation. Add the proportionate share of the assets of the partnership(s) and joint venture(s), and deduct the recorded asset(s) for the investment in partnerships and joint ventures.
- A corporation's share in a partnership or joint venture is determined under paragraph 54(5)(b) of the Ontario Act and, if the partnership or joint venture had no income or loss, is calculated as if the partnership's or joint venture's income were $1 million. For a corporation with an indirect interest in a partnership or joint venture, determine the corporation's share according to paragraph 54(5)(c) of the Ontario Act.

** **Rules for total revenue**
- Report total revenue in accordance with generally accepted accounting principles, adjusted so that consolidation and equity methods are not used.
- If the tax year is less than 51 weeks, **multiply** the total revenue of the corporation or the partnership, whichever applies, by 365 and **divide** by the number of days in the tax year.
- The amount on line 144 is determined for the partnership or joint venture fiscal period that ends in the tax year of the corporation. If the partnership or joint venture has 2 or more fiscal periods ending in the filing corporation's tax year, **multiply** the sum of the total revenue for each of the fiscal periods by 365 and **divide** by the total number of days in all the fiscal periods.
- A corporation's share in a partnership or joint venture is determined under paragraph 54(5)(b) of the Ontario Act and, if the partnership or joint venture had no income or loss, is calculated as if the partnership's or joint venture's income were $1 million. For a corporation with an indirect interest in a partnership or joint venture, determine the corporation's share according to paragraph 54(5)(c) of the Ontario Act.

## Part 2 – Adjusted net income/loss for CMT purposes

| | | | | |
|---|---|---|---|---|
| Net income/loss per financial statements * | | | 210 | 13,000 |
| **Add** (to the extent reflected in income/loss): | | | | |
| Provision for current income taxes/cost of current income taxes | 220 | | | |
| Provision for deferred income taxes (debits)/cost of future income taxes | 222 | | | |
| Equity losses from corporations | 224 | | | |
| Financial statement loss from partnerships and joint ventures | 226 | | | |
| Dividends deducted on financial statements (subsection 57(2) of the Ontario Act), excluding dividends paid by credit unions under subsection 137(4.1) of the federal Act | 230 | | | |
| **Other additions** (see note below): | | | | |
| Share of adjusted net income of partnerships and joint ventures ** | 228 | | | |
| Total patronage dividends received, not already included in net income/loss | 232 | | | |
| 281 | 282 | | | |
| 283 | 284 | | | |
| Subtotal | | | | A |
| **Deduct** (to the extent reflected in income/loss): | | | | |
| Provision for recovery of current income taxes/benefit of current income taxes | 320 | 1,091,000 | | |
| Provision for deferred income taxes (credits)/benefit of future income taxes | 322 | | | |
| Equity income from corporations | 324 | | | |
| Financial statement income from partnerships and joint ventures | 326 | | | |
| Dividends deductible under section 112, section 113, or subsection 138(6) of the federal Act | 330 | | | |
| Dividends not taxable under section 83 of the federal Act (from Schedule 3) | 332 | | | |
| Gain on donation of listed security or ecological gift | 340 | | | |
| Accounting gain on transfer of property to a corporation under section 85 or 85.1 of the federal Act *** | 342 | | | |
| Accounting gain on transfer of property to/from a partnership under section 85 or 97 of the federal Act **** | 344 | | | |
| Accounting gain on disposition of property under subsection 13(4), subsection 14(6), or section 44 of the federal Act ***** | 346 | | | |
| Accounting gain on a windup under subsection 88(1) of the federal Act or an amalgamation under section 87 of the federal Act | 348 | | | |
| **Other deductions** (see note below): | | | | |
| Share of adjusted net loss of partnerships and joint ventures ** | 328 | | | |
| Tax payable on dividends under subsection 191.1(1) of the federal Act **multiplied** by 3 | 334 | | | |
| Interest deducted/deductible under paragraph 20(1)(c) or (d) of the federal Act, not already included in net income/loss | 336 | | | |
| Patronage dividends paid (from Schedule 16) not already included in net income/loss | 338 | | | |
| 381 Other comprehensive income included in income | 382 | 13,000 | | |
| 383 | 384 | | | |
| 385 | 386 | | | |
| 387 | 388 | | | |
| 389 | 390 | | | |
| Subtotal | | 1,104,000 | | 1,104,000 B |
| Adjusted net income/loss for CMT purposes (line 210 **plus** amount A **minus** amount B) | | | 490 | -1,091,000 |

If the amount on line 490 is positive and the corporation is subject to CMT as determined in Part 1, enter the amount on line 515 in Part 3.

If the amount on line 490 is negative, enter the amount on line 760 in Part 7 (enter as a positive amount).

**Note**

In accordance with *Ontario Regulation 37/09*, when calculating net income for CMT purposes, accounting income should be adjusted to:

- exclude unrealized gains and losses due to mark-to-market changes or foreign currency changes on specified mark-to-market property (assets only);
- include realized gains and losses on the disposition of specified mark-to-market property not already included in the accounting income, if the property is not a capital property or is a capital property disposed in the year or in a previous tax year ended after March 22, 2007.

"Specified mark-to-market property" is defined in subsection 54(1) of the Ontario Act.

These rules also apply to partnerships. A corporate partner's share of a partnership's adjusted income flows through on a proportionate basis to the corporate partner.

* **Rules for net income/loss**

- Banks must report net income/loss as per the report accepted by the Superintendent of Financial Institutions under the federal *Bank Act*, adjusted so consolidation and equity methods are not used.

## Part 2 – Adjusted net income/loss for CMT purposes (continued)

– Life insurance corporations must report net income/loss as per the report accepted by the federal Superintendent of Financial Institutions or equivalent provincial insurance regulator, before SAT and adjusted so consolidation and equity methods are not used. If the life insurance corporation is resident in Canada and carries on business in and outside of Canada, **multiply** the net income/loss by the ratio of the Canadian reserve liabilities **divided** by the total reserve liability. The reserve liabilities are calculated in accordance with Regulation 2405(3) of the federal Act.

– Other corporations must report net income/loss in accordance with generally accepted accounting principles, except that consolidation and equity methods must not be used. When the equity method has been used for accounting purposes, equity losses and equity income are removed from book income/loss on lines 224 and 324 respectively.

– Corporations, other than insurance corporations, should report net income from line 9999 of the GIFI (Schedule 125) on line 210.

** The share of the adjusted net income of a partnership or joint venture is calculated as if the partnership or joint venture were a corporation and the tax year of the partnership or joint venture were its fiscal period. For a corporation with an indirect interest in a partnership through one or more partnerships, determine the corporation's share according to clause 54(5)(c) of the Ontario Act.

*** A joint election will be considered made under subsection 60(1) of the Ontario Act if there is an entry on line 342, and an election has been made for transfer of property to a corporation under subsection 85(1) of the federal Act.

**** A joint election will be considered made under subsection 60(2) of the Ontario Act if there is an entry on line 344, and an election has been made under subsection 85(2) or 97(2) of the federal Act.

***** A joint election will be considered made under subsection 61(1) of the Ontario Act if there is an entry on line 346, and an election has been made under subsection 13(4) or 14(6) and/or section 44 of the federal Act.

For more information on how to complete this part, see the *T2 Corporation – Income Tax Guide*.

## Part 3 – CMT payable

| | | | | |
|---|---|---|---|---|
| Adjusted net income for CMT purposes (line 490 in Part 2, if positive) | | 515 | | |
| **Deduct:** | | | | |
| CMT loss available (amount R from Part 7) | 1,551,765 | | | |
| **Minus:** Adjustment for an acquisition of control * | 518 | | | |
| Adjusted CMT loss available | 1,551,765 ▶ | | 1,551,765 | C |
| Net income subject to CMT calculation (if negative, enter "0") | | 520 | | |

Amount from line 520 ______ x (Number of days in the tax year before July 1, 2010 ______ / Number of days in the tax year 365) x 4 % = ______ 1

Amount from line 520 ______ x (Number of days in the tax year after June 30, 2010 365 / Number of days in the tax year 365) x 2.7 % = ______ 2

Subtotal (amount 1 **plus** amount 2) ______ 3

| | | | |
|---|---|---|---|
| Gross CMT: amount on line 3 above x OAF ** | 540 | | |
| **Deduct:** | | | |
| Foreign tax credit for CMT purposes *** | 550 | | |
| CMT after foreign tax credit deduction (line 540 **minus** line 550) (if negative, enter "0") | | | D |
| **Deduct:** | | | |
| Ontario corporate income tax payable before CMT credit (amount F6 from Schedule 5) | | | |
| Net CMT payable (if negative, enter "0") | | | E |

Enter amount E on line 278 of Schedule 5, *Tax Calculation Supplementary – Corporations*, and complete Part 4.

* Enter the portion of CMT loss available that exceeds the adjusted net income for the tax year from carrying on a business before the acquisition of control. See subsection 58(3) of the Ontario Act.

*** Enter "0" on line 550 for life insurance corporations as they are not eligible for this deduction. For all other corporations, enter the cumulative total of amount J for the province of Ontario from Part 9 of Schedule 21 on line 550.

**** Calculation of the Ontario allocation factor (OAF):**

If the provincial or territorial jurisdiction entered on line 750 of the T2 return is "Ontario," enter "1" on line F.

If the provincial or territorial jurisdiction entered on line 750 of the T2 return is "multiple," complete the following calculation, and enter the result on line F:

Ontario taxable income **** / Taxable income ***** ______ = ______

**Ontario allocation factor** ........ 1.00000 F

**** Enter the amount allocated to Ontario from column F in Part 1 of Schedule 5. If the taxable income is nil, calculate the amount in column F as if the taxable income were $1,000.

*****Enter the taxable income amount from line 360 or amount Z of the T2 return, whichever applies. If the taxable income is nil, enter "1,000."

## Part 4 – CMT credit carryforward

| | | | | |
|---|---|---|---|---|
| CMT credit carryforward at the end of the previous tax year * | | | | G |
| **Deduct:** | | | | |
| CMT credit expired * | 600 | | | |
| CMT credit carryforward at the beginning of the current tax year * (see note below) | | | 620 | |
| **Add:** | | | | |
| CMT credit carryforward balances transferred on an amalgamation or the windup of a subsidiary (see note below) | | | 650 | |
| CMT credit available for the tax year (amount on line 620 **plus** amount on line 650) | | | | H |
| **Deduct:** | | | | |
| CMT credit deducted in the current tax year (amount P from Part 5) | | | | I |
| Subtotal (amount H **minus** amount I) | | | | J |
| **Add:** | | | | |
| Net CMT payable (amount E from Part 3) | | | | |
| SAT payable (amount O from Part 6 of Schedule 512) | | | | |
| Subtotal | | | | K |
| CMT credit carryforward at the end of the tax year (amount J **plus** amount K) | | | 670 | L |

* For the first harmonized T2 return filed with a tax year that includes days in 2009:
- do not enter an amount on line G or line 600;
- for line 620, enter the amount from line 2336 of Ontario CT23 Schedule 101, *Corporate Minimum Tax (CMT)*, for the last tax year that ended in 2008.

For other tax years, enter on line G the amount from line 670 of Schedule 510 from the previous tax year.

**Note:** If you entered an amount on line 620 or line 650, complete Part 6.

## Part 5 – CMT credit deducted from Ontario corporate income tax payable

| | | | | |
|---|---|---|---|---|
| CMT credit available for the tax year (amount H from Part 4) | | | | M |
| Ontario corporate income tax payable before CMT credit (amount F6 from Schedule 5) | | | 1 | |
| For a corporation that is not a life insurance corporation: | | | | |
| CMT after foreign tax credit deduction (amount D from Part 3) | | 2 | | |
| For a life insurance corporation: | | | | |
| Gross CMT (line 540 from Part 3) | | 3 | | |
| Gross SAT (line 460 from Part 6 of Schedule 512) | | 4 | | |
| The **greater** of amounts 3 and 4 | | 5 | | |
| **Deduct:** line 2 or line 5, whichever applies: | | | 6 | |
| Subtotal (if negative, enter "0") | | | | N |
| Ontario corporate income tax payable before CMT credit (amount F6 from Schedule 5) | | | | |
| **Deduct:** | | | | |
| Total refundable tax credits excluding Ontario qualifying environmental trust tax credit (amount J6 **minus** line 450 from Schedule 5) | 30,604 | | | |
| Subtotal (if negative, enter "0") | | | | O |
| CMT credit deducted in the current tax year (least of amounts M, N, and O) | | | | P |

Enter amount P on line 418 of Schedule 5 and on line I in Part 4 of this schedule.

Is the corporation claiming a CMT credit earned before an acquisition of control? 675 1 Yes ☐ 2 No ☒

If you answered **yes** to the question at line 675, the CMT credit deducted in the current tax year may be restricted. For information on how the deduction may be restricted, see subsections 53(6) and (7) of the Ontario Act.

## Part 6 – CMT credit available for carryforward by year of origin

Complete this part if:
- the tax year includes January 1, 2009; or
- the previous tax year-end is deemed to be December 31, 2008, under subsection 249(3) of the federal Act.

| Year of origin | CMT credit balance * |
|---|---|
| 10th previous tax year | 680 |
| 9th previous tax year | 681 |
| 8th previous tax year | 682 |
| 7th previous tax year | 683 |
| 6th previous tax year | 684 |
| 5th previous tax year | 685 |
| 4th previous tax year | 686 |
| 3rd previous tax year | 687 |
| 2nd previous tax year | 688 |
| 1st previous tax year | 689 |
| Total ** | |

* CMT credit that was earned (by the corporation, predecessors of the corporation, and subsidiaries wound up into the corporation) in each of the previous 10 tax years and has not been deducted.

** Must equal the total of the amounts entered on lines 620 and 650 in Part 4.

## Part 7 – CMT loss carryforward

| | | | | |
|---|---|---|---|---|
| CMT loss carryforward at the end of the previous tax year * | | 1,551,765 Q | | |
| **Deduct:** | | | | |
| CMT loss expired * | 700 | | | |
| CMT loss carryforward at the beginning of the tax year * (see note below) | | 1,551,765 ▶ | 720 | 1,551,765 |
| **Add:** | | | | |
| CMT loss transferred on an amalgamation under section 87 of the federal Act ** (see note below) | | | 750 | |
| CMT loss available (line 720 **plus** line 750) | | | | 1,551,765 R |
| **Deduct:** | | | | |
| CMT loss deducted against adjusted net income for the tax year (lesser of line 490 (if positive) and line C in Part 3) | | | | |
| Subtotal (if negative, enter "0") | | | | 1,551,765 S |
| **Add:** | | | | |
| Adjusted net loss for CMT purposes (amount from line 490 in Part 2, if **negative**) (enter as a positive amount) | | | 760 | 1,091,000 |
| CMT loss carryforward balance at the end of the tax year (amount S **plus** line 760) | | | 770 | 2,642,765 T |

* For the first harmonized T2 return filed with a tax year that includes days in 2009:
- do not enter an amount on line Q or line 700;
- for line 720, enter the amount from line 2214 of Ontario CT23 Schedule 101, *Corporate Minimum Tax (CMT)*, for the last tax year that ended in 2008.

For other tax years, enter on line Q the amount from line 770 of Schedule 510 from the previous tax year.

** Do not include an amount from a predecessor corporation if it was controlled at any time before the amalgamation by any of the other predecessor corporations.

**Note:** If you entered an amount on line 720 or line 750, complete Part 8.

## Part 8 – CMT loss available for carryforward by year of origin

Complete this part if:
- the tax year includes January 1, 2009; or
- the previous tax year-end is deemed to be December 31, 2008, under subsection 249(3) of the federal Act.

| Year of origin | Balance earned in a tax year ending before March 23, 2007 * | Balance earned in a tax year ending after March 22, 2007 ** |
|---|---|---|
| 10th previous tax year | 810 | 820 |
| 9th previous tax year | 811 | 821 |
| 8th previous tax year | 812 | 822 |
| 7th previous tax year | 813 | 823 |
| 6th previous tax year | 814 | 824 |
| 5th previous tax year | 815 | 825 |
| 4th previous tax year | 816 | 826 |
| 3rd previous tax year | 817 | 827 |
| 2nd previous tax year | 818 | 828 |
| 1st previous tax year | | 829 |
| Total *** | | |

* Adjusted net loss for CMT purposes that was earned (by the corporation, by subsidiaries wound up into or amalgamated with the corporation before March 22, 2007, and by other predecessors of the corporation) in each of the previous 10 tax years that ended before March 23, 2007, and has not been deducted.

** Adjusted net loss for CMT purposes that was earned (by the corporation and its predecessors, but not by a subsidiary predecessor) in each of the previous 20 tax years that ended after March 22, 2007, and has not been deducted.

*** The total of these two columns must equal the total of the amounts entered on lines 720 and 750.

Canada Revenue Agency  Agence du revenu du Canada

**SCHEDULE 511**

# ONTARIO CORPORATE MINIMUM TAX – TOTAL ASSETS AND REVENUE FOR ASSOCIATED CORPORATIONS

| Name of corporation | Business Number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- For use by corporations to report the total assets and total revenue of all the Canadian or foreign corporations with which the filing corporation was associated at any time during the tax year. These amounts are required to determine if the filing corporation is subject to corporate minimum tax.
- Total assets and total revenue include the associated corporation's share of any partnership(s)/joint venture(s) total assets and total revenue.
- Attach additional schedules if more space is required.
- File this schedule with the *T2 Corporation Income Tax Return*.

| | Names of associated corporations 200 | Business number (Canadian corporation only) (see Note 1) 300 | Total assets* (see Note 2) 400 | Total revenue** (see Note 2) 500 |
|---|---|---|---|---|
| 1 | Hydro One Inc. | 86999 4731 RC0001 | 13,247,000,000 | 650,000,000 |
| 2 | Hydro One Networks Inc. | 87086 5821 RC0001 | 19,698,000,000 | 5,502,000,000 |
| 3 | Hydro One Telecom Inc. | 86800 1066 RC0001 | 76,876,000 | 80,880,000 |
| 4 | Hydro One Telecom Link Limited | 88786 7513 RC0001 | 1,111,000 | 442,000 |
| 5 | Hydro One Brampton Networks Inc. | 86486 7635 RC0001 | 403,229,000 | 468,680,000 |
| 6 | Hydro One Lake Erie Link Management Inc | 87892 1519 RC0001 | 4,990,000 | 0 |
| 7 | Hydro One Lake Erie Link Company Inc. | 87560 6519 RC0001 | 18,000 | 0 |
| 8 | Hydro One B2M LP Inc. | 81838 2046 RC0001 | 1 | 0 |
| 9 | B2M GP Inc. | 81838 1840 RC0001 | 999 | 0 |
| 10 | Hydro One B2M Holdings Inc. | 82217 7531 RC0001 | 100 | 0 |
| 11 | 1908872 Ontario Inc. | 82581 6838 RC0001 | 1 | 0 |
| 12 | 1908873 Ontario Inc. | 83392 0978 RC0001 | 1 | 0 |
| 13 | 1893080 Ontario Inc. | 82217 7333 RC0001 | 2 | 0 |
| | | **Total** | 450 33,431,225,104 | 550 6,702,002,000 |

Enter the total assets from line 450 on line 116 in Part 1 of Schedule 510, *Ontario Corporate Minimum Tax*.
Enter the total revenue from line 550 on line 146 in Part 1 of Schedule 510.

Note 1: Enter "NR" if a corporation is not registered.

Note 2: If the associated corporation does not have a tax year that ends in the filing corporation's current tax year but was associated with the filing corporation in the previous tax year of the filing corporation, enter the total revenue and total assets from the tax year of the associated corporation that ends in the previous tax year of the filing corporation.

* **Rules for total assets**

- Report total assets in accordance with generally accepted accounting principles, adjusted so that consolidation and equity methods are not used.
- Include the associated corporation's share of the total assets of partnership(s) and joint venture(s) but exclude the recorded asset(s) for the investment in partnerships and joint ventures.
- Exclude unrealized gains and losses on assets that are included in net income for accounting purposes but not in income for corporate income tax purposes.

** **Rules for total revenue**

- Report total revenue in accordance with generally accepted accounting principles, adjusted so that consolidation and equity methods are not used.
- If the associated corporation has 2 or more tax years ending in the filing corporation's tax year, **multiply** the sum of the total revenue for each of those tax years by 365 and **divide** by the total number of days in all of those tax years.
- If the associated corporation's tax year is less than 51 weeks and is the only tax year of the associated corporation that ends in the filing corporation's tax year, **multiply** the associated corporation's total revenue by 365 and **divide** by the number of days in the associated corporation's tax year.
- Include the associated corporation's share of the total revenue of partnerships and joint ventures.
- If the partnership or joint venture has 2 or more fiscal periods ending in the associated corporation's tax year, **multiply** the sum of the total revenue for each of the fiscal periods by 365 and **divide** by the total number of days in all the fiscal periods.

**SCHEDULE 546**

# *CORPORATIONS INFORMATION ACT* ANNUAL RETURN FOR ONTARIO CORPORATIONS

| Name of corporation | Business Number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- This schedule should be completed by a corporation that is incorporated, continued, or amalgamated in Ontario and subject to the Ontario *Business Corporations Act* (BCA) or Ontario *Corporations Act* (CA), except for registered charities under the federal *Income Tax Act*. This completed schedule serves as a *Corporations Information Act* Annual Return under the *Ontario Corporations Information Act*.
- Complete parts 1 to 4. Complete parts 5 to 7 only to report change(s) in the information recorded on the Ontario Ministry of Government Services (MGS) public record.
- This schedule must set out the required information for the corporation as of the date of delivery of this schedule.
- A completed Ontario *Corporations Information Act* Annual Return must be delivered within six months after the end of the corporation's tax year-end. The MGS considers this return to be delivered on the date that it is filed with the Canada Revenue Agency (CRA) together with the corporation's income tax return.
- It is the corporation's responsibility to ensure that the information shown on the MGS public record is accurate and up-to-date. To review the information shown for the corporation on the public record maintained by the MGS, obtain a Corporation Profile Report. Visit **www.ServiceOntario.ca** for more information.
- This schedule contains non-tax information collected under the authority of the Ontario *Corporations Information Act*. This information will be sent to the MGS for the purposes of recording the information on the public record maintained by the MGS.

## Part 1 – Identification

**100** Corporation's name (exactly as shown on the MGS public record)
Hydro One Remote Communities Inc.

| Jurisdiction incorporated, continued, or amalgamated, whichever is the most recent | **110** Date of incorporation or amalgamation, whichever is the most recent (Year Month Day) | **120** Ontario Corporation No. |
|---|---|---|
| Ontario | 1998-08-18 | 1310735 |

## Part 2 – Head or registered office address (P.O. box not acceptable as stand-alone address)

**200** Care of (if applicable)

| **210** Street number | **220** Street name/Rural route/Lot and Concession number | **230** Suite number |
|---|---|---|
| 483 | Bay Street 8th Floor | |

**240** Additional address information if applicable (line 220 must be completed first)
South Tower

| **250** Municipality (e.g., city, town) | **260** Province/state | **270** Country | **280** Postal/zip code |
|---|---|---|---|
| Toronto | ON | CA | M5G 2P5 |

## Part 3 – Change identifier

Have there been any changes in any of the information most recently filed for the public record maintained by the MGS for the corporation with respect to names, addresses for service, and the date elected/appointed and, if applicable, the date the election/appointment ceased of the directors and five most senior officers, or with respect to the corporation's mailing address or language of preference? To review the information shown for the corporation on the public record maintained by the MGS, obtain a Corporation Profile Report. For more information, visit **www.ServiceOntario.ca**.

**300** [ 1 ] If there have been no changes, enter **1** in this box and then go to "Part 4 – Certification."
If there are changes, enter **2** in this box and complete the applicable parts on the next page, and then go to "Part 4 – Certification."

## Part 4 – Certification

I certify that all information given in this *Corporations Information Act* Annual Return is true, correct, and complete.

**450** BARAGETTI (Last name) **451** GIOVANNA (First name)

**454** ______________________, (Middle name(s))

**460** [ 3 ] Please enter one of the following numbers in this box for the above-named person: **1** for director, **2** for officer, or **3** for other individual having knowledge of the affairs of the corporation. If you are a director and officer, enter **1** or **2**.

Note: Sections 13 and 14 of the Ontario *Corporations Information Act* provide penalties for making false or misleading statements or omissions.

**Complete the applicable parts to report changes in the information recorded on the MGS public record.**

## Part 5 – Mailing address

500 Please enter one of the following numbers in this box:
1 - Show no mailing address on the MGS public record.
2 - The corporation's mailing address is the same as the head or registered office address in Part 2 of this schedule.
3 - The corporation's complete mailing address is as follows:

510 Care of (if applicable)

520 Street number | 530 Street name/Rural route/Lot and Concession number | 540 Suite number

550 Additional address information if applicable (line 530 must be completed first)

560 Municipality (e.g., city, town) | 570 Province/state | 580 Country | 590 Postal/zip code

## Part 6 – Language of preference

600 Indicate your language of preference by entering **1** for English or **2** for French. This is the language of preference recorded on the MGS public record for communications with the corporation. It may be different from line 990 on the T2 return.

Canada Revenue Agency | Agence du revenu du Canada

**SCHEDULE 550**

# ONTARIO CO-OPERATIVE EDUCATION TAX CREDIT

| Name of corporation | Business Number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- Use this schedule to claim an Ontario co-operative education tax credit (CETC) under section 88 of the *Taxation Act, 2007* (Ontario).
- The CETC is a refundable tax credit that is equal to an eligible percentage (10% to 30%) of the eligible expenditures incurred by a corporation for a qualifying work placement. The maximum credit amount is $1,000 for each qualifying work placement ending before March 27, 2009, and $3,000 for each qualifying work placement beginning after March 26, 2009. For a qualifying work placement that straddles March 26, 2009, the maximum credit amount is prorated.
- Eligible expenditures are salaries and wages (including taxable benefits) paid or payable to a student in a qualifying work placement, or fees paid or payable to an employment agency for services performed by the student in a qualifying work placement. These expenditures must be paid on account of employment or services, as applicable, at a permanent establishment of the corporation in Ontario. Expenditures for a work placement (WP) are not eligible expenditures if they are greater than the amounts that would be paid to an arm's length employee.
- A WP must meet all of the following conditions to be a qualifying work placement:
  - the student performs employment duties for a corporation under a qualifying co-operative education program (QCEP);
  - the WP has been developed or approved by an eligible educational institution as a suitable learning situation;
  - the terms of the WP require the student to engage in productive work;
  - the WP is for a period of at least 10 consecutive weeks or, in the case of an internship program, not less than 8 consecutive months and not more than 16 consecutive months;
  - the student is paid for the work performed in the WP;
  - the corporation is required to supervise and evaluate the job performance of the student in the WP;
  - the institution monitors the student's performance in the WP; and
  - the institution has certified the WP as a qualifying work placement.
- Make sure you keep a copy of the letter of certification from the Ontario eligible educational institution containing the name of the student, the employer, the institution, the term of the WP, and the name/discipline of the QCEP to support the claim. Do not submit the letter of certification with the *T2 Corporation Income Tax Return.*
- File this schedule with the *T2 Corporation Income Tax Return.*

## Part 1 – Corporate information

| 110 Name of person to contact for more information | 120 Telephone number including area code |
|---|---|
| SELMA YAM | (416) 345-6827 |

Is the claim filed for a CETC earned through a partnership?* . . . . . **150** 1 Yes [ ] 2 No [X]

If you answered **yes** to the question at line 150, what is the name of the partnership? . . . . . **160** ______

Enter the percentage of the partnership's CETC allocated to the corporation . . . . . **170** ______ %

* When a corporate member of a partnership is claiming an amount for eligible expenditures incurred by a partnership, complete a Schedule 550 for the partnership as if the partnership were a corporation. Each corporate partner, other than a limited partner, should file a separate Schedule 550 to claim the partner's share of the partnership's CETC. The allocated amounts can not exceed the amount of the partnership's CETC.

## Part 2 – Eligibility

1. Did the corporation have a permanent establishment in Ontario in the tax year? . . . . . **200** 1 Yes [X] 2 No [ ]
2. Was the corporation exempt from tax under Part III of the *Taxation Act*, 2007 (Ontario)? . . . . . **210** 1 Yes [ ] 2 No [X]

If you answered **no** to question 1 or **yes** to question 2, then the corporation is **not eligible** for the CETC.

## Part 3 – Eligible percentage for determining the eligible amount

Corporation's salaries and wages paid in the previous tax year * . . . . . **300** 9,723,581

For eligible expenditures incurred before March 27, 2009:

- If line 300 is $400,000 or less, enter 15% on line 310.
- If line 300 is $600,000 or more, enter 10% on line 310.
- If line 300 is more than $400,000 and less than $600,000, enter the percentage on line 310 using the following formula:

$$\text{Eligible percentage} = 15\,\% - \left[ 5\,\% \times \left( \frac{\text{amount on line 300} \quad \textbf{minus} \quad \$ \quad 400{,}000}{\$ \quad 200{,}000} \right) \right]$$

**Eligible percentage for determining the eligible amount** . . . . . **310** 10.000 %

For eligible expenditures incurred after March 26, 2009:

- If line 300 is $400,000 or less, enter 30% on line 312.
- If line 300 is $600,000 or more, enter 25% on line 312.
- If line 300 is more than $400,000 and less than $600,000, enter the percentage on line 312 using the following formula:

$$\text{Eligible percentage} = 30\,\% - \left[ 5\,\% \times \left( \frac{\text{amount on line 300} \quad \textbf{minus} \quad \$ \quad 400{,}000}{\$ \quad 200{,}000} \right) \right]$$

**Eligible percentage for determining the eligible amount** . . . . . **312** 25.000 %

* If this is the first tax year of an amalgamated corporation and subsection 88(9) of the *Taxation Act, 2007* (Ontario) applies, enter the salaries and wages paid in the previous tax year by the predecessor corporations.

## Part 4 – Calculation of the Ontario co-operative education tax credit

Complete a separate entry for each student for each qualifying work placement that ended in the corporation's tax year. If a qualifying work placement would otherwise exceed four consecutive months, divide the WP into periods of four consecutive months and enter each full period of four consecutive months as a separate WP. If the WP does not divide equally into four-month periods and if the period that is less than 4 months is 10 or more consecutive weeks, then enter that period as a separate WP. If that period is less than 10 consecutive weeks, then include it with the WP for the last period of 4 consecutive months. Consecutive WPs with two or more associated corporations are deemed to be with only one corporation, as designated by the corporations.

| | A<br>Name of university, college, or other eligible educational institution<br>**400** | B<br>Name of qualifying co-operative education program<br>**405** |

| 1. | 4,435 | 3,000 | 3,000 | | 3,000 |
| 2. | 4,435 | 3,000 | 3,000 | | 3,000 |
| 3. | 5,715 | 3,000 | 3,000 | | 3,000 |
| 4. | 5,715 | 3,000 | 3,000 | | 3,000 |
| 5. | | | | | |

**Ontario co-operative education tax credit** (total of amounts in column K) 500 12,000 L

or, if the corporation answered **yes** at line 150 in Part 1, determine the partner's share of amount L:

Amount L ______ x percentage on line 170 in Part 1 ______ % = . . . . . . . . . . . . . . . . . . . . . . ______ M

Enter amount L or M, whichever applies, on line 452 of Schedule 5, *Tax Calculation Supplementary – Corporations.* If you are filing more than one Schedule 550, add the amounts from line L or M, whichever applies, on all the schedules and enter the total amount on line 452 of Schedule 5.

Note 1: Reduce eligible expenditures by all government assistance, as defined under subsection 88(21) of the *Taxation Act, 2007* (Ontario), that the corporation has received, is entitled to receive, or may reasonably expect to receive, for the eligible expenditures, on or before the filing due date of the *T2 Corporation Income Tax Return* for the tax year.

Note 2: Calculate the eligible amount (Column G) using the following formula:

Column G = (column F1 x percentage on line 310) + (column F2 x percentage on line 312)

Note 3: If the WP ends before March 27, 2009, the maximum credit amount for the WP is $1,000.
If the WP begins after March 26, 2009, the maximum credit amount for the WP is $3,000.
If the WP begins before March 27, 2009, and ends after March 26, 2009, calculate the maximum credit amount using the following formula:

($1,000 x X/Y) + [$3,000 x (Y – X)/Y]

where "X" is the number of consecutive weeks of the WP completed by the student before March 27, 2009, and "Y" is the total number of consecutive weeks of the student's WP.

Note 4: When claiming a CETC for repayment of government assistance, complete a **separate entry** for each repayment and complete columns A to E and J and K with the details for the previous year WP in which the government assistance was received. Include the amount of government assistance repaid in the tax year multiplied by the eligible percentage for the tax year in which the government assistance was received, to the extent that the government assistance reduced the CETC in that tax year.

Canada Revenue Agency | Agence du revenu du Canada

**SCHEDULE 552**

# ONTARIO APPRENTICESHIP TRAINING TAX CREDIT

| Name of corporation | Business Number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2013-12-31 |

- Use this schedule to claim an Ontario apprenticeship training tax credit (ATTC) under section 89 of the *Taxation Act, 2007* (Ontario).
- The ATTC is a refundable tax credit that is equal to a specified percentage (25% to 45%) of the eligible expenditures incurred by a corporation for a qualifying apprenticeship. Before March 27, 2009, the maximum credit for each apprentice is $5,000 per year to a maximum credit of $15,000 over the first 36-month period of the qualifying apprenticeship. After March 26, 2009, the maximum credit for each apprentice is $10,000 per year to a maximum credit of $40,000 over the first 48-month period of the qualifying apprenticeship. The maximum credit amount is prorated for an employment period of an apprentice that straddles March 26, 2009.
- Eligible expenditures are salaries and wages (including taxable benefits) paid to an apprentice in a qualifying apprenticeship or fees paid to an employment agency for the provision of services performed by the apprentice in a qualifying apprenticeship. These expenditures must be:
  - paid on account of employment or services, as applicable, at a permanent establishment of the corporation in Ontario;
  - for services provided by the apprentice during the first 36 months of the apprenticeship program, if incurred before March 27, 2009; and
  - for services provided by the apprentice during the first 48 months of the apprenticeship program, if incurred after March 26, 2009.
- An expenditure is not eligible for an ATTC if:
  - the same expenditure was used, or will be used, to claim a co-operative education tax credit; or
  - it is more than an amount that would be paid to an arm's length apprentice.
- An apprenticeship must meet the following conditions to be a qualifying apprenticeship:
  - the apprenticeship is in a qualifying skilled trade approved by the Ministry of Training, Colleges and Universities (Ontario); and
  - the corporation and the apprentice must be participating in an apprenticeship program in which the training agreement has been registered under the *Ontario College of Trades and Apprenticeship Act, 2009 or* the *Apprenticeship and Certification Act, 1998* or in which the contract of apprenticeship has been registered under the *Trades Qualification and Apprenticeship Act.*
- Make sure you keep a copy of the training agreement or contract of apprenticeship to support your claim. Do not submit the training agreement or contract of apprenticeship with your *T2 Corporation Income Tax Return.*
- File this schedule with your *T2 Corporation Income Tax Return.*

## Part 1 – Corporate information (please print)

| **110** Name of person to contact for more information | **120** Telephone number including area code |
|---|---|
| SELMA YAM | (416) 345-6827 |

Is the claim filed for an ATTC earned through a partnership? * . . . . . **150** 1 Yes [ ] 2 No [X]

If **yes** to the question at line 150, what is the name of the partnership? . . . . . **160** ______

Enter the percentage of the partnership's ATTC allocated to the corporation . . . . . **170** ______ %

* When a corporate member of a partnership is claiming an amount for eligible expenditures incurred by a partnership, complete a Schedule 552 for the partnership as if the partnership were a corporation. Each corporate partner, other than a limited partner, should file a separate Schedule 552 to claim the partner's share of the partnership's ATTC. The total of the partners' allocated amounts can never exceed the amount of the partnership's ATTC.

## Part 2 – Eligibility

1. Did the corporation have a permanent establishment in Ontario in the tax year? . . . . . **200** 1 Yes [X] 2 No [ ]
2. Was the corporation exempt from tax under Part III of the *Taxation Act, 2007* (Ontario)? . . . . . **210** 1 Yes [ ] 2 No [X]

If you answered **no** to question 1 or **yes** to question 2, then you are **not eligible** for the ATTC.

## Part 3 – Specified percentage

Corporation's salaries and wages paid in the previous tax year * . . . . . **300** 9,723,581

For eligible expenditures incurred before March 27, 2009:
- If line 300 is $400,000 or less, enter 30% on line 310.
- If line 300 is $600,000 or more, enter 25% on line 310.
- If line 300 is more than $400,000 and less than $600,000, enter the percentage on line 310 using the following formula:

$$\text{Specified percentage} = 30\,\% - \left[ 5\,\% \times \frac{(\text{amount on line 300} \text{ minus } 400{,}000)}{200{,}000} \right]$$

**Specified percentage** . . . . . **310** 25.000 %

For eligible expenditures incurred after March 26, 2009:
- If line 300 is $400,000 or less, enter 45% on line 312.
- If line 300 is $600,000 or more, enter 35% on line 312.
- If line 300 is more than $400,000 and less than $600,000, enter the percentage on line 312 using the following formula:

$$\text{Specified percentage} = 45\,\% - \left[ 10\,\% \times \frac{(\text{amount on line 300} \text{ minus } 400{,}000)}{200{,}000} \right]$$

**Specified percentage** . . . . . **312** 35.000 %

* If this is the first tax year of an amalgamated corporation and subsection 89(6) of the *Taxation Act, 2007* (Ontario) applies, enter salaries and wages paid in the previous tax year by the predecessor corporations.

## Part 4 – Calculation of the Ontario apprenticeship training tax credit

Complete a **separate entry** for each apprentice that is in a qualifying apprenticeship with the corporation. When claiming an ATTC for repayment of government assistance, complete a **separate entry** for each repayment, and complete columns A to G and M and N with the details for the employment period in the previous tax year in which the government assistance was received.

| | L<br>ATTC on eligible expenditures (lesser of columns I and K)<br>470 | M<br>ATTC on repayment of government assistance (see note 5 below)<br>480 | N<br>ATTC for each apprentice (column L or column M, whichever applies)<br>490 |
|---|---|---|---|
| 1. | 137 | | 137 |
| 2. | 1,973 | | 1,973 |
| 3. | 1,452 | | 1,452 |
| 4. | 5,644 | | 5,644 |
| 5. | 4,466 | | 4,466 |
| 6. | 4,932 | | 4,932 |
| 7. | | | |

**Ontario apprenticeship training tax credit** (total of amounts in column N) 500 18,604 O or, if the corporation answered **yes** at line 150 in Part 1, determine the partner's share of amount O:

Amount O ________ x percentage on line 170 in Part 1 ________ % = . . . . . . . . . . . . . . . . ________ P

Enter amount O or P, whichever applies, on line 454 of Schedule 5, *Tax Calculation Supplementary – Corporations.* If you are filing more than one Schedule 552, add the amounts from line O or P, whichever applies, on all the schedules, and enter the total amount on line 454 of Schedule 5.

Note 1: When there are multiple employment periods as an apprentice in the tax year with the corporation, do not include days in which the individual was not employed as an apprentice.
For H1: The days employed as an apprentice must be within 36 months of the registration date provided in column E.
For H2: The days employed as an apprentice must be within 48 months of the registration date provided in column E.

Note 2: Maximum credit = ($5,000 x H1/365*) + ($10,000 x H2/365*)
* 366 days, if the tax year includes February 29

Note 3: Reduce eligible expenditures by all government assistance, as defined under subsection 89(19) of the *Taxation Act, 2007* (Ontario), that the corporation has received, is entitled to receive, or may reasonably expect to receive, in respect of the eligible expenditures, on or before the filing due date of the *T2 Corporation Income Tax Return* for the tax year.
For J1: Eligible expenditures before March 27, 2009, must be for services provided by the apprentice during the first 36 months of the apprenticeship program.
For J2: Eligible expenditures after March 26, 2009, must be for services provided by the apprentice during the first 48 months of the apprenticeship program.

Note 4: Calculate the amount in column K as follows:
Column K = (J1 x line 310) + (J2 x line 312)

Note 5: Include the amount of government assistance repaid in the tax year multiplied by the specified percentage for the tax year in which the government assistance was received, to the extent that the government assistance reduced the ATTC in that tax year.
Complete a **separate entry** for each repayment of government assistance.

# T2 Corporation Income Tax Return

055 Do not use this area

Filed: 2017-08-28
EB-2017-0051
Exhibit D2-09-01
Attachment 2
Page 1 of 100

This form serves as a federal, provincial, and territorial corporation income tax return, unless the corporation is located in Quebec or Alberta. If the corporation is located in one of these provinces, you have to file a separate provincial corporation return.

All legislative references on this return are to the federal *Income Tax Act* and *Income Tax Regulations*. This return may contain changes that had not yet become law at the time of publication.

Send one completed copy of this return, including schedules and the *General Index of Financial Information* (GIFI), to your tax centre or tax services office. You have to file the return within six months after the end of the corporation's tax year.

For more information see **www.cra.gc.ca** or Guide T4012, *T2 Corporation – Income Tax Guide*.

## Identification

**Business number (BN)** . . . . . . . . . . 001 87083 6269 RC0001

## Attachments

**Financial statement information:** Use GIFI schedules 100, 125, and 141.
**Schedules** – Answer the following questions. For each **yes** response, **attach** the schedule to the T2 return, unless otherwise instructed.

| Question | Line | Yes | Schedule |
|---|---|---|---|
| Is the corporation related to any other corporations? | 150 | X | 9 |
| Is the corporation an associated CCPC? | 160 | X | 23 |
| Is the corporation an associated CCPC that is claiming the expenditure limit? | 161 | | 49 |
| Does the corporation have any non-resident shareholders who own voting shares? | 151 | | 19 |
| Has the corporation had any transactions, including section 85 transfers, with its shareholders, officers, or employees, other than transactions in the ordinary course of business? Exclude non-arm's length transactions with non-residents | 162 | | 11 |
| If you answered **yes** to the above question, and the transaction was between corporations not dealing at arm's length, were all or substantially all of the assets of the transferor disposed of to the transferee? | 163 | | 44 |
| Has the corporation paid any royalties, management fees, or other similar payments to residents of Canada? | 164 | X | 14 |
| Is the corporation claiming a deduction for payments to a type of employee benefit plan? | 165 | X | 15 |
| Is the corporation claiming a loss or deduction from a tax shelter? | 166 | | T5004 |
| Is the corporation a member of a partnership for which a partnership account number has been assigned? | 167 | | T5013 |
| Did the corporation, a foreign affiliate controlled by the corporation, or any other corporation or trust that did not deal at arm's length with the corporation have a beneficial interest in a non-resident discretionary trust (without reference to section 94)? | 168 | | 22 |
| Did the corporation own any shares in one or more foreign affiliates in the tax year? | 169 | | 25 |
| Has the corporation made any payments to non-residents of Canada under subsections 202(1) and/or 105(1) of the federal *Income Tax Regulations*? | 170 | | 29 |
| Did the corporation have a total amount over $1 million of reportable transactions with non-arm's length non-residents? | 171 | | T106 |
| For private corporations: Does the corporation have any shareholders who own 10% or more of the corporation's common and/or preferred shares? | 173 | X | 50 |
| Has the corporation made payments to, or received amounts from, a retirement compensation plan arrangement during the year? | 172 | | ——— |
| Does the corporation earn income from one or more Internet webpages or websites? | 180 | X | 88 |
| Is the net income/loss shown on the financial statements different from the net income/loss for income tax purposes? | 201 | X | 1 |
| Has the corporation made any charitable donations; gifts to Canada, a province, or a territory; gifts of cultural or ecological property; or gifts of medicine? | 202 | | 2 |
| Has the corporation received any dividends or paid any taxable dividends for purposes of the dividend refund? | 203 | | 3 |

| Subtotal | | | | B |
| Subtotal (amount A **minus** amount B) (if negative, enter "0") | | | | C |
| **Add:** Section 110.5 additions or subparagraph 115(1)(a)(vii) additions | 355 | | | D |
| **Taxable income** (amount C **plus** amount D) | 360 | | | |
| Income exempt under paragraph 149(1)(t) | 370 | | | |
| **Taxable income** for a corporation with exempt income under paragraph 149(1)(t) (line 360 **minus** line 370) | | | | Z |

* This amount is equal to 3.5 times the Part VI.1 tax payable at line 724 on page 8.

## Small business deduction

**Canadian-controlled private corporations (CCPCs) throughout the tax year**

Income from active business carried on in Canada from Schedule 7 . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . **400** ________ A

Taxable income from line 360 on page 3, **minus** 100/28 3.57143 of the amount on line 632* on page 7,
**minus** 4 times the amount on line 636** on page 7, and **minus** any amount that, because of
federal law, is exempt from Part I tax . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . **405** ________ B

Business limit (see notes 1 and 2 below) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . **410** ________ C

**Notes:**

1. For CCPCs that are not associated, enter $ 500,000 on line 410. However, if the corporation's tax year is less than 51 weeks, prorate this amount by the number of days in the tax year divided by 365, and enter the result on line 410.

2. For associated CCPCs, use Schedule 23 to calculate the amount to be entered on line 410.

**Business limit reduction:**

Amount C ________ x **415** *** ________ / 11,250 D = . . . . . . . . . . . . . . . . . . . . . . . . ________ E

Reduced business limit (amount C **minus** amount E) (if negative, enter "0") . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . **425** ________ F

**Small business deduction**

Amount A, B, C, or F, whichever is the least ________ x 17 % = . . . . . . . . . . . . . . . . . . . . . . . **430** ________ G

Enter amount G on line I on page 7.

* Calculate the amount of foreign non-business income tax credit deductible on line 632 without reference to the refundable tax on the CCPC's investment income (line 604) and without reference to the corporate tax reductions under section 123.4.

** Calculate the amount of foreign business income tax credit deductible on line 636 without reference to the corporation tax reductions under section 123.4.

*** **Large corporations**

- If the corporation is not associated with any corporations in both the current and previous tax years, the amount to be entered on line 415 is: (total taxable capital employed in Canada for the **prior year** minus $10,000,000) x 0.225%.
- If the corporation is not associated with any corporations in the current tax year, but was associated in the previous tax year, the amount to be entered on line 415 is: (total taxable capital employed in Canada for the **current year** minus $10,000,000) x 0.225%.
- For corporations associated in the current tax year, see Schedule 23 for the special rules that apply.

## FINANCIAL STATEMENTS

## DECEMBER 31, 2014

**HYDRO ONE REMOTE COMMUNITIES INC.**
**INDEPENDENT AUDITORS' REPORT**

To Directors of Hydro One Remote Communities Inc.

We have audited the accompanying financial statements of Hydro One Remote Communities Inc., which comprise the balance sheet as at December 31, 2014, the statements of operations and comprehensive income, changes in shareholder's deficit and cash flows for the year then ended, and notes, comprising a summary of significant accounting policies and other explanatory information.

*Management's Responsibility for the Financial Statements*

Management is responsible for the preparation and fair presentation of these financial statements in accordance with United States Generally Accepted Accounting Principles, and for such internal control as management determines is necessary to enable the preparation of financial statements that are free from material misstatement, whether due to fraud or error.

*Auditors' Responsibility*

Our responsibility is to express an opinion on these financial statements based on our audit. We conducted our audit in accordance with Canadian generally accepted auditing standards. Those standards require that we comply with ethical requirements and plan and perform the audit to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on our judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, we consider internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

*Opinion*

In our opinion, the financial statements present fairly, in all material respects, the financial position of Hydro One Remote Communities Inc. as at December 31, 2014, and its results of operations and its cash flows for the year then ended in accordance with United States Generally Accepted Accounting Principles.

## 1. DESCRIPTION OF THE BUSINESS

Hydro One Inc. (Hydro One) was incorporated on December 1, 1998, under the *Business Corporations Act* (Ontario) and is wholly owned by the Province of Ontario (Province). The principal businesses of Hydro One are the transmission and distribution of electricity to customers within Ontario.

Hydro One Remote Communities Inc. (Hydro One Remote Communities or the Company) was incorporated on August 18, 1998 under the *Business Corporations Act* (Ontario), and is a wholly owned subsidiary of Hydro One. Hydro One Remote Communities operates 19 small electrical, generation and distribution systems in remote communities in northern Ontario that are not connected to the Province's electricity grid. The Company's business is regulated by the Ontario Energy Board (OEB).

## 2. SIGNIFICANT ACCOUNTING POLICIES

### Basis of Accounting

These Financial Statements are prepared and presented in accordance with United States (US) Generally Accepted Accounting Principles (GAAP) and in Canadian dollars.

The Company uses a cost recovery model applied to achieve breakeven net income and the financial statements are prepared for the use of the OEB. Certain amounts presented in these Financial Statements represent allocations from Hydro One that are subject to review and approval by the OEB. Consolidated Financial Statements of Hydro One for the year ended December 31, 2014 have been prepared and are publicly available.

Hydro One Remote Communities performed an evaluation of subsequent events through to March 24, 2015, the date these Financial Statements were available to be issued, to determine whether any events or transactions warranted recognition and disclosure in these Financial Statements. No such events or transactions were identified.

### Use of Management Estimates

The preparation of financial statements requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities at the date of the financial statements and the reported amounts of revenues and expenses during the reporting periods. Management evaluates these estimates on an on-going basis based upon: historical experience; current conditions; and assumptions believed to be reasonable at the time the assumption is made with any adjustments being recognized in results of operations in the period they arise. Significant estimates relate to regulatory assets and regulatory liabilities, environmental liabilities, post-retirement and post-employment benefits, asset impairment, contingencies, unbilled revenue, allowance for doubtful accounts and deferred income tax assets and liabilities. Actual results may differ significantly from these estimates, which may be impacted by future decisions made by the OEB or the Province.

### Rate Setting

In October 2013, Hydro One Remote Communities filed an IRM application with the OEB for 2014 distribution rates, seeking approval for a rate increase of approximately 0.48%. On March 13, 2014, the OEB approved an increase of approximately 1.7% to basic rates for the distribution and generation of electricity, with an effective date of May 1, 2014. The final rate increase was adjusted by the OEB's updated rate adjustment parameters and Hydro One Remote Communities' IRM stretch factor.

In 2012, Hydro One Remote Communities filed a cost-of-service application for 2013 distribution rates. The application requested an increase of 3.45% to customer rates for generation and distribution and an increase of approximately $7 million to annual Rural and Remote Rate Protection (RRRP). In 2013, the OEB approved the proposed rate increase and annual RRRP of approximately $32 million.

### Regulatory Accounting

The OEB has the general power to include or exclude costs, revenues, losses or gains in the rates of a specific period, resulting in a change in the timing of accounting recognition from that which would have applied in an unregulated company. Such change in timing involves the application of rate-regulated accounting, giving rise to the recognition of regulatory assets and liabilities. The Company's regulatory assets represent certain amounts receivable from future customers and costs that have been deferred for accounting purposes because it is probable that they will be recovered in future rates. In addition, the Company has recorded regulatory liabilities that generally represent amounts that are refundable to future electricity customers. The Company continually assesses the likelihood of recovery of each of its regulatory assets and continues to believe that it is probable that the OEB will factor its regulatory assets and liabilities into the setting of future rates. If, at some future date, the Company judges that it is no longer probable that the OEB will include a regulatory asset or liability in setting future rates, the appropriate carrying amount will be reflected in results of operations in the period that the assessment is made.

Hydro One Remote Communities is regulated under a cost recovery model applied to achieve breakeven net income, after consideration of the recovery of / provision for payments in lieu of corporate income taxes (PILs). Any excess or deficiency in RRRP amounts necessary to lead to breakeven net income is added to, or drawn from, the Remote Rate Protection Revenue (RRPR) variance account. The balance in the RRPR variance account is subject to future review and disposition by the OEB.

### Revenue Recognition

Revenues are recognized on an accrual basis and include billed and unbilled revenues. Revenues attributable to the generation and delivery of electricity are based on OEB-approved distribution rates and are recognized as electricity is delivered to customers. The Company estimates monthly revenue for a period based on wholesale electricity purchases because customer meters are not generally read at the end of each month. At the end of each month, the electricity delivered to customers, but not billed, is estimated and revenue is recognized. The unbilled revenue estimate is affected by energy demand, weather, line losses and changes in the composition of customer classes.

Distribution revenue also includes RRRP which is an amount relating to rate protection for remote customers received from the Independent Electricity System Operator (IESO) based on a standardized customer rate that is approved by the OEB. Current legislation provides RRRP for prescribed classes of rural, residential and remote consumers by reducing the electricity rates that would otherwise apply.

Revenues are recorded net of indirect taxes.

### Accounts Receivable and Allowance for Doubtful Accounts

Billed accounts receivable are recorded at the invoiced amount and overdue amounts related to regulated billings bear interest at OEB approved rates. The allowance for doubtful accounts reflects the Company's best estimate of losses on accounts receivable balances. The allowance is based on accounts receivable aging, historical experience and other currently available information. The Company estimates the allowance for doubtful accounts on customer receivables by applying internally developed loss rates to the outstanding receivable balances by risk segment. Risk segments represent groups of customers with similar credit quality indicators and are computed based on various attributes, including number of days receivables are past due, delinquency of balances and payment history. Loss rates applied to the accounts receivable balances are based on historical average write-offs as a percentage of accounts receivable in each risk segment. An account is considered delinquent if the amount billed is not received within 120 days from the bill due date. Accounts receivable are written off against the allowance when they are deemed uncollectible. The existing allowance for uncollectible accounts will continue to be affected by changes in volume, prices and economic conditions.

Long-term accounts receivable are recorded at their invoiced amount and represent amounts due from specified First Nations. The component of long-term accounts receivable that is energy-related does not bear interest. These amounts are reduced by fixed-interval payments, received monthly throughout the term of the agreement. Provision for uncollectible amounts for this component is set at the inception of the balance and is maintained until settlement of those amounts. The provision for this component is monitored and adjusted only if required with management discretion. The component of long-term accounts

receivable that is non-energy related is reduced annually by a fixed incremental amount which is expensed through performance of the associated contract. There is no provision associated with these amounts.

**Corporate Income Taxes**

Under the *Electricity Act, 1998,* Hydro One Remote Communities is required to make (recover) PILs to (from) the Ontario Electricity Financial Corporation (OEFC). These payments are calculated in accordance with the rules for computing income and other relevant amounts contained in the *Income Tax Act* (Canada) and the *Taxation Act, 2007* (Ontario), as modified by the *Electricity Act, 1998,* and related regulations.

Current and deferred income taxes are computed based on the tax rates and tax laws enacted at the balance sheet date. Tax benefits associated with income tax positions taken, or expected to be taken, in a tax return are recorded only when the "more-likely-than-not" recognition threshold is satisfied and are measured at the largest amount of benefit that has a greater than 50% likelihood of being realized upon settlement. Management evaluates each position based solely on the technical merits and facts and circumstances of the position, assuming the position will be examined by a taxing authority having full knowledge of all relevant information. Significant management judgment is required to determine recognition thresholds and the related amount of tax benefits to be recognized in the Financial Statements. Management re-evaluates tax positions each period in which new information about recognition or measurement becomes available.

***Current Income Taxes***

The recovery of or the provision for current taxes and the assets and liabilities recognized for the current and prior periods are measured at the amounts receivable from, or payable to, the OEFC.

***Deferred Income Taxes***

Deferred income taxes are provided for using the liability method. Deferred income taxes are recognized based on the estimated future tax consequences attributable to temporary differences between the carrying amount of assets and liabilities in the Financial Statements and their corresponding tax bases.

Deferred income tax liabilities are generally recognized on all taxable temporary differences. Deferred tax assets are recognized to the extent that it is more-likely-than-not that these assets will be realized from taxable income available against which deductible temporary differences can be utilized.

Deferred income taxes are calculated at the tax rates that are expected to apply in the period when the liability is settled or the asset is realized, based on the tax rates and tax laws that have been enacted at the balance sheet date. Deferred income taxes that are not included in the rate-setting process are charged or credited to the Statements of Operations and Comprehensive Income.

If management determines that it is more-likely-than-not that some or all of a deferred income tax asset will not be realized, a valuation allowance is recorded against the deferred income tax asset to report the net balance at the amount expected to be realized. Previously unrecognized deferred income tax assets are reassessed at each balance sheet date and are recognized to the extent that it has become more-likely-than-not that the tax benefit will be realized.

The Company records regulatory assets and liabilities associated with deferred income taxes that will be included in the rate-setting process.

The Company uses the flow-through method to account for investment tax credits (ITCs) earned on eligible scientific research and experimental development expenditures, and apprenticeship job creation. Under this method, only non-refundable ITCs are recognized as a reduction to income tax expense.

**Inter-company Demand Facility**

Hydro One maintains pooled bank accounts for its use and for the use of its subsidiaries, including Hydro One Remote Communities. The balance in the inter-company demand facility represents the cumulative net effect of all deposits and

withdrawals made by the Company to and from the pooled cash accounts. Interest is earned on positive inter-company balances based on the average of the bankers' acceptance rate at the beginning and end of the month, less 0.02%. Interest is charged on overdraft inter-company balances based on the same bankers' acceptance rate, plus 0.15%.

**Fuel, Materials and Supplies**

Fuel is used in the generation of electricity. Materials and supplies represent consumables, small spare parts and construction materials held for internal construction and maintenance of property, plant and equipment. These assets are carried at average cost less any impairments recorded.

**Property, Plant and Equipment**

Property, plant and equipment is recorded at original cost, net of customer contributions received in aid of construction and any accumulated impairment losses. The cost of additions, including betterments and replacements of asset components, is included on the Balance Sheets as property, plant and equipment.

The original cost of property, plant and equipment includes direct materials, direct labour (including employee benefits), contracted services, attributable capitalized financing costs, and direct and indirect overheads that are related to the capital project or program. Indirect overheads include a portion of corporate costs such as finance, treasury, human resources, information technology and executive costs. Overhead costs, including corporate functions and field services costs, are capitalized on a fully allocated basis, consistent with an OEB-approved methodology.

Property, plant and equipment in service consists of generation, distribution, and administration and service assets. Property, plant and equipment also includes future use assets, such as major components and spare parts and capitalized project development costs associated with deferred capital projects.

***Generation***

Generation assets are used in the generation of electricity, including hydroelectric equipment, wind turbines, diesel generators, and tank farms.

***Distribution***

Distribution assets include assets related to the distribution of low-voltage electricity, including lines, poles, switches, transformers, protective devices, and metering systems.

***Administration and Service***

Administration and service assets include administrative buildings, personal computers, tools, and other minor assets.

**Capitalized Financing Costs**

Capitalized financing costs represent interest costs attributable to the construction of property, plant and equipment. The financing cost of attributable borrowed funds is capitalized as part of the acquisition cost of such assets. The capitalized portion of financing costs is a reduction to financing charges recognized in the Statements of Operations and Comprehensive Income. Capitalized financing costs are calculated using the Company's weighted average effective cost of debt.

**Construction in Progress**

Construction in progress consists of the capitalized cost of constructed assets that are not yet complete and which have not yet been placed in service.

**Depreciation**

The cost of property, plant and equipment is depreciated on a straight-line basis based on the estimated remaining service life of each asset category.

The Company periodically initiates an external independent review of its property, plant and equipment depreciation rates, as required by the OEB. Any changes arising from such a review are implemented on a remaining service life basis, consistent with their inclusion in electricity rates. The last review resulted in changes to rates effective January 1, 2013.

A summary of average service lives and depreciation and amortization rates for the various classes of assets is included below:

| | Average Service Life | Rate (%) Range | Rate (%) Average |
|---|---|---|---|
| Generation | 22 years | 3% – 7% | 5% |
| Distribution | 48 years | 1% – 7% | 2% |
| Administration and service | 45 years | 2% – 20% | 4% |

In accordance with group depreciation practices, the original cost of property, plant and equipment, or major components thereof, that are normally retired, is charged to accumulated depreciation with no gain or loss being reflected in results of operations. Where a disposition of property, plant and equipment occurs through sale, a gain or loss is calculated based on proceeds and such gain or loss is included in depreciation expense. Depreciation expense also includes the costs incurred to remove property, plant and equipment assets where no asset retirement obligation has been recorded.

**Long-Lived Asset Impairment**

When circumstances indicate the carrying value of long-lived assets may not be recoverable, the Company evaluates whether the carrying value of such assets has been impaired. For such long-lived assets, impairment exists when the carrying value exceeds the sum of the future estimated undiscounted cash flows expected to result from the use and eventual disposition of the asset. When alternative courses of action to recover the carrying amount of a long-lived asset are under consideration, a probability-weighted approach is used to develop estimates of future undiscounted cash flows. If the carrying value of the long-lived asset is not recoverable based on the estimated future undiscounted cash flows, an impairment loss is recorded, measured as the excess of the carrying value of the asset over its fair value. As a result, the asset's carrying value is adjusted to its estimated fair value. As at December 31, 2014, no asset impairment had been recorded.

**Costs of Arranging Debt Financing**

For financial liabilities classified as other than held-for-trading, the Company defers the external transaction costs related to obtaining debt financing and presents such amounts as deferred debt issuance costs on the Balance Sheets. Deferred debt issuance costs are amortized over the contractual life of the related debt on an effective-interest rate basis and the amortization is included within financing charges in the Statements of Operations and Comprehensive Income. Transaction costs for items classified as held-for-trading are expensed immediately.

**Comprehensive Income**

Comprehensive income is comprised of net income and other comprehensive income (OCI). OCI includes the amortization of net unamortized hedging losses on the Company's proportionate share of Hydro One's discontinued cash flow hedges. The Company amortizes its net unamortized hedging losses on discontinued cash flow hedges to financing charges using the effective interest method over the term of the associated hedged debt. Hydro One Remote Communities presents OCI and net income in a single continuous Statement of Operations and Comprehensive Income.

**Financial Assets and Liabilities**

All financial assets and liabilities are classified into one of the following five categories: held-to-maturity investments; loans and receivables; held-for-trading; other liabilities; or available-for-sale. Financial assets and liabilities classified as held-for-

trading are measured at fair value. All other financial assets and liabilities are measured at amortized cost, except accounts receivable which are measured at the lower of cost or fair value. Accounts receivable are classified as loans and receivables. The Company considers the carrying amount of accounts receivable to be a reasonable estimate of fair value because of the short time to maturity of these instruments. Provisions for impaired accounts receivable are recognized as adjustments to the allowance for doubtful accounts and are recognized when there is objective evidence that the Company will not be able to collect amounts according to the original terms.

The Company determines the classification of its financial assets and liabilities at the date of initial recognition. The Company designates certain of its financial assets and liabilities to be held at fair value, when it is consistent with the Company's risk management policy disclosed in Note 11 – Fair Value of Financial Instruments and Risk Management.

Transaction costs associated with financial assets and liabilities that are designated as held-for-trading are recognized immediately in results of operations. All financial instrument transactions are recorded at trade date.

**Derivative Instruments and Hedge Accounting**

The Company currently does not engage in derivative trading or speculative activities and had no derivative instruments outstanding at December 31, 2014. OCI includes the amortization of net unamortized hedging losses on the Company's proportionate share of Hydro One's discontinued cash flow hedges.

**Employee Future Benefits**

Employee future benefits provided by Hydro One include pension, post-retirement and post-employment benefits. The costs of Hydro One's pension, post-retirement and post-employment benefit plans are recorded over the periods during which employees render service.

Hydro One recognizes the funded status of its pension, post-retirement and post-employment plans on its Consolidated Balance Sheets and subsequently recognizes the changes in funded status at the end of each reporting year. Pension, post-retirement and post-employment plans are considered to be underfunded when the projected benefit obligation exceeds the fair value of the plan assets. Liabilities are recognized in the Consolidated Balance Sheets of Hydro One for any net underfunded projected benefit obligation. The net underfunded projected benefit obligation may be disclosed as a current liability, long-term liability, or both. The current portion is the amount by which the actuarial present value of benefits included in the benefit obligation payable in the next 12 months exceeds the fair value of plan assets. If the fair value of plan assets exceeds the projected benefit obligation of the plan, an asset is recognized equal to the net overfunded projected benefit obligation. The post-retirement and post-employment benefit plans are unfunded because there are no related plan assets. For the year ended December 31, 2014, the measurement date for all plans was December 31.

***Pension benefits***

Hydro One has a contributory defined benefit pension plan covering all regular employees of Hydro One and its subsidiaries, including Hydro One Remote Communities, but not including Hydro One Brampton Inc and Norfolk Power Inc. The Hydro One pension plan does not segregate assets in a separate account for individual subsidiaries, nor is the obligation of the pension plan allocated to, or funded separately by, entities within the consolidated group. Accordingly, for purposes of these Financial Statements, the pension plan is accounted for as a defined contribution plan and no pension benefit asset or liability is recorded.

A detailed description of Hydro One pension benefits is provided in Note 15 – Pension and Post-Retirement and Post-Employment Benefits, to the Consolidated Financial Statements of Hydro One for the year ended December 31, 2014.

***Post-retirement and post-employment benefits***

Hydro One has post-retirement and post-employment benefit plans covering all regular employees of Hydro One and its subsidiaries, including Hydro One Remote Communities. The benefit obligations of the these post-retirement and post-employment benefit plans are not segregated, or funded separately, for Hydro One Remote Communities. Accordingly, for

purposes of these Financial Statements, the post-retirement and post-employment benefit obligations are allocated to the Company based on base pensionable earnings.

The Company records a regulatory asset equal to its allocated share of Hydro One's incremental net unfunded projected benefit obligation for post-retirement and post-employment plans at each year end based on annual actuarial reports. The regulatory asset for the incremental net unfunded projected benefit obligation for post-retirement and post-employment plans, in absence of regulatory accounting, would be recognized in accumulated OCI (AOCI). A regulatory asset is recognized because management considers it to be probable that post-retirement and post-employment benefit costs will be recovered in the future through the rate-setting process.

Post-retirement and post-employment benefits, are recorded and included in rates on an accrual basis. Costs are determined by independent actuaries using the projected benefit method prorated on service and based on assumptions that reflect management's best estimates. Past service costs from plan amendments are amortized to results of operations based on the expected average remaining service period.

For post-retirement benefits, all actuarial gains or losses are deferred using the "corridor" approach. The amount calculated above the "corridor" is amortized to results of operations on a straight-line basis over the expected average remaining service lives of active Hydro One employees in the plan and over the remaining life expectancy of inactive Hydro One employees in the plan. The post-retirement benefit obligation is remeasured to its fair value at each year end based on an annual actuarial report, with an offset to associated regulatory asset, to the extent of the remeasurement adjustment.

For post-employment obligations, the actuarial gains and losses that are incurred during the year are recognized immediately to results of operations. The post-employment benefit obligation is remeasured to its fair value at each year end based on an annual actuarial report, with an offset to associated regulatory asset, to the extent of the remeasurement adjustment.

All post-retirement and post-employment future benefit costs are attributed to labour and are either charged to results of operations or capitalized as part of the cost of property, plant and equipment and intangible assets.

A detailed description of Hydro One post-retirement and post-employment benefits is provided in Note 15 – Pension and Post-Retirement and Post-Employment Benefits, to the Consolidated Financial Statements of Hydro One for the year ended December 31, 2014.

**Loss Contingencies**

Hydro One Remote Communities is involved in certain legal and environmental matters that arise in the normal course of business. In the preparation of its Financial Statements, management makes judgements regarding the future outcome of contingent events and records a loss for a contingency based on its best estimate when it is determined that such loss is probable and the amount of the loss can be reasonably estimated. When a range estimate for the probable loss exists and no amount within the range is a better estimate than any other amount, the Company records a loss at the minimum amount within the range.

Management regularly reviews current information available to determine whether recorded provisions should be adjusted and whether new provisions are required. Estimating probable losses may require analysis of multiple forecasts and scenarios that often depend on judgements about potential actions by third parties, such as federal, provincial and local courts or regulators. Contingent liabilities are often resolved over long periods of time. Amounts recorded in the Financial Statements may differ from the actual outcome once the contingency is resolved. Such differences could have a material impact on future results of operations, financial position and cash flows of the Company.

Provisions are based upon current estimates and are subject to greater uncertainty the longer the projection period. A significant upward or downward trend in the number of claims filed, the nature of the alleged injury, and the average cost of resolving each such claim could change the estimated provision, as could any substantial adverse or favorable verdict at trial. A federal or provincial legislative outcome or structured settlement could also change the estimated liability. Legal fees are expensed as incurred.

### Environmental Liabilities

Environmental liabilities are recorded in respect of past contamination when it is determined that future environmental remediation expenditures are probable under existing statute or regulation and the amount of the future expenditures can be reasonably estimated. Hydro One Remote Communities records a liability for the estimated future expenditures associated with the contaminated land assessment and remediation (LAR) based on the present value of these estimated future expenditures. The Company determines the present value with a discount rate equal to its credit-adjusted risk-free interest rate on financial instruments with comparable maturities to the pattern of future environmental expenditures. As the Company anticipates that the future expenditures will continue to be recoverable in future rates, an offsetting regulatory asset has been recorded to reflect the future recovery of these environmental expenditures from customers. Hydro One Remote Communities reviews its estimates of future environmental expenditures annually or more frequently if there are indications that circumstances have changed.

## 3. NEW ACCOUNTING PRONOUNCEMENTS

### Recently Adopted Accounting Pronouncements

In July 2013, the Financial Accounting Standards Board (FASB) issued Accounting Standards Update (ASU) 2013-11, Income Taxes (Topic 740): Presentation of an Unrecognized Tax Benefit When a Net Operating Loss Carryforward, a Similar Tax Loss, or a Tax Credit Carryforward Exists. This ASU provides guidance on the presentation of unrecognized tax benefits. This ASU is effective for fiscal years, and interim periods within those years, beginning after December 15, 2013, and should be applied prospectively to all unrecognized tax benefits that exist at the effective date. The adoption of this ASU did not have a significant impact on the Company’s financial statements.

### Recent Accounting Guidance Not Yet Adopted

In May 2014, the FASB issued ASU 2014-09, Revenue from Contracts with Customers (Topic 606). This ASU provides guidance on revenue recognition that depicts the transfer of promised goods or services to customers in an amount that reflects the consideration to which the entity expects to be entitled in exchange for those goods and services. This ASU is required to be applied retrospectively and is effective for fiscal years, and interim periods within those years, beginning after December 15, 2016. The Company is currently assessing the impact of adoption of ASU 2014-09 on its financial statements.

In August 2014, the FASB issued ASU 2014-15, Presentation of Financial Statements – Going Concern (Subtopic 205-40): Disclosure of Uncertainties about an Entity’s Ability to Continue as a Going Concern. This ASU provides guidance about management’s responsibility to evaluate whether there is substantial doubt about an entity’s ability to continue as a going concern and related disclosures. This ASU is effective for the annual period ending December 31, 2016, and for annual and interim periods thereafter. The adoption of this ASU is not anticipated to have a significant impact on the Company’s financial statements.

## 4. DEPRECIATION AND AMORTIZATION

| *Year ended December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Depreciation of property, plant and equipment | 2,594 | 2,564 |
| Asset removal costs | 430 | 589 |
| Amortization of regulatory assets | 1,599 | 1,656 |
| | 4,623 | 4,809 |

## 5. FINANCING CHARGES

| *Year ended December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Interest on long-term debt | 1,477 | 1,237 |
| Interest on inter-company demand facility | 187 | 216 |
| Amortization of hedging losses | 13 | 13 |
| Other | 28 | 14 |
| Less: Interest capitalized on construction in progress | (146) | (376) |
| | 1,559 | 1,104 |

## 6. PROVISION FOR PILS

The provision for PILs differs from the amount that would have been recorded using the combined Canadian Federal and Ontario statutory income tax rate. The reconciliation between the statutory and the effective tax rates is provided as follows:

| *Year ended December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Income (loss) before provision for (recovery of) PILs | 10 | (1,091) |
| Canadian Federal and Ontario statutory income tax rate | 26.50% | 26.50% |
| Provision for (recovery of) PILs at statutory rate | 3 | (289) |
| | | |
| Increase (decrease) resulting from: | | |
| | | |
| Net temporary differences included in amounts charged to customers: | | |
| RRPR variance account | (687) | (318) |
| Environmental expenditures | (424) | (439) |
| Pension contribution in excess of pension expense | (132) | (90) |
| Overheads capitalized for accounting but deducted for tax purposes | (93) | (82) |
| Interest capitalized for accounting but deducted for tax purposes | (39) | (100) |
| Losses carryforward | 846 | – |
| Depreciation and amortization in excess of capital cost allowance | 338 | 469 |
| Post-retirement and post-employment benefit expense in excess of cash payments | 189 | 135 |
| Other | – | 56 |
| Net temporary differences | (2) | (369) |
| Prior year adjustments | 10 | (332) |
| Rate difference on loss carryback | – | (110) |
| Other permanent differences | (1) | 9 |
| Total provision for (recovery of) PILs | 10 | (1,091) |
| | | |
| Current provision for (recovery of) PILs | 10 | (1,091) |
| Deferred provision for (recovery of) PILs | – | – |
| Total provision for (recovery of) PILs | 10 | (1,091) |
| | | |
| Effective income tax rate | 100% | 100% |

The current provision for PILs is remitted to, or received from, the OEFC. At December 31, 2014, the amount receivable from the OEFC was $2,683 thousand (2013 – $2,697 thousand).

### Deferred Income Tax Assets

Deferred income tax assets and liabilities arise from differences between the carrying amounts and tax bases of the Company's assets and liabilities. At December 31, 2014 and 2013, deferred income tax assets and liabilities consisted of the following:

| *December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| **Deferred income tax assets** | | |
| Post-retirement and post-employment benefits expense in excess of cash payments | 4,762 | 4,466 |
| Environmental expenditures | 4,459 | 4,840 |
| Depreciation and amortization in excess of capital cost allowance | 1,231 | 1,845 |
| Non capital losses | 1,183 | – |
| Regulatory amounts not recognized for tax | (7,060) | (6,615) |
| Other | (242) | (189) |
| Total deferred income tax assets | 4,333 | 4,347 |
| Less: current portion | 120 | 108 |
| | 4,213 | 4,239 |

During 2014 and 2013, there was no change in the rate applicable to future taxes.

## 7. ACCOUNTS RECEIVABLE

| *December 31 (thousands of Canadian dollars)* | Current accounts receivable | Long-term accounts receivable | Total |
|---|---|---|---|
| **2014** | | | |
| Accounts receivable – billed | 3,214 | 1,409 | 4,623 |
| Accounts receivable – unbilled | 1,385 | – | 1,385 |
| Accounts receivable, gross | 4,599 | 1,409 | 6,008 |
| Allowance for doubtful accounts | (145) | (159) | (304) |
| Accounts receivable, net | 4,454 | 1,250 | 5,704 |
| | | | |
| **2013** | | | |
| Accounts receivable – billed | 3,887 | 674 | 4,561 |
| Accounts receivable – unbilled | 1,404 | – | 1,404 |
| Accounts receivable, gross | 5,291 | 674 | 5,965 |
| Allowance for doubtful accounts | (296) | – | (296) |
| Accounts receivable, net | 4,995 | 674 | 5,669 |

The following table shows the movements in the total allowance for doubtful accounts for the years ended December 31, 2014 and 2013:

| *Year ended December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Allowance for doubtful accounts – January 1 | (296) | (302) |
| Write-offs | 77 | 95 |
| Adjustments to allowance for doubtful accounts | (85) | (89) |
| Allowance for doubtful accounts – December 31 | (304) | (296) |

## 8. PROPERTY, PLANT AND EQUIPMENT

| *December 31 (thousands of Canadian dollars)* | Costs | Accumulated Depreciation | Construction in Progress | Total |
|---|---|---|---|---|
| **2014** | | | | |
| Generation | 44,770 | 20,385 | 1,742 | 26,127 |
| Distribution | 9,488 | 1,906 | 99 | 7,681 |
| Administration and Service | 11,110 | 2,297 | 297 | 9,110 |
| | 65,368 | 24,588 | 2,138 | 42,918 |
| **2013** | | | | |
| Generation | 41,616 | 19,517 | 2,716 | 24,815 |
| Distribution | 8,394 | 1,748 | 596 | 7,242 |
| Administration and Service | 10,545 | 1,991 | 161 | 8,715 |
| | 60,555 | 23,256 | 3,473 | 40,772 |

Financing charges capitalized on property, plant and equipment under construction were $146 thousand in 2014 (2013 – $376 thousand).

## 9. REGULATORY ASSETS AND LIABILITIES

Regulatory assets and liabilities arise as a result of the rate-making process. Hydro One Remote Communities has recorded the following regulatory assets and liabilities:

| *December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| **Regulatory assets:** | | |
| Environmental | 12,369 | 13,426 |
| RRPR variance account | 4,578 | 1,985 |
| Post-retirement and post-employment benefits | 2,637 | 2,939 |
| Total regulatory assets | 19,584 | 18,350 |
| Less: current portion | 1,301 | 2,427 |
| | 18,283 | 15,923 |
| **Regulatory liabilities:** | | |
| Deferred income tax regulatory liability | 4,333 | 4,347 |
| Total regulatory liabilities | 4,333 | 4,347 |
| Less: current portion | 120 | 109 |
| | 4,213 | 4,238 |

### Environmental

The Company records a liability for the estimated future expenditures required to remediate environmental contamination. Management considers it probable that such expenditures will be recovered in the future through the rate-setting process, and as such, the Company has recorded an equivalent amount as a regulatory asset. In 2014, this regulatory asset increased by $180 thousand (2013 – $2,872 thousand) to reflect related changes in the Company's environmental liabilities. The environmental regulatory asset is amortized to results of operations based on the pattern of actual expenditures incurred and charged to environmental liabilities. The OEB has the discretion to examine and assess the prudency and the timing of recovery of all of the Company's actual environmental expenditures. In the absence of rate-regulated accounting, 2014 operation, maintenance and administration expenses would have been higher by $180 thousand (2013 – $2,872 thousand). In addition, 2014 amortization expense would have been lower by $1,598 thousand (2013 – $1,656 thousand), and 2014 financing charges would have been higher by $361 thousand (2013 – $330 thousand).

### RRPR Variance Account

Hydro One Remote Communities receives RRRP amounts from the IESO. At December 31, 2014, the Company has recognized a regulatory asset representing the amounts required to achieve breakeven net income, as regulated under the cost recovery model, in excess of net RRRP amounts received. At December 31, 2013, net RRRP amounts received were also lower than amounts required to achieve breakeven net income, and as such, a regulatory asset was also recognized. In the absence of rate-regulated accounting, 2014 revenue would have been lower by $2,593 thousand (2013 – $1,198 thousand).

### Post-Retirement and Post-Employment Benefits

The Company recognizes the net unfunded status of post-retirement and post-employment obligations on the Balance Sheets with an incremental offset to the associated regulatory assets. A regulatory asset is recognized because management considers it to be probable that post-retirement and post-employment benefit costs will be recovered in the future through the rate-setting process. The post-retirement and post-employment benefit obligation is remeasured to its fair value at each year end based on an annual actuarial report, with an offset to the associated regulatory asset, to the extent of the remeasurement adjustment. In the absence of rate-regulated accounting, 2014 OCI would have been higher by $302 thousand (2013 – $205 thousand).

### Deferred Income Tax Regulatory Liability

Deferred income taxes are recognized on temporary differences between the carrying amount of assets and liabilities in the financial statements and the corresponding tax bases used in the computation of taxable profit. The Company has recognized regulatory assets and liabilities that correspond to deferred income taxes that flow through the rate-setting process. In the absence of rate-regulated accounting, the Company's provision for PILs would have been recognized using the liability method and there would be no regulatory accounts established for taxes to be recovered through future rates. As a result, the 2014 recovery of PILs would have been lower by approximately $2 thousand (2013 – $367 thousand).

## 10. LONG-TERM DEBT

Long-term debt totalling $33,000 thousand is payable to Hydro One and consists of a $23,000 thousand note maturing in 2036 and a $10,000 thousand note maturing in 2044.

The $23,000 thousand note was issued on May 19, 2005, with an interest rate of 5.38% per annum and a maturity date of May 20, 2036. The note was issued on maturity of a previous note in the same principal amount that was issued on April 1, 1999 in consideration of the purchase price of Hydro One Remote Communities' net assets. On issuance of this note, $115 thousand of transaction costs and a $31 thousand debt discount incurred by Hydro One were allocated to Hydro One Remote Communities, based on its proportionate share of Hydro One's related debt issue.

The $10,000 thousand note was issued on June 6, 2014, with an interest rate of 4.19% per annum and a maturity date of June 6, 2044. On issuance of this note, $50 thousand of transaction costs and a $10 thousand debt discount incurred by Hydro One were allocated to Hydro One Remote Communities, based on its proportionate share of Hydro One's related debt issue.

## 11. FAIR VALUE OF FINANCIAL INSTRUMENTS AND RISK MANAGEMENT

Fair value is considered to be the exchange price in an orderly transaction between market participants to sell an asset or transfer a liability at the measurement date. The fair value definition focuses on an exit price, which is the price that would be received in the sale of an asset or the amount that would be paid to transfer a liability.

Hydro One Remote Communities classifies its fair value measurements based on the following hierarchy, as prescribed by the accounting guidance for fair value, which prioritizes the inputs to valuation techniques used to measure fair value into three levels:

Level 1 inputs are unadjusted quoted prices in active markets for identical assets or liabilities that Hydro One Remote Communities has the ability to access. An active market for the asset or liability is one in which transactions for the asset or liability occurs with sufficient frequency and volume to provide ongoing pricing information.

Level 2 inputs are those other than quoted market prices that are observable, either directly or indirectly, for an asset or liability. Level 2 inputs include, but are not limited to, quoted prices for similar assets or liabilities in an active market, quoted prices for identical or similar assets or liabilities in markets that are not active and inputs other than quoted market prices that are observable for the asset or liability, such as interest rate curves and yield curves observable at commonly quoted intervals, volatilities, credit risk and default rates. A Level 2 measurement cannot have more than an insignificant portion of the valuation based on unobservable inputs.

Level 3 inputs are any fair value measurements that include unobservable inputs for the asset or liability for more than an insignificant portion of the valuation. A Level 3 measurement may be based primarily on Level 2 inputs.

**Non-Derivative Financial Assets and Liabilities**

At December 31, 2014 and 2013, the Company's carrying amounts of accounts receivable, inter-company demand facility, and accounts payable are representative of fair value because of the short-term nature of these instruments.

**Fair Value Hierarchy**

The fair value hierarchy of financial assets and liabilities at December 31, 2014 and 2013 are as follows:

| *December 31, 2014 (thousands of Canadian dollars)* | Carrying Value | Fair Value | Level 1 | Level 2 | Level 3 |
|---|---|---|---|---|---|
| **Liabilities:** | | | | | |
| Inter-company demand facility | 6,806 | 6,806 | 6,806 | – | – |
| Long-term debt | 33,000 | 39,226 | – | 39,226 | – |
| | 39,806 | 46,032 | 6,806 | 39,226 | – |

| *December 31, 2013 (thousands of Canadian dollars)* | Carrying Value | Fair Value | Level 1 | Level 2 | Level 3 |
|---|---|---|---|---|---|
| **Liabilities:** | | | | | |
| Inter-company demand facility | 18,031 | 18,031 | 18,031 | – | – |
| Long-term debt | 23,000 | 25,450 | – | 25,450 | – |
| | 41,031 | 43,481 | 18,031 | 25,450 | – |

The fair value of the long-term debt is based on unadjusted period-end market prices for the same or similar debt of the same remaining maturities.

There were no significant transfers between any of the levels during the years ended December 31, 2014 and 2013.

**Risk Management**

Exposure to market risk, credit risk and liquidity risk arises in the normal course of the Company's business.

***Market Risk***

Market risk refers primarily to the risk of loss that results from changes in commodity prices, foreign exchange rates and interest rates. The Company does not have commodity risk. The foreign exchange risk is currently not significant, although Hydro One could in the future decide to issue and allocate foreign currency-denominated debt to the Company, along with an allocation of the resulting foreign exchange gains and losses. The Company is exposed to fluctuations in interest rates related to the interest charges passed on by Hydro One on the outstanding inter-company demand facility. The Company is charged interest on overdraft inter-company balances based on the one-month bankers' acceptance rate, plus 0.15%.

***Credit Risk***

Financial assets create a risk that a counterparty will fail to discharge an obligation, causing a financial loss. At December 31, 2014 and 2013, there were no significant concentrations of credit risk with respect to any class of financial assets. The Company's revenue is earned from a broad base of customers. As a result, Hydro One Remote Communities did not earn a significant amount of revenue from any individual customer. At December 31, 2014 and 2013, there was no significant accounts receivable balance due from any single customer.

At December 31, 2014, the Company's total provision for bad debts was $304 thousand (2013 – $296 thousand). Adjustments and write-offs are determined on the basis of a review of overdue accounts, taking into consideration historical experience. At December 31, 2014, approximately 36% of the Company's current accounts receivable were aged more than 60 days (2013 – 47%). Sufficient allowances have been recorded to reflect the risk of potential credit losses.

***Liquidity Risk***

Liquidity risk refers to the Company's ability to meet its financial obligations as they come due. Hydro One Remote Communities meets its short-term liquidity requirements through the inter-company demand facility with Hydro One and funds from operations. The short-term liquidity available to the Company should be sufficient to fund normal operating requirements.

At December 31, 2014, accounts payable and accrued liabilities in the amount of $9,812 thousand (2013 – $5,657 thousand) are expected to be settled in cash at their carrying amounts within the next year.

At December 31, 2014, Hydro One Remote Communities had long-term debt in the principal amount of $33,000 thousand (2013 – $23,000 thousand). No long-term debt matures during the next year. Interest payments for the next 12 months on the Company's outstanding long-term debt amount to $1,656 thousand (2013 – $1,237 thousand). Principal repayments and interest payments are summarized by the number of years to maturity in the following table.

| **Years to Maturity** | **Principal Repayments on Long-term Debt** *(thousands of Canadian dollars)* | **Interest Payments** *(thousands of Canadian dollars)* | **Weighted Average Interest Rate** *(%)* |
|---|---|---|---|
| 1 year | – | 1,656 | 5.019 |
| 2 years | – | 1,656 | 5.019 |
| 3 years | – | 1,656 | 5.019 |
| 4 years | – | 1,656 | 5.019 |
| 5 years | – | 1,656 | 5.019 |
| | – | 8,280 | 5.019 |
| 6 – 10 years | – | 8,280 | 5.019 |
| Over 10 years | 33,000 | 22,405 | 5.019 |
| | 33,000 | 38,965 | 5.019 |

## 12. PENSION AND POST-RETIREMENT AND POST-EMPLOYMENT BENEFITS

Hydro One has a defined benefit pension plan, a supplementary pension plan, and post-retirement and post-employment benefit plans. The defined benefit pension plan (Pension Plan) is contributory and covers all regular employees of Hydro One and its subsidiaries, except Hydro One Brampton Networks. The supplementary pension plan provides members of the Pension Plan with benefits that would have been earned and payable under the Pension Plan but for the limitations imposed by the *Income Tax Act* (Canada). The supplementary pension plan obligation is included with other post-retirement and post-employment benefit obligations on the Balance Sheets.

**Pension Benefits**

The Pension Plan provides benefits based on highest three-year average pensionable earnings. For new management employees who commenced employment on or after January 1, 2004, and for new Society of Energy Professionals

represented staff hired after November 17, 2005, benefits are based on highest five-year average pensionable earnings. After retirement, pensions are indexed to inflation.

Company and employees' contributions to the Pension Plan are based on actuarial valuations performed at least every three years. Hydro One's annual Pension Plan contributions for 2014 of $174 million (2013 – $160 million) were based on an actuarial valuation effective December 31, 2013 (2013 – effective December 31, 2011) and the level of 2014 pensionable earnings. Estimated annual Pension Plan contributions for 2015 and 2016 are approximately $174 million and $175 million, respectively, based on an actuarial valuation as at December 31, 2013 and projected levels of pensionable earnings. Future minimum contributions beyond 2016 will be based on an actuarial valuation effective no later than December 31, 2016. Contributions are payable one month in arrears. All of the contributions are expected to be in the form of cash.

At December 31, 2014, based on the December 31, 2013 actuarial valuation, the present value of Hydro One's projected pension benefit obligation was estimated to be $7,535 million (2013 – $6,576 million). The fair value of pension plan assets available for these benefits was $6,299 million (2013 – $5,731 million).

**Post-Retirement and Post-Employment Benefits**

During the year ended December 31, 2014, Hydro One Remote Communities charged $941 thousand (2013 – $775 thousand) of post-retirement and post-employment benefit costs to results of operations, and capitalized $272 thousand (2013 – $250 thousand) as part of the cost of property, plant and equipment. Benefits paid by the Company in 2014 were $91 thousand (2013 – $264 thousand). In addition, the incremental offset to decrease the associated post-retirement and post-employment benefits regulatory assets by $302 thousand (2013 – $205 thousand) was recorded on the Company's Balance Sheets to reflect the expected regulatory inclusion of this amount in future rates, which would otherwise be recorded in OCI.

The Company presents its post-retirement and post-employment benefit liability on the Balance Sheets within the following line items:

| *December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Accrued liabilities | 346 | 300 |
| Post-retirement and post-employment benefit liability | 12,862 | 12,088 |
| | 13,208 | 12,388 |

## 13. ENVIRONMENTAL LIABILITIES

The Company has accrued the following discounted amounts for environmental liabilities on the Balance Sheets at December 31, 2014 and 2013:

| *December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Environmental liabilities, January 1 | 13,426 | 11,880 |
| Interest accretion | 361 | 330 |
| Expenditures | (1,598) | (1,656) |
| Revaluation adjustment | 180 | 2,872 |
| Environmental liabilities, December 31 | 12,369 | 13,426 |
| Less: current portion | 1,301 | 2,427 |
| | 11,068 | 10,999 |

The following table illustrates the reconciliation between the undiscounted basis of the environmental liabilities and the amount recognized on the Balance Sheets after factoring in the discount rate:

| *December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Undiscounted environmental liabilities, December 31 | 12,881 | 14,014 |
| Less: discounting accumulated liabilities to present value | 512 | 588 |
| Discounted environmental liabilities, December 31 | 12,369 | 13,426 |

At December 31, 2014, the estimated future environmental expenditures were as follows:

| *(thousands of Canadian dollars)* | |
|---|---|
| 2015 | 1,301 |
| 2016 | 2,619 |
| 2017 | 2,717 |
| 2018 | 1,851 |
| 2019 | 1,657 |
| Thereafter | 2,736 |
| | 12,881 |

The Company records a liability for the estimated future expenditures for the contaminated LAR when it is determined that future environmental remediation expenditures are probable under existing statute or regulation and the amount of the future expenditures can be reasonably estimated.

There are uncertainties in estimating future environmental costs due to potential external events such as changes in legislation or regulations, and advances in remediation technologies. In determining the amounts to be recorded as environmental liabilities, the Company estimates the current cost of completing required work and makes assumptions as to when the future expenditures will actually be incurred, in order to generate future cash flow information. A long-term inflation rate assumption of approximately 2% has been used to express these current cost estimates as estimated future expenditures. Future expenditures have been discounted using factors ranging from approximately 3.6% to 4.9%, depending on the appropriate rate for the period when expenditures are expected to be incurred. All factors used in estimating the Company’s environmental liabilities represent management’s best estimates of the present value of costs required to meet existing legislation or regulations. However, it is reasonably possible that numbers or volumes of contaminated assets, cost estimates to perform work, inflation assumptions and the assumed pattern of annual cash flows may differ significantly from the Company’s current assumptions.

The Company’s best estimate of the total estimated future expenditures to complete its LAR program is $12,881 thousand. These expenditures are expected to be incurred over the period from 2015 to 2020. As a result of its annual review of environmental liabilities, the Company recorded a revaluation adjustment in 2014 to increase the LAR environmental liability by $180 thousand (2013 – $2,872 thousand).

## 14. SHARE CAPITAL

### Common Shares

The Company has 2 issued and outstanding common shares. The Company is authorized to issue an unlimited number of common shares.

### Dividends

The Company has no retained earnings and does not pay dividends under its breakeven business model.

## 15. RELATED PARTY TRANSACTIONS

Hydro One Remote Communities is a subsidiary of Hydro One, and Hydro One is owned by the Province. The OEFC, IESO, Ontario Power Authority (OPA), Ontario Power Generation Inc. (OPG) and the OEB are related parties to Hydro One Remote Communities because they are controlled or significantly influenced by the Province. Transactions between these parties and Hydro One Remote Communities are described below.

Hydro One Remote Communities receives amounts for RRRP from the IESO. RRRP amounts received for the year ended December 31, 2014 were $32,259 thousand (2013 – $33,046 thousand). Consistent with its breakeven business model, the Company recognized $34,852 thousand as RRRP revenue in 2014 (2013 – $34,245 thousand). This 2014 revenue exceeded amounts received by $2,593 thousand (2013 – $1,199 thousand) and the RRPR variance account balance was adjusted by this amount.

PILs are paid to or received from the OEFC.

The amounts due to and from related parties as a result of the transactions referred to above are as follows:

| *December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Accounts receivable | 106 | 97 |
| Income tax receivable | 2,683 | 2,697 |

Transactions with related parties occur at normal market prices or at a proxy for fair value based on the requirements of the OEB's Affiliate Relationships Code. Outstanding balances at period end are interest free and settled in cash.

### Hydro One and Subsidiaries

The Company provides services to, and receives services from, Hydro One and its other subsidiaries. Amounts due to and from Hydro One and its other subsidiaries are settled through the inter-company demand facility.

The Company has entered into various agreements with Hydro One and its other subsidiaries related to the provision of corporate functions and services, such as legal, financial and human resources services, and operational services, such as environmental, forestry, and line services. 2014 revenues include $109 thousand (2013 – $195 thousand) related to the provision of services to Hydro One and its other subsidiaries. 2014 operation, maintenance and administration costs include $2,958 thousand (2013 – $3,475 thousand) related to the purchase of services from Hydro One and its other subsidiaries.

The Company's long-term debt is due to Hydro One. In addition, balances payable or receivable under the inter-company demand facility are due to or from Hydro One and its other subsidiaries. Financing charges include interest expense on the long-term debt in the amount of $1,477 thousand (2013 – $1,237 thousand), and interest expense on the inter-company demand facility in the amount of $187 thousand (2013 – $216 thousand). At December 31, 2014, the Company had accrued interest payable to Hydro One totaling $172 thousand (2013 – $142 thousand).

## 16. STATEMENTS OF CASH FLOWS

The changes in non-cash balances related to operations consist of the following:

| *Year ended December 31 (thousands of Canadian dollars)* | **2014** | **2013** |
|---|---|---|
| Accounts receivable | 541 | (802) |
| Materials and supplies | (356) | 443 |
| Income taxes receivable | 14 | (1,108) |
| Long-term accounts receivable | (576) | (256) |
| Accounts payable | 173 | (284) |
| Accrued liabilities | 5,105 | (1,526) |
| Accrued interest | 30 | – |
| Post-retirement and post-employment benefit liability | 1,076 | 760 |
| | 6,007 | (2,773) |
| **Supplementary information:** | | |
| Net interest paid | 1,447 | 1,453 |

As a result of using the cost recovery model applied to achieve after tax breakeven net income, any PILs paid are fully recovered.

## 17. CONTINGENCIES

### Legal Proceedings

Hydro One Remote Communities is involved in various lawsuits, claims and regulatory proceedings in the normal course of business. In the opinion of management, the outcome of such matters will not have a material adverse effect on the Company's financial position, results of operations or cash flows.

### Transfer of Assets

The transfer orders by which Hydro One acquired certain of Ontario Hydro's businesses as of April 1, 1999 did not transfer title to some assets located on Reserves (as defined in the *Indian Act* (Canada)). Currently, the OEFC holds these assets. Under the terms of the transfer orders, Hydro One is required to manage these assets until it has obtained all consents necessary to complete the transfer of title of these assets to itself. Hydro One cannot predict the aggregate amount that it may have to pay, either on an annual or one-time basis, to obtain the required consents. In 2014, Hydro One paid approximately $1 million (2013 – $2 million) in respect of these consents. If Hydro One or the Company cannot obtain the required consents, the OEFC will continue to hold these assets for an indefinite period of time. If Hydro One cannot reach a satisfactory settlement, it may have to relocate these assets to other locations at a cost that could be substantial or, in a limited number of cases, to abandon a line and replace it with diesel-generation facilities. The costs relating to these assets could have a material adverse effect on Hydro One's and the Company's results of operations if Hydro One is not able to recover them in future rate orders.

## 18. COMMITMENTS

### Operating Lease

Hydro One Remote Communities is committed as lessee to an operating lease agreement for use of reserve land to operate a hydro facility for a period of 10 years.

During the year ended December 31, 2014, the Company made lease payments totalling $120 thousand (2013 – $1 million). At December 31, 2014, the future minimum lease payments under non-cancellable operating leases were as follows: 2015 – $120 thousand; 2016 – $120 thousand; 2017 – $120 thousand; 2018 – $150 thousand; 2019 – $150 thousand; and thereafter – $450 thousand.

**Schedule 141**

# Notes checklist

| Corporation's name | Business number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2014-12-31 |

- Parts 1, 2, and 3 of this schedule must be completed from the perspective of the person (referred to in these parts as the **accountant**) who prepared or reported on the financial statements. If the person preparing the tax return is not the accountant referred to above, they must still complete Parts 1, 2, 3, and 4, as applicable.
- For more information, see Guide RC4088, *General Index of Financial Information (GIFI)* and Guide T4012, *T2 Corporation – Income Tax Guide*.
- Complete this schedule and include it with your T2 return along with the other GIFI schedules.

## Part 1 – Information on the accountant who prepared or reported on the financial statements

Does the accountant have a professional designation? . . . . . **095** 1 Yes [X] 2 No [ ]

Is the accountant connected* with the corporation? . . . . . **097** 1 Yes [ ] 2 No [X]

* A person connected with a corporation can be: (i) a shareholder of the corporation who owns more than 10% of the common shares; (ii) a director, an officer, or an employee of the corporation; or (iii) a person not dealing at arm's length with the corporation.

**Note**
If the accountant does not have a professional designation **or** is connected to the corporation, you do not have to complete Parts 2 and 3 of this schedule. However, you **do have** to complete Part 4, as applicable.

## Part 2 – Type of involvement with the financial statements

Choose the option that represents the highest level of involvement of the accountant: . . . . . **198**

Completed an auditor's report . . . . . 1 [X]

Completed a review engagement report . . . . . 2 [ ]

Conducted a compilation engagement . . . . . 3 [ ]

## Part 3 – Reservations

If you selected option **1** or **2** under **Type of involvement with the financial statements** above, answer the following question:

Has the accountant expressed a reservation? . . . . . **099** 1 Yes [ ] 2 No [X]

## Part 4 – Other information

If you have a professional designation and are not the accountant associated with the financial statements in Part 1 above, choose one of the following options: . . . . . **110**

Prepared the tax return (financial statements prepared by client) . . . . . 1 [X]

Prepared the tax return and the financial information contained therein (financial statements have not been prepared) . . . . . 2 [ ]

Were notes to the financial statements prepared? . . . . . **101** 1 Yes [X] 2 No [ ]

If **yes**, complete lines 104 to 107 below:

Are subsequent events mentioned in the notes? . . . . . **104** 1 Yes [ ] 2 No [X]

Is re-evaluation of asset information mentioned in the notes? . . . . . **105** 1 Yes [ ] 2 No [X]

Is contingent liability information mentioned in the notes? . . . . . **106** 1 Yes [X] 2 No [ ]

Is information regarding commitments mentioned in the notes? . . . . . **107** 1 Yes [X] 2 No [ ]

Does the corporation have investments in joint venture(s) or partnership(s)? . . . . . **108** 1 Yes [ ] 2 No [X]

## Part 4 – Other information (continued)

**Impairment and fair value changes**

In any of the following assets, was an amount recognized in net income or other comprehensive income (OCI) as a result of an impairment loss in the tax year, a reversal of an impairment loss recognized in a previous tax year, or a change in fair value during the tax year? . . . . . **200** 1 Yes [ ] 2 No [X]

If **yes**, enter the amount recognized:

| | | In net income Increase (decrease) | | In OCI Increase (decrease) |
|---|---|---|---|---|
| Property, plant, and equipment | 210 | | 211 | |
| Intangible assets | 215 | | 216 | |
| Investment property | 220 | | | |
| Biological assets | 225 | | | |
| Financial instruments | 230 | | 231 | |
| Other | 235 | | 236 | |

**Financial instruments**

Did the corporation derecognize any financial instrument(s) during the tax year (other than trade receivables)? . . . . . **250** 1 Yes [ ] 2 No [X]

Did the corporation apply hedge accounting during the tax year? . . . . . **255** 1 Yes [ ] 2 No [X]

Did the corporation discontinue hedge accounting during the tax year? . . . . . **260** 1 Yes [ ] 2 No [X]

**Adjustments to opening equity**

Was an amount included in the opening balance of retained earnings or equity, in order to correct an error, to recognize a change in accounting policy, or to adopt a new accounting standard in the current tax year? . . . . . **265** 1 Yes [ ] 2 No [X]

If **yes**, you have to maintain a separate reconciliation.

## Detailed information (continued)

- For the purpose of this schedule, **pre-production mining exploration expenditures** are pre-production mining expenditures incurred **after** March 28, 2012, by the taxpayer to determine the existence, location, extent, or quality of certain mineral resources in Canada, excluding expenses incurred in the exploration of an oil or gas well. See subparagraph (a)(i) of the definition of **pre-production mining expenditure** in subsection 127(9) for more information.
- For the purpose of this schedule, **pre-production mining development expenditures** are pre-production mining expenditures incurred **after** March 28, 2012, by the taxpayer to bring a new mineral resource mine in Canada into production, excluding expenses in the development of a bituminous sands deposit or an oil shale deposit. See subparagraph (a)(ii) of the definition of **pre-production mining expenditure** in subsection 127(9) for more information.

## Part 1 – Investments, expenditures, and percentages

| **Investments** | **Specified percentage** |
|---|---|
| Qualified property acquired primarily for use in Atlantic Canada . . . | 10 % |
| Qualified resource property acquired primarily for use in Atlantic Canada and acquired: | |
| – after March 28, 2012, and before 2014 . . . | 10 % |
| – after 2013 and before 2016 . . . | 5 % |
| – after 2015* . . . | 0 % |
| **Expenditures** | |
| If you are a Canadian-controlled private corporation (CCPC), this percentage may apply to the portion that you claim of the SR&ED qualified expenditure pool that does not exceed your expenditure limit (see Part 10) . . . | 35 % |
| **Note:** If your current year's qualified expenditures are more than the corporation's expenditure limit (see Part 10), the excess is eligible for an ITC calculated at the 20 % rate**. | |
| If you are a corporation that is not a CCPC and have incurred qualified expenditures for SR&ED in any area in Canada: | |
| – before 2014** . . . | 20 % |
| – after 2013** . . . | 15 % |
| If you are a taxable Canadian corporation that incurred pre-production mining expenditures before March 29, 2012 . . . | 10 % |
| If you are a taxable Canadian corporation that incurred pre-production mining exploration expenditures***: | |
| – after March 28, 2012, and before 2013 . . . | 10 % |
| – in 2013 . . . | 5 % |
| – after 2013*** . . . | 0 % |
| If you are a taxable Canadian corporation that incurred pre-production mining development expenditures****: | |
| – after March 28, 2012, and before 2014**** . . . | 10 % |
| – in 2014 . . . | 7 % |
| – in 2015 . . . | 4 % |
| – after 2015**** . . . | 0 % |
| If you paid salary and wages to apprentices in the first 24 months of their apprenticeship contract for employment . . . | 10 % |
| If you incurred eligible expenditures after March 18, 2007, for the creation of licensed child care spaces for the children of your employees and, potentially, for other children . . . | 25 % |

* A transitional relief rate of 10% may apply to property acquired after 2013 and before 2017, if the property is acquired under a written agreement entered into before March 29, 2012, or the property is acquired as part of a **phase** of a project where the construction or the engineering and design work for the construction started before March 29, 2012. See paragraph (a.1) of the definition of **specified percentage** in subsection 127(9) for more information.

** The reduction of the rate from 20% to 15% applies to 2014 and later tax years, except that, for 2014 tax years that start before 2014, the reduction is pro-rated based on the number of days in the tax year that are after 2013.

*** Pre-production mining exploration expenditures are described in subparagraph (a)(i) of the definition of **pre-production mining expenditure** in subsection 127(9).

**** A transitional relief rate of 10% may apply to expenditures incurred after 2013 and before 2016, if the expenditure is incurred under a written agreement entered into before March 29, 2012, or the expenditure is incurred as part of the development of a new mine where the construction or the engineering and design work for the construction of the new mine started before March 29, 2012. See subparagraph (k)(ii) of the definition of **specified percentage** in subsection 127(9) for more information. Pre-production mining development expenditures are described in subparagraph (a)(ii) of the definition of **pre-production mining expenditure** in subsection 127(9).

| Corporation's name | Business number | Tax year-end Year Month Day |
|---|---|---|
| Hydro One Remote Communities Inc. | 87083 6269 RC0001 | 2015-10-31 |

## Part 2 – Determination of a qualifying corporation

Is the corporation a qualifying corporation? . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . **101** 1 Yes X 2 No

For the purpose of a refundable ITC, a **qualifying corporation** is defined under subsection 127.1(2). The corporation has to be a CCPC and its taxable income (before any loss carrybacks) for its previous tax year cannot be more than its **qualifying income limit** for the particular tax year. If the corporation is associated with any other corporations during the tax year, the total of the taxable incomes of the corporation and the associated corporations (before any loss carrybacks), for their last tax year ending in the previous calendar year, cannot be more than their qualifying income limit for the particular tax year.

**Note:** A CCPC calculating a refundable ITC is considered to be associated with another corporation if it meets any of the conditions in subsection 256(1), except where:

- one corporation is associated with another corporation solely because one or more persons own shares of the capital stock of both corporations; and
- one of the corporations has at least one shareholder who is not common to both corporations.

If you are a **qualifying** corporation, you will earn a **100%** refund on your share of any ITCs earned at the 35% rate on qualified **current** expenditures for SR&ED, up to the allocated expenditure limit. The 100% refund does not apply to qualified **capital** expenditures eligible for the 35% credit rate. They are only eligible for the **40%** refund*.

Some CCPCs that are **not qualifying** corporations may also earn a **100%** refund on their share of any ITCs earned at the 35% rate on qualified **current** expenditures for SR&ED, up to the allocated expenditure limit. The expenditure limit can be determined in Part 10. The 100% refund does not apply to qualified **capital** expenditures eligible for the 35% credit rate. They are only eligible for the **40%** refund*.

The 100% refund will not be available to a corporation that is an **excluded corporation** as defined under subsection 127.1(2). A corporation is an excluded corporation if, at any time during the year, it is a corporation that is either controlled by (directly or indirectly, in any manner whatever) or is related to:

a) one or more persons exempt from Part I tax under section 149;
b) Her Majesty in right of a province, a Canadian municipality, or any other public authority; or
c) any combination of persons referred to in a) or b) above.

* Capital expenditures incurred after December 31, 2013, including lease payments for property that would have been a capital expenditure if purchased directly, are **not** qualified SR&ED expenditures and are **not** eligible for an ITC on SR&ED expenditures.

## Part 3 – Corporations in the farming industry

Complete this area if the corporation is making SR&ED contributions.

Is the corporation claiming a contribution in the current year to an agricultural organization whose goal is to finance SR&ED work (for example, check-off dues)? . . . . . . . . . . . . . . . . . . . . . . . . . . . . . **102** 1 Yes 2 No X

Contributions to agricultural organizations for SR&ED* . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . **103**

If **yes**, complete Schedule 125, *Income Statement Information*, to identify the type of farming industry the corporation is involved in. For more information on Schedule 125, see Guide RC4088, *General Index of Financial Information (GIFI)*. Enter contributions on line 350 of Part 8.

* Enter only contributions not already included on Form T661. Include all of the contributions made before 2013 and 80% of the contributions made after 2012.

## Qualified Property and Qualified Resource Property

## Part 4 – Eligible investments for qualified property and qualified resource property from the current tax year

| CCA* class number **105** | Description of investment **110** | Date available for use **115** | Location used (province or territory) **120** | Amount of investment **125** |
|---|---|---|---|---|
| | | | | |
| | | | **Total of investments for qualified property and qualified resource property** | A |

* CCA: capital cost allowance

## Part 5 – Current-year credit and account balances – ITC from investments in qualified property and qualified resource property

| | | | | |
|---|---|---|---|---|
| ITC at the end of the previous tax year | | | | B |
| **Deduct:** | | | | |
| Credit deemed as a remittance of co-op corporations | 210 | | | |
| Credit expired | 215 | | | |
| Subtotal (line 210 **plus** line 215) | | | | C |
| ITC at the beginning of the tax year (amount B **minus** amount C) | | 220 | | |
| **Add:** | | | | |
| Credit transferred on amalgamation or wind-up of subsidiary | 230 | | | |
| ITC from repayment of assistance | 235 | | | |
| Qualified property; and qualified resource property acquired after March 28, 2012, and before January 1, 2014* (applicable part of amount A from Part 4) ______ x 10 % = | 240 | | | |
| Qualified resource property acquired after December 31, 2013, and before January 1, 2016 (applicable part of amount A from Part 4) ______ x 5 % = | 242 | | | |
| Credit allocated from a partnership | 250 | | | |
| Subtotal (total of lines 230 to 250) | | | | D |
| Total credit available (line 220 **plus** amount D) | | | | E |
| **Deduct:** | | | | |
| Credit deducted from Part I tax (enter at amount D in Part 30) | 260 | | | |
| Credit carried back to the previous year(s) (amount H from Part 6) | | a | | |
| Credit transferred to offset Part VII tax liability | 280 | | | |
| Subtotal (total of line 260, amount a, and line 280) | | | | F |
| Credit balance before refund (amount E **minus** amount F) | | | | G |
| **Deduct:** | | | | |
| Refund of credit claimed on investments from qualified property and qualified resource property (from Part 7) | | 310 | | |
| **ITC closing balance of investments from qualified property and qualified resource property** (amount G **minus** line 310) | | 320 | | |

* Include investments acquired after 2013 and before 2017 that are eligible for transitional relief.

## Part 6 – Request for carryback of credit from investments in qualified property and qualified resource property

| | Year | Month | Day | | | |
|---|---|---|---|---|---|---|
| 1st previous tax year | | | | Credit to be applied | 901 | |
| 2nd previous tax year | | | | Credit to be applied | 902 | |
| 3rd previous tax year | | | | Credit to be applied | 903 | |
| | | | | **Total** (enter at amount a in Part 5) | | H |

## Part 7 – Refund of ITC for qualifying corporations on investments from qualified property and qualified resource property

| | | |
|---|---|---|
| Current-year ITCs (total of lines 240, 242, and 250 from Part 5) | | I |
| Credit balance before refund (amount G from Part 5) | | J |
| **Refund** ( 40 % of amount I or J, whichever is less) | | K |

Enter amount K or a lesser amount on line 310 in Part 5 (also enter it on line 780 of the T2 return if the corporation does not claim an SR&ED ITC refund).

# SR&ED

## Part 8 – Qualified SR&ED expenditures

**Current expenditures**

| | | | | |
|---|---|---|---|---|
| Current expenditures (from line 557 on Form T661) | | | | |
| Contributions to agricultural organizations for SR&ED | | | | |
| **Deduct:** Government assistance, non-government assistance, or contract payment | | | | |
| Contributions to agricultural organizations for SR&ED for the federal ITC (this amount is updated to line 103 of Part 3. For more details, consult the Help.)* | | + ▶ | | |
| Current expenditures (line 557 on Form T661 **plus** line 103 from Part 3)* | | | 350 | |
| Capital expenditures incurred **before** 2014 (from line 558 on Form T661)** | | | 360 | |
| Repayments made in the year (from line 560 on Form T661) | | | 370 | |
| **Qualified SR&ED expenditures** (total of lines 350 to 370) | | | 380 | |
