

OTTAWA AREA INTEGRATED REGIONAL RESOURCE PLAN - APPENDIX

Part of the Greater Ottawa Planning Region | April 28, 2015

Ottawa IRRP

Appendix A: Demand Forecast

Appendix A: Demand Forecasts

A.1 Gross Demand Forecasts

A.1.1 Hydro One Distribution Methodology for Reference Forecast

In developing the reference forecast, the historical relationship between Hydro One Distribution load and economic/demographic factors were taken into account using regression analysis. Next, forecast values of economic/demographic factors were used in that relationship to arrive at the load forecast. It was then further tuned to additional local information as gathered from measured loading trends, municipal officials, etc. The forecast also took into account the load impact of CDM as well as embedded generation.

Also, in cases where it was known that a large customer was going to start (or cease) operating at a certain date in the future, the forecast was adjusted upward (downward) accordingly to reflect projected load impact of such event.

The reference forecast is weather normal in the sense that it reflects peak forecast at average peak-time weather conditions in the past.

The Hydro One Distribution load growth was allocated to each transformer/distribution station based on local information such as the community development plan, available vacant lands, etc.

A.1.2 Hydro Ottawa Limited Methodology for Reference Forecast

Hydro Ottawa owns and operates the distribution system of a portion of the City of Ottawa and the Village of Casselman, serving approximately 320,000 (April 2015) customers. Hydro Ottawa is supplied through the Hydro One transmission system at primary voltages of 115 kV and 230 kV. Hydro Ottawa then distributes to its customers at five different voltage levels (27.6 kV, 13.2 kV, 12.43 kV, 8.32 kV and 4.16 kV) through 84 owned and co-owned substations and an additional 6 station owned by Hydro One.

The gross demand forecast provided by Hydro Ottawa was based off of the coincident weather normalized summer peak from 2012, as provided by the former OPA.

Each station was forecast separately using trend analysis to extend past growth rates into the future – an average annual growth rate was calculated using the station's historic load level

from 2008 to 2012. This trending was used to predict the baseline load growth for the 20-year forecast period (2013-2032) and reflects typical addition of new customers and the load maturation of existing customers. These historic trend based forecasts were adjusted to account for anticipated load changes and additions that are not consistent with the historic regional load growth. These adjustments are based on City of Ottawa and developer plans, forecast load transfers and other local knowledge.

A.2 Conservation

The forecast conservation savings included in the demand forecasts for the Ottawa IRRP were derived from the provincial conservation forecast, which aligns with the conservation targets described in the 2013 LTEP: “Achieving Balance: Ontario’s Long-Term Energy Plan”. The LTER set an electrical energy conservation target of 30 TWh in 2032, with about 10 TWh of the energy savings coming from C&S, and the remaining 20 TWh from EE programs. The 30 TWh energy savings target will also lead to associated peak demand savings. Time-of-Use rate impacts and Demand Response resources are focused on peak demand reduction rather than energy savings and, as such, are not reflected in the 30 TWh energy target and are considered separately in forecasting.

To assess the peak demand savings from the provincial conservation targets, two demand forecasts are developed. A gross demand forecast is produced that represents the anticipated electricity needs of the province based on growth projections, for each hour of the year. This forecast is based on a model that calculates future gross annual energy consumption by sector and end use. Hourly load shape profiles are applied to develop province-wide gross hourly demand forecasts. Natural conservation impacts are included in the provincial gross demand forecast, however the effects of the planned conservation are not included. A net hourly demand forecast is also produced, reflecting the electricity demand reduction impacts of C&S, EE programs, and TOU. The gross and net forecasts were then compared in each year to derive the peak demand savings. In other words, the difference between the gross and net peak demand forecasts is equal to the demand impacts of conservation at the provincial level.

The above methodology was used to derive the combined peak demand savings, which was further broken down to three categories as shown in Table-1. Peak demand savings associated with load shifting in response to TOU rates were estimated using an econometric model based on customers’ elasticity of substitution and the TOU price ratio. The remaining peak savings were allocated between C&S and EE programs based on their energy saving projections, with about 1/3 attributed to C&S and 2/3 to EE programs.

The resulting peak demand savings in each year are represented as a percentage of total provincial peak demand in Figure A-1, using 2012 as a base year.

Figure A-1: Approaches to Meeting Medium- and Long-Term Needs

	<u>2013</u>	<u>2014</u>	<u>2015</u>	<u>2016</u>	<u>2017</u>	<u>2018</u>	<u>2019</u>	<u>2020</u>	<u>2021</u>	<u>2022</u>	<u>2023</u>	<u>2024</u>	<u>2025</u>	<u>2026</u>	<u>2027</u>	<u>2028</u>	<u>2029</u>	<u>2030</u>	<u>2031</u>	<u>2032</u>
C&S	0.1%	0.2%	0.3%	0.7%	0.8%	1.2%	1.7%	2.1%	2.5%	2.66%	2.70%	2.93%	3.1%	3.3%	3.8%	4.2%	4.5%	4.9%	5.2%	5.5%
TOU	0.2%	0.4%	0.5%	0.6%	0.6%	0.6%	0.6%	0.6%	0.6%	0.6%	0.6%	0.6%	0.6%	0.6%	0.6%	0.6%	0.6%	0.6%	0.6%	0.6%
EE program	0.6%	1.1%	1.39%	1.54%	1.69%	1.83%	2.7%	3.6%	3.7%	4.1%	4.7%	5.5%	5.9%	6.3%	6.6%	7.0%	7.2%	7.4%	7.9%	8.3%
Total	1%	2%	2%	3%	3%	4%	5%	6%	7%	7%	8%	9%	10%	10%	11%	12%	12%	13%	14%	14%

These percentages were applied to the gross demand forecasts provided by the Ottawa Region LDCs at the transformer station level to determine the peak demand savings assumed in the planning forecast. This allocation methodology relies on the assumption that the peak demand savings from the provincial conservation will be realized uniformly across the province. Actions recommended in the Ottawa IRRP to monitor actual demand savings, and to assess conservation potential in the region, will assist in developing region-specific conservation assumptions going forward.

Existing DR resources are included in the base year and gross demand forecasts. Additional DR resources can be considered as potential options to meet regional needs.

A.2.1 Conservation Assumptions by Sub-Area and Station

The following tables show the expected peak demand impact of provincial energy targets at each transformer station, developed according to the methodology described in Appendix A.2 above, for the purposes of the high-growth forecast.
