- Transmission adequacy is assessed based on the system's ability to supply forecast coincident peak demand with all elements in service while maintaining equipment loading within continuous ratings and voltages within normal range, and with one element out of service while maintaining circuit loading within long-term emergency (LTE) ratings and transformer loading within their applicable summer 10-Day Limited Time Rating (LTR).
- Station capacity adequacy is assessed by comparing the non-coincident peak load with the station's normal planning supply capacity, assuming a 90% lagging power factor for stations having no low-voltage capacitor banks and 95% lagging power factor for stations having low-voltage capacitor banks.
- Normal planning supply capacity for transformer stations is determined by the Hydro One summer 10-Day LTR of a single transformer at that station.
- Normal planning supply capacity for distribution stations is determined by the Hydro One summer Peak Loading Limit (PLL) at the station.
- Adequacy assessment is conducted as per Ontario Resource Transmission Assessment Criteria (ORTAC).

6.2 Information Gathering Process

6.2.1. Load forecast:

The LDCs provided their load forecasts for summer and winter for all the stations supplying their loads in the Renfrew region for the 10-year study period including the inputs from the Municipalities such as MEPs and CEPs. The IESO provided an Electricity Demand Side Management ("eDSM") , and Distributed Energy Resources ("DER") forecast for the Renfrew region. The region's

extreme summer/winter coincident peak gross load forecasts for each station were prepared in accordance with the Load Forecast Guidelines published by the OEB RPPAG. The LDC load forecast growth rates were calculated (including expected growth, committed customers load etc.) and applied to the actual 2025 summer/winter peak extreme weather corrected loads. The extreme summer/winter weather correction factors were provided by Hydro One. The net extreme summer weather load forecasts were produced by reducing the gross load forecasts for each station by the percentage eDSM and then by the amount of effective new DER capacity provided by the IESO for that station. It is to be noted that as contracts for existing DER resources in the region begin to expire, at which point the load forecast has a decreasing contribution from local DER resources, and an increase in net demand. This extreme summer/winter weather corrected net load forecast for the individual stations in the Renfrew region is given in Appendix A. The graphical representation of the regional net coincidental load growth for both summer and winter season over the study period is shown in Figure 4 below.

	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035
Summer	141.7	145.4	149.4	153.6	156.9	158.6	161.7	164.1	165.7	169.2
Winter	152.2	156.6	161.8	165.4	169.1	170.7	172.8	174.0	176.5	181.1

Figure 4: Renfrew Region Coincident Load Forecast

6.2.2. Sensitivity Analysis:

A sensitivity analysis was undertaken by the TWG to capture uncertainty in the load forecast as well as variability of drivers such as electrification. Hence, the NA recommendations are not necessarily linked to sensitivity scenarios; but rather are used to identify any emerging needs for consideration in developing recommendations. The impact of sensitivity analysis for the high and low growth scenarios are provided in section 8 of this report.

6.2.3. Asset Renewal Needs for Major HV Equipment:

List of major HV transmission equipment planned and/or identified to be refurbished and/or replaced based on asset condition assessment, relevant for Regional Planning purposes. This includes HV transformers, autotransformers, HV Breakers, HV underground cables and overhead lines.

No new Asset renewal needs were identified during the study period.

6.2.4. System Reliability and Operational Issues:

In case of contingencies on the transmission system, ORTAC provides the load restoration requirements relative to the amount of load affected. Planned system configuration must not exceed 600 MW of load curtailment/rejection. In all other cases, the following restoration times are provided for load to be restored for the outages caused by design contingencies.

- All loads must be restored within 8 hours.
- Load interrupted in excess of 150 MW must be restored within 4 hours.
- Load interrupted in excess of 250 MW must be restored within 30 minutes.

Based on the net load forecast, the loss of one element will not result in load interruption greater than 150MW. The maximum load interrupted by configuration due to the loss of two elements is below the load loss limit of 600MW by the end of the 10-year study period.

During the studies TWG identified system operational issues on 115 kV D6 line. Under high growth scenarios there are voltage issues observed at end of line stations for Petawawa DS, Forest Lea DS and Craig DS during normal all in-service condition.

IESO will perform more detailed study to identify system reliability and operational issues in the region during next phases of regional planning.

7. NEEDS

This section describes emerging new needs identified in the Renfrew Region and/or updates on previously identified needs since the completion of previous Regional Planning cycle.

Needs that were identified in the previous regional planning cycle with associated projects that were recently completed and reaffirmed needs that are underway are briefly described below with relevant updates and will not be discussed further in this report.

1. Pembroke TS T1/T2 – A station capacity need was identified in the previous regional planning cycle. However, based on updated detailed LTR studies with recent loading profile at the station the LTR of the station have been updated and this need no longer exists within the short-term planning cycle due to higher LTR ratings than the value used in the previous regional planning cycle.
2. Forest Lea DS – A load transfer need was identified in the previous regional planning cycle. However, based on the revised PLL, this need no longer exists, as the updated PLL is higher than the value used in the previous regional planning cycle.
3. 115 kV D6 Line Refurbishment - The existing HONI 115 kV circuit D6 will be partially relocated and will reduce the length of the line section between CTS-1 and Petawawa JCT from 38.9 km to 30.7 km and therefore will reduce the overall D6 circuit length from 90.8 km to 82.7 km. The project is expected to be completed in December 2027.
4. Des Joachims T6 Autotransformer- Due to asset condition Replacement of autotransformer T6 with standard 125 MVA 239/121-13.9 kV autotransformer completed in June 2026.

Note: The planned in-service year for the above projects is tentative and is subject to change.

All near and mid-term needs that are discussed as a part of this report are summarized in Table 5 below.

Table 5: Near/Mid-term Needs Identified in this NA and/or Updated from Previous RIP

Need Location	Need Description/Update	NA Report Section
Asset Renewal Needs		
115 kV D6 Line	Complete 76.8 km line refurbishment between Des Joachims TS and Petawawa/Craig DS	7.1.1
Station Capacity Needs		
Cobden DS	Projected to reach capacity in 2029 under normal growth summer forecast and in 2028 under summer High growth scenario.	7.2.1
Cobden TS T1/T2	Projected to reach capacity in 2033 under summer High growth scenario.	7.2.2

Transmission Line Capacity Needs		
115 kV D6	Projected to reach capacity in 2031 under summer high growth scenario.	7.3.1
115 kV X2Y	Projected to reach capacity limits at the end of study period (2035) during X6 contingency and summer high growth scenario.	7.3.2
System Reliability, Operation and Load Restoration Needs		
115 kV D6 – Voltage Performance	Voltage issues identified in 2035 for normal summer forecast and in 2031 for High growth summer forecast	7.4.1
X2Y Load Restoration	Projected to exceed thermal ratings of X2Y when complete load of Cobden TS needs to be restored under X6 contingency in 2029 under normal growth scenario and 2028 under high growth scenario.	7.4.2

7.1 Asset Renewal Needs for Major HV Transmission Equipment

In addition to the previously identified asset renewal needs from the second regional planning cycle, Hydro One and the TWG identified no new asset renewal needs for major HV transmission equipment over the next 10 years in the Renfrew Region.

Asset renewal needs are determined by asset condition assessment. Asset condition assessment is based on a range of considerations such as:

- Equipment deterioration due to aging infrastructure or other factors,
- Technical obsolescence due to outdated design,
- Lack of spare parts availability or manufacturer support, and/or
- Potential health and safety hazards, etc.

The major high voltage equipment information shared and discussed as part of this process is listed below:

- 230/115kV autotransformers
- 230 and 115kV load serving step down transformers
- 230 and 115kV breakers where:
  replacement of six breakers or more than 50% of station breakers, the lesser of the two
- 230 and 115kV transmission lines requiring refurbishment where:
  Leave to Construct (i.e., section 92) approval is required for any alternative to like-for-like
- 230 and 115kV underground cable requiring replacement where:
  Leave to Construct (i.e., section 92) approval is required for any alternative to like-for-like

The asset renewal assessment considers the following options for "right sizing" the equipment:

- Maintaining the status quo
- Replacing equipment with similar equipment with *lower* ratings and built to current standards
- Replacing equipment with similar equipment with *lower* ratings and built to current standards by transferring some load to other existing facilities
- Eliminating equipment by transferring all the load to other existing facilities
- Replacing equipment with similar equipment and built to current standards (i.e., "like-for-like" replacement)
- Replacing equipment with higher ratings and built to current standards

Table 6: Major HV Transmission Assets Planned for Replacement in Renfrew Region in next 10 years

Station/Circuit	Need Description	Planned ISD
115 kV D6	Complete 76.8 km line refurbishment between Des Joachims TS and Petawawa/Craig DS	2027

7.1.1 115 kV D6 Line Refurbishment

The 115 kV D6 is a single circuit transmission line that connects Des Joachims TS to Pembroke TS along the Ottawa River in the Laurentian Hills area. Based on asset condition assessment, the circuit was identified for refurbishment and expected to be completed by end of 2027. The planned in-service date for the project is in end of 2027.

7.2 Station Capacity Needs

A Station Capacity assessment was performed over the study period 2026-2035 for the 230kV and 115kV Transforming stations in the Renfrew Region using either the summer or winter peak load forecasts that were provided by the Technical Working Group. Based on the results, the following Station capacity needs have been identified during the study period:

7.2.1 Cobden DS – T3

Cobden DS is located in the eastern part of the Renfrew region and is supplied by the 115 kV X2Y circuit, with provision to be supplied by X6 under contingency conditions. The station has one transformer, T3, with a summer PLL of 8.9 MW, and supplies load to Hydro One Distribution.

Based on the load forecast, Cobden DS is expected to exceed its summer PLL in 2029. Winter loading is forecast to remain within limits throughout the study period. Under the high-growth scenario, the projected summer need date advances to 2028.

The TWG recommends that the identified station capacity needs be addressed through coordinated planning between Hydro One Transmission and Hydro One Distribution. In the near term, feasible mitigation measures should be evaluated, including load transfers, transformer upgrades, and the implementation of SCADA-based fan monitoring to maximize the utilization of existing assets. The TWG further recommends continued monitoring of station loading and demand growth trends, with the objective of developing an appropriate longer-term solution through the Local Planning process when capacity reinforcement is required.

7.2.2 Cobden TS – T1/T2

Cobden TS is an important supply point for customers in and around the Cobden area. The station is supplied by X2Y and X6 circuits and is equipped with two 42 MVA transformers, T1 and T2 with a summer and winter LTR of 41.6 MW and 49.3 MW respectively.

Under the normal load forecast, no station capacity need has been identified at Cobden TS over the study period. However, sensitivity analysis indicates that under the summer high-growth forecast, Cobden TS is expected to exceed its summer LTR in 2033. Given that this need only materializes under the high-growth sensitivity scenario, TWG recommends continued monitoring of actual load growth at the station and revisiting the capacity need in the next phase of regional planning.

7.3 Transmission Lines Capacity Needs

All line and equipment loads shall be within their continuous ratings with all elements in service and within their long-term emergency ratings with any one element out of service. Immediately following contingencies, lines may be loaded up to their short-term emergency ratings where control actions such as re-dispatch, switching, etc. are available to reduce the loading to the long-term emergency ratings. A Transmission Lines Capacity Assessment was performed over the study period 2026-2035 for the 230kV and 115kV Transmission line circuits in the Renfrew Region by assessing thermal limits of the circuit and the voltage range as per ORTAC to cater this need. Based on the results, the following line capacity needs have been identified during the study period:

7.3.1 115 kV D6

The 115 kV Des Joachims subsystem is supplied from Des Joachims TS through 115kV circuit D6 and serves load eastward toward Petawawa DS, Craig DS and Forest Lea DS. Circuit D6 forms a critical supply path in the western Renfrew area, and prior regional planning has recognized the importance of this corridor in maintaining reliable supply to communities including Laurentian Hills, Deep River, Petawawa and Laurentian Valley. As outlined in section 7.1.1 Hydro One's D6 refurbishment project, involving

approximately 76.8 km of 115 kV transmission line between Des Joachims TS and Pembroke TS, was initiated to address end-of-life assets and support continued reliability of supply in the area this refurbishment with larger standard conductors have increased the load meeting capability of the circuit from 50.9 MW to 93.9 MW. Adequacy studies were completed for the Des Joachims subsystem under both a normal growth forecast and a high growth sensitivity with the new conductors are shown in Figure 5 below

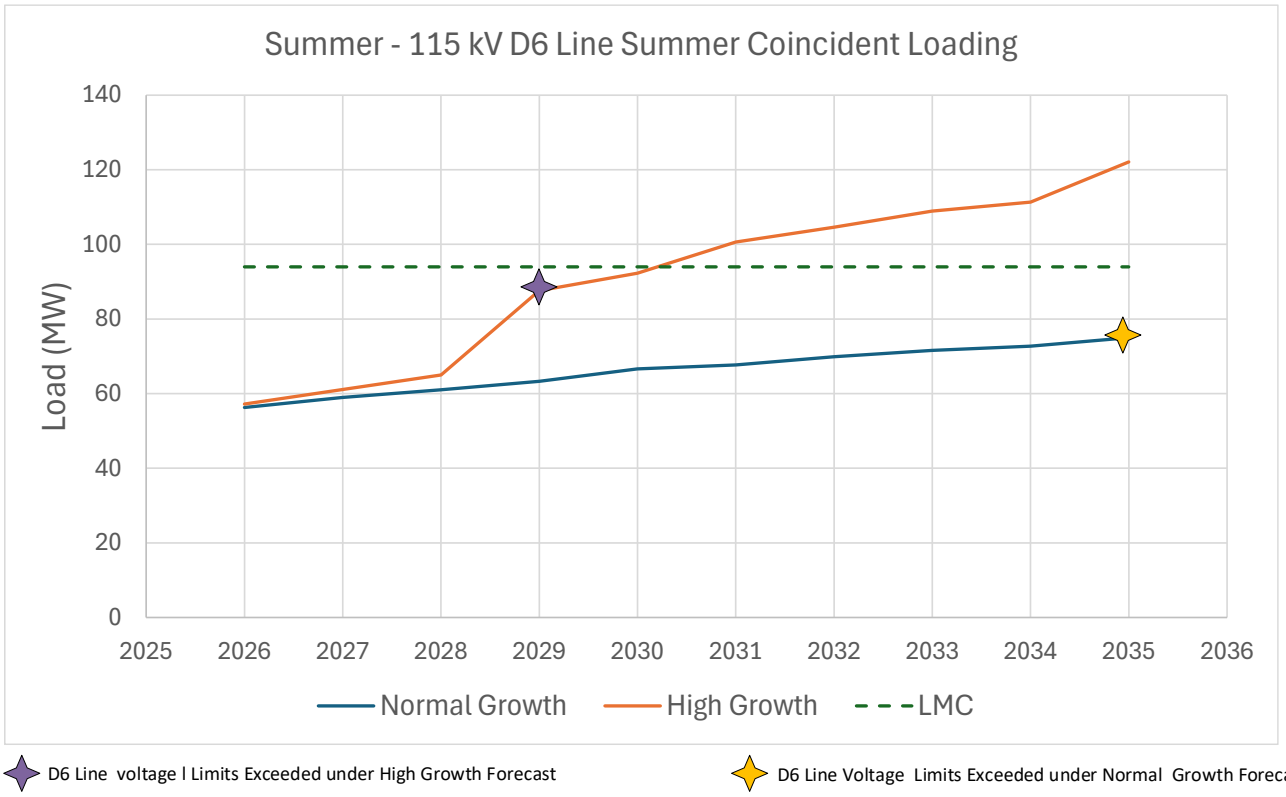

Figure 5: 115 kV D6 Loading

Normal Growth Scenario

Under the normal growth scenario, the 115 kV Des Joachims subsystem is expected to remain thermally adequate over the study period. The D6 line refurbishment project provides sufficient capacity to accommodate the forecast load growth on the subsystem. However, while no thermal capacity concerns were identified, the studies indicate that voltage performance becomes a limiting factor in the later years of the study period. In particular, stations located toward the remote end of Circuit D6, including Petawawa DS, Craig DS and Forest Lea DS, were found to experience voltage levels below the applicable ORTAC minimum voltage criteria. As a result, the subsystem is considered adequate from a line-loading perspective under normal growth, but voltage support or other mitigation measures will be required in the longer term to maintain acceptable voltage performance at the end-of-line stations.

High Growth Scenario

Under the high growth scenario, the adequacy of the 115 kV Des Joachims subsystem becomes more constrained. This sensitivity was developed to reflect increased connection interest along Circuit D6 and assumed 50% higher load growth than the normal forecast, along with potential new transmission-connected load with a high certainty score. Study results indicate that, under this higher load outlook, Circuit D6 exceeds its thermal capability beginning in the 2031 summer forecast year. In addition to the thermal limitation, voltage violations are also observed at the remote stations connected to D6, including Petawawa DS, Craig DS and Forest Lea DS in 2029. These results indicate that the subsystem would not be adequate under the high growth scenario without additional reinforcement or mitigation.

Further studies in next phase should be undertaken to develop solutions (including non-wires alternatives).

7.3.2 115 kV X2Y

X2Y is a 58 km, 115 kV circuit located northwest of the Greater Ottawa area and electrically associated with the Renfrew regional supply area. The circuits provide connection and/or supply to Pembroke TS, Chenaux TS, Cobden TS, Cobden DS, CTS-2, and Bryson CGS in Hydro-Québec. X2Y has an LTE rating of 91.0 MVA and 102.8 MVA in summer and winter respectively.

Under the normal growth forecast the X2Y remains within its thermal limits but under the high growth forecast X2Y approaches its thermal limits under X6 contingency at the end of study period.

TWG recommends studying this need in the next phase of the regional planning for long-term solution for the X2Y limiting section. If the total loading at Pembroke TS, Cobden TS, and Cobden DS exceeds the thermal rating of the limiting X2Y section before solutions are implemented, then operating measures can be deployed in the interim to alleviate the limit.

7.4 System Reliability, Operation and Restoration Needs

The transmission system must be planned to satisfy demand levels up to the extreme weather, and to provide a median-economic forecast for an extended period with any one transmission element out of service. A study has been carried out, considering the net coincident load forecast and the loss of one element over the study period 2026-2035 to cater for this need**.** Based on the results, the following needs have been identified during the study period:

7.4.1 Voltage Performance of 115 kV D6

A series of system studies were conducted to evaluate the voltage performance of the 115 kV D6 circuit under various operating conditions and long-term load growth assumptions.

Under the 2035 normal growth scenario and 2029 high growth scenario the analysis shows that the pre-contingency voltage on D6 violates ORTAC limits. Specifically, the voltage on the affected sections of

D6 falls below the minimum ORTAC limit of 113 kV, indicating inadequate voltage performance in this scenario.

TWG recommends further review of this need in the next phase of regional planning.

7.4.2 X2Y Load Restoration

Under normal configuration, Cobden TS is supplied from X6 and X2Y, with the low-voltage bus tie normally open. Following an X6 contingency, restoration of the full Cobden TS load requires manual closure of the LV tie switch. This restoration configuration transfers additional load onto X2Y, resulting in the circuit exceeding its LTE rating in the near term.

When restoring the load of Cobden TS from X2Y under X6 contingency the need is expected to emerge in 2029 under the normal summer growth scenario and advance to 2028 under the high-growth scenario whereas for the winter time the need is expected to emerge in 2028 for both normal and high growth scenarios. Accordingly, the restoration need is considered a near- to medium-term transmission loading need, depending on the growth scenario. As load loss is less than 150 MW for the contingency, it will be restored within 8 hours as per load restoration criteria in section 6.2.4

TWG recommends further review of this need in the next phases of regional planning.

8. SENSITIVITY ANALYSIS

The objective of a sensitivity analysis is to capture uncertainty in the load forecast as well as variability of electric demand drivers to identify any emerging needs and/or advancement or deferment of recommended investments. The TWG determined that the key electric demand driver in the Renfrew region to be considered in this sensitivity analysis is electric vehicle (EV) penetration and unforeseen electrification which would cause the load to increase at a faster rate than shown in the forecast; or the potential delay in some projects which could result in less demand than anticipated.

The TWG reviewed EV scenarios, and any unforeseen electrification needs to develop high demand growth forecasts by applying 50% additional growth to the growth rate on the extreme summer/winter corrected Normal Growth net load forecasts. The low growth scenario was obtained by reducing the growth rate by 50%. The High Growth scenario incorporates EV scenarios, includes consideration of potential additional demand from electrification as well as anticipated large industrial and commercial customers expected to connect in the near to mid-term.

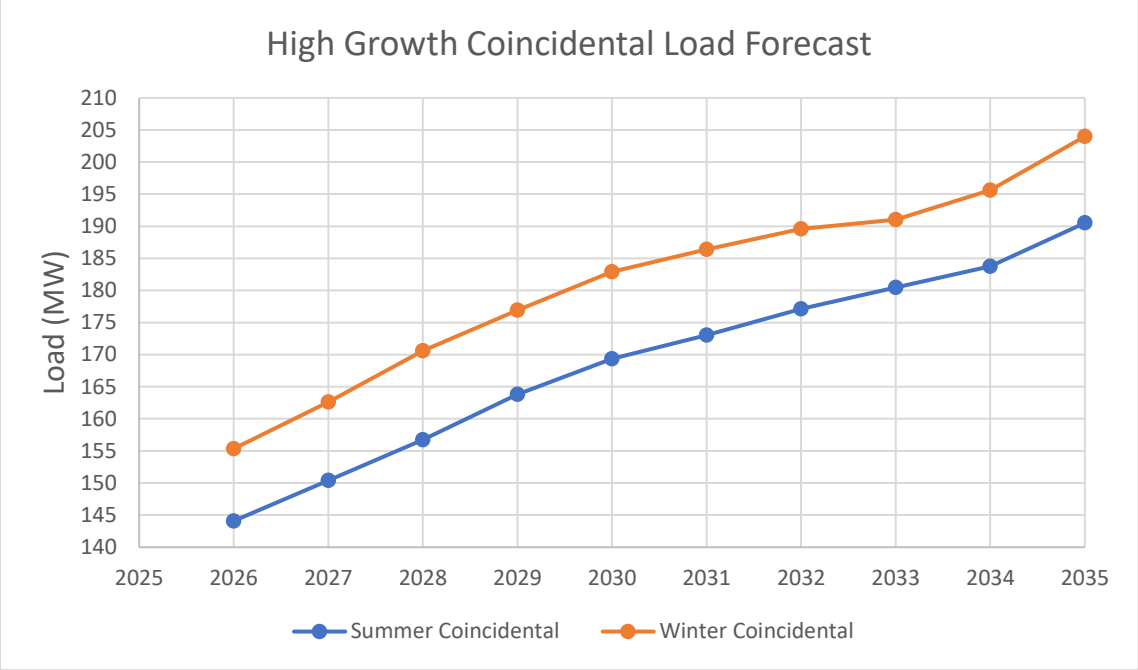

Figure 6: High Growth Forecast for existing station

The normal and high growth forecasts are shown in Tables A.1, A.2, A.3 and A.4.

The impact of sensitivity analysis for the high and low growth scenario identified the following updates or new Station/Line capacity needs:

Table 7: Impact of Sensitivity Analysis on Station/Line capacity Needs in the Region

Sr.no.	Need Identified	Normal Growth Scenario	High Growth Scenario	Low Growth Scenario
1	Cobden DS	2029	2028	-
2	Cobden TS T1/T2	-	2033	-
3	115 kV D6 Line	-	2031	-
4	115 kV X2Y Line	-	~2035	-
5	Voltage Performance of 115 kV D6	2035	2031	-
6	X2Y Load Restoration	2029	2028	-

9. CONCLUSION AND RECOMMENDATION

The Needs Assessment has considered N-1 contingency scenarios to identify needs in the area. The next phases will include a revised forecast and additional outage/contingency analysis beyond what was assessed here. These studies may find further limits on the system's ability to supply additional load. Technical Working Group's recommendations to address the needs identified are as follows:

Table 8: Needs that Require Further Regional Coordination

#	Need Location	Need Description
Station Capacity Needs		
1	Cobden DS	Projected to reach capacity in 2029 under normal growth summer forecast and in 2028 under summer High growth scenario.

Table 9: Needs that Require Further Regional Coordination

#	Need Location	Need Description
Station Capacity Needs		
1	Cobden DS	Projected to reach capacity in 2029 under normal growth summer forecast and in 2028 under summer High growth scenario.
2	Cobden TS T1/T2	Projected to reach capacity in 2033 under summer High growth scenario.
Transmission Line Capacity Needs		
3	115 kV D6	Projected to reach capacity in 2031 under summer high growth scenario.
4	115 kV X2Y	Projected to reach capacity in 2035 under summer high growth scenario.
System Reliability, Operation and Load restoration Needs		
5	115 kV D6 – Voltage Performance	Voltage issues identified in 2035 for normal summer forecast and in 2031 for High growth summer forecast.
6	X2Y Load Restoration	Projected to exceed thermal ratings of X2Y when complete load of Cobden TS needs to be restored under X6 contingency in 2029 under normal growth scenario and 2028 under high growth scenario.

List of LDC(s) to be involved in further regional planning phases:

- Hydro One Distribution
- Ottawa River Power Corporation (ORPC)

List of LDC(s) which are not required to be involved in further regional planning phases:

- None

Rideau St Lawrence Distribution Inc.

DISCLAIMER

This Regional Infrastructure Plan ("RIP") report was prepared for the purpose of developing an electricity infrastructure plan to address all near and mid-term needs identified in previous planning phases and any additional needs identified based on new and/or updated information provided by the RIP Technical Working Group ("TWG"). The preferred solution(s) that have been identified in this report may be reevaluated based on the findings of further analysis. The load forecast and results reported in this RIP report are based on the information provided and assumptions made by the participants of the Regional Planning Technical Working Group.

The Technical Working Group participants, their respective affiliated organizations, and Hydro One Networks Inc. (collectively, "the Authors") make no representations or warranties (express, implied, statutory or otherwise) as to the RIP report or its contents, including, without limitation, the accuracy or completeness of the information therein and shall not, under any circumstances whatsoever, be liable to each other, or to any third party for whom the RIP report was prepared ("the Intended Third Parties"), or to any other third party reading or receiving the RIP report ("the Other Third Parties"), for any direct, indirect or consequential loss or damages or for any punitive, incidental or special damages or any loss of profit, loss of contract, loss of opportunity or loss of goodwill resulting from or in any way related to the reliance on, acceptance or use of the RIP report or its contents by any person or entity, including, but not limited to, the aforementioned persons and entities.

EXECUTIVE SUMMARY

THIS REGIONAL INFRASTRUCTURE PLAN ("RIP") WAS PREPARED BY HYDRO ONE WITH SUPPORT FROM THE TECHNICAL WORKING GROUP IN ACCORDANCE WITH THE ONTARIO TRANSMISSION SYSTEM CODE REQUIREMENTS. IT IDENTIFIES INVESTMENTS IN TRANSMISSION FACILITIES, DISTRIBUTION FACILITIES, OR BOTH, THAT SHOULD BE DEVELOPED AND IMPLEMENTED TO MEET THE ELECTRICITY INFRASTRUCTURE NEEDS WITHIN THE ST. LAWRENCE REGION.

The participants of the Regional Infrastructure Plan ("RIP") Technical Working Group included members from the following organizations:

- Cooperative Hydro Embrun Inc.
- Hydro One Networks Inc. (Distribution)
- Hydro One Networks Inc. (Transmission)
- Independent Electricity System Operator ("IESO")
- Rideau St Lawrence Distribution Inc.

The first cycle of RP process was completed in April 2016 with the publication of the Needs Assessment ("NA") Report. As no further regional coordination or planning was required, the NA recommended that the needs be addressed between relevant Local Distribution Companies (LDCs) and Hydro One and other parties as required.

In accordance with the Regional Planning process, the Regional Planning cycle should be triggered at least every five years. In light of the timing of the needs identified in the previous NA report as well as new asset replacement/refurbishment needs identified in the St. Lawrence Region, the 2nd Regional Planning cycle for the St. Lawrence region was triggered in Q3 2021 beginning with the NA phase. This NA report was completed in Sept. 2021 and did not identify any needs requiring further coordinated regional planning.

This RIP is the final phase of the second cycle of the St. Lawrence regional planning process, and is developed based on the information and recommendations in the previous NA report.

The major infrastructure investment recommended for the St. Lawrence Region over the near and mid-term planning horizon is provided in the Table 1 below, along with a description of the investment, its planned in-service date, and budgetary estimate for planning purposes.

Table 1. Recommended Plans in St Lawrence Region over the Next 10 Years

Stations / Lines Project	Investment	Planned I/S Date	Cost[1] ($M)
L22H	Replacement of conductor, shieldwire, insulator and tower work	2026	64

[1] These costs are budgetary estimates for planning purposes unless otherwise specified.

The St. Lawrence TWG recommends that:

- Hydro One and relevant LDC(s) continue with the implementation of infrastructure investments listed in Table 1 above;
- As no other needs have been identified in the region, the TWG will assess the St. Lawrence region during the next regional planning cycle.

The next regional planning cycle for the St. Lawrence Region must be triggered within five years, beginning with the NA phase. It is expected that the next NA will start in Q3 2026. However, the next regional planning cycle can be started earlier if required to address any new emerging needs.

1. INTRODUCTION

THIS REPORT PRESENTS THE REGIONAL INFRASTRUCTURE PLAN ("RIP") TO ADDRESS THE ELECTRICITY NEEDS OF THE ST LAWRENCE REGION BETWEEN 2021 AND 2032.

The report was prepared by Hydro One Networks Inc. (Transmission) ("Hydro One") on behalf of the Technical Working Group ("TWG") that consists of Hydro One, Cooperative Hydro Embrun Inc., Hydro One Networks Inc. (Distribution), Rideau St Lawrence Distribution Inc., the Independent Electricity System Operator ("IESO"), in accordance with the new Regional Planning process established by the Ontario Energy Board in 2013.

The St Lawrence region is located in southeastern Ontario bordering the St Lawrence River. The region starts at the Gananoque in the West and extends to the inter-provincial boundary with Quebec in the East. Electrical supply to the Region is provided from four 230 kV and three 115 kV step-down transformer stations. The approximate boundaries of the St Lawrence Region are shown below in Figure 1-1.

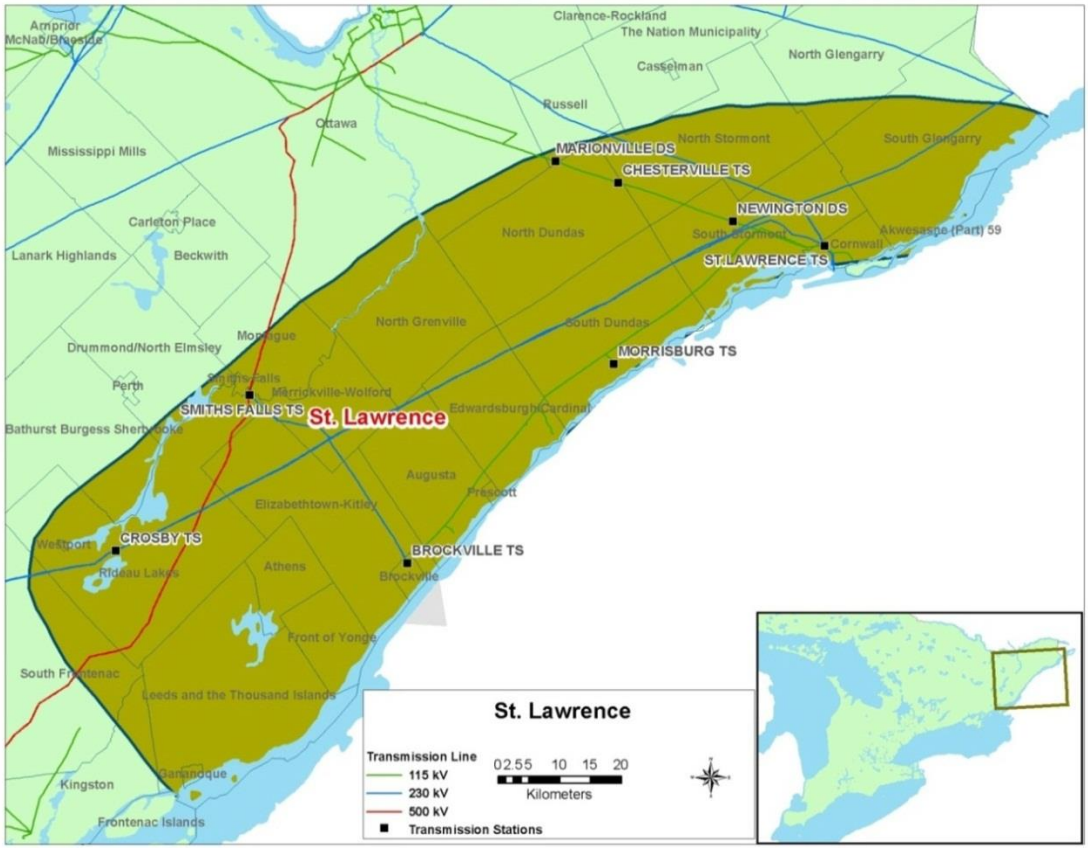

FIGURE 1-1: ST LAWRENCE REGION MAP

1.1. Objectives and Scope

The RIP report examines the needs in the St Lawrence Region. Its objectives are to:

- Provide a comprehensive summary of needs and wires plans to address the needs;
- Assess and develop a wires plan to address these needs; and
- Identify investments in transmission and distribution facilities or both that should be developed and implemented on a coordinated basis to meet the electricity infrastructure needs within the region.

The RIP reviewed factors such as the load forecast, major high voltage transmission equipment requiring replacement over the near and mid-term horizon, transmission and distribution system capability along with any updates to local plans, conservation and demand management ("CDM") forecasts, renewable and non-renewable generation development, and other electricity system and local drivers that may impact the need and alternatives under consideration.

The scope of this RIP is as follows:

- A consolidated report of the relevant wires plans to address near and medium-term needs identified in previous planning phases; and,
- Discussion of any other major transmission infrastructure investment plans over the planning horizon.

1.2. Structure

The rest of the report is organized as follows:

- Section 2 provides an overview of the regional planning process.
- Section 3 describes the regional characteristics.
- Section 4 describes the transmission work completed over the last ten years.
- Section 5 describes the load forecast and study assumptions used in this assessment.
- Section 6 describes the adequacy of the transmission facilities in the region over the study period.
- Section 7 discusses the needs and provides the alternatives and preferred solutions.
- Section 8 provides the conclusion and next steps.

2. REGIONAL PLANNING PROCESS

2.1. Overview

Planning for the electricity system in Ontario is done at three levels: bulk system planning, regional system planning, and distribution system planning. These levels differ in the facilities that are considered and the scope of impact on the electricity system. Planning at the bulk system level typically looks at issues that impact the system on a provincial level, while planning at the regional and distribution levels looks at issues on a more regional or localized level.

Regional planning looks at supply and reliability issues at a regional or local area level. Therefore, it largely considers the 115 kV and 230 kV portions of the power system that supply various parts of the province.

2.2. Regional Planning Process

A structured regional planning process was established by the Ontario Energy Board ("OEB") in 2013 through amendments to the Transmission System Code ("TSC") and Distribution System Code ("DSC"). The process consists of four phases: the Needs Assessment[1] ("NA"), the Scoping Assessment ("SA"), the Integrated Regional Resource Plan ("IRRP"), and the Regional Infrastructure Plan ("RIP").

The following describes the process in general, considering all four phases of the study.

The regional planning process begins with the NA phase, which is led by the transmitter to determine if there are regional needs. The NA phase identifies the needs and the TWG determines whether further regional coordination is necessary to address them. If no further regional coordination is required, further planning is undertaken by the transmitter and the impacted local distribution company ("LDC") or customer and develops a Local Plan ("LP") to address them.

In situations where identified needs require coordination at the regional or sub-regional levels, the IESO initiates the SA phase. During this phase, the IESO, in collaboration with the transmitter and impacted LDCs, reviews the information collected as part of the NA phase, along with additional information on potential non-wires alternatives, and makes a decision on the most appropriate regional planning approach. The approach is either a RIP, which is led by the transmitter, or an IRRP, which is led by the IESO. If more than one sub-region was identified in the NA phase, it is possible that a different approach could be taken for different sub-regions.

The IRRP phase will generally assess infrastructure (wires) versus resource (non-wires alternatives) options at a higher or more macro level, but sufficient to permit a comparison of options. If the IRRP phase identifies that infrastructure options may be most appropriate to meet a need, the RIP phase will conduct detailed planning to identify and assess the specific wires alternatives and recommend a preferred wires solution. Similarly, resource options that the IRRP

[1] Also referred to as Needs Screening

identifies as best suited to meet a need are then further planned in greater detail by the IESO. The IRRP phase also includes IESO led stakeholder engagement with municipalities, Indigenous communities, business sectors and other interested stakeholders in the region.

The RIP phase is the fourth and final phase of the regional planning process and involves discussion of previously identified needs and plans, identification of any new needs that may have emerged since the start of the planning cycle, and development of a wires plan to address the needs where a wires solution would be the best overall approach. This phase is led and coordinated by the transmitter and the deliverable is a comprehensive report of a wires plan for the region. Once completed, this report is also referenced in transmitter's rate filing submissions and as part of LDC rate applications with a planning status letter provided by the transmitter.

To efficiently manage the regional planning process, Hydro One has been undertaking wires planning activities in collaboration with the IESO and/or LDCs for the region as part of and/or in parallel with:

- Planning activities that were already underway in the region prior to the new regional planning process taking effect;
- The NA, SA, and LP phases of regional planning;
- Participating in and conducting wires planning as part of the IRRP for the region or sub-region;
- Working and planning for connection capacity requirements with the LDCs and transmission connected customers.

Figure 2-1 illustrates the various phases of the regional planning process (NA, SA, IRRP, and RIP) and their respective phase trigger, lead, and outcome.

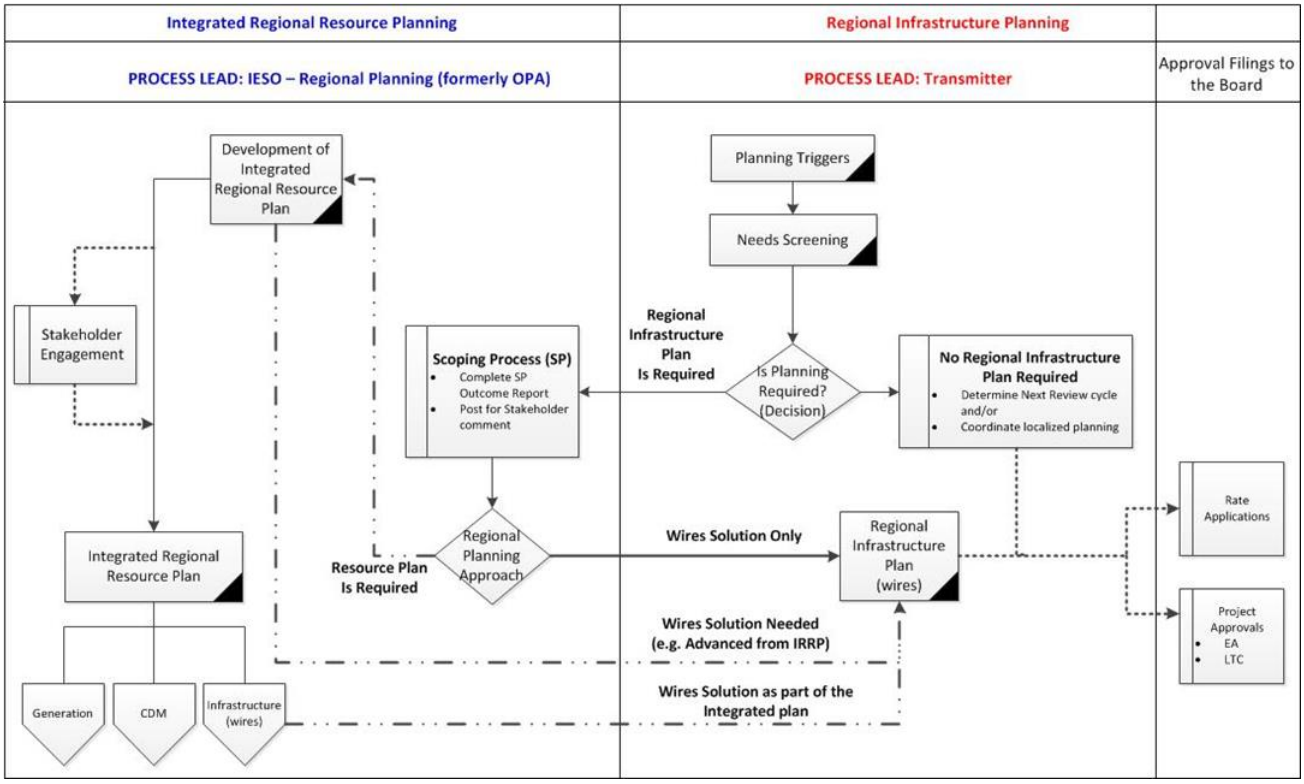

FIGURE 2-1: REGIONAL PLANNING PROCESS FLOWCHART

2.3. RIP Methodology

The Needs Assessment did not identify any needs requiring further coordinated regional planning. As such this RIP report summarizes the information and recommendations in the previous NA report.. The following discusses the RIP process in general.

.

The RIP phase consists of a four step process (see Figure 2-2) as follows:

1) Data Gathering: The first step of the process is the review of planning assessment data collected in the previous phase of the regional planning process. Hydro One collects this information and reviews it with the Technical Working Group to reconfirm or update the information as required. The data collected includes:

   - Net peak demand forecast at the transformer station level. This includes the effect of any distributed generation or conservation and demand management programs.
   - Existing area network and capabilities including any bulk system power flow assumptions.
   - Other data and assumptions as applicable such as asset conditions; load transfer capabilities, and previously committed transmission and distribution system plans.

2) Technical Assessment: The second step is a technical assessment to review the adequacy of the regional system including any previously identified needs. Depending

upon the changes to load forecast or other relevant information, regional technical assessment may or may not be required or be limited to specific issue only. Additional near and mid-term needs may be identified in this phase.

3) Alternative Development: The third step is the development of wires options to address the needs and to come up with a preferred alternative based on an assessment of technical considerations, feasibility, environmental impact and costs.
4) Implementation Plan: The fourth and last step is the development of the implementation plan for the preferred alternative.

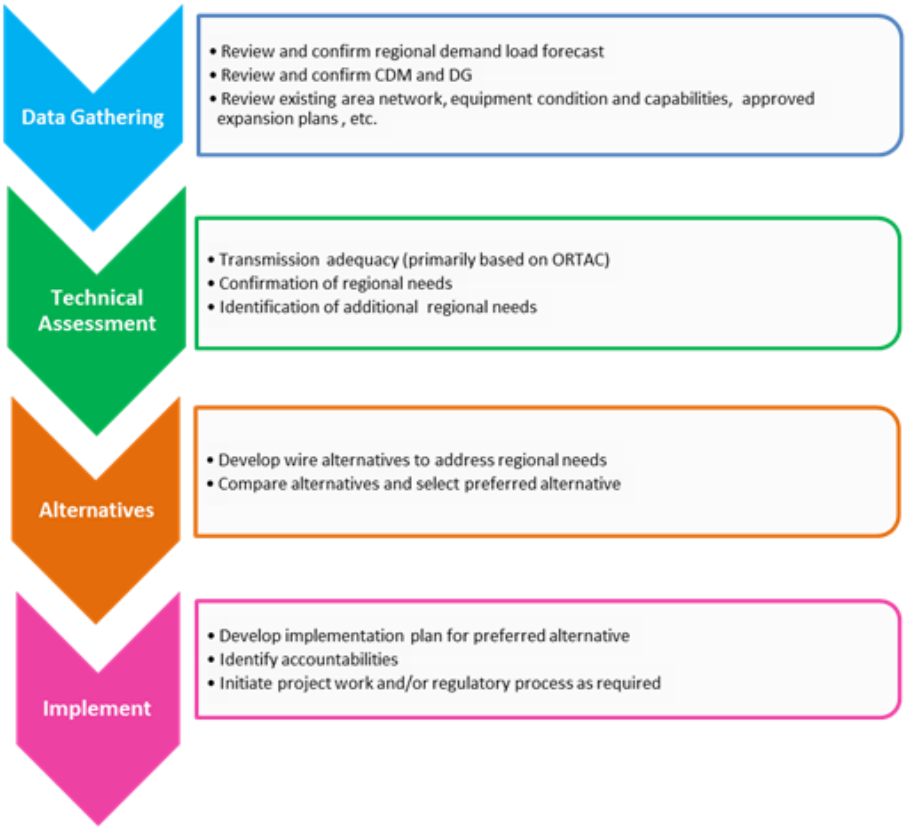

FIGURE 2-2: RIP METHODOLOGY

3. REGIONAL CHARACTERISTICS

THE ST LAWRENCE REGION IS LOCATED IN SOUTHEASTERN ONTARIO BORDERING THE ST LAWRENCE RIVER. THE REGION STARTS AT THE GANANOQUE IN THE WEST AND EXTENDS TO THE INTER-PROVINCIAL BOUNDARY WITH QUEBEC IN THE EAST.

The St Lawrence Region is connected to the Greater Ottawa Region through 230kV circuits L24A and B31L. Circuit B31L also provides an interconnection between the Provinces of Ontario and Quebec. In addition, 115kV circuit L2M also connects St Lawrence to the Greater Ottawa Region, however this connection is normally open and is only used for load transfers between the two areas in case of system need. The Region is also connected to the Peterborough to Kingston Region through 230kV circuits L20H, L21H, and L22H. The existing facilities and interconnection of the Region are summarized below and depicted in the single line diagram shown in Figure 3-1 and 3-2.

St Lawrence TS is the major transmission station for the region and connects to the main source of supply for the area, Saunders GS via four 230kV circuits. All the 230kV and 115kV circuits listed above connect at St Lawrence TS. Also connecting to the 230kV yard of the station are two International Power Lines (IPL). These IPLs connect Ontario to the State of New York and power exchange across the IPLs are regulated using two phase shifting transformers. The station also has two 230kV/115kV 250MVA autotransformers to connect the 230kV and 115kV networks.

There is a total of seven transformer stations in the area to supply load customers. There are also two industrial customer stations and a customer owned generating station. The stations are broken down into the following categories:

1. **St Lawrence 230 kV Area:** The transformer stations in this area are supplied by the St Lawrence TS to Hinchinbrook TS 230kV transmission lines. In addition, St Lawrence TS DESN is also supplied from the 230kV. The following stations are included:
    - Brockville TS
    - Crosby TS
    - Smith Falls TS
    - St Lawrence TS

    Figure 3-1 shows additional 230kV circuits connected to St Lawrence TS. These circuits were not part of the St Lawrence regional planning scope of work for the following reasons:

    - L24A, B31L: These circuits do not supply stations included in the St Lawrence area.
    - S25L, S26L, S30L, S32L: These circuits connect to OPG Saunders generating station.
    - L33P, L34P. These circuits are International Power Lines that connect Ontario to the State of New York.

2. **St Lawrence 115 kV Area:** The transformer stations in this area are supplied 115kV circuits. The circuits are radial from St Lawrence TS. The 115kV area also includes two industrial customer stations and a customer owned generating station. The following load customer stations are included:
    - Chesterville TS
    - Morrisburg TS
    - Newington DS

    The industrial station and generating stations are also included in the study area, however the study focuses on the regional needs and load customer station.

    Figure 3-2 shows an additional 115kV circuit, L5C. This circuit is normally not supplying load station included in this region. It is a backup supply for the City of Cornwall. This circuit is not included in the scope of the St Lawrence regional planning.

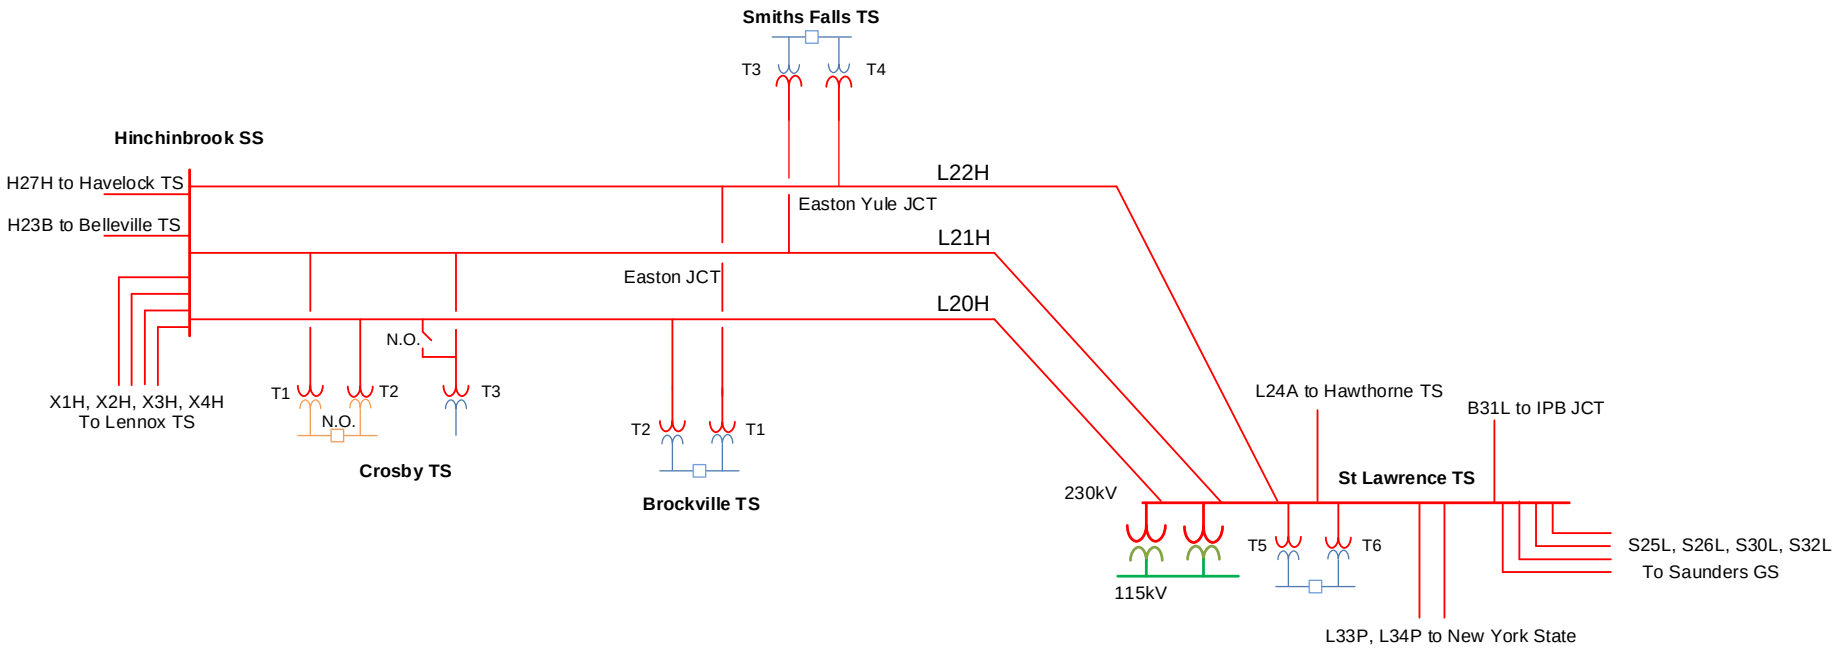

FIGURE 3-1: SINGLE LINE DIAGRAM OF THE ST LAWRENCE REGION 230KV TRANSMISSION NETWORK

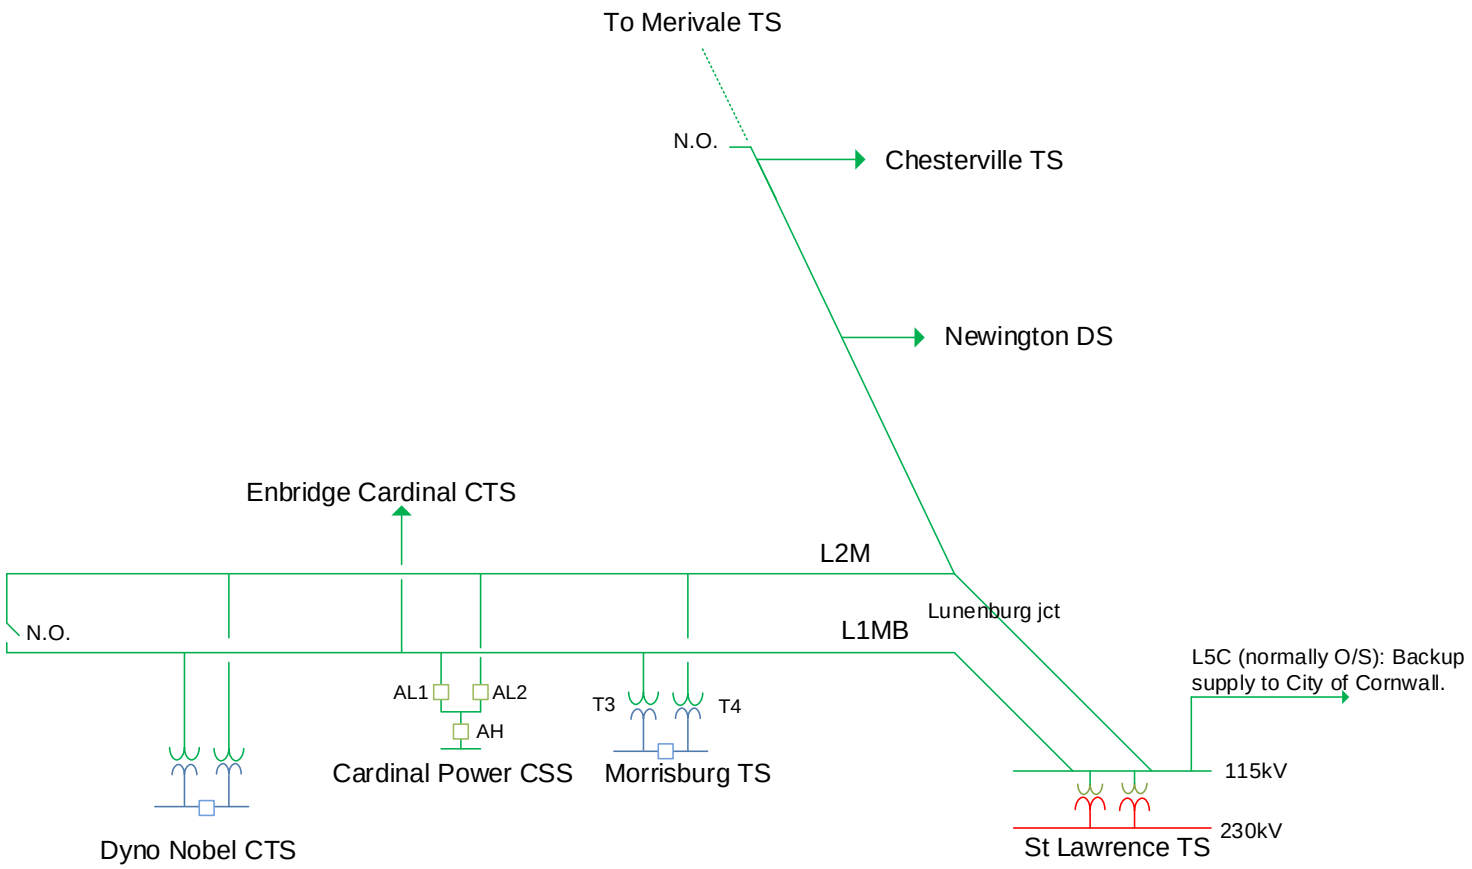

FIGURE 3-2: SINGLE LINE DIAGRAM OF THE ST LAWRENCE REGION 230KV TRANSMISSION NETWORK

4. TRANSMISSION FACILITIES/ PROJECTS COMPLETED AND/OR UNDERWAY OVER THE LAST TEN YEARS

OVER THE LAST TEN YEARS, A NUMBER OF TRANSMISSION PROJECTS HAVE BEEN PLANNED AND UNDERTAKEN BY HYDRO ONE AIMED TO MAINTAIN THE RELIABILITY AND ADEQUACY OF ELECTRICITY SUPPLY TO THE ST LAWRENCE REGION.

A summary and description of the major projects completed over the last 10 years is provided below:

- Chesterville TS (2014): Replaced 25/33/42 MVA, 115/44 kV step down transformers with new 25/33/42 MVA, 115/44 kV – replaced existing transformers with similar units to address asset condition.

A summary and description of the major transmission project currently underway is provided below. This project was initiated as a result of transformer failure and was agreed to by Hydro One, IESO, the New York Power Authority and New York Independent System Operator.

- St Lawrence Phase Shifting Transformers (2023) – replace failed phase shifting transformer PS33 and its companion PSR34. These transformers are used to regulate the power exchanged over the Ontario-New York interconnection at St Lawrence TS.

5. LOAD FORECAST AND STUDY ASSUMPTIONS

5.1. Load Forecast

The electricity demand in the St Lawrence Region is anticipated to grow by about 7.5% over the next ten years (2022-2032). Figure 5-1 shows the St Lawrence Region's planning load forecast (winter net, non-coincident extreme weather corrected peak) developed during this NA phase.

This load forecast, along with the summer forecast, was used to determine the loading that would be seen by transmission lines and autotransformer stations and to identify the need for additional line and auto-transformation capacity.

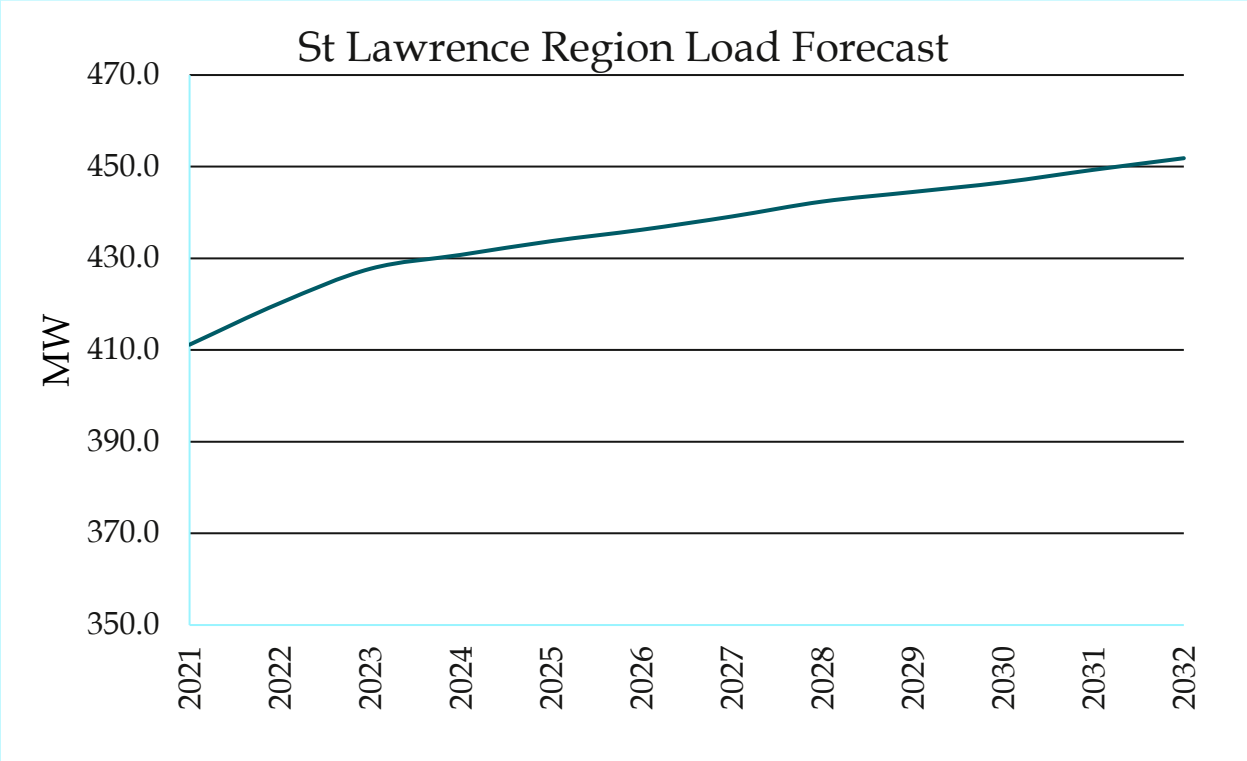

FIGURE 5-1: ST LAWRENCE REGION LOAD FORECAST

The regional-coincident load forecast represents the total peak load of the 7 step-down transformer stations in the St Lawrence Region. The Region's peak winter load is forecasted to increase from 420 MW in 2022 to 452 MW by 2032.

The load forecast for St Lawrence RIP is provided in Appendix D. The load forecast for this RIP was prepared by adjusting the actual 2019/2020 summer and winter peak loads applying an extreme weather correction factor and then applying growth rates derived from the LDCs' forecast. This forecast was further adjusted taking into account the impact of CDM and DGs

provided by the IESO. The forecasts shown in Appendix D show a reduction in DG output in the long term of the forecast. This is due to the uncertainty of DG contribution as contracts begin to expire. The forecast is showing the impact assuming the DG remains in operation or stop operation.

The Needs Assessment focuses on a 10 year period. However, a 20 year forecast was completed to review trends of the load over the long term.

Hydro One has also researched to find community energy plans in the region. No energy plans have been identified that would impact the assessment undertaken as part of this report. The TWG will monitor and take them into consideration as they are developed.

5.2. Study Assumptions

The following assumptions are made in the NA report.

- The study period is based assessments is 2021-2032.
- Station capacity adequacy is assessed by comparing the non-coincident peak load with the station's normal planning supply capacity, assuming a 90% lagging power factor for stations having no low-voltage capacitor banks and 95% lagging power factor for stations having low voltage capacitor banks. Normal planning supply capacity for transformer stations is determined by the summer 10-day Limited Time Rating (LTR).
- Generating station Saunders GS was assumed to generate at its average 98% of time dependable hydro generation level which is 467MW for winter and 511MW for summer.
- No power exchanges on the Ontario Eastern interconnections.
- Load forecast data was requested from industrial customers in the region. Where data was not provided, the load was assumed to be consistent with historical loads.
- The Region is winter peaking so this assessment is based on winter peak loads. However sensitivity analysis was also done using summer peak loads
- Adequacy assessment is conducted as per Ontario Resource Transmission Assessment Criteria (ORTAC).

6. ADEQUACY OF EXISTING FACILITIES

THIS SECTION REVIEWS THE ADEQUACY OF THE EXISTING TRANSMISSION AND TRANSFORMER STATION FACILITIES SUPPLYING THE ST LAWRENCE REGION OVER THE PLANNING PERIOD (2021-2032).

During this regional planning cycle, the Needs Assessments was completed for the St Lawrence Region. No needs requiring further coordinated regional planning were identified, therefore those findings are presented here.

6.1. 230 kV Transmission Facilities

The three 230 kV transmission circuits considered in the St Lawrence Region are classified as part of the Bulk Electricity System ("BES"). They connect the Region to the rest of the Ontario's transmission system through the Peterborough to Kingston Region. These circuits also serve local area stations within the Region and the power flow on them depends on the bulk system transfer as well as local area loads. These circuits are as follows (please refer to Figure 3-1):

a) St Lawrence TS to Hinchinbrook TS 230 kV circuits L20H, L21H, and L22H supplies Brockville TS, Crosby TS, and Smith Falls TS

The RIP review of the current load forecast shows that based on the forecasted station loadings, all the above three (3) 230 kV transmission lines are expected to be adequate over the study period under normal and N-1 supply condition.

As discussed in previously Section 3, St Lawrence TS is connected to Saunders generating station, to the State of New York through two IPLs, and to the Province of Quebec through circuit B31L (Beauharnois generating station). As a result of these connections, many operating scenarios and system conditions can influence the flows on circuits L20H, L21H, and L22H. These scenarios are evaluated under Bulk planning and are not part of the scope of the Needs Assessment. However, it should be noted that there is a generation rejection scheme in place that can runback Saunders GS and/or Beauharnois GS under post-contingency conditions. This scheme ensures that the St Lawrence to Hinchinbrook TS lines are not overloaded under peak summer conditions.

6.2. 230/115 kV Autotransformer Facilities

The 230/115 kV autotransformers at St Lawrence TS supplying the Region are within their ratings and are adequate to supply the forecasted load over the study period.

6.3. 115 kV Transmission Facilities

The St Lawrence Region contains two 115 kV circuits. These 115 kV circuits serve three transformer stations, two industrial customers, and connect a customer owned generating station. The 115kV circuits supplying the Region are adequate over the study period for the loss of a single 115kV circuit in the Region under the study assumptions of the Needs Assessment.

6.4. Step-Down Transformer Station Facilities

There are 7 step-down transformer stations within the St Lawrence Region. These stations are listed with the load forecast in Appendix D. There are also two transmission-connected industrial customer transformer stations.

The region is winter peaking. The stations winter and summer peak non-coincident load forecasts are given in Table D-1 and D-2 in Appendix D.

All the transformer stations in the region are forecasted to remain within their normal supply capacity during the study period. Capacity needs for these stations will be reviewed in the next regional planning cycle.

Depending on the load growth and the future decisions on contracts for distributed energy resources connected to the station, the capacity of some stations could reach their limit in the long term (10+ years). The TWG will continue to monitor the load growth at the stations and will re-evaluate the capacity during the next planning cycle.

6.5. System Reliability and Load Restoration

In case of contingencies on the transmission system, ORTAC provides the load restoration requirements relative to the amount of load affected. Planned system configuration must not exceed 600 MW of load curtailment/rejection. In all other cases, the following restoration times are provided for load to be restored for the outages caused by design contingencies.

- All loads must be restored within 8 hours.
- Load interrupted in excess of 150 MW must be restored within 4 hours.
- Load interrupted in excess of 250 MW must be restored within 30 minutes.

Based on the net load forecast, the loss of one element will not result in load interruption greater than 150MW. The maximum load interrupted by configuration due to the loss of two elements is below the load loss limit of 600MW by the end of the 10-year study period.

6.6. 115kV System

The distributed energy resources (DER) connected to the 115kV stations of the area and the 115kV generating station have resulted in the following, identified in the Cardinal Power G3 Expansion SIA/CIA [3, 4]:

a) Reverse Power Flow at Morrisburg TS and Dyno Nobel CTS

At Morrisburg TS, under light load condition with high output for DER and 115kV connected generation, a reverse power flow issue was identified. This situation occurs if one of the line breakers at Cardinal Power has an inadvertent opening (IBO). This IBO results in all of Cardinal Power's generation being sent to one line, which causes reverse power at Morrisburg TS beyond its maximum limit. Additional generation connection has been restricted at Morrisburg TS to manage the reverse power flow at the station.

Under the same conditions mentioned above, an IBO at Cardinal Power can also result in power flow through the Dyno Nobel CTS transformers to exceed their rating.

For Morrisburg TS and Dyno Nobel CTS transformer loading issues, Cardinal Power run back scheme is triggered to reduce the flows to within equipment ratings as it was outlined in the SIA and CIA [3, 4]. No further action is recommended within the scope of this regional planning.

b) L2M/L1MB

Under light load condition and with all distributed generation in the area and the Cardinal Power generation at maximum output the section of the L1MB/L2M line between St Lawrence to Lunenburg JCT can be loaded beyond its short time emergency (STE) rating for loss of either circuit [3,4].

To manage the situation, Morrisburg TS has been restricted to accept new generation connection. In addition, there is Cardinal Power's runback scheme which will reduce the plant output following the loss of either circuit and hence reduce the post-contingency loading on either of the L1MB/L2M lines. However, since the lines could be loaded beyond their STE, measures such generation re-dispatch is implemented by the IESO as per the Cardinal Power G3 Expansion studies [3, 4].

6.7. Other Needs Identified during Regional Planning

6.7.1. Asset Renewal for 230 kV circuit L22H

Hydro One identified the need for refurbishment of 230kV circuit L22H between Easton JCT and Hinchinbrooke North JCT within the 10-year planning horizon. The need is based on asset condition assessment. In general, asset condition assessment is based on a range of considerations such as equipment deterioration due to aging infrastructure and other factors; technical obsolescence due to outdated design; lack of spare parts availability or manufacturer support; and/or potential health and safety hazards.

Asset renewal work for L22H is summarized in Table 6-1 below.

TABLE 6-1: ST LAWRENCE REGION – PLANNED ASSET REPLACEMENT WORK

Stations / Lines Project	Details	Timeframe
Circuit L22H	A total of 65 km of 230 kV circuit L22H between Easton JCT X Hinchinbrook North JCT has been identified for refurbishment. The work includes the replacement of conductors, shieldwire, insulators and refurbishment of lattice steel structures.	2026

No other major high-voltage transmission equipment in the St Lawrence region has been identified for replacement at this time.

7. REGIONAL NEEDS AND PLANS

THIS SECTION DISCUSSES ELECTRICAL INFRASTRUCTURE NEEDS IN THE ST LAWRENCE REGION IDENTIFIED IN THE PREVIOUS REGIONAL PLANNING CYCLE, THE NEEDS ASSESSMENT REPORT FOR THIS CYCLE; AND SUMMARIZES THE PLANS DEVELOPED TO ADDRESS THESE NEEDS.

7.1. Asset Renewal for 230 kV circuit

7.1.1. Description

As indicated in Section 6.1, L22H is expected to be adequate over the study period under normal and N-1 contingency conditions, including the section planned for refurbishment.

A total of 65 km of 230 kV circuit L22H between Easton JCT X Hinchinbrook North JCT requires refurbishment. The work includes the replacement of conductors, shieldwire, insulators and refurbishment of lattice steel structures.

The TWG recommends that refurbishment of L22H between Easton JCT X Hinchinbrook North JCT does not require further regional coordination. The implementation and execution plan for this need will be coordinated by Hydro One and affected LDCs. However, as part of IESO-led Bulk Planning Studies, IESO and Hydro One will work together to determine if conductor upgrade is required for the line section in the L22H refurbishment plan.

7.2. Needs Identified in Previous Cycle

7.2.1. Delivery Point Performance at Chesterville TS

The past Needs Assessment had identified that the target delivery point performance had been missed due to momentary outages (due to severe weather patterns). Hydro One was to review the delivery point performance of the station to determine if corrective actions were required. From the review of performance of the delivery point, no corrective actions were identified. Hydro One will continue to monitor the delivery point.

8. CONCLUSIONS AND NEXT STEPS

THIS REGIONAL INFRASTRUCTURE PLAN CONCLUDES THE REGIONAL PLANNING PROCESS FOR THE ST. LAWRENCE REGION.

The major infrastructure investments recommended by the TWG in the near and mid-term planning horizon are provided in Table 8-1 below.

TABLE 8-1: RECOMMENDED PLANS IN ST. LAWRENCE REGION OVER THE NEXT 10 YEARS

Stations / Lines Project	Details	Timeframe
L22H	Refurbishment of 65 km of the circuit between Easton JCT X Hinchinbrook North JCT	2026

The TWG recommends that:

- Hydro One and LDCs to continue with the implementation of infrastructure investments listed in Table 8-1 above while keeping the TWG apprised of project status;
- No other needs have been identified and further assessment of the St. Lawrence region will be undertaken by the TWG in the next regional planning cycle.

14. APPENDIX E. LIST OF ACRONYMS

Acronym	Description
A	Ampere
BES	Bulk Electric System
BPS	Bulk Power System
CDM	Conservation and Demand Management
CIA	Customer Impact Assessment
CGS	Customer Generating Station
CSS	Customer Switching Station
CTS	Customer Transformer Station
DESN	Dual Element Spot Network
DG	Distributed Generation
DSC	Distribution System Code
GATR	Guelph Area Transmission Reinforcement
GS	Generating Station
HV	High Voltage
IESO	Independent Electricity System Operator
IRRP	Integrated Regional Resource Plan
kV	Kilovolt
LDC	Local Distribution Company
LP	Local Plan
LTE	Long Term Emergency
LTR	Limited Time Rating
LV	Low Voltage
MTS	Municipal Transformer Station
MW	Megawatt
MVA	Mega Volt-Ampere
MVAR	Mega Volt-Ampere Reactive
NA	Needs Assessment
NERC	North American Electric Reliability Corporation
NGS	Nuclear Generating Station
NPCC	Northeast Power Coordinating Council Inc.
OEB	Ontario Energy Board
ORTAC	Ontario Resource and Transmission Assessment Criteria
PF	Power Factor
PPWG	Planning Process Working Group
RIP	Regional Infrastructure Plan
SA	Scoping Assessment
SIA	System Impact Assessment
SPS	Special Protection Scheme
SS	Switching Station
TS	Transformer Station
TSC	Transmission System Code

NEEDS ASSESSMENT REPORT

St. Lawrence

Date: March 30, 2026

Needs Assessment Report

St. Lawrence

Date: March 30, 2026

Lead Transmitter:

Hydro One Networks Inc.

Prepared by: St. Lawrence Technical Working Group

Page intentionally left blank.

Disclaimer

This Needs Assessment (NA) Report was prepared for the purpose of identifying potential needs in the St. Lawrence and to recommend which needs a) do not require further regional coordination and can be directly addressed by developing a preferred plan as part of the NA phase and b) require further assessment and regional coordination. The results reported in this NA are based on the input and information provided by the Technical Working Group (TWG) for this region at the time. Updates may be made based on the best available information throughout the planning process.

The TWG participants, their respective affiliated organizations, and Hydro One Networks Inc. (collectively, "the Authors") shall not, under any circumstances whatsoever, be liable to each other, to any third party for whom the Needs Assessment Report was prepared ("the Intended Third Parties") or to any other third party reading or receiving the Needs Assessment Report ("the Other Third Parties"). The Authors, Intended Third Parties and Other Third Parties acknowledge and agree that: (a) the Authors make no representations or warranties (express, implied, statutory or otherwise) as to this document or its contents, including, without limitation, the accuracy or completeness of the information therein; (b) the Authors, Intended Third Parties and Other Third Parties and their respective employees, directors and agents (the "Representatives") shall be responsible for their respective use of the document and any conclusions derived from its contents; (c) and the Authors will not be liable for any damages resulting from or in any way related to the reliance on, acceptance or use of the document or its contents by the Authors, Intended Third Parties or Other Third Parties or their respective Representatives.

Executive Summary

REGION St. Lawrence Region (the "Region")

LEAD Hydro One Networks Inc. ("HONI")

START DATE: January 30, 2026 **END DATE:** March 30, 2026

The second Regional Planning cycle for the St. Lawrence Region was completed in March 2022 with the publication of the Regional Infrastructure Plan ("RIP") report (RIP Report).

In accordance with the Regional Planning process, the Regional Planning cycle should be triggered at least once every five years. Considering these timelines, the third Regional Planning cycle was triggered in December 2025 for this Region. The planning horizon for this Needs Assessment ("NA") is ten years. The NA for the St. Lawrence Region was advanced to align with high growing electricity demand in the region. A 20-year planning assessment is undertaken in the next phases of regional planning, i.e., IRRP and RIP phases.

The purpose and scope of the NA is to:

a) Identify any new needs and reaffirm needs identified in the previous regional planning cycle; and,
b) Recommend which needs:
   i) require further assessment and regional coordination to develop a preferred plan (and hence, proceed to the next phases of regional planning); and,
   ii) do not require further regional coordination (i.e., can be addressed directly between Hydro One and the impacted LDC(s) to develop a preferred plan and/or no regional investment is required at this time and the need may be reviewed during the next regional planning cycle).

The Technical Working Group (TWG) comprises of representatives from Local Distribution Companies ("LDC"), the Independent Electricity System Operator ("IESO"), and Hydro One Transmission. They provide input and relevant information for the region and undertake a technical assessment to identify the electrical infrastructure needs in the region. They collaborate to develop both summer and winter gross and net peak electricity demand forecasts (including input from municipalities), which form the basis for the technical assessment. The following are key considerations of the technical assessment:

a) Current and future station capacity and transmission adequacy.
b) System reliability needs and operational concerns.
c) Major HV transmission equipment requiring replacement with consideration to "right-sizing"; and,
d) Sensitivity analysis to capture uncertainty in the load forecast as well as variability of demand drivers such as electrification.

In this Needs Assessment, TWG has identified the following regional needs and recommendations:

Table 1: Needs that Do Not Require Further Regional Coordination

	Need Location	Need Description
Asset Renewal Needs		
1	St. Lawrence TS	115kV Breaker Replacement
2	Brockville TS	T1/T2 renewal based on asset condition assessment
System Reliability and Operation Needs		
1	Brockville TS	Installation of new LV Capacitor bank to mitigate the voltage issues on 44 kV bus

Table 2: Needs that Require Further Regional Coordination

	Need Location	Need Description
Station Capacity Needs		
1	Chesterville TS T1/T2	Projected to reach capacity in 2035 under normal growth and in 2033 under High growth scenario
2	Brockville TS T1/T2	Projected to reach capacity in 2032 under High Growth Scenario
Transmission Capacity Needs		
1	L2M	Projected to reach capacity in summer 2034, and in 2031 under Summer High Growth Scenario for the loss of L1MB
2	LxH	Under certain generation patterns and dispatch scenarios, some sections of the circuit may result in overloads based on existing loading condition.
System Reliability and Operation Needs		
1	Voltage on L2M	Voltage issues identified for High Growth Scenarios under L1MB contingency in mid-term.
2	L20H/L22H	Load Restoration
3	L2M/L1MB	Load Restoration

List of LDC(s) to be involved in further regional planning phases:

- Hydro One Distribution
- Cooperative Hydro Embrun Inc.
- Rideau St. Lawrence Distribution Inc.

List of LDC(s) which are not required to be involved in further regional planning phases:

- None

1. INTRODUCTION

The second cycle of the Regional Planning process for the St. Lawrence Region was completed March 2022 with the publication of the Regional Infrastructure Plan ("RIP") Report (RIP Report). The RIP report included a common discussion of all the options and recommended plans for preferred wire infrastructure investments to address the near- and medium-term needs.

This Needs Assessment initiates the third regional planning cycle for the St. Lawrence Region. The purpose of this Needs Assessment ("NA") is to:

a) Identify any new needs and reaffirm needs identified in the previous regional planning cycle; and,
b) Recommend which needs:
   i) require further assessment and regional coordination to develop a preferred plan (and hence, proceed to the next phases of regional planning); and,
   ii) do not require further regional coordination (i.e., can be addressed directly between Hydro One and the impacted LDC(s) to develop a preferred plan and/or no regional investment is required at this time and the need may be reviewed during the next regional planning cycle).

The planning horizon for this NA assessment is ten years. A flow chart of the Regional Planning Process is shown in Figure 1 below.

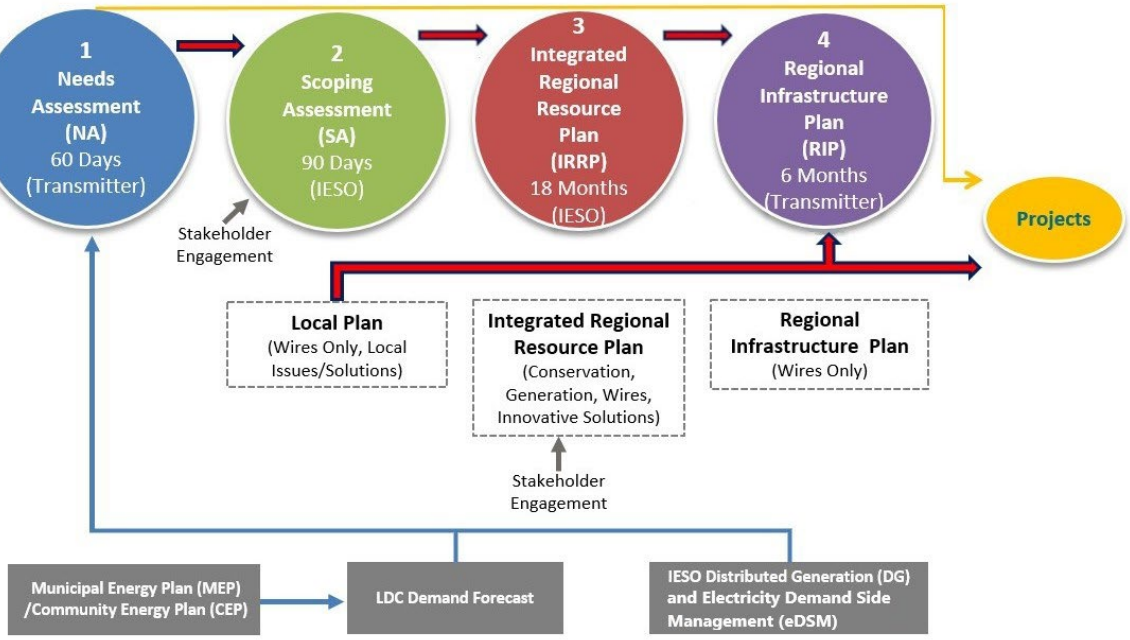

Figure 1: Regional Planning Process

This report was prepared by the St. Lawrence Technical Working Group("TWG"), led by Hydro One Networks Inc. The report presents the results of the assessment based on information provided by Hydro One, the Local Distribution Companies ("LDC") and the Independent Electricity System Operator ("IESO"). Participants of the TWG are listed below in Table 1.

Table 3: St. Lawrence Region TWG Participants

Sr. no.	Name of TWG Participants
1	Hydro One Networks Inc. (Lead Transmitter)
2	Independent Electricity System Operator (IESO)
3	Hydro One Networks Inc. (Hydro One Dx)
4	Cooperative Hydro Embrun Inc. (embedded to Hydro One Dx)
5	Rideau St. Lawrence Distribution Inc. (embedded to Hydro One Dx)

2. REGIONAL ISSUE/TRIGGER

In accordance with the Regional Planning process, the Regional Planning cycle should be triggered at least once every five years. The NA for the St. Lawrence Region was advanced to align with high growing electricity demand in the region

3. SCOPE OF NEEDS ASSESSMENT

The scope of this NA covers the St. Lawrence region and includes:

- Review and reaffirm needs/plans identified in the previous cycle RIP (as applicable),
- Identify any new needs resulting from this assessment,
- Recommend which need(s) require further assessment and regional coordination in the next phases of the regional planning cycle to develop a preferred plan; and,
- Recommend which needs do not require further regional coordination (i.e., can be addressed directly between Hydro One and the impacted LDC(s) to develop a preferred plan and/or no regional investment is required at this time and the need may be reviewed during the next regional planning cycle).

The Technical Working Group TWG may also identify additional needs during the next phases of the planning process, namely Scoping Assessment ("SA"), Integrated Regional Resource Plan ("IRRP"), Local plan (LP) and RIP, based on updated information available at that time.

The planning horizon for this NA assessment is 10 years.

4. REGIONAL DESCRIPTION AND CONNECTION CONFIGURATION

The St. Lawrence Region covers the southeastern part of Ontario bordering the St. Lawrence River. The region starts east of Gananoque and extends to the inter-provincial boundary with Quebec in the East. The western part of the region is supplied by Hydro One owned stations connected to the 230 kV network. The remainder of the region is supplied from Hydro One stations connected to the 115kV network except for St. Lawrence TS, which is supplied from 230kV.

The City of Cornwall is supplied by Fortis Ontario with transmission lines from Quebec and is not included in this Region. The geographical boundaries of the St. Lawrence region are shown in Figure 2 below.

Note : Map shows the approximate location for regional planning.

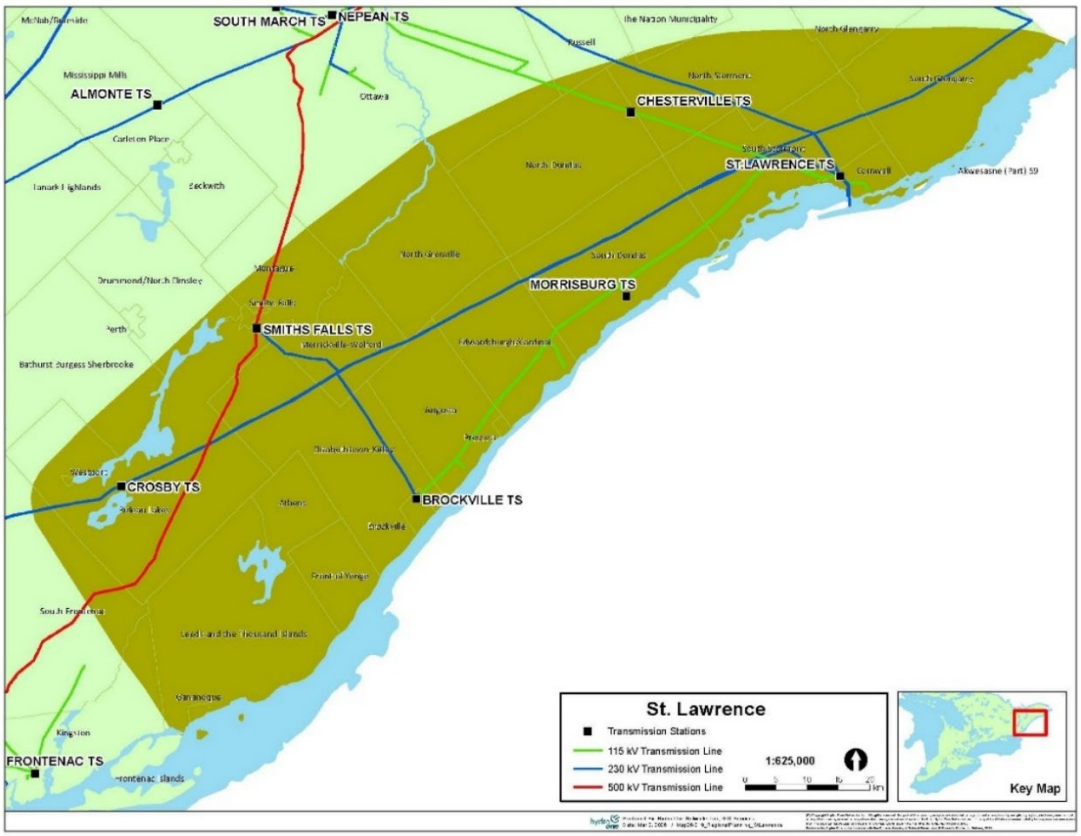

Figure 2: Map of St. Lawrence Regional Planning Area

Electrical supply for this region is provided through a network of 230kV and 115kV transmission circuits. The major source of supply for this region is OPG's Saunders Hydro Electric station which connects to St. Lawrence TS 230kV yard.

The St. Lawrence Region is connected to the Greater Ottawa Region through 230kV circuits L24A and B31L. Circuit B31L also provides an interconnection between the Provinces of Ontario and Quebec. In addition, 115kV circuit L2M also connects St. Lawrence to the Greater Ottawa Region, however this connection is normally open and is only used for load transfers between the two areas in case of system need. The Region is also connected to the Peterborough to Kingston Region through 230kV circuits L20H, L21H, and L22H.

The existing facilities in the Region are summarized below and depicted in the single line diagram shown in Figure 2 and 3.

- St. Lawrence TS is the major transmission station for the region and connects to the main source of supply for the area, Saunders GS via four 230kV circuits. Also connecting to the 230kV yard of the station are two International Power Lines (IPL). These IPLs connect Ontario to the State of New York and power exchange across the IPLs are regulated using two phase shifting transformers. The station also has two 230kV/115kV 250MVA autotransformers to connect the 230kV and 115kV networks.

- Seven step-down transformer stations supply the St. Lawrence Area load. At 230kV: Brockville TS, Crosby TS, Smith Falls TS, and St. Lawrence TS. At 115kV: Chesterville TS, Morrisburg TS, and Newington DS.

- Two Customer Transformer Stations (CTS) are supplied in the Region from the 115kV network: CTS-1 and CTS-2 .

- Another source of supply to the area is an existing transmission connected generating station, CGS-1 with maximum output 134MW (summer) and 184MW (winter).

The circuits and stations of the area are summarized in Table 2 below:

Table 4: Transmission Station and Circuits in the St. Lawrence Region

115kV circuits	230kV circuits	Hydro One Transformer Stations	Generation Stations
L1MB, L2M, L5C[1]	L20H, L21H, L22H, L24A[2], B31L[2], L33P[3], L34P[3]	Brockville TS, Chesterville TS, Crosby TS, Morrisburg TS, Newington DS, Smith Falls TS, St. Lawrence TS*, CTS-1, CTS-2	Saunders GS (1056 MW) CGS-1 (184 MW)

*Stations with Autotransformers installed

[1]L5C is normally o/s and used as a backup supply for the City of Cornwall.

[2]L24A and B31L connect to St. Lawrence TS but do not have load customers connection.

[3]IPLs circuits.

The single line diagram of the 230kV Transmission Network of St. Lawrence region is shown in Figure 3 below.

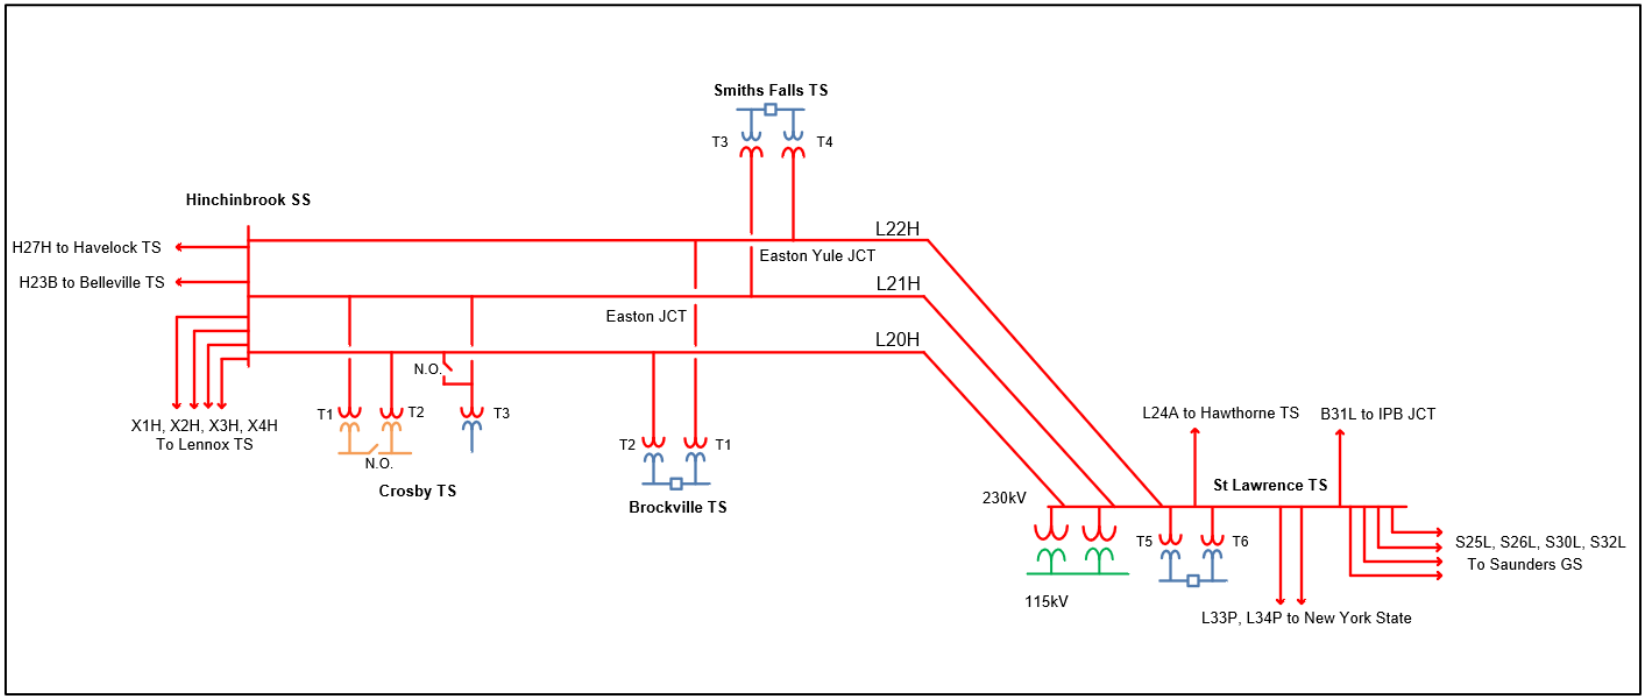

Figure 3: St. Lawrence 230kV Transmission Single Line Diagram

The single line diagram of the 115kV Transmission Network of St. Lawrence region is shown in Figure 4 below.

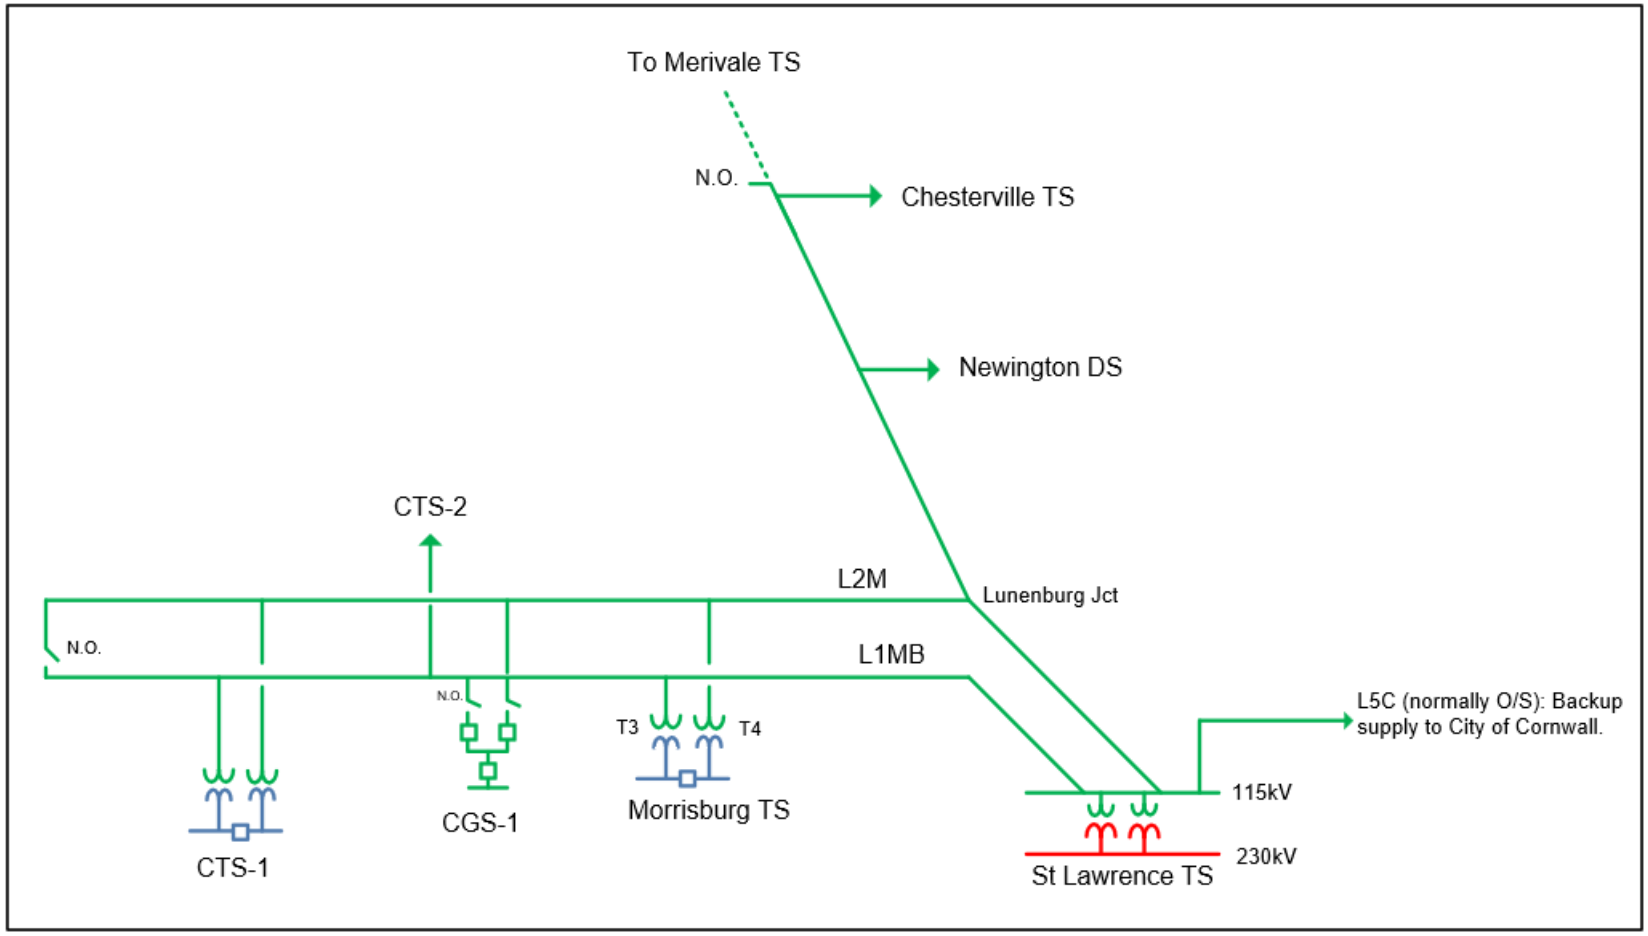

Figure 4: St. Lawrence 115kV Transmission Single Line Diagram

5. INPUTS AND DATA

TWG participants, including representatives from LDCs, IESO, and Hydro One provided information and input for the St. Lawrence NA. With respect to the load forecast information, the OEB Regional Planning Process Advisory Group (RPPAG) recently published a document called "Load Forecast Guideline for Ontario" in Oct. 2022. The objective of this document is to provide guidance to the TWG in the development of the load forecasts used in the various phases of the regional planning process with a focus on the NA and the IRRP. One of the inputs into the LDC's load forecast that is called for in this guideline is information from Municipal Energy Plans (MEP) and/or Community Energy Plans (CEP). The list of all the Municipalities falling under the geographical boundaries of the region are given in Appendix-C.

The information provided includes the following:

- St. Lawrence 10-year summer and winter Load Forecasts for all supply stations inclusive of the inputs provided by the municipalities. Some municipalities in the region have informed us that their formal input will be provided before the end of March 2026. This information will be considered in the next phases of regional planning, i.e IRRP and RIP.

The TWG has made some assumptions and undertaken sensitivity analysis to capture uncertainties via different growth scenarios.

- Known capacity and reliability need, operating issues, and/or major assets requiring replacement/ refurbishment; and
- Planned/foreseen transmission and distribution investments that are relevant to Regional Planning for the St. Lawrence.
- Captured uncertainty in the load forecast as well as variability of electric demand drivers to identify any emerging needs and/or advancement or deferment of recommended investments.

6. ASSESSMENT METHODOLOGY

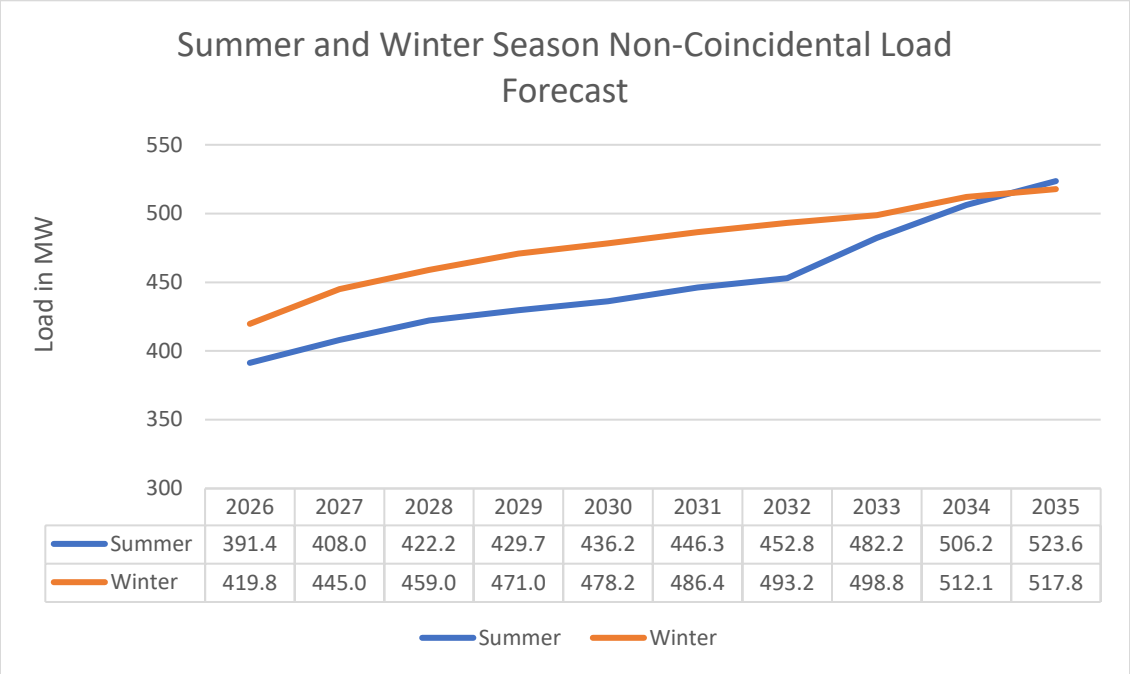
The following methodology and assumptions are made in development of this Needs Assessment:

6.1 Technical Assessments and Study Assumptions

The technical assessment of needs was undertaken based on:

- Current and future station capacity and transmission adequacy.
- System reliability and operational considerations.

- Asset renewal for major high voltage transmission equipment requiring replacement with consideration to "right-sizing"; and,
- Load forecast data was requested from industrial customers in the region, and
- This assessment is based on summer and winter peak loads. Three load forecasts were developed per season, i.e. Normal Growth scenario, High and Low Growth scenarios. The High and Low Growth scenarios were developed to conduct a sensitivity analysis to cover unforeseen developments such as fuel switching, Government policies, higher than expected EV charging trend during peak load conditions, etc.



The following other assumptions are made in this report.

- The study period for this Needs Assessment is 2026-2035.
- The Region is winter-peaking, with a projected shift toward summer peaking toward the end of the study period; therefore, this assessment considers both winter and summer peak loads.
- Line capacity adequacy is assessed by using non-coincidental peak loads in the area.
- Station capacity adequacy is assessed by comparing the non-coincident peak load with the station's normal planning supply capacity, assuming a 90% lagging power factor for stations having no low-voltage capacitor banks and 95% lagging power factor for stations having low-voltage capacitor banks.
- Normal planning supply capacity for transformer stations is determined by the Hydro One summer 10-Day Limited Time Rating (LTR) of a single transformer at that station.
- Load forecast data was requested from industrial customers in the region. Where data was not provided, the load was assumed to be consistent with historical loads.
- Saunders Generating Station was assumed to generate at 750MW for winter and 840MW for summer.
- No import from New York at the St. Lawrence interconnection.
- No import from Quebec from Beauharnois interconnection.
- System studies and reported results are based on N-1 (single contingency) conditions, meaning the system is assessed to remain within applicable thermal, voltage, and stability limits following the loss of any one credible transmission element , with the system otherwise in the base configuration.
- CGS-1 is assumed to remain in service until its planned retirement at the end of 2034. Accordingly, it is treated as available for dispatch throughout the study period. System performance was evaluated with CGS-1 both fully dispatched and offline to establish local area limits and to assess the sensitivity of these limits to the generator's availability.
- For the purpose of this study, the Skyview BESS is assumed to discharge during peak demand hours and charge during off-peak hours. The BESS is also assumed to provide VAR support as required.
- Adequacy assessment is conducted as per Ontario Resource Transmission Assessment Criteria (ORTAC).

6.2 Information Gathering Process

6.2.1 Load forecast:

The LDCs provided their load forecasts for summer and winter for all the stations supplying their loads in the St. Lawrence region for the 10-year study period including the inputs from the Municipalities such as MEPs and CEPs. The IESO provided an Electricity Demand Side Management ("eDSM"), and Distributed Generation ("DG") forecast for the St. Lawrence region. The region's extreme summer/winter non-coincident peak gross load forecasts for each station were prepared by applying the LDC load forecast growth rates to the actual historical summer/winter peak extreme weather corrected loads. The extreme summer/winter weather correction factors were provided by Hydro One. The net extreme summer weather load forecasts were produced by reducing the gross load forecasts for each station by the percentage eDSM and then by the amount of effective DG capacity provided by the IESO for that station. It is to be noted that as contracts for existing DG resources in the region begin to expire, at which point the load forecast has a decreasing contribution from local DG resources, and an increase in net demand. This extreme summer/winter weather corrected net load forecast for the individual stations in the St. Lawrence region is given in Appendix A. The graphical representation of the regional net non-coincidental load growth for both summer and winter season over the study period is shown in Figure 5 below.

	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035
Summer	391.4	408.0	422.2	429.7	436.2	446.3	452.8	482.2	506.2	523.6
Winter	419.8	445.0	459.0	471.0	478.2	486.4	493.2	498.8	512.1	517.8

Figure 5: St. Lawrence Region net Summer and Winter season Non-Coincidental Load

6.2.2 Sensitivity Analysis:

A sensitivity analysis was undertaken by the TWG to capture uncertainty in the load forecast as well as variability of drivers such as electrification. Hence, the NA recommendations are not necessarily linked

to sensitivity scenarios; but rather are used to identify any emerging needs for consideration in developing recommendations. The impact of sensitivity analysis for the high and low growth scenarios is provided in section 8 of this report.

6.2.3 Asset Renewal Needs for Major HV Equipment:

List of major HV transmission equipment planned and/or identified to be refurbished and/or replaced based on asset condition assessment, relevant for Regional Planning purposes. This includes HV transformers, autotransformers, HV Breakers, HV underground cables and overhead lines. The scope of equipment considered is given in section 7.1.

6.2.4 System Reliability, Operational and Load Restoration Issues:

In case of contingencies on the transmission system, ORTAC provides the load restoration requirements relative to the amount of load affected. Planned system configuration must not exceed 600 MW of load curtailment/rejection. In all other cases, the following restoration times are provided for load to be restored for the outages caused by design contingencies.

- All loads must be restored within 8 hours.
- Load interrupted in excess of 150 MW must be restored within 4 hours.
- Load interrupted in excess of 250 MW must be restored within 30 minutes.

Based on the net load forecast, the loss of one element will not result in load interruption greater than 150MW. The maximum load interrupted by configuration due to the loss of two elements is below the load loss limit of 600MW by the end of the 10-year study period.

IESO will perform more detailed study to identify system reliability and operational issues in the region during next phases of regional planning.

The needs identified during this NA are discussed in section 7.4.

7. NEEDS

This section describes emerging new needs identified in the St. Lawrence Region and/or updates on previously identified needs since the completion of Previous Regional Planning cycle.

Needs that were identified in the previous regional planning cycle with associated projects that were recently completed and reaffirmed needs that are underway are briefly described below with relevant updates and will not be discussed further in this report.

1. St. Lawrence Phase Shifting Transformers – Replaced failed phase shifting transformer PS33 and its companion PSR34. This work was completed in 2023.
2. Chesterville TS Delivery Point Performance – Chesterville TS has returned to its expected performance and is no longer delivery point outlier.

3. Circuit L22H – A total of 65 km of 230 kV circuit L22H between Easton JCT X Hinchinbrook North JCT is planned for refurbishment. As per the latest condition assessment, this circuit is considered for refurbishment in long term.

Note: The planned in-service year for the above projects is tentative and is subject to change.

All near and mid-term needs that are discussed as a part of this report are summarized in Table 5 below.

Table 5: Near/Mid-term Needs Identified in this NA and/or Updated from Previous RIP

Need Location	Need Description/Update	NA Report Section
Asset Renewal Needs		
St. Lawrence TS	115kV breakers renewal based on asset condition	7.1.1
Brockville TS	T1/T2 transformers renewal based on asset condition	7.1.2
Station Capacity Needs		
Chesterville TS T1/T2	Projected to reach capacity in 2035 under normal growth and in 2033 under summer High growth scenario	7.2.1
Brockville TS T1/T2	Projected to reach capacity in 2032 under High Growth Scenario	7.2.2
Transmission Line Capacity Needs		
L2M	Projected to reach capacity in summer 2034 and, under Summer High growth scenario in 2031	7.3.1
LxH Circuits	No Capacity need identified for 230 kV LxH lines with NA assumptions . However, they are near their loading limits and will be studied further in next phases of regional planning cycle.	7.3.2
System Reliability and Operation Needs		
Brockville TS	Install LV Capacitor bank	7.4.1
115 kV L2M – Voltage performance	Voltage issues identified for High Growth Scenarios under L1MB contingency in mid-term.	7.4.2
L20H/L22H	Load Restoration	7.4.3
L2M/L1MB	Load Restoration	7.4.4

7.1 Asset Renewal Needs for Major HV Transmission Equipment

In addition to the previously identified asset renewal needs from the second regional planning cycle, Hydro One and the TWG identified new asset renewal needs for major HV transmission equipment over the next 10 years in the St. Lawrence Region. They are listed in Table 6 below. Hydro One is the only Transmission Asset Owner (TAO) in the Region.

Asset renewal needs are determined by asset condition assessment. Asset condition assessment is based on a range of considerations such as:

- Equipment deterioration due to aging infrastructure or other factors,
- Technical obsolescence due to outdated design,
- Lack of spare parts availability or manufacturer support, and/or
- Potential health and safety hazards, etc.

The major high voltage equipment information shared and discussed as part of this process is listed below:

- 230/115kV autotransformers
- 230 and 115kV load serving step down transformers
- 230 and 115kV breakers where:
  replacement of six breakers or more than 50% of station breakers, the lesser of the two
- 230 and 115kV transmission lines requiring refurbishment where:
  Leave to Construct (i.e., section 92) approval is required for any alternative to like-for-like
- 230 and 115kV underground cable requiring replacement where:

Leave to Construct (i.e., section 92) approval is required for any alternative to like-for-like

The asset renewal assessment considers the following options for “right sizing” the equipment:

- Maintaining the status quo
- Replacing equipment with similar equipment with lower ratings and built to current standards
- Replacing equipment with similar equipment with *lower* ratings and built to current standards by transferring some load to other existing facilities
- Eliminating equipment by transferring all the load to other existing facilities
- Replacing equipment with similar equipment and built to current standards (i.e., “like-for-like” replacement)
- Replacing equipment with higher ratings and built to current standards

TWG is recommending that Hydro One as a facility owner and operator of its transmission equipment, should plan to refurbish or replace aging major HV equipment and doing nothing is generally not an option due to safety and reliability risk of equipment failure. This also results in increased maintenance costs and longer duration of customer outages.

Table 6: Major HV Transmission Assets Requiring Replacement in St. Lawrence Region in next 10 years

Station/Circuit	Need Description	Planned ISD
St. Lawrence TS	115 kV breaker replacement based on asset condition	2034
Brockville TS T1/T2	T1/T2 transformers renewal based on asset condition	2034

7.1.1 115 kV Breakers – St. Lawrence TS

St. Lawrence TS is an important transformer stations within Hydro One's network. Located approximately 5 km northwest of Cornwall, it serves as an important node on Hydro One's 230-kV grid system, and the main supply to the 115kV system of the region through its autotransformers.

Based on asset condition assessments, the existing five (5) 115 kV oil-filled circuit breakers at St. Lawrence TS have been identified for renewal. To address this asset renewal need and maintain system reliability, Hydro One plans to replace the existing units with new SF_6 circuit breakers, along with any associated protection and control updates. The estimated in-service date for the replacement is Q4 2034.

7.1.2 Brockville TS (T1/T2)

The existing transformers 125 MVA 215.5/44 kV T1 and T2 were commissioned in 1975 and based on asset condition assessment, they are identified for replacement with like-for-like units as this is the highest rating available with a planned in-service date in 2034.

However, the station will be exceeding its LTR under summer high growth scenario in 2032 which is further discussed in section 7.2.2.

7.2 Station Capacity Needs

A Station Capacity assessment was performed over the study period **2026-2035** for the 230kV and 115kV transformer stations in the St. Lawrence Region using either the summer or winter peak load forecasts that were developed with input from the TWG. Based on the results, the following station capacity needs have been identified during the study period:

7.2.1 Chesterville TS (T1/T2)

Chesterville TS is located in the northern part of the St Lawrence region and is supplied from the 115 kV L2M circuit . The station provides load supply to Hydro One Distribution and the embedded Cooperative Hydro Embrun through two 42 MVA, 115.5/44 kV transformers T1 and T2.

According to the load forecast, Chesterville TS is expected to exceed its summer LTR by approximately 1 MW in 2035, while winter loading remains within LTR limits throughout the study period. Under the high-growth scenario, the projected summer needs date advances to 2033. Given that this capacity

need occurs near the end of the study horizon and under the high-growth scenario, the Technical Working Group (TWG) recommends continued monitoring of the load and revisiting this capacity need in the next phase of regional planning cycle.

7.2.2 Brockville TS (T1/T2)

Brockville TS is located within the City of Brockville and is supplied by the 230 kV L20H and L22H transmission circuits. The station provides load supply to Hydro One Distribution and the embedded Rideau St. Lawrence Distribution service area through two 125 MVA, 215.5/44 kV transformers T1 and T2. Based on asset-condition assessments, both transformers have been identified for replacement by 2034, as outlined in Section 7.1.2.

Sensitivity analysis indicates that, under the high-growth forecast, Brockville TS is expected to exceed its summer LTR by approximately 2 MW and its winter LTR by approximately 2.5 MW in 2032.

The development of an appropriate solution to address this emerging capacity need will be further assessed through the next phase of the regional planning cycle.

7.3 Transmission Lines Capacity Needs

All line and equipment loads shall be within their continuous ratings with all elements in service and within their long-term emergency ratings with any one element out of service. Immediately following contingencies, lines may be loaded up to their short-term emergency ratings where control actions such as re-dispatch, switching, etc. are available to reduce the loading to the long-term emergency ratings. A Transmission Lines Capacity Assessment was performed over the study period **2026-2035** for the 230kV and 115kV Transmission line circuits in the St. Lawrence Region by assessing thermal limits of the circuit and the voltage range as per ORTAC to cater this need. This section summarizes the findings from the analysis.

7.3.1 115 kV System Adequacy

The 115 kV system in the St. Lawrence planning region is supplied by two long transmission circuits, L2M and L1MB, which together form the backbone of supply to the area. The L2M circuit is a 167 km, 115 kV line extending from Merivale TS to St. Lawrence TS with a normally open disconnect switch at Chesterville TS that separates the Greater Ottawa and St Lawrence Regions. The St. Lawrence section of L2M is approximately 118 km supplying two sectors: northwest and southwest of St Lawrence TS. This southern sector supplies multiple downstream stations in a radial configuration including Morrisburg TS, CTS-1, CTS-2, and CGS-1. The northern sector supplies radially Chesterville TS and Newington DS. The second primary supply circuit, L1MB, is approximately 90 km in length and runs from St. Lawrence TS to CTS-1, providing supply to Morrisburg TS, CGS-1, CTS-1, and CTS-2. The long radial nature of both circuits makes voltage performance and reactive support key considerations when evaluating system adequacy, especially under higher loading conditions or reduced local generation.

The southern section of 115kV circuits described above runs parallel to Highway 401 from Cornwall to Brockville and has gathered interest due to their strategic location for new connection requests. As part of this Needs Assessment study, the capability of the system was reviewed. This section provides details on the capacity and possible options to further extend the system's capability to serve new loads.

The following scenarios evaluate system adequacy under different operating conditions, with and without generation from CGS1. The additional load capability values presented are scenario-based as the studies were done using N-1 contingency scenario. The next phases will include additional outage/contingency analysis beyond what was assessed here and may further limit the system's ability to supply additional load. The results shown are to provide an indication of the system's capability.

Scenario 1 – No MW Generation from CGS-1

Case 1 – Line Section Requires No Upgrade

Under Scenario 1, with no MW generation from CGS-1 and starting with 2026 forecast loading levels, the existing 115 kV system has the capability to support load growth up to 2034 normal summer growth forecast. This corresponds to about 32 MW of additional new load with existing reactive power (VAR) support is available. In this condition with L1MB out of service, the loading of the L2M line segment between St. Lawrence TS and Lunenburg Junction remains within limits, meaning the system can accommodate this incremental load without requiring any upgrade to L2M.

Loading beyond 2034 would require upgrades to the 115kV circuit as described below. The voltage performance of the circuit is reaching ORTAC limits, however no violations were observed. This outcome demonstrates that the existing infrastructure can continue to reliably meet the area load up to year 2034 of the normal growth forecast for the region as shown in Figure 6.

Thermal assessments for the 2035 summer normal growth scenario, with CGS-1 out of service and with no additional VAR support installed in the area, indicates that the line section between St. Lawrence TS and Lunenburg Jct. exceeds its LTE rating under L1MB contingency. Under the 2031 summer High Growth scenario, this same segment exceeds its LTE capability when subjected to L1MB contingency.

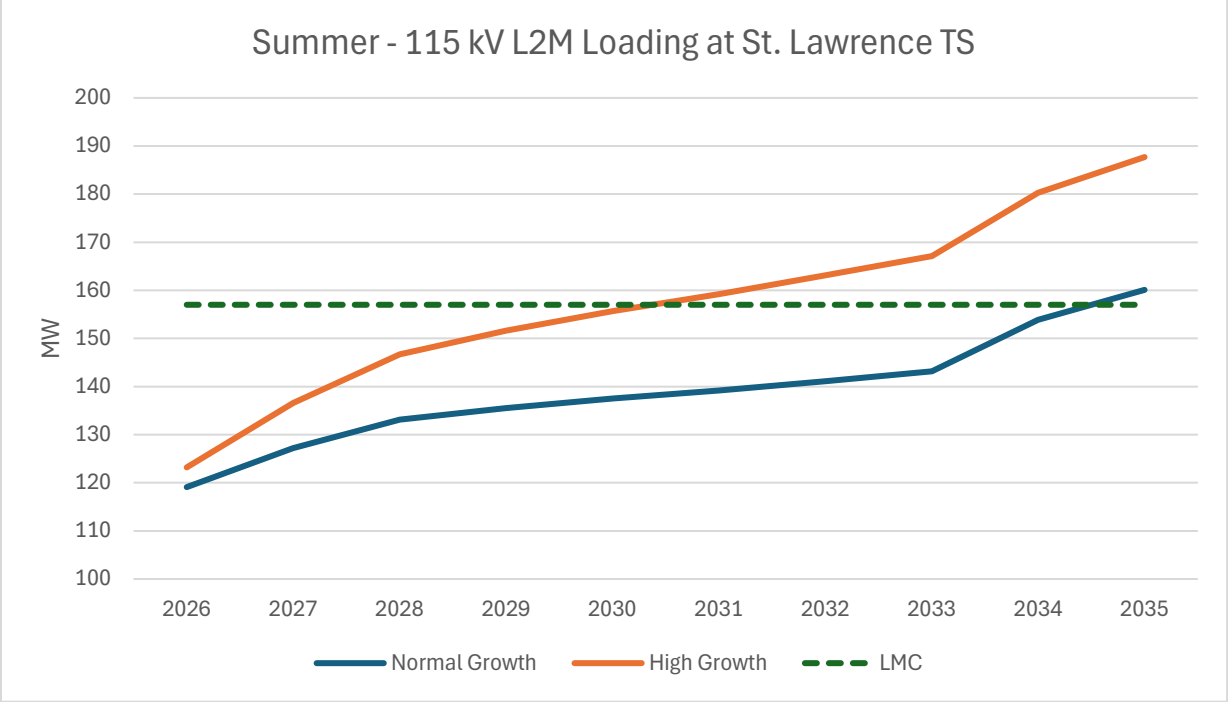


Figure 6: 115 kV L2M Loading

Case 2 – Line Section Requires Upgrade

If the line segment between St. Lawrence TS and Lunenburg Junction is upgraded and additional reactive power support is installed on the 115 kV system, the load-carrying capability increases significantly. Under this enhanced configuration, the system is capable of supporting approximately 100MW beyond the 2026 load forecast. Upgrade of the line improves its thermal capacity. When combined with increased VAR support to maintain acceptable voltage levels, the reinforced system can reliably accommodate a substantially higher level of future demand without violating planning criteria.

TWG recommends that IESO and Hydro One as a part of IRRP and RIP studies should consider options, such as, but not limited to running CGS-1 as a synchronous condenser and/or installing dynamic VAR support near Brockville area.

Scenario 2 – With MW Generation from CGS-1

When CGS-1 is generating, the power flow pattern across the 115 kV system changes, resulting in improved voltage support and reduced loading on upstream segments of L2M and L1MB. Under this scenario, the system is able to serve about 100 MW of additional load above 2026 loading from normal growth forecast without requiring any upgrades or refurbishment to the transmission lines. The presence of local generation strengthens voltages along the radial corridor, improving overall system behavior under high-load conditions. However, despite the enhanced support from CGS-1, additional reactive compensation is still needed to maintain voltage performance within acceptable limits as

demand grows. With appropriate VAR installations, the system can reliably supply higher load levels while leveraging the benefits of local generation from CGS-1.
As the identified thermal constraint occurs when CGS1 and L1MB is out of service with L2M exceeding its capacity in 2035 under normal growth, and in 2031 under high growth loading conditions, the TWG recommends

a. IESO to explore extending the contract and ensuring that CGS-1 output is available at peak hours to provide both MW and MVAR support. - or
b. Other transmission options to reinforce the 115kV to enable new connections beyond the 2034 summer normal growth forecast.
   A plan should be developed for 230 kV expansion in the mid-term as the capacity on 115 kV system is limited and load growth continues .

Further studies in next phase should be undertaken to develop solutions (including non-wires alternatives).

New connections such as Industrial/Commercial customers shall be required to install VAR support for their system.

7.3.2 230 kV – LxH circuits

The LxH circuit group comprising the 230 kV L20H, L21H, and L22H transmission circuits—extends between Hinchinbrook SS and St. Lawrence TS, forming a long-distance supply corridor approximately 160 km in length. These circuits provide the primary 230 kV supply to several key stations in the region, including Smiths Falls TS, Brockville TS, and Crosby TS. A significant portion of LxH sections have limited capacity as a result of sag limitations.

With the connection of the Skyview BESS near Easton Junction, system studies indicate that during discharge conditions under the High-Growth scenario in 2035, certain LxH line sections approach their LTE ratings. Although no thermal violations are observed under Normal-Growth and regional planning assumptions, the analysis shows that the LxH circuits have limited remaining thermal headroom for accommodating future increases in regional demand. Please refer to section 8 for further information.

St. Lawrence TS is connected to the Saunders Generating Station, to the State of New York via two interprovincial lines (IPLs), and to the Province of Quebec through circuit B31L, which is tied to the Beauharnois Generating Station. Due to these interconnections, a wide range of operating scenarios and system conditions can influence power flows on circuits L20H, L21H, and L22H. Under certain generation patterns and dispatch scenarios, these factors may result in overloads on sections of these lines based on existing loading condition.

The TWG recommends reviewing the capacity need of L20H/L21H circuits and developing mitigation options as part of IRRP and RIP phases of regional planning. Increasing capacity will help economic growth projected in the area and large load connections in the area. Please refer to section 8 for further details.

7.4 System Reliability, Operation and Load Restoration Needs

The transmission system must be planned to satisfy demand levels up to the extreme weather, and to provide a median-economic forecast for an extended period with any one transmission element out of service. A study has been conducted, considering the net non-coincident load forecast and the loss of one element over the study period **2026-2035** to cater for this need**.** Based on the results, the following line needs have been identified during the study period:

7.4.1 Brockville TS – LV Capacitor bank

As new loads are anticipated to connect in the Brockville area, the increased demand will require additional reactive power resources to maintain acceptable low-voltage (LV) performance. To support system voltage and improve power factor, there is a need to install LV capacitor banks at Brockville TS.

Study assessments indicate that Brockville TS begins to experience LV voltage decline beyond permissible ORTAC limits as loading increases after 2028 under normal growth scenario. To ensure voltage remains within allowable thresholds, TWG recommends installing 44 kV capacitor banks to meet station capability and to ensure compliance with ORTAC and TSC switching requirements at the station. The capacitor bank has been right sized (2x21.6 MVAR) based on meeting system performance and station loading.

Hydro One will proceed with implementation of this with a tentative in-service date for this project in 2029.

7.4.2 Voltage Performance of 115 kV L2M

A series of system studies were conducted to evaluate the voltage performance of the 115 kV L2M circuit under various operating conditions and long-term load growth assumptions.

Under the high-growth 2032 scenario, the analysis shows that the post-contingency voltage on L2M violates ORTAC limits only under the L1MB outage contingency. Specifically, the voltage on the affected sections of L2M falls below the minimum ORTAC limit of 113 kV, indicating inadequate voltage performance in this scenario. Results also indicate that under normal growth the voltage approaches its limits by end of the study period.

The TWG recommends further review of this need in the next phases of regional planning cycle.

7.4.3 Load Restoration for L20H/L22H

Brockville TS is supplied solely by the 230 kV L20H and L22H circuits. Loss of both circuits would result in a complete loss of supply to the station. Under the Normal Growth forecast, the projected winter peak load at Brockville TS exceeds 150 MW by the end of the study period. Under the High Growth forecast, the station load is projected to exceed 150 MW in 2033 (summer) and 2030 (winter).

In accordance with ORTAC load restoration requirements for double circuit contingencies where more than 150 MW of load is interrupted, TWG is recommending IRRP and RIP to consider building a Switching Station near Easton Jct. which can provide switching flexibility for load restoration for Brockville along with several other system benefits in the area.

7.4.4 Load Restoration for L2M/L1MB

115 kV Circuits L2M and L1MB supply Chesterville TS, Morrisburg TS, Newington DS, CTS-1 and CTS -2. The double contingency of L2M and L1MB will result in complete loss of supply to these stations. Under the Normal Growth forecast, the projected summer peak load at these stations exceeds 150 MW by the end of the study period. Under the High Growth forecast, the station load is projected to exceed 150 MW in 2030 (summer) and 2029 (winter).

In accordance with ORTAC load restoration requirements for double circuit contingencies more than 150 MW of load may be interrupted. The TWG will review this need as part of next phases of regional planning cycle.

8. SENSITIVITY ANALYSIS

The objective of a sensitivity analysis is to capture uncertainty in the load forecast as well as variability of electric demand drivers to identify any emerging needs and/or advancement or deferment of recommended investments. The TWG determined that the key electric demand driver in the St. Lawrence region to be considered in this sensitivity analysis is electric vehicle (EV) penetration and unforeseen electrification which would cause the load to increase at a faster rate than shown in the forecast; or the potential delay in some projects which could result in less demand than anticipated.

The TWG conducted a sensitivity analysis by applying ±50% growth adjustments to the Normal Growth forecast to establish the High Growth and Low Growth scenarios. The High Growth scenario incorporates EV scenarios, includes consideration of potential additional demand from electrification as well as anticipated large industrial and commercial customers expected to connect in the near to mid-term.

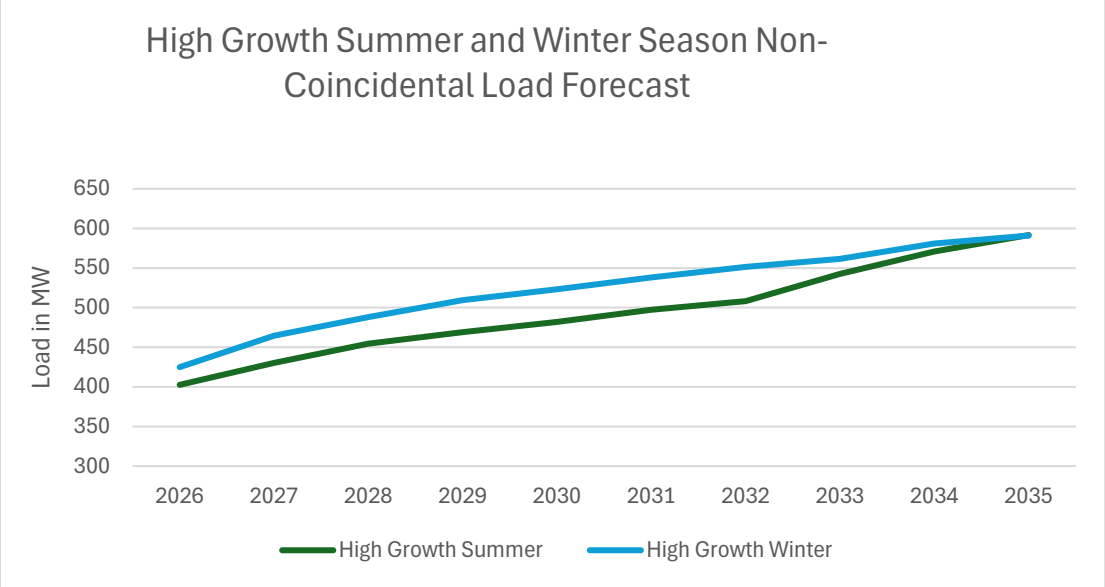

Figure 7: High Growth Forecast for existing stations.

Given further input is expected from municipalities on electricity demand, the TWG has reviewed the system capability as per study assumptions for growth beyond the NA load forecast and the findings are shown below. This additional input will be further considered in next phases of regional planning cycle.

Following is the capacity based on currently available information

a. On 115 kV system, approximately 40 MW capacity would be available (beyond the existing station's high growth forecast) to serve new industrial/commercial customers subject to upgrade described in section 7.3.
b. On 230 kV system, approximately 90 MW capacity is currently available for industrial/commercial customers (beyond the existing station's high growth forecast). Capacity beyond 90 MW will require upgrade to 230 kV circuits as described in 7.3 and system reinforcement such as switching station as described in section 7.4.

Note : - Some of the municipal information was not available and will be updated in the next phase of regional planning

The normal and high growth forecasts are shown in Tables A.1, A.2, A.3 and A.4.

The impact of sensitivity analysis for the high and low growth scenario identified the following updates or new Station/Line capacity needs:

Table 7: Impact of Sensitivity Analysis on Station/Line capacity Needs in the Region

Sr.no.	Need Identified	Normal Growth Scenario	High Growth Scenario	Low Growth Scenario
1	Chesterville TS T1/T2	2035 (Summer)	2033 (Summer)	-
2	Brockville TS T1/T2	-	2032 (Summer) 2032 (Winter)	-
3	L2M	2034 (Summer)	2031 (Summer)	-

The sensitivity analysis identified the additional capacity needs during study period. These needs will be assessed again during the next phases of this Regional Planning cycle.

9. CONCLUSION AND RECOMMENDATION

The Needs Assessment has considered N-1 contingency scenarios to identify needs in the area. The next phases will include a revised forecast and additional outage/contingency analysis beyond what was assessed here. These studies may find further limits on the system's ability to supply additional load.

9.1 Regional Needs

The Technical Working Group's recommendations to address the needs identified are as follows:

Table 8: Needs that Do Not Require Further Regional Coordination

#	Need Location	Need Description
1	St. Lawrence TS	115 kV breaker replacement based on asset condition
2	Brockville TS	T1/T2 transformers renewal based on asset condition
3	Brockville TS	Installation of new LV Capacitor bank to mitigate the voltage issues on 44 kV bus.

Table 9: Needs that Require Further Regional Coordination

#	Need Location	Need Description
1	Chesterville TS T1/T2	Projected to reach capacity in 2035 under normal growth and in 2033 under High growth scenario
2	Brockville TS T1/T2	Projected to reach capacity in 2032 under High Growth Scenario
3	L2M	Projected to reach capacity in 2034 under Summer normal growth and 2031 under Summer High Growth Scenario
2	LxH	Under certain generation patterns and dispatch scenarios, some sections of the circuit may result in overloads based on existing loading condition.
4	Voltage on L2M	Voltage issues identified for High Growth Scenarios under L1MB contingency in mid-term.
5	L20H/L22H	Load restoration
6	L2M/L1MB	Load restoration

Note : Further input is expected from municipalities on electricity demand by end of March 2026 and will be considered in next phases of regional planning cycle which may trigger additional needs in the region.

List of LDC(s) to be involved in further regional planning phases:

- Hydro One Distribution
- Cooperative Hydro Embrun Inc.
- Rideau St. Lawrence Distribution Inc.

List of LDC(s) which are not required to be involved in further regional planning phases:

- None

9.2 Consideration for Future Growth

Given further input is expected from municipalities on electricity demand, the TWG has reviewed the system capability as per study assumptions for growth beyond the NA load forecast and the findings are shown below. This additional input will be further considered in next phases of regional planning cycle.

a. 115 kV analysis, approximately 40 MW capacity would be available (beyond the existing station high growth forecast) to serve new industrial/commercial customers subject to upgrade described in section 7.3.
   - A plan should be developed for 230 kV expansion in the mid-term as the capacity on 115 kV system is limited and load growth continues.

b. 230 kV analysis, approximately 90 MW capacity is still available for industrial/commercial customers (beyond the existing station high growth forecast). Capacity beyond 90 MW will require upgrade to 230 kV circuits as described in 7.3 and system reinforcement such as switching station as described in section 7.4.

REGIONAL INFRASTRUCTURE PLAN

October 1st, 2021

hydro one

(This page is intentionally left blank)

Prepared and supported by:

Company
Hydro One Sault Ste. Marie LP. (Lead Transmitter)
Hydro One Networks Inc. (Transmission)
Independent Electricity System Operator (IESO)
Hydro One Networks Inc. (Distribution)
Algoma Power Inc.
Chapleau Public Utilities Corporation
PUC Distribution Inc.

DISCLAIMER

This Regional Infrastructure Plan ("RIP") report was prepared for the purpose of developing an electricity infrastructure plan to address all near and mid-term needs identified in previous planning phases and any additional needs identified based on new and/or updated information provided by the RIP Study Team.

The preferred solution(s) that have been identified in this report may be reevaluated based on the findings of further analysis. The load forecast and results reported in this RIP report are based on the information provided and assumptions made by the participants of the RIP Study Team.

Study Team participants, their respective affiliated organizations, and Hydro One Networks Inc. (collectively, "the Authors") make no representations or warranties (express, implied, statutory or otherwise) as to the RIP report or its contents, including, without limitation, the accuracy or completeness of the information therein and shall not, under any circumstances whatsoever, be liable to each other, or to any third party for whom the RIP report was prepared ("the Intended Third Parties"), or to any other third party reading or receiving the RIP report ("the Other Third Parties"), for any direct, indirect or consequential loss or damages or for any punitive, incidental or special damages or any loss of profit, loss of contract, loss of opportunity or loss of goodwill resulting from or in any way related to the reliance on, acceptance or use of the RIP report or its contents by any person or entity, including, but not limited to, the aforementioned persons and entities.

EXECUTIVE SUMMARY

THIS REGIONAL INFRASTRUCTURE PLAN ("RIP") WAS PREPARED BY HYDRO ONE SAULT STE. MARIE LP WITH SUPPORT FROM THE RIP STUDY TEAM IN ACCORDANCE TO THE ONTARIO TRANSMISSION SYSTEM CODE REQUIREMENTS. IT IDENTIFIES INVESTMENTS IN TRANSMISSION FACILITIES, DISTRIBUTION FACILITIES, OR BOTH, THAT SHOULD BE DEVELOPED AND IMPLEMENTED TO MEET THE ELECTRICITY INFRASTRUCTURE NEEDS WITHIN THE EAST LAKE SUPERIOR REGION.

The participants of the Regional Infrastructure Plan ("RIP") Study Team included members from the following organizations:

- Algoma Power Inc. ("API")
- Chapleau Public Utilities Corporation ("Chapleau PUC")
- Hydro One Networks Inc. (Transmission)
- Hydro One Sault Ste. Marie LP. ("HOSSM")
- Hydro One Networks Inc. (Distribution)
- Independent Electricity System Operator ("IESO")
- PUC Distribution Inc. ("PUC")

This RIP is the final phase of the second cycle of East Lake Superior (ELS) regional planning process, which follows the completion of the East Lake Superior Integrated Regional Resource Plan ("IRRP") in April 2021 and the East Lake Superior Region Needs Assessment ("NA") in June 2019. This RIP provides a consolidated summary of the needs and recommended plans for East Lake Superior Region over the planning horizon (1 – 20 years) based on available information.

This RIP discusses needs identified in the previous regional planning cycle, the Needs Assessment and IRRP reports for this cycle, and wires solutions recommended to address these needs. Implementation plans to address some of these needs are already completed or are underway. Since the previous regional planning cycle, the following projects are underway or completed

- **End of life Wood Pole Replacements**: Multiple wood pole replacement projects were completed on a number of 115kV and 230kV circuits. These circuits consisted of wood pole structures that were assessed at being at their end of life and in need of replacements. The following circuits have their end of life wood pole structures replacement completed between 2014 to 2019:
    - No.2 and No.3 Algoma (completed in 2014)
    - Northern Ave 115kV circuit (completed in 2014)
    - No.1 Garshore (completed in 2015)
    - Hogg (completed in 2015)
    - P21G (completed in 2019)

- **Hwy 101 TS**: Installed a new control building completed with new protection relays, batteries, chargers, automatic transfer schemes and RTU to replace end of life components such as electro-mechanical relays and batteries. This project was completed and in-serviced in 2015.

- **Anjigami TS**: Performed electrical and civil upgrade, including the installation of a new 44kV breaker, redundant battery and chargers, and replacement of protection equipment and other end of life AC/DC system. It also includes ground grid improvements. This project was completed in 2017.

- **Echo River TS**: Improve transmission reliability with the installation of an additional 230/34.5kV 25MVA Transformer (T2) as an on-site spare. This project is underway with a targeted in-service date of 2023 Q2.

The major infrastructure investments recommended by the Study Team in the near and mid-term planning horizon are provided in the Table 1 below, along with their planned in-service date and budgetary estimates for planning purpose.

Table 1. Recommended Plans in East Lake Superior Region over the Next 10 Years

No.	Need	Recommended Action Plan	Planned I/S Date	Budgetary Estimate(1)
1	Eliminate/Minimize manual communication between IESO and OGCC when arming Third Line Instantaneous Load Rejection Scheme	Enable remote arming of Third Line Instantaneous Load Rejection Scheme via ICCP line between IESO's EMS and HONI's NMS	2021	$10K
2	Third line TS: End of life protection	Replace end of life protection per current standard	2022	$0.8M
3	Echo River TS : Transmission Supply Reliability and end of life breaker	Install 'hot' spare transformer and replace end of life breaker	2023/2024	$11.5M
4	115kV Sault No.3: end of life structures and conductor	Replace end of life structure and conductor per current standard[1]	2024	$54.4M
5	Batchawana TS: End of life components	Refurbish Batchawana TS with MUS provision	2024	$6.2M
6	Goulais TS: End of life components	Refurbish Goulais TS with MUS provision	2024	$13.4M
7	Patrick St. TS, Algoma No.1 overload	Implement Automatic Load Rejection Scheme at Patrick St. TS	2023	$1.2M

[1] To coordinated with IESO's 2021 Bulk Planning Study regarding Sault No.3 Circuit Overloading

8	Patrick St. TS: End of life 115kV breaker	Replace end of life 115kV breakers 'like for like' per current standard	2024	$3.3M
9	Third Line TS : T2 end of life	Replace end of life T2 'like for like' per current standard	2025	$16.4M
10	Northern Ave TS: end of life component replacement	Replace end of life T1 with smaller MVA unit and protection relays per current standard	2025	$2.5M
11	Anjigami/Hollingsworth TS : Transformer overload	Build new 115/44kV Station - HOSSM to work with API to continue to develop solutions	2024/2025	$30M
12	Clergue TS: End of life metal clad switch gear	Replace end of life switch gear 'like for like' per current standard	2026	$5.2M
13	Hollingsworth TS: End of life Protection relay	Replace end of life protection per current standard	2025	$1.1M
14	D.A. Watson TS: End of life metal clad switch gear	Replace end of life switch gear 'like for like' per current standard	2026	$9.2M

The Study Team recommends that:

- Hydro One to continue with the implementation of infrastructure investments listed in Table 1 while keeping the Study Team apprised of project status;
- All the other identified needs/options in the long-term will be further reviewed by the Study Team in the next regional planning cycle.

1 INTRODUCTION

THIS REPORT PRESENTS THE REGIONAL INFRASTRUCTURE PLAN ("RIP") TO ADDRESS THE ELECTRICITY NEEDS OF THE EAST LAKE SUPERIOR REGION BETWEEN 2019 AND 2039.

The report was prepared by Hydro One Sault Ste. Marie LP (HOSSM) on behalf of the Study Team that consists of Hydro One Networks Inc. (Transmission), Hydro One (Distribution), Algoma Power Inc. (API), PUC Distribution Inc., Chapleau Public Utilities Corporation and the Independent Electricity System Operator ("IESO"), in accordance with the new Regional Planning process established by the Ontario Energy Board in 2013.

The East Lake Superior Region is the region extends from the town of Dubreuilville in the north to the town of Bruce Mines in the south and includes the city of Sault Ste. Marie and the township of Chapleau. The region is roughly bordered geographically by Highway 129 to the east, Highway 101 to the north, Lake Superior to the west and St. Mary's River and St. Joseph Channel to the south as shown in Figure 1.1 below. The region is supplied from a combination of local generation and connection to the Ontario electricity grid via 230 kV transmission lines to Mississagi Transformer Station in the East, 230kV and 115 kV transmission lines to Wawa Transformer Station in the North.

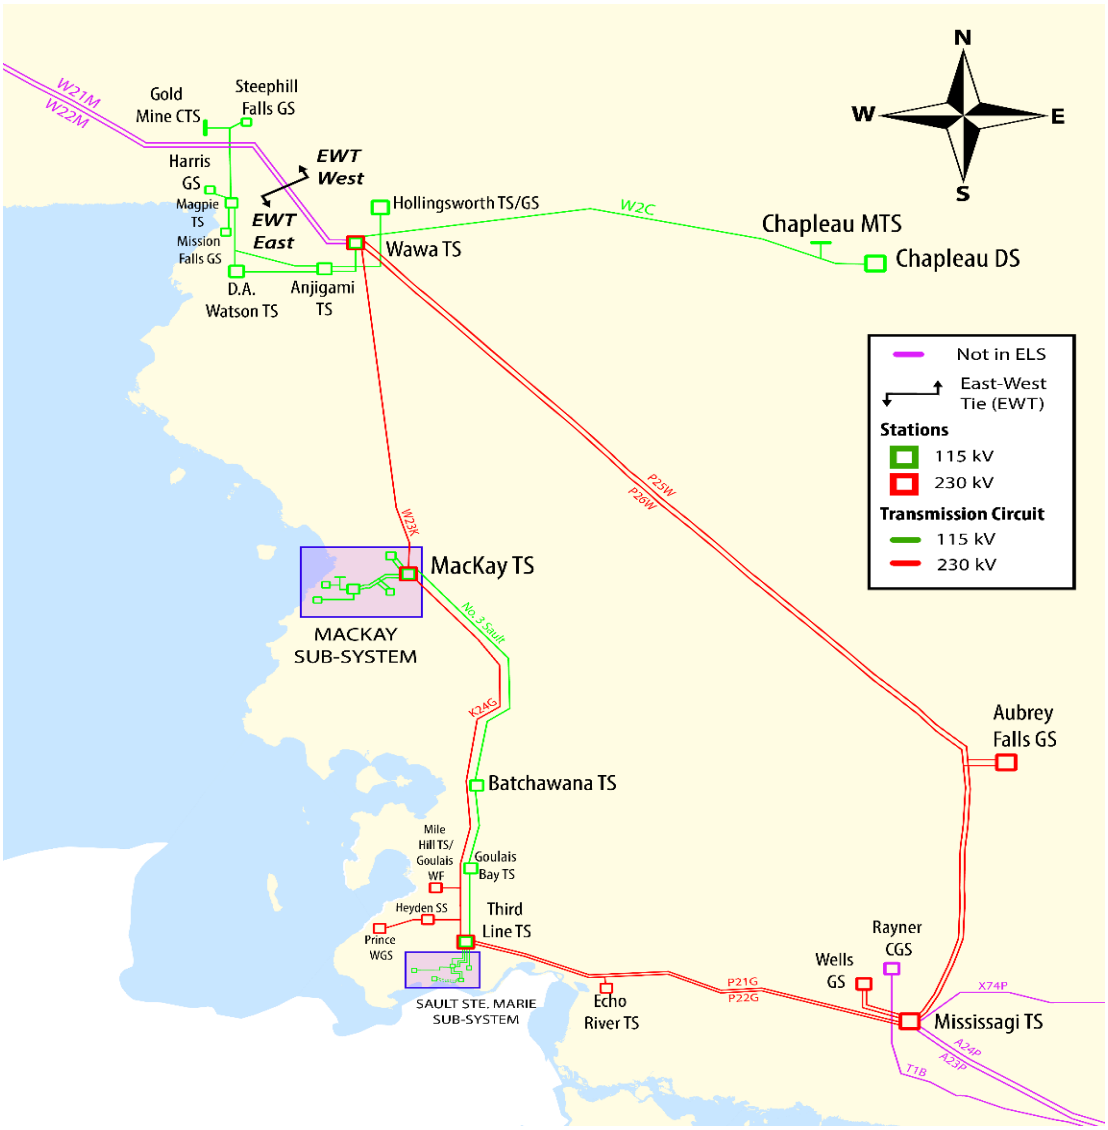

Figure 1-1: East Lake Superior Region Map

1.1 Objectives and Scope

The RIP report examines the needs in the East Lake Superior Region. Its objectives are to:

- Provide a comprehensive summary of needs and wires plans to address the needs;
- Identify any new needs that may have emerged since previous planning phases e.g., Needs Assessment ("NA"), Scoping Assessment ("SA"), and/or Integrated Regional Resource Plan ("IRRP");
- Assess and develop a wires plan to address these needs; and
- Identify investments in transmission and distribution facilities or both that should be developed and implemented on a coordinated basis to meet the electricity infrastructure needs within the region.

The RIP reviewed factors such as the load forecast, major high voltage sustainment issues emerging over the near, mid- and long-term horizon, transmission and distribution system capability along with any updates to local plans, conservation and demand management ("CDM") forecasts, renewable and non-renewable generation development, and other electricity system and local drivers that may impact the need and alternatives under consideration.

The scope of this RIP is as follows:

- A consolidated report of the relevant wires plans to address near and medium-term needs identified in previous planning phases (Needs Assessment, Scoping Assessment, and/or Integrated Regional Resource Plan);
- Discussion of any other major transmission infrastructure investment plans over the planning horizon;
- Identification of any new needs and a wires plan to address these needs based on new and/or updated information;
- Develop a plan to address any longer term needs identified by the Study Team.

1.2 Structure

The rest of the report is organized as follows:

- Section 2 provides an overview of the regional planning process.
- Section 3 describes the regional characteristics.
- Section 4 describes the transmission work completed over the last ten years.
- Section 5 describes the load forecast and study assumptions used in this assessment.
- Section 6 describes the adequacy of the transmission facilities in the region over the study period.
- Section 7 discusses the needs and provides the alternatives and preferred solutions.
- Section 8 provides the conclusion and next steps.

2 REGIONAL PLANNING PROCESS

2.1 Overview

Planning for the electricity system in Ontario is done at three levels: bulk system planning, regional system planning, and distribution system planning. These levels differ in the facilities that are considered and the scope of impact on the electricity system. Planning at the bulk system level typically looks at issues that impact the system on a provincial level, while planning at the regional and distribution levels looks at issues on a more regional or localized level.

Regional planning looks at supply and reliability issues at a regional or local area level. Therefore, it largely considers the 115 kV and 230 kV portions of the power system that supply various parts of the province.

2.2 Regional Planning Process

A structured regional planning process was established by the Ontario Energy Board ("OEB") in 2013 through amendments to the Transmission System Code ("TSC") and Distribution System Code ("DSC"). The process consists of four phases: the Needs Assessment [2] ("NA"), the Scoping Assessment ("SA"), the Integrated Regional Resource Plan ("IRRP"), and the Regional Infrastructure Plan ("RIP").

The regional planning process begins with the NA phase, which is led by the transmitter to determine if there are regional needs. The NA phase identifies the needs and the Study Team determines whether further regional coordination is necessary to address them. If no further regional coordination is required, further planning is undertaken by the transmitter and the impacted local distribution company(s) ("LDC") or customer(s) and develops a Local Plan ("LP") to address them.

In situations where identified needs require coordination at the regional or sub-regional levels, the IESO initiates the SA phase. During this phase, the IESO, in collaboration with the transmitter and impacted LDCs, reviews the information collected as part of the NA phase, along with additional information on potential non-wires alternatives, and makes a decision on the most appropriate regional planning approach. The approach is either a RIP, which is led by the transmitter, or an IRRP, which is led by the IESO. If more than one sub-region was identified in the NA phase, it is possible that a different approach could be taken for different sub-regions.

The IRRP phase will generally assess infrastructure (wires) versus resource (CDM and Distributed Generation and energy efficiency) options at a higher or more macro level, but sufficient to permit a comparison of options. If the IRRP phase identifies that infrastructure options may be most appropriate to meet a need, the RIP phase will conduct detailed planning to identify and assess the specific wires alternatives and recommend a preferred wires solution. Similarly, resource options that the IRRP identifies as best suited to meet a need are then further planned in greater detail by the IESO. The IRRP phase also includes IESO led stakeholder engagement with municipalities, Indigenous communities, business sectors and other interested stakeholders in the region.

[2] Also referred to as Needs Screening

The RIP phase is the fourth and final phase of the regional planning process and involves: discussion of previously identified needs and plans; identification of any new needs that may have emerged since the start of the planning cycle; and development of a wires plan to address the needs where a wires solution would be the best overall approach. This phase is led and coordinated by the transmitter and the deliverable is a comprehensive report of a wires plan for the region. Once completed, this report is also referenced in transmitter's rate filing submissions and as part of LDC rate applications with a planning status letter provided by the transmitter.

To efficiently manage the regional planning process, Hydro One has been undertaking wires planning activities in collaboration with the IESO and/or LDCs for the region as part of and/or in parallel with:

- Planning activities that were already underway in the region prior to the new regional planning process taking effect;
- The NA, SA, and LP phases of regional planning;
- Participating in and conducting wires planning as part of the IRRP for the region or sub-region;
- Working and planning for connection capacity requirements with the LDCs and transmission connected customers.

Figure 2-1 illustrates the various phases of the regional planning process (NA, SA, IRRP, and RIP) and their respective phase trigger, lead, and outcome.

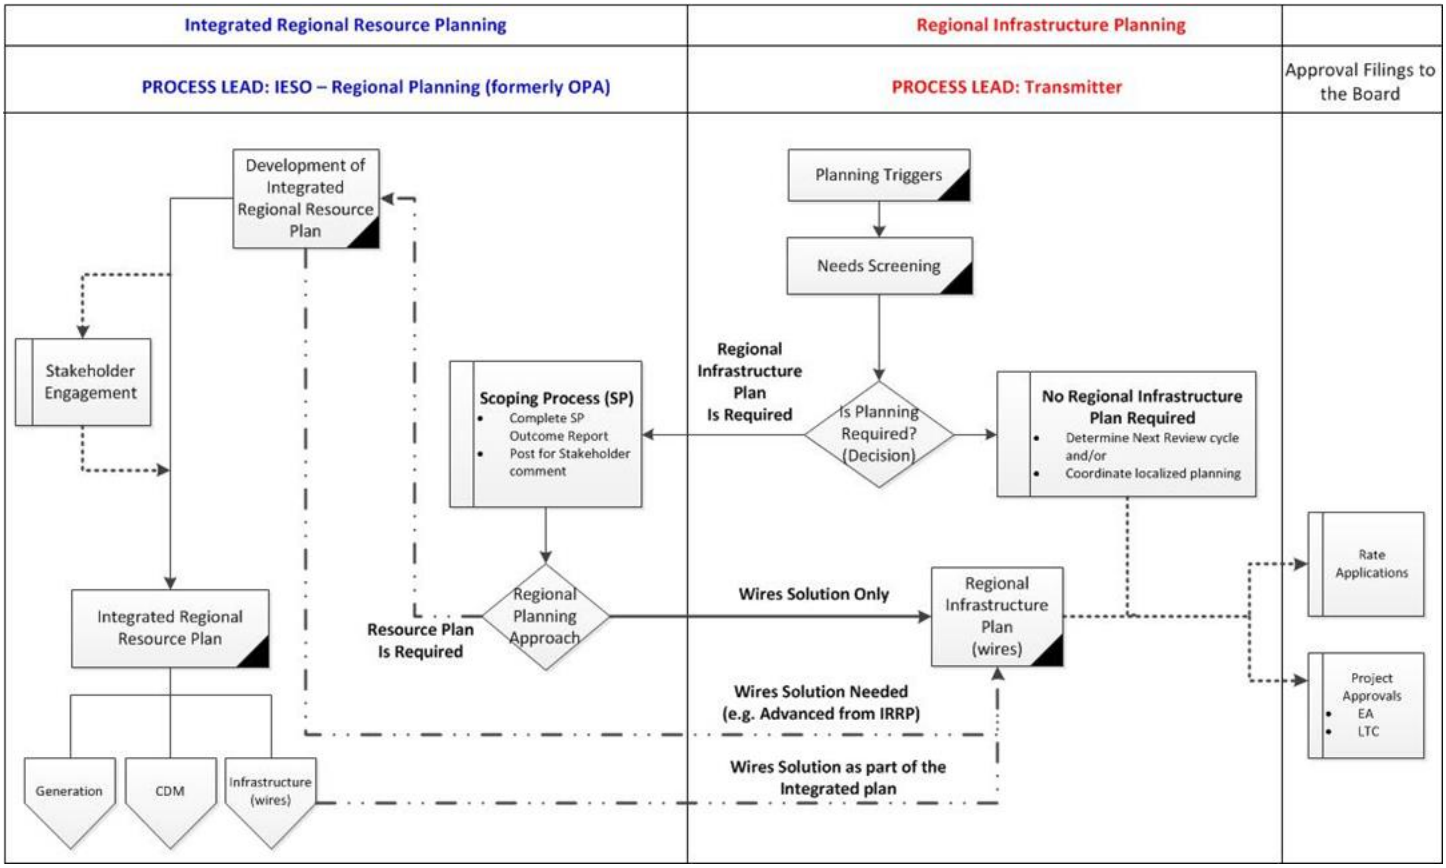

Figure 2-1: Regional Planning Process Flowchart

2.3 RIP Methodology

The RIP phase consists of a four step process (see Figure 2-2) as follows:

1) Data Gathering: The first step of the process is the review of planning assessment data collected in the previous phase of the regional planning process. Hydro One collects this information and reviews it with the Study Team to reconfirm or update the information as required. The data collected includes:
   - Net peak demand forecast at the transformer station level. This includes the effect of any distributed generation or conservation and demand management programs.
   - Existing area network and capabilities including any bulk system power flow assumptions.
   - Other data and assumptions as applicable such as asset conditions; load transfer capabilities, and previously committed transmission and distribution system plans.
2) Technical Assessment: The second step is a technical assessment to review the adequacy of the regional system including any previously identified needs. Depending upon the changes to load forecast or other relevant information, regional technical assessment may or may not be required

or be limited to specific issue only. Additional near and mid-term needs may be identified in this phase.

3) Alternative Development: The third step is the development of wires options to address the needs and to come up with a preferred alternative based on an assessment of technical considerations, feasibility, environmental impact and costs.
4) Implementation Plan: The fourth and last step is the development of the implementation plan for the preferred alternative.

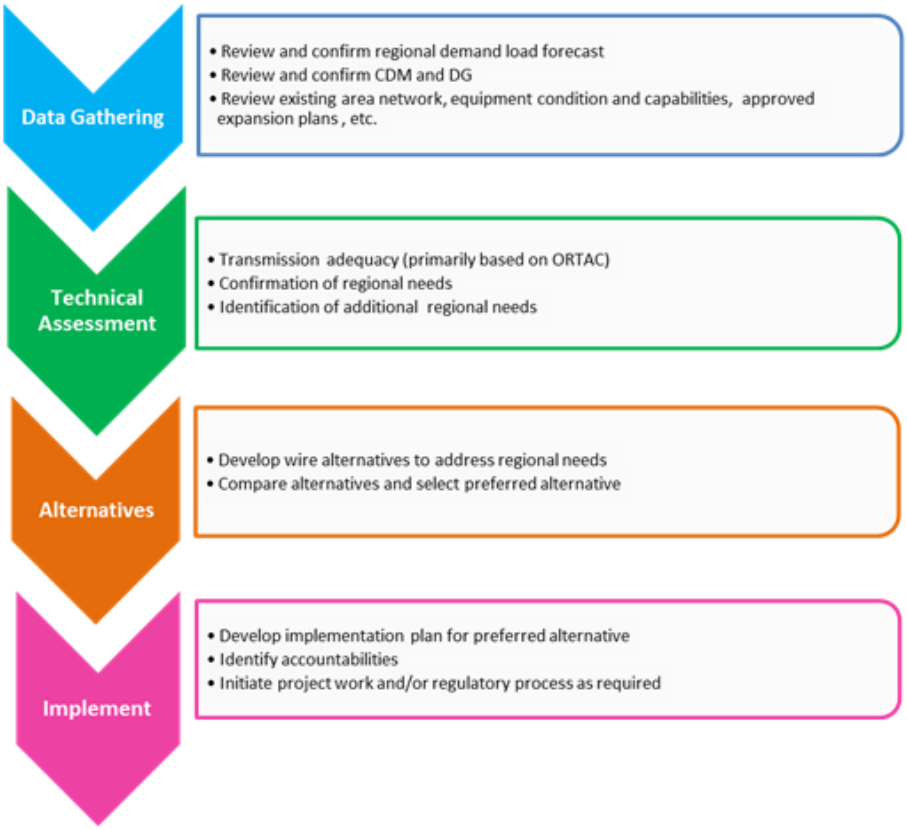

Figure 2-2: RIP Methodology

3 REGIONAL CHARACTERISTICS

THE EAST LAKE SUPERIOR REGION INCLUDES THE AREA ROUGHLY BORDERED GEOGRAPHICALLY BY TOWN OF DUBERUILVILLE AND HIGHWAY 101 TO THE NORTH AND THE TOWNSHIP OF CHAPLEAU, BRUCE MINES TO THE SOUTH AND INCLUDES THE CITY OF SAULT STE. MARIE, HIGHWAY 129 TO THE EAST, AND LAKE SUPERIOR TO THE WEST. IT CONSISTS OF THE CITY OF SAULT STE. MARIE.

The region is supplied from a combination of local generation and connections to the Ontario electricity grid via 230 kV transmission lines to Mississagi Transformer Station in the East, 230kV and 115 kV transmission lines to Wawa Transformer Station in the North. Majority of the region's electrical need is supplied through a 230/115 kV transformer station at Third Line TS. Local generation in the area consists of mainly hydroelectric and wind generation with a total installed capacity of 1039 MW in the 115 kV and 230kV networks. The East Lake Superior Region is a winter peaking region, with 2020 winter peak demand at 361MW.

PUC Distribution Inc. ("PUC") is the Local Distribution Company ("LDC") which serves the electricity demand in the City of Sault Ste. Marie. The LDC that supplies primarily rural customers – industrial, commercial, and residential customers in the aregion are API, Chapleau PUC and Hydro One Networks Inc. Distribution

Below is a description of major Transmission asset in the region:

- Third line TS is the major transmission station that connects the 115kV system within the City of Sault Ste. Marie via two 230/115kV autotransformer to the 230kV bulk electricity network.
- Mackay TS is a 230/115kV station with one 230/115kV autotransformer that connects the local 115kV network in the vicinity of Montreal River to the 230kV bulk electricity network.
- Wawa TS is a 230/115kV station with two 230/115kV autotransformer that connects the local 115kV network in the vicinity of Michipicoten River.
- 12 other Transmission stations supply the area, with 10 of them operating at 115kV, 1 operating at 230kV , 1 operating at 44kV [3]
- A total of 319 km of 230kV circuits, 232 km of 115kV circuits and 10 km of 44kV circuits interconnect transmission stations, generation customer(s), distribution customer(s) and Transmission connected load customer(s) within the region.

Table in Appendix A and B summarize Transmission station and circuits at different operating voltages and in the area. A geographical map showing the electrical facilities of the East Lake Superior Region is provided in Figure 3-1. A single line diagram showing the electrical facilities of the East Lake Superior Region is provided in Figure 3-2.

[3] The 44kV station and line is included in HOSSM's transmitter license and are deemed transmission asset by the OEB.

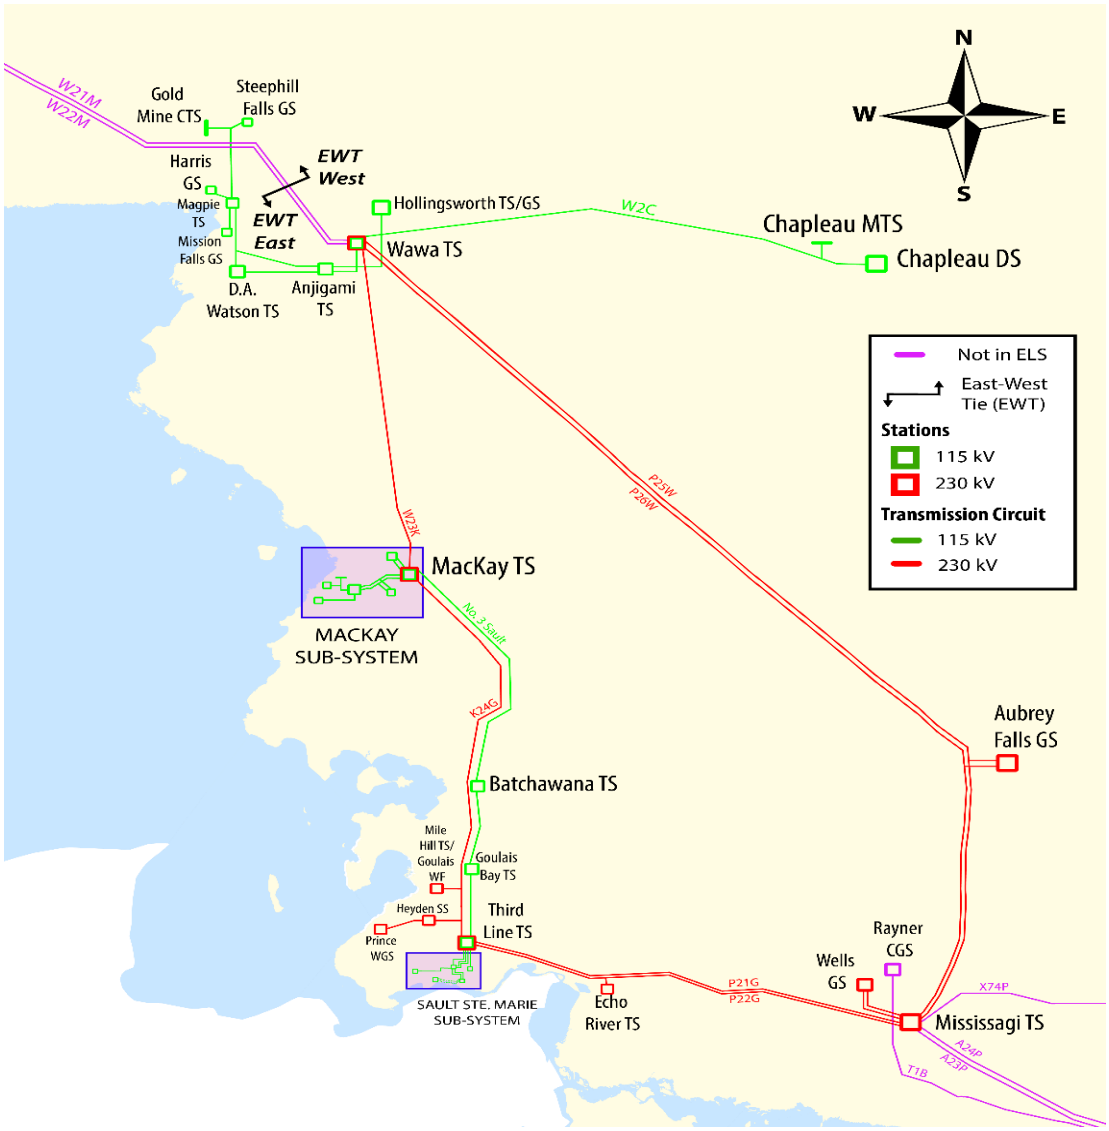

Figure 3-1: East Lake Superior Region's Transmission Network

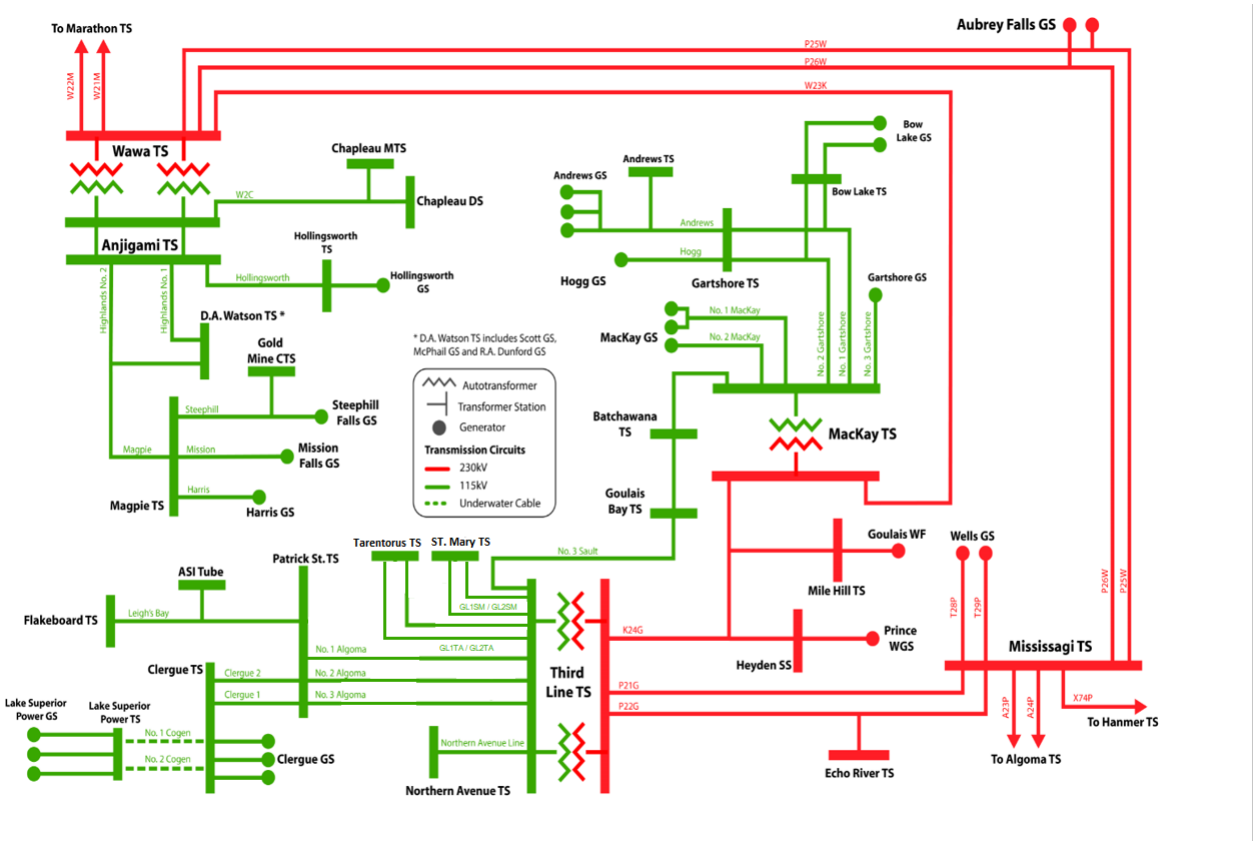

Figure 3-2: Single Line Diagram of East Lake Superior Region's Transmission Network

4 TRANSMISSION FACILITIES/PROJECTS COMPLETED AND/OR UNDERWAY SINCE LAST REGIONAL PLANNING

THE ESL REGIONS COMPLETED IT 1ST CYCLE REGIONAL PLANNING IN 2014. SINCE THAT TIME, SEVERAL \TRANSMISSION PROJECTS HAVE BEEN PLANNED AND/OR UNDERTAKEN BY HYDRO ONE SAULT STE. MARIE AIMED TO MAINTAIN THE RELIABILITY AND ADEQUACY OF ELECTRICITY SUPPLY TO THE EAST LAKE SUPERIOR REGION.

A summary and description of the major projects completed and/or currently underway since the completion of last cycle regional planning is provided below.

- **End of life Wood Pole Replacements**: Multiple wood pole replacement projects were completed on a number of 115kV and 230kV circuits. These circuits consisted of wood pole structures that were assessed at being at their end of life and in need of replacements. The following circuits have their end of life wood pole structures replacement completed between 2013 to 2019:
    - No.2 and No.3 Algoma (completed in 2014)
    - Northern Ave (completed in 2014)
    - No.1 Garshore (completed in 2015)
    - Hogg (completed in 2015)
    - P21G (completed in 2019)

- **Hwy 101 TS**: Installed a new control building completed with new protection relays, batteries, chargers, automatic transfer schemes and RTU to replace end of life components such as electro-mechanical relays and batteries. This project was completed and in-serviced in 2015.

- **Anjigami TS**: Performed electrical and civil upgrade, including the installation of a new 44kV breaker, redundant battery and chargers, and replacement of protection equipment and other end of life AC/DC system. It also includes ground grid improvements. This is completed in 2017.

- **Echo River TS**: Improve transmission reliability with the installation of an additional 230/34.5kV 25MVA Transformer (T2) as an on-site spare. This project is underway and have a targeted in-service date of 2023 Q2.

5 LOAD FORECAST AND STUDY ASSUMPTIONS

5.1 Load Forecast

The LDCs provided load forecasts for all the stations supplying their loads in the East Lake Superior region for the 20-year study period during the IESO led IRRP phase of regional planning. The net extreme weather corrected winter load forecast was produced by modifying the LDC forecast provided for each station to reflect extreme weather conditions and subtracted the estimated peak demand impacts of provincial conservation policy and committed Distributed Energy Resource (DER) that may have been contracted through previous provincial programs such as the Feed-in Tariff (FIT) and micro FIT program.

The electricity demand in the East Lake Superior Region is anticipated to stay flat over the next 20 years, with a peak of 348W in 2031. Figure 5-1 shows the East Lake Superior Region's Winter peak net load forecast developed during the East Lake Superior IRRP process. This IRRP forecast was used to determine the loading that would be seen by transmission lines and autotransformer stations and to identify the need for additional line and auto-transformation capacity. The IRRP non-coincident load forecasts for the individual stations in the East Lake Superior Region is given in Appendix D, Table D-1 and Table D-2. This forecast does not included a high industrial growth or expansion scenario, which will be studied as part of the IESO's bulk planning study in 2021 given the impact to the bulk transmission network in the broader region

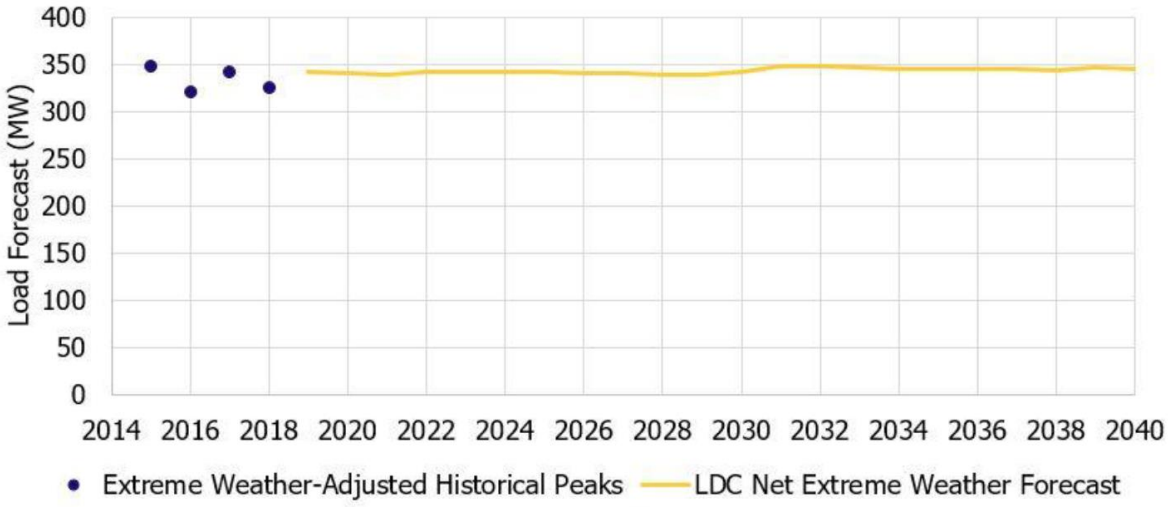

Figure 5-1: East Lake Superior Region Load Forecast

5.2 Study Assumptions

The following other assumptions are made in this report.

- The study period for the RIP assessments is 2019-2038.
- All facilities that are identified in Section 4 and that are planned to be placed in-service within the study period are assumed to be in-service.

- Winter is the critical period with respect to line and transformer loadings. The assessment is therefore based on winter peak loads.
- Station capacity adequacy is assessed by comparing the non-coincident peak load with the station's normal planning supply capacity, assuming a 90% lagging power factor for stations having no low-voltage capacitor banks. Normal planning supply capacity for transformer stations is determined by the winter 10-day Limited Time Rating (LTR).
- Autotransformers and line capacity adequacy is assessed by using coincident peak loads in the area or supplied station(s). Where a circuit is feeding radial load, the capacity adequacy is assessed by using the connected station's non-coincident peak.
- Adequacy assessment is conducted as per Ontario Resource Transmission Assessment Criteria (ORTAC).
- The East-West Tie Transmission Reinforcement is included in the assessment.
- Hydro-electric generation assumption is taken as the output that is coincident with the region's overall 98% dependable output. Wind generation assumption were modelled by IESO based on their summer and winter capacity contribution factors per IESO Reliability Outlook, multiplied by their peak capacity.
- Sault No.3 circuit will be refurbished and return to network configuration at 115kV.

6 ADEQUACY OF EXISTING FACILITIES

THIS SECTION REVIEWS THE ADEQUACY OF THE EXISTING TRANSMISSION LINE AND TRANSFORMER STATION FACILITIES SUPPLYING THE EAST LAKE SUPERIOR REGION OVER THE PLANNING PERIOD (2019-2038). ALL PROJECTS CURRENTLY UNDERWAY ARE ASSUMED IN-SERVICE.

Within the current regional planning cycle two regional assessments have been conducted for the East Lake Superior Region. The findings of these studies are input to this Regional Infrastructure Plan. The studies are:

- 2019 East Lake Superior Region Needs Assessment ("NA") Report
- 2019 East Lake Superior Region Scoping Assessment ("SA") Report
- 2021 East Lake Superior Integrated Regional Resource Plan ("IRRP") and Appendices

This section provides a review of the adequacy of the transmission lines and stations in the East Lake Superior Region. The adequacy is assessed from a loading perspective using the latest regional load forecast provided in Appendix D. Sustainment aspects were identified in the NA report and are addressed in Section 7 of this report. The review assumes that the following projects shown in Table 6-1 will be in-service. Sections 6.1 to 6.4 present the results of this review.

Table 6-1: New Facilities Assumed In-Service

Facility	In-Service Date
'hot' spare transformer at Echo River TS	2023
115kV Sault No.3 circuit re-conductoring	2024

6.1 230 kV Transmission Facilities

The East Lake Superior 230 kV transmission facilities consist of the following 230 kV transmission circuits (please refer to Figure 3-1 and 3-2):

a) Mississagi TS to Third Line TS 230 kV circuits: P21G and P22G
b) Mississagi TS to Wawa TS 230 kV circuit: P25W and P26W
c) Wawa TS to Mackay TS 230 kV circuits: W23K
d) Mackay TS to Third Line 230 kV circuits: K24G

230kV circuits supplying the region are within their thermal limits as per ORTAC over the study period for the loss of a single 230kV circuit in the region. Voltage concerns is observed when applying multiple contingencies on Bulk Electric System (BES) elements as per performance requirements set out in NERC TLP-001-4.

6.1.1 Voltage Concerns on following the loss of P21G and P22G

P21G and P22G are critical 230kV supply circuits that connects Third Line TS with Mississagi TS. A double circuit loss of P21G and P22G due to them being adjacent circuits on common towers, or the loss of either one circuit, followed by a contingency on the companion circuit would cause voltage decline in violation with ORTAC voltage change limits (i.e., in excess of 10%) at Third Line TS and other 115kV facilities supplied from Third Line TS throughout the planning horizon. Loss of both P21G and P22G will also result in the loss of Third Line autotransformer T1 by configuration. IESO's IRRP has determined that the voltage instability threshold for the region is reached when the GLP inflow interface exceed 230MW and both P21G and P22G are out of service.

Third line TS is equipped with Instantaneous Load Rejection Scheme with six load blocks to be armed for the loss of P21G and P22G, or the loss of T1 and T2. Currently, the IESO will direct HOSSM to arm this scheme via Hydro One's Ontario Grid Control Centre (OGCC) using manual phone call, where IESO will request arming of certain amount of load for rejection depending on prevailing system conditions. HOSSM will prioritize selection of available load blocks. IESO has expressed the need to enable remote arming of this scheme directly from IESO control room to make the arming procedure more efficient. Section 7 will discuss in more detail.

6.2 230/115 kV Autotransformers Facilities

The 230/115 kV autotransformers facilities in the region consist of the following elements:

a. Third Line TS 230/115 kV, 150/200/250MVA autotransformers: T1, T2
b. Mackay TS 230/115 kV, 150/200/250MVA autotransformers: T2

Loading of Third Line TS autotransformers has been identified to approach their 10-day LTR when the companion autotransformer is lost. Loading on companion autotransformer during single event contingency (N-1) would be reduced modestly beyond 2024 when the Sault No.3 circuit returns to a network at 115kV (non-radial configuration).

This is not a firm need as there is no existing violations but this is flagged because loading on Third Line autotransformers is approaching its LTR limit and should continue to be monitored. Despite the fact that one of the autotransformer (T2) has been identified for end-of-life replacement by 2025, such replacement would only marginally improve supply capacity by 10MVA for Third Line's autotransformers due to LTR rating of the existing autotransformer (T1), which was put into service since 2007 and is not near End-of-Life.

6.3 115 kV Transmission Facilities

115kV circuits supplying the region are within their thermal limits as per ORTAC over the study period for the loss of a single transmission element in the region. A list of circuits can be found in Appendix B. Capacity overload is observed on 115kV circuit Algoma No.1 and Sault No.3 following multiple contingencies as per performance requirements set out in NERC TLP-001-4.

6.3.1 Capacity overload on 115kV circuit Algoma No.1

A failure of breaker 214 to operate at Patrick St TS will remove Algoma No.2 and Algoma No. 3 circuits from Third Line TS to Patrick St TS by configuration. This results in thermal overload of the remaining Algoma No. 1 circuit beyond its short-term emergency (STE) rating during peak loads at Patrick St TS, of which Algoma No. 1 is the lowest rated circuit out of the three. This thermal overload on Algoma No. 1 can also occur with one of the Algoma circuits initially out of service, followed by the loss of another Algoma circuit.

This is an existing issue which was also identified in the NA and SA report. This is currently mitigated by the Patrick St TS manual load shedding scheme under which load is curtailed manually at Patrick St TS following the loss of one of the Algoma line circuits. This is done to prevent overloading of the Algoma No. 1 circuit in case the second circuit is also lost. Since this scheme is manual, load has to be shed before the actual contingency of the second circuit has taken place. This scheme was designed as an interim solution until a more permanent solution was implemented. The IRRP has recommended a need for a more permanent solution.

6.3.2 Capacity overload of 115kV circuit Sault No.3

During an outage to either P25W or P26W circuit between Wawa TS to Mississagi TS, a contingency on the K24G circuit between Third Line TS and Mackay TS results in the thermal overload of the Sault No.3 circuit beyond its STE ratings starting in 2023 when No.3 Sault circuit is connected in a network configuration[4]. This phenomenon is a result of high East West Transfer (EWT) flows and losing two circuits that carry that flow. [5]

In addition, when one of the Third Line TS autotransformers is out of service, a Sault No.3 circuit operated as network configuration (after its proposed upgrades) helps to alleviate overloading of the companion Third Line TS autotransformer. However, if the second autotransformer is also lost, Sault No.3 circuit will be overloaded beyond its STE rating and causes a significant voltage decline in the 115kV area served by Third Line TS. The risk of capacity overload on Sault No.3 circuit and area voltage decline as a result of losing both autotransformer is presently mitigated by Third line's Instantaneous Load Rejection scheme. Subjected to the outcome of IESO's 2021 Bulk Planning Study with regards to Sault No.3 overloading, the overloading may continue to be a need.

6.4 Step-Down Transformer Station Facilities

There are a total of 11 step-down transformers stations in the East Lake Superior Region, connected to the 230 kV and 115 kV transmission network as listed below. The stations winter peak load forecast is given in Appendix D.

Table 6-2: East Lake Superior Step-Down Transformer Stations

230 kV Connected	115 kV Connected	
Echo River TS	Andrew TS	Chapleau MTS

[4] Sault No.3 circuit is currently operated radial to Mackay GS (G3) and is being refurbished as part of a sustainment project
[5] EWT is defined as the MW flow at Wawa TS on circuits W21M and W22M. By 2023, EWT tie flow will also include the flow of the new NextBridge circuits.

	Anjigami TS	Goulais TS
	Batchawana TS	Hollingsworth TS
	Clergue TS	Northern Ave TS
	Chapleau DS	St Mary CTS
	Tarentorus CTS	

Capacity of Anjigami T1 / Hollingsworth T1 & T2 are exceeded by end of 2024 based on the load forecast provided by LDC, where Hollingsworth T1 & T2 will be overload when Anjigami T1 is out of service, and vice versa. The overload is caused by loading increases on the 44kV circuit that Anjigami TS and Hollingsworth TS supply in parallel. HOSSM is working with the impacted LDC and have proposed to build a new 115/44kV station, with a proposed name Limer TS (subject to change) that will tap off Hollingsworth 115kV circuit to handle the load increase.

6.5 Bulk Areas Need

There is a potential for significant growth in industrial load in the ELS region over the planning period which would have a material impact on the bulk transmission system outside the region. Hence, the IESO has initiated a bulk planning study for this scenario outside of the regional planning process.

Based on the reference load forecast included in the IRRP, the following bulk system need was identified and will be further coordinated with the bulk planning study described above:

- Following the loss of one of the 230 KV circuits, P25W or P26W circuits from Mississagi TS to Wawa TS, the companion circuit becomes loaded beyond its LTR rating under high westward power flow on the EWT.

Results and recommendations from the bulk planning study would be published separately. HOSSM and HONI will work with IESO to address recommendations as appropriate.

7 REGIONAL NEEDS AND PLANS

THIS SECTION DISCUSSES ELECTRICAL INFRASTRUCTURE NEEDS IN THE EAST LAKE SUPERIOR REGION AND SUMMARIZES THE PLANS DEVELOPED TO ADDRESS THESE NEEDS.

This section outlines and discusses electrical infrastructure needs in the East Lake Superior Region and plans to address these needs. The electrical infrastructure needs encompass both end of life replacement needs identified in the Need Assessment phase, and needs identified in section 6. A list of needs are summarized below in Table 7.1.

Table 7-1: Identified Near and Mid-Term Needs in East Lake Superior Region

Section	Facilities/Circuit	Need	Timing
7.1	Third Line TS/OGCC	Enable remote arming of Third Line TS Instantaneous Load Rejection Scheme	Immediate
7.2	Third Line TS	End of life Protection replacement	2022
7.3	Patrick St TS, Algoma No.1 overload	Automate existing manual load curtailment scheme to meet NERC standards	Immediate
7.4	Echo River TS	Transmission Supply Reliability / End of Life 230kV Breaker replacement	2023/2024
7.5	115kV Sault No.3	Sault No.3 Structure and End of Life Conductor Replacement[6]	2024
7.6	Batchawana TS and Goulais TS	End of Life component replacement	2024
7.7	Patrick St TS	End of Life 115kV breaker replacement	2024
7.8	Third Line TS	T2 End of Life Replacement	2025
7.9	Northern Ave TS	T1 End of Life replacement	2025

[6] To coordinated with IESO's 2021 Bulk Planning Study Regarding Sault No.3 Circuit Overloading

7.10	Anjigami/Hollingsworth TS	Anjigami/Hollingsworth Transformers Overload	2024
7.11	Clergue TS	End of life metal clad switch gear replacement	2026
7.12	Hollingsworth TS	End of life Protection replacement	2026
7.13	Watson TS	End of life metal clad switch gear replacement	2026

7.1 Third Line TS – Enable remote arming of Third Line TS Instantaneous Load Rejection Scheme.

7.1.1 Description

Instantaneous Load Rejection Scheme at Third line TS are designed to respond to the loss of both P21G and P22G, or the loss of both T1 and T2. This scheme is currently armed under the direction of IESO. Upon IESO request, OGCC will manually arm the scheme and prioritized available load blocks for rejection. OGCC has established communication channels to perform arming function via Hydro One Network Management System (NMS).

7.1.2 Alternatives and Recommendation

The following alternatives were considered to address Main TS end-of-life assets need:

1. **Alternative 1 - Maintain Status Quo**: This alternative was considered and rejected as it will not address the manual process involved in arming of the load rejection scheme, as well as the selection of load blocks to be armed. The risk of communication delays between IESO and OGCC is not mitigated.

2. **Alternative 2 – Enable remote arming of Third Line TS Instantaneous Load rejection scheme:** Under this alternative, Hydro One will work with IESO to make necessary control points available on IESO's Energy Management System (EMS) interface such that IESO's control command can be relayed to OGCC's NMS via existing Inter-Control Centre Communication Protocol (ICCP) link, which will subsequently be relayed to Third Line's Instantaneous Load Rejection Scheme.

The Study Team recommends Alternative 2 as the technically preferred and most cost-effective alternative because this will facilitate the automation of dispatch arming from IESO in a real-time setting, and eliminate manual communications delays between IESO and Hydro One. Further, given the ICCP infrastructure already exists, the cost to perform alternative 2 is expect to be limited to control points and status points set up in NMS and EMS respectively, as well as testing activities that can be done in both ends to ensure

functionality. The estimated cost for this upgrade is about $10,000 and is expected to in-service by end of 2021.

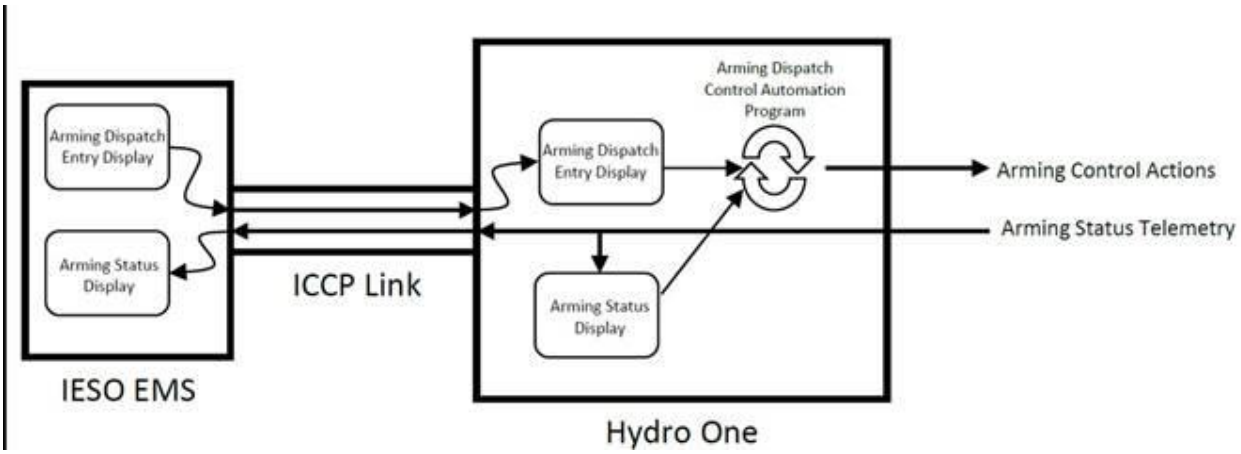

Figure 7-1: ICCP link between IESO and Hydro One.

7.2 Third Line TS – End of life Protection Replacement

7.2.1 Description

Third Line TS is a major transformer station in the region and it consists of two (2) 230/115kV, 150/200/250MVA autotransformers supplied by 230kV circuits K24G, P21G and P22G. Third line TS 115kV station yard supplies multiple load stations via Algoma No. 1, No. 2, No. 3 circuits, No.3 Sault circuit and Northern Ave circuit. It also supplies two (2) LDC HV load supply stations via 115kV circuits GL1SM GL2SM, GL1TA, and GL2TA. Based on an asset condition assessment, P21G's and P22G's line protections are approaching end of life. Further, due to legacy reasons, P21G's and P22G's line protection do not meet standard physical separation requirement .

7.2.2 Alternatives and Recommendation

The following alternatives were considered to address the end-of-life assets need:

1. **Alternative 1 - Maintain Status Quo:** This alternative is rejected as it does not address the risk of failure due to end-of-life asset condition and would result in increased maintenance expenses and reduce supply reliability to the ELS region.

2. **Alternative 2 – Replace end-of-life protection as per current standard:** Under this alternative the existing end-of-life protection will be replaced with new protection relay consistent with Hydro One standard. This alternative will also implement 'A' and 'B' protection separation, which will

bring these protection be in compliance with reliability standards, addresses the end-of-life assets need, minimizes losses and maintains reliable supply to the customers in the area.

The Study Team recommends Alternative 2 – replace end-of-life protection relay. The protection replacement work is expected to be complete by 2022.

7.3 Patrick St TS – Automatic Load Rejection Scheme

7.3.1 Description

Patrick St TS is an 115kV switching station that consists of thirteen (13) 115kV breakers. It connects to Third Line TS – 115kV station yard via 115kV Algoma No. 1, No. 2 and No. 3 circuits. It also connects to Clergue TS via 115kV Clergue No .1 and No. 2 circuits. The station supplies major industrial customers in the Sault Ste. Marie area. Based on IESO IRRP findings, upon a breaker failure of breaker 214, or a contingency on either Algoma No.2 or Algoma No.3 circuit, followed by another contingency on the remaining circuit, Algoma No.1 will be overloaded beyond its STE rating during peak load. At present, a manual load shedding scheme is implemented as an interim solution until a more permanent solution is available.

7.3.2 Alternatives and Recommendation

The following alternatives were considered to address the interim manual load shedding scheme need:

1. **Alternative 1 - Maintain Status Quo:** This alternative is rejected as it does not address the risk of circuit overload during contingency and could result in equipment (overhead conductor) damage, increase public safety risk and reduce supply reliability to connected customers.

2. **Alternative 2 – Implement Automatic Load Rejection Scheme at Patrick St TS:** This alternative would implement an automatic load rejection upon the loss of Algoma No.2 and Algoma No.3 to reject load blocks and respect the existing LTE rating of Algoma No.1 circuit.

Considering above options, the Study Team recommends that Hydro One proceed with Alternative 2, consistent with recommendation from the ELS's IRRP.

7.4 Echo River TS – Install Spare 230kV Transformer (2023) and end of life 230kV breaker replacement (2024)

7.4.1 Description

Echo River TS is a 230kV load supply station. The station consists of a single 230/115/34.5kV autotransformer and a single 230kV circuit breaker (556) to supply two (2) 34.5 kV customer feeders. Historically, load at Echo River TS can be transferred to Northern Ave TS 34.5 kV feeders via the API's distribution system in case of outages at Echo River TS, such as transformer maintenance or failure.

As per the 2nd cycle of Need Assessment completed in Q2 2019 for the ELS region, it has been identified that the existing back up from Northern Ave TS can no longer provide adequate voltage support at peak load during a transformer outage at Echo River TS.

Echo River 230kV breaker 556 is a live tank minimum oil breaker, which has also been identified to be end of life and obsoleted based on asset condition assessment.

7.4.2 Alternatives and Recommendation

The following alternatives were considered to address the end-of-life assets need:

1. **Alternative 1 - Maintain Status Quo:** This alternative is rejected as it does not address system reliability needs and HOSSM asset needs due to asset condition. This alternative would result in increased maintenance expenses and reduce supply reliability to the customers.

2. **Alternative 2 – "Cold" spare 230kV Transformer and replace end of life 230kV breaker :** install a "cold" spare in Echo River TS that is completed with new spill containment only, without 230kV and 34.5kV connection facilities and dedicated protection equipment. The spare will not normally put on potential. This alternative is not recommended as the load restoration time associated with connecting the unit and making it ready to serve load would exceed ORTAC load restoration requirement.

3. **Alternative 3 – "Hot" spare 230kV Transformer and replace end of life 230kV breaker:** install a "hot" spare in Echo River TS that is completed with new 230kV and 34.5kV connection facilities, dedicated protection equipment and new spill containment systems. The spare transformer is usually on potential and ready to serve load upon switching. This alternative can significantly shorten load restoration time to respect ORTAC load restoration timeline in the event of a transformer outage due to maintenance or failure, which improves local transmission supply reliability.

The Study Team recommends Alternative 3 – "Hot" spare 230kV Transformer and replace end of life 230kV breaker. The spare transformer is planned to be completed by 2023, while the breaker replacement work is planned to be completed in 2024. In lieu of replacing the breaker HOSSM will install a 230 kV circuit switcher and enable transfer trip functionality between Echo River TS and it's terminal stations.

7.5 115kV Sault No.3 Structure and Conductor Replacement

7.5.1 Description

Built in 1929, Sault No.3 is a 90 km long 115kV transmission circuit that runs from MacKay TS 115kV station yard to Third Line TS 115kV station yard. This circuit provides an alternative path for local generation to reach load centres close to the Sault Ste. Marie area. Based on asset condition assessment, approximately 70km of the circuit's conductor from Goulais TS (str # 129) to MacKay TS is the original conductor, and has been rated between "Poor" and "Very Poor" as it has multiple component (sleeves) failures. This circuit also accounts for 39% of all line equipment related outages experienced over the 2013 – 2017 period within HOSSM's sytem. The circuit is currently de-rated as a pre-cautionary action to minimize further stress. Due to the de-rating, Sault No.3 circuit is also forced to operate in a radial

configuration to Mackay G3 to limit loading on the line. The end of life replacement work would include 'like for standard' conductor replacement and replacement of selected wood poles along the corridor as condition warrants.

HOSSM has completed the detail project defitnition work for this project. It is noted that the on-going IESO bulk system studies have considered upgrading Sault 3 to 230kV[7] as a potential solution. IESO bulk system studies is expected to be available Q4 2021. Provided that IESO's recommendation is to refurbish the line as per current plan, the project is expected to be completed by 2024.

7.5.2 Alternatives and Recommendation

The following alternatives were considered to address the end-of-life assets need:

1. **Alternative 1 - Maintain Status Quo:** This alternative is rejected as it does not address the risk of failure due to asset condition. Failure of this circuit can impact the power supply to load centres close to the city of Sault Ste. Marie.

2. **Alternative 2 - Replace conductor, structures and associated End-of-Life components with Hydr One standard 115kV equipment:** Under this alternative, the existing conductor and wood pole that are assessed to be end of life will be replaced with new 115 kV rated line and structures. This alternative will also allow Sault No.3 to return to its network configuration.

The Study Team recommends Alternative 2 – the replacement of the end-of-life conductor and wood pole structures between Mackay TS and Goulais TS (str # 129) as it addresses the end-of-life assets need and maintains reliable supply to the customers in the area.

7.6 Batchawana TS and Goulais – End of life Component Replacement

7.6.1 Description

Batchawana TS and Goulais Bay TS are load supply stations with single transformer to supply to the Batchawana Bay and Goulais Bay areas. Goulais Bay TS is about 30 km North of Sault Ste. Marie, while Batchawana TS is about 47 km North of Sault Ste. Marie along Hwy 17. Both are connected to 115kV No.3 Sault circuit. Figure 7-2 below shows geographical location of both station. Based on asset condition assessment, both stations are at End-of-life stage with obsoleted equipment including power transformers, protections (fuse), batteries, chargers, steel structure foundations and remote terminal units. Both stations are also built with legacy design standards and do not provide adequate clearance to today's standard. Their single transformer configuration has also made it difficult to schedule and perform maintenance.

[7] Possibly upgrading to 230kV standard and operate at 115kV until 230kV operation is needed for the bulk system.

Figure 7-2: Batchawana TS and Goulais Bay TS on 115kV circuit

7.6.2 Alternatives and Recommendation

A detailed assessment that analyzed supply options for Batchawana TS and Goulais Bay TS was carried out between HOSSM and API from 2019 -2020 to compare and evaluate supply options based on Transmission and Distribution supply reliability and performances. The assessment compared three (3) different options, they are:

- Option 1: Refurbish both Goulais Bay TS and Batchawana TS using a new 115kV, 3 –phase power transformer, with provision for a 115kV Mobile Unit substation (MUS) connection facility in each station. Transformer capacity to be sized to handle the long term peak forecast of the individual stations.

- Option 2: Consolidate Goulais Bay TS and Batchawana TS into a ‘New’ TS that is equipped with two 20MVA, 3-phase transformer to supply both distribution sub-system at either 12.5kV or 25kV. The location of this ‘New’ TS would be in the vicinity of Goulais bay.

- Option 3: Consolidate Goulais Bay TS and Batchawana TS into a 'New' TS with dedicated 25kV "express feeder" between Goulais and Batchawana. This 'New' TS would be located in the vicinity of Goulais bay, and be equipped with two 20MVA, 3-phase transformer to supply both distribution sub-system at either 12.5kV or 25kV. An additional 25/12.5kV unit is required on the distribution system in the vicinity of Batchawana bay to convert voltage from the incoming 25kV dedicated "express feeder" to 12.5kV in order to supply distribution sub-system in the vicinity of Batchawana bay.

Depending on the choice of distribution voltage, there are two (2) different scenarios (12.5kV vs 25kV) for each option above. Evaluation of alternatives was completed by HOSSM and API as documented in the 2021 East Lake Superior Regional Local Planning Report. As per the report's recommendation, HOSSM is proceeding with option 1 - Refurbish both Goulais Bay TS and Batchawana TS. More details related to the supply option analysis can be found in the Local Planning Report – Supply Option Analysis for Goulais and Batchawana (2020), available on Hydro One public website. Refurbishment for both stations are expected to be completed in 2024.

7.7 Patrick St TS – End of life 115kV breaker replacement

7.7.1 Description

Patrick St TS is an 115kV switching station that consists of thirteen (13) 115kV breakers. It connects to Third Line TS – 115kV station yard via 115kV Algoma No. 1, No. 2 and No. 3 circuits. It also connects to Clergue TS via 115kV Clergue No .1 and No. 2 circuits. The station supplies major industrial customers in the Sault Ste. Marie area. Based on asset condition assessment, breaker 208, 211, 214 and 217 are minimum oil live tank breakers that are considered End of Life and obsolete.

7.7.2 Alternatives and Recommendation

The following alternatives were considered to address the end-of-life assets need:

1. **Alternative 1 - Maintain Status Quo:** This alternative is rejected as it does not address the risk of failure due to asset condition and would result in increased maintenance expenses and reduce supply reliability for customers.

2. **Alternative 2 - Replace the end-of-life breakers with new standard breakers:** This alternative involves the replacement of breaker 208, 211, 214 and 217 with new SF6 breakers in similar ratings.. This alternative is recommended as it addresses the end-of-life asset needs and maintains reliable supply to customers connected at Patrick St TS by reducing the risk of breaker failure; and reducing on-going maintenance cost associated with obsolete breaker technology.

Alternative 2 is recommended. The project is expected to be completed by 2024.

7.8 Third Line TS – T2 End of Life Replacement

7.8.1 Description

Third Line TS is a major transformer station in the region and it consists of two (2) 230/115kV, 150/200/250MVA autotransformers supplied by 230kV circuits K24G, P21G and P22G. Third line TS 115kV station yard supplies multiple load stations via Algoma No. 1, No. 2, No. 3 circuits, No.3 Sault circuit and Northern Ave circuit. It also supplies two (2) PUC HV load supply stations via 115kV circuits GL1SM GL2SM, GL1TA, and GL2TA. Among the 2 autotransformers, T2 is at end of life based on asset condition assessment. Based on long term load forecast, units with similar ratings are required for the end of life autotransformer T2 replacement.

7.8.2 Alternatives and Recommendation

The following alternatives were considered to address the end-of-life assets need:

1. **Alternative 1 - Maintain Status Quo:** This alternative is rejected as it does not address the risk of failure due to asset condition and would result in increased maintenance expenses and reduce supply reliability to the region.

2. **Alternative 2 – Replace T2 with equivalent size unit as per current standard:** This alternative would replace old T2 with a unit that has equivalent rating. This is recommended alternative as it will mitigate risk of autotransformer failure due to its deteriorating conditions and maintain supply reliability of the region.

3. **Alternative 3 – Replace T2 with larger size unit:** This alternative would replace old T2 with a unit that has higher rating. This alternative is rejected as a 230/115kV autotransformer at 150/200/250MVA is currently the highest rating available based on HOSSM and Hydro One standards.

Alternative 2 is recommended. The project is expected to be completed by 2025.

7.9 Northern Ave TS – T1 End of Life Replacement

Northern Ave TS is a 115kV load supply station that is connected to Third Line TS via 115kV Northern Ave circuit. Northern Ave Transformer T1 is a 115/34.5kV, 20/26.7MVA step down transformer that supplies Algoma Power Inc. via one (1) 34.5kV feeder. Transformer T1 is at end of life. Historically, Northern Ave TS has been used as a backup supply to Echo River TS to facilitate outages. Reliance on Northern Ave TS is expected to reduce starting 2023 as the spare unit at Echo River TS comes into service in 2023. The longer term forecast for Northern Ave TS peaks at 2.7MW.

7.9.1 Alternatives and Recommendation

The following alternatives were considered to address the end-of-life assets need:

1. **Alternative 1 - Maintain Status Quo:** This alternative is rejected as it does not address the risk of failure due to asset condition and would result in increased maintenance expenses and reduce supply reliability to connected customers.

2. **Alternative 2 – Replace T1 with a smaller MVA size unit as per current standard:** This alternative would replace T1 with a 'like for similar' unit that has a smaller MVA rating compared to existing T1, and would be adequate for Northern Ave's long term load forecast. This is recommended alternative as it will mitigate risk of transformer failure due to its deteriorating conditions and maintain supply reliability of the station.

Alternative 2 is recommended. The project is expected to be completed by 2025.

7.10 Anjigami/Hollingsworth TS – Transformer overload.

Anjigami TS is a 115kV/44kV load supply station with a single transformer. Hollingsworth TS is a 115kV/12.5kV/44kV station that supplies load on 44kV, and connected to Hollingsworth CGS on the 12.5kV. Anjigami's and Hollingsworth's 44kV feeders are connected to each other with a 10km long 44kV line to supply LDC load on No.4 circuit. Base on LDC load forecast, load increase on 44kV system by end of 2024 would exceed transformer capacity in both Anjigami TS and Hollingsworth TS when the companion station is out of service. HOSSM is working with API and have proposed to build a new 115/44kV station, with a proposed name Limer TS (subject to change) that will tap off Hollingsworth 115kV circuit to handle the load increase.

7.10.1 Alternatives and Recommendation

The following alternatives were considered to address the end-of-life assets need:

1. **Alternative 1 - Maintain Status Quo:** This alternative is rejected as it does not address the transformer capacity needs based on load forecast.

2. **Alternative 2 – Replace Anjigami T1, Hollingsworth T1 and T2 with a larger MVA size units as per current standard to handle load increases:** This alternative is considered but not recommended as both Anjigami TS and Hollingsworth TS have a limited footprint, and site expansion would be required for both sites for such upgrade. Further, due to Hollingsworth TS existing configuration, upgrades are also required on all existing 12.5kV facilities, including disconnect switches, breakers, and overhead bus work to accommodate the load increase.

3. **Alternative 3 – Build new 115/44kV 'Limer TS' that will be supplied from Hollingsworth 115kV circuit, transfer existing LDC load from existing 44kV system to 'Limer TS' :** This alternative would build a new 115/44kV station in the vicinity of Hollingsworth TS and tap off from 115kV Hollingsworth circuit to supply new loads as well as existing load that are presently supplied by Anjigami/Hollingsworth 44kV system. The new station would be similar to a DESN station with two (2) 115/44kV, 50/67/83MVA transformers as per current HONI standard, HV

and LV connection facilities such as circuit switchers and feeder breakers, modern protections and telecommunication systems to service the new load. API will re-route their 44kV feeder(s) and connect to 'Limer TS'.

Given the alternatives above, Alternative 3 is recommended because it is expected to be the most cost efficient alternatives. Compared to Alternative 2, where it will require the coordination of 2 environmental approvals at different sites for site expansion, replacement of three (3) transformer (Anjigami T1, Hollingsworth T1 and T2), and upgrade on existing 12.5kV equipment at Hollingsworth TS, Alternative 3 has a more concise scope. Building new station will also have less outage constraints when compared to upgrading existing facilities. HOSSM will continue to work with API to develop a local solution. The project is expected to be completed by end of 2024/early 2025.

7.11 Clergue TS - End of life metal clad switch gear replacement

Clergue TS is a 115kV station that connects Clergue Generating Station and LSP co-generation station to the HOSSM system via two (2) 115kV circuits emanating from Patrick St TS. Based on an asset condition assessment, the existing 12 kV minimum-oil metal-clad switchgear is at End-of-Life and obsoleted

Based on the load forecast and expected system conditions, similar equipment ratings are required for end of life replacement.

7.11.1 Alternatives and Recommendation

The following alternatives were considered to address the end-of-life assets need:

1. **Alternative 1 - Maintain Status Quo:** This alternative is rejected as it does not address the risk of failure due to asset condition and would result in increased maintenance expenses and reduce supply reliability to connected customers.

2. **Alternative 2 – Replace existing metal clad switch gear with SF6 metal clad switch gear as per current standard:** This alternative would replace existing minimal oil metal clad switch gear with SF6 metal clad switch gear. This is recommended alternative as it will mitigate risk of switch gear failure due to its deteriorating conditions and maintain supply reliability of the station.

Alternative 2 is recommended. The project is expected to be completed by 2026.

7.12 Hollingsworth TS – End of life Protection Replacement

Hollingsworth TS is a 115kV station that connects Hollingsworth Generating Station and is supplied by Hollingsworth 115kV circuit. Majority of protection relay equipment in Hollingsworth TS were in-serviced 2005. Based on asset condition assessment, the existing protection relay would approach end of life by 2025.

7.12.1 Alternatives and Recommendation

The following alternatives were considered to address the end-of-life assets need:

1. **Alternative 1 - Maintain Status Quo:** This alternative is rejected as it does not address the risk of failure due to asset condition and would result in increased maintenance expenses and reduce supply reliability to connected customers.

2. **Alternative 2 – Replace end of life protection with "like for like" protection relay as per current standard:** This alternative would replace identified end of life protection relays with as per current standard. This is recommended alternative as it will mitigate risk of protection relay failure due to their deteriorating conditions and maintain supply reliability to connected customers.

Alternative 2 is recommended. The project is expected to be completed by 2025

7.13 Watson TS - End of life Metal Clad switch gear replacement

DA Watson TS is a 115kV load supply station that also has connectivity with three (3) local hydro generating stations. The station has two 45/60/75 MVA transformers and nine 34.5kV feeders using metal clad switch gear. Based on an asset condition assessment, the existing minimal oil metalclad switch gear are at End of life and obsolete

7.13.1 Alternatives and Recommendation

The following alternatives were considered to address the end-of-life assets need:

1. **Alternative 1 - Maintain Status Quo:** This alternative is rejected as it does not address the risk of failure due to asset condition and would result in increased maintenance expenses and reduce supply reliability to connected customers.

2. **Alternative 2 – Replace existing metal clad switch gear with SF6 metal clad switch gear as per current standard:** This alternative would replace existing minimal oil metal clad switch gear with SF6 metal clad switch gear. This is recommended alternative as it will mitigate risk of equipment failure due to its deteriorating conditions and maintain supply reliability of the station.

Alternative 2 is recommended. The project is expected to be completed by 2026.

8 CONCLUSIONS AND NEXT STEPS

THIS REGIONAL INFRASTRUCTURE PLAN CONCLUDES THE REGIONAL PLANNING PROCESS FOR THE EAST LAKE SUPERIOR REGION.

The major infrastructure investments recommended by the Study Team in the near and mid-term planning horizon are provided in Table 8-1 below, along with their planned in-service date and budgetary estimates for planning purpose.

Table 8-1: Recommended Plans in East Lake Superior Region over the Next 10 Years

No.	Need	Recommended Action Plan	Planned I/S Date	Budgetary Estimate
1	Eliminate/Minimize manual communication between IESO and OGCC when arming Third Line Instantaneous Load Rejection Scheme	Enable remote arming of Third Line Instantaneous Load Rejection Scheme via ICCP line between IESO's EMS and HONI's NMS	2021	$10K
2	Third line TS: End of life Protection	Replace end of life protection per current standard	2022	$0.8M
3	Echo River TS : Transmission Supply Reliability and end of life breaker	Install 'hot' spare transformer and replace end of life breaker	2023/2024	$11.5M
4	115kV Sault No.3: end of life structures and conductor	Replace end of life structure and conductor per current standard[8]	2024	$54.4M
5	Batchawana TS: End of life components	Refurbish Batchawana TS with MUS provision	2024	$6.2M
6	Goulais TS: End of life components	Refurbish Goulais TS with MUS provision	2024	$13.4M
7	Patrick St. TS, Algoma No.1 overload	Implement Automatic Load Rejection Scheme at Patrick St. TS	2023	$1.2M
8	Patrick St. TS: End of life 115kV breaker	Replace end of life 115kV breakers	2024	$3.3M
9	Third Line TS : T2 end of life	Replace end of life T2	2025	$16.4M
10	Northern Ave TS: end of life component replacement	Replace end of life T1 with smaller MVA unit and protection relays per current standard	2025	$2.5M
11	Anjigami/Hollingsworth TS : Transformer overload	Build new 115/44kV Station - HOSSM to work with API to continue to develop solutions	2024/2025	$30M

[8] To coordinated with IESO's 2021 Bulk Planning Study Regarding Sault No.3 Circuit Overloading

12	Clergue TS: End of life metal clad switch gear	Replace end of life switch	2026	$5.2M
13	Hollingsworth TS: End of life Protection relay	Replace end of life protections	2025	$1.1M
14	D.A. Watson TS: End of life metal clad switch gear	Replace end of life switch gear	2026	$9.2M

The Study Team recommends that:

- Hydro One to continue with the implementation of infrastructure investments listed in Table 8-1 while keeping the Study Team apprised of project status;
- Any other identified needs/options in the long-term will be further reviewed by the Study Team in the next regional planning cycle.

NEEDS ASSESSMENT REPORT

East Lake Superior

Date: October 9, 2024

Needs Assessment Report

East Lake Superior

Date: October 9, 2024

Lead Transmitter:

Hydro One Networks Inc.

Prepared by: East Lake Superior Technical Working Group

Page intentionally left blank

Disclaimer

This Needs Assessment (NA) Report was prepared for the purpose of identifying potential needs in the East Lake Superior region and to recommend which needs a) do not require further regional coordination and can be directly addressed by developing a preferred plan as part of the NA phase and b) require further assessment and regional coordination. The results reported in this NA are based on the input and information provided by the Technical Working Group (TWG) for this region at the time. Updates may be made based on best available information throughout the planning process.

The TWG participants, their respective affiliated organizations, and Hydro One Networks Inc. (collectively, "the Authors") shall not, under any circumstances whatsoever, be liable to each other, to any third party for whom the Needs Assessment Report was prepared ("the Intended Third Parties") or to any other third party reading or receiving the Needs Assessment Report ("the Other Third Parties"). The Authors, Intended Third Parties and Other Third Parties acknowledge and agree that: (a) the Authors make no representations or warranties (express, implied, statutory or otherwise) as to this document or its contents, including, without limitation, the accuracy or completeness of the information therein; (b) the Authors, Intended Third Parties and Other Third Parties and their respective employees, directors and agents (the "Representatives") shall be responsible for their respective use of the document and any conclusions derived from its contents; (c) and the Authors will not be liable for any damages resulting from or in any way related to the reliance on, acceptance or use of the document or its contents by the Authors, Intended Third Parties or Other Third Parties or their respective Representatives.

Executive Summary

REGION	East Lake Superior Region (the "Region")		
LEAD	Hydro One Networks Inc. ("HONI")		
START DATE:	June 11, 2024	**END DATE:**	October 9, 2024

1. INTRODUCTION

This is the third cycle of Regional Planning for the region. The second cycle Regional Planning for the East Lake Superior ("ELS") Region was completed in October 2021 with the publication of the Regional Infrastructure Plan ("RIP") report.

The purpose of this Needs Assessment ("NA") is to:

a) Identify any new needs and reaffirm needs identified in the previous Regional Planning cycle; and,

b) Recommend which needs:

i) require further assessment and regional coordination to develop a preferred plan (and hence, proceed to the next phases of regional planning); and,

ii) do not require further regional coordination (i.e., can be addressed directly between a transmitter and the impacted LDC(s) to develop a preferred plan and/or no regional investment is required at this time and the need may be reviewed during the next regional planning cycle).

2. REGIONAL ISSUE/TRIGGER

In accordance with the Regional Planning process, the Regional Planning cycle should be triggered at least once every five years. Considering these timelines, the third Regional Planning cycle was triggered in June 2024 for the ELS Region.

3. SCOPE OF NEEDS ASSESSMENT

The scope of the ELS Region NA includes:

a) Review and reaffirm needs/plans identified in the previous regional planning cycle RIP (as applicable),

b) Identify any new needs resulting from this assessment,

c) Recommend which need(s) requires further assessment and regional coordination in the next phases of the regional planning cycle to develop a preferred plan; and

d) Recommend which needs do not require further regional coordination (i.e., can be addressed directly between connecting transmitter and the impacted LDC(s) to develop a preferred plan

and/or no regional investment is required at this time and the need may be reviewed during the next regional planning cycle).

The TWG may also identify additional needs during the next phases of the planning process, namely Scoping Assessment ("SA"), Integrated Regional Resource Plan ("IRRP"), and RIP, based on updated information available at that time.

The planning horizon for this NA assessment is ten years.

4. REGIONAL DESCRIPTION AND CONNECTION CONFIGURATION

The ELS region spans from Mississagi TS near Wharncliffe to Wawa TS in the township of Wawa, encompassing the city of Sault Ste. Marie. The 230 kV circuits in the Region provide electric power to the Region and facilitate power flow across the province. The 115 kV network emanating from Third Line TS supplies majority of the load in the city of Sault Ste. Marie, whereas the 115 kV network at Mackay TS connects local wind and hydro generation to the transmission network. The 115 kV system out of Wawa TS is used to supply local load and to connect local generation in the area.

5. INPUTS/DATA

The TWG comprises of representatives from Local Distribution Companies ("LDC"), the Independent Electricity System Operator ("IESO"), PUC-Transmission LP and Hydro One and provides input and relevant information for the ELS Region regarding capacity needs, reliability needs, operational issues, and major high-voltage ("HV") transmission assets requiring replacement over the planning horizon. The LDCs also capture input from municipalities in the development of their 10-year summer and winter load forecast.

In accordance with the regional planning process, stakeholder engagement takes place during the IRRP phase.

6. ASSESSMENT METHODOLOGY

The assessment's primary objective is to identify the electrical infrastructure needs in the Region over the 10-year planning horizon. The assessment methodology includes a review of planning information such as load forecast (which factors various demand drivers and consideration of MEPs and/or CEPs where available), conservation and demand management ("CDM") forecast, distributed generation ("DG") forecast, system reliability and operation, and major HV transmission assets requiring replacement.

A technical assessment of needs is undertaken based on:

a) Current and future station capacity and transmission adequacy;

b) System reliability needs and operational concerns;

c) Major HV transmission equipment requiring replacement with consideration to "right-sizing"; and,

d) Sensitivity analysis to capture uncertainty in the load forecast as well as variability of demand drivers such as electrification.

7. NEEDS

I. Updates on needs identified during the previous regional planning cycle

The following needs and projects discussed in the second ELS RIP cycle have been completed.

- Providing remote arming of Third Line TS Instantaneous Load Rejection ("ILR") scheme to the IESO: completed in 2023/2024.
- Echo River TS – Install new transformer and breaker replacement: project completed in 2024.

Needs from the second ELS RIP cycle that already have a planned project are shown below.

- Third Line TS – End-of-life P21G/P22G protection replacement: planned in-service year for the project is 2027.
- Third Line TS – Autotransformer T2 replacement: planned in-service year for the project is 2027.
- Sault No.3 – End-of-life Line replacement: planned in-service year for the project is 2026.
- Batchawana TS – End-of-life components replacement: Algoma Power Inc ("API") has requested Hydro One Sault Ste. Marie ("HOSSM") to procure equipment and build the LV yard capable of operating at 25 kV in the future. The project is being executed with expected completion in Q4 2024.
- Goulais TS – End-of-life components replacement: API has requested HOSSM to procure equipment and build the LV yard capable of operating at 25 kV in the future. API has also requested for another feeder position to improve reliability within their distribution system. API and HOSSM are to continue coordination activities. Planned in-service year for the project is 2028.
- Patrick St. TS – End-of-life 115 kV breaker replacement: planned in-service year for the project is 2028.
- Northern Ave TS – End-of-life Transformer T1 replacement: planned in-service year for the project is 2030.
- Clergue TS – End-of-life Metal clad switchgear replacement: planned in-service year for the project is 2028.
- Hollingsworth TS – End-of-life protection replacement: planned in-service year for the project is 2031.
- D.A. Watson – End-of-life Metal clad switchgear replacement: planned in-service year for the project is 2031.

II. Newly identified needs or needs requiring further review

a) Asset Renewal for Major HV Transmission Equipment

- St. Mary's MTS and Tarentorous MTS – station refurbishment/upgrade

b) Transformation Capacity

- Anjigami TS and Hollingsworth TS – transformer overload due to growing demand in the load pocket.
- Third Line TS – 230/115 kV autotransformer reaches 90% of LTR upon the loss of companion unit.
- Tagona West TS – 230/115 kV autotransformer overload upon the loss of companion unit.

c) Transmission System Capacity

- Algoma No.1/ No.2/ No.3 – circuit overload after loss of any two Algoma circuits.
- Sault No. 3 – circuit overload.

d) Voltage Performance

- Voltage violation at Third Line TS after the loss of both autotransformers.

e) System Reliability, Operation and Load restoration

- Third Line TS – voltage limitations: The 115 kV bus can only be operated in a narrow range of 118 kV – 124 kV

8. SENSITIVITY ANALYSIS

The objective of a sensitivity analysis is to capture uncertainty in the load forecast as well as variability of electric demand drivers to identify any emerging needs and/or advancement or deferment of recommended investments. Due to the nature of load inquiries in the Region, the TWG agreed to assess sensitivity scenarios by adding a large load of 200 MW at the following locations in the Region:

a. Double circuit tap to the new 230 kV circuits P23G/P24G
b. Direct connection to 230 kV bus at Tagona West TS
c. Direct connection to 230 kV bus at Mackay TS

As per the sensitivity analysis, no new needs arise due to the addition of a large load in the ELS region. However, the analysis does indicate a few emerging needs that can be monitored as the load in the region grows. Based on the analysis findings no immediate action is required.

9. RECOMMENDATIONS

The TWG recommendations are as follows:

I. Needs that require further assessment and regional coordination

These needs may have broader regional impacts and require further assessment and coordination during the next phases[1] of the Regional Planning cycle. A list of these needs is provided below.

- St. Mary's MTS and Tarentorous MTS – need is recommended for further review in the next phases of RP.
- Third Line TS – 230/115 kV autotransformer reaches 90% of LTR upon the loss of companion unit: Continue to monitor the loading of the autotransformers at Third Line TS.
- Tagona West TS – 230/115 kV autotransformer overload upon the loss of companion unit: PUC Transmission intends to implement manual load reduction with connecting load customer to mitigate the need. To be further studied as part of the System Impact Assessment ("SIA") and accordingly documented in the next phases of RP.
- Algoma No.1/ No.2/ No.3 – circuit overload after loss of any two Algoma circuits: Need can be mitigated by cross-tripping overloaded circuit using the Third Line RAS, rejecting all load at Patrick St. TS. Recommended to review refining the amount of load rejected in the next phases of RP.
- Sault No.3 – circuit overload: During an outage of P25W or P26W, a loss of K24G can result in an overload of Sault No.3. The need can be mitigated by cross-tripping Sault No.3 using Mackay Generation Rejection scheme. Recommended to review necessity of Sault No.3 cross-trip in the next phases of RP, in coordination with SIA for the new northeast bulk projects.
- Voltage violation at Third Line TS: The violations can be mitigated by using Load Rejection (LR) schemes and/or RAS at Third Line TS. Recommended to review the necessity Third Line TS LRs and RAS contingencies in the next phases of RP, in coordination with SIA for the new northeast bulk projects.
- Third Line TS – 115 kV voltage limitations: Existing voltage limit at Third Line TS 115 kV bus is restricted to operate between 118 kV - 124 kV range. Recommended to monitor need until PUC Distribution replaces existing transformers with new units equipped with ULTC at St. Mary's MTS and Tarentorous MTS.

II. Needs that do not require further regional coordination

These needs are local in nature and do not have a regional impact. They can be addressed by a straightforward transmission and/or distribution wires solution. They do not require investment in any upstream transmission facility or require Leave to Construct (i.e., Section 92) approvals. These needs

[1] Non-wires options are further considered (i.e. incremental to CDM and DG that is considered in this NA) as potential options in addressing these needs during the IRRP phase.

generally impact a limited number of LDCs and can be addressed directly between applicable transmitter(s) and the LDC(s) to develop a preferred local plan. The need is provided below:

- Anjigami TS and Hollingsworth TS – transformer overload: Assess solution options via a Local Plan between API and HOSSM.

All LDCs in the TWG will be participating in further Regional Planning activities.

1. INTRODUCTION

The second cycle of the Regional Planning ("RP") process for the East Lake Superior (''ELS'') region (the "Region") was completed in October 2021 with the publication of the Regional Infrastructure Plan ("RIP") Report. The RIP report included a common discussion of all the options and recommended plans for preferred wire infrastructure investments to address the near- and medium-term needs.

This Needs Assessment initiates the third regional planning cycle for the ELS Region. The purpose of this Needs Assessment ("NA") is to:

a) Identify any new needs and reaffirm needs identified in the previous regional planning cycle; and,
b) Recommend which needs:
   i) require further assessment and regional coordination to develop a preferred plan (and hence, proceed to the next phases of regional planning); and,
   ii) do not require further regional coordination (i.e., can be addressed directly between transmitter(s) and the impacted LDC(s) to develop a preferred plan and/or no regional investment is required at this time and the need may be reviewed during the next regional planning cycle).

A flow chart of the Regional Planning Process is shown in Figure 1 below.

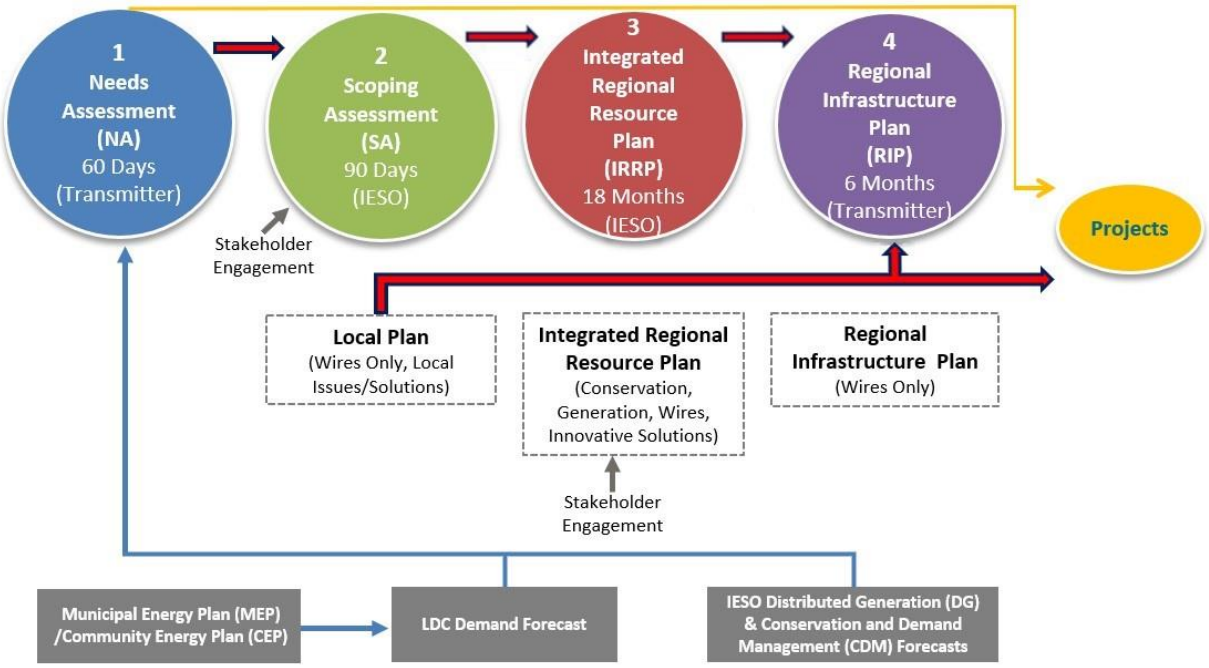

Figure 1: Regional Planning Process

This report was prepared by the ELS Technical Working Group ("TWG"), led by Hydro One Networks Inc (Transmission). The report presents the results of the assessment based on information provided by the

transmitters, the Local Distribution Companies ("LDC") and the Independent Electricity System Operator ("IESO"). Participants of the TWG are listed below in Table 1.

Table 1: East Lake Superior Region TWG Participants

Sr. no.	Name of TWG Participants
1	Algoma Power Inc.
2	PUC Transmission
3	PUC Distribution
4	Hydro One Transmission (HONI, HOSSM)
5	Hydro One Distribution
6	Independent Electricity System Operator

2. REGIONAL ISSUE/TRIGGER

In accordance with the Regional Planning process, the Regional Planning cycle should be triggered at least once every five years. As such, the third Regional Planning cycle was triggered for the ELS region.

3. SCOPE OF NEEDS ASSESSMENT

The scope of this NA covers the East Lake Superior region and includes:

- Review and reaffirm needs/plans identified in the previous cycle RIP (as applicable),
- Identify any new needs resulting from this assessment,
- Recommend which need(s) requires further assessment and regional coordination in the next phases of the regional planning cycle to develop a preferred plan; and,
- Recommend which needs do not require further regional coordination (i.e., can be addressed directly between the connecting transmitter(s) and the impacted LDC(s) to develop a preferred plan and/or no regional investment is required at this time and the need may be reviewed during the next regional planning cycle).

The Technical Working Group ("TWG") may also identify additional needs during the next phases of the planning process, namely Scoping Assessment ("SA"), Integrated Regional Resource Plan ("IRRP"), Local plan ("LP") and RIP, based on updated information available at that time.

The planning horizon for this NA assessment is 10 years.

4. REGIONAL DESCRIPTION AND CONNECTION CONFIGURATION

The ELS region spans from Mississagi Transformer Station ("TS") near Wharncliffe, Ontario to Wawa TS in the town of Wawa, Ontario encompassing the city of Sault Ste. Marie and surrounding areas. The newly formed transmitter, PUC Transmission LP along with Hydro One Sault Ste. Marie ("HOSSM") and Hydro One Network Inc. are the three transmitters in the Region. Algoma Power Inc., PUC Distribution and Hydro One Distribution are the three LDCs in the Region responsible for distribution of electric power to residential, commercial and industrial customers at sub-transmission levels (69 kV and under).

The 230 kV circuits in the Region provide bulk electric power to the Region and facilitate power flow across the province. The 115 kV network emanating from Third Line TS supplies majority of the load in the city of Sault Ste. Marie, whereas the 115 kV network at Mackay TS connects local wind and hydro generation to the transmission network. The 115 kV system out of Wawa TS is used to supply local load and to connect local generation in the area.

After conclusion of the last regional planning cycle in 2021, the IESO completed bulk system studies for northeast Ontario and issued a study report in October 2022. An additional voltage study report identifying reactive requirements for northern Ontario was published in December 2023. The reports recommended the following infrastructure projects to supply growing electricity demand in Sault Ste. Marie and Timmins.

i. A new 500 kV line between Hanmer TS and Mississagi TS – Planned completion by 2029.
ii. A new 230 kV double circuit line between Mississagi TS and Third Line TS – Planned completion by 2029. The nomenclature used for the new circuits in this report is P23G and P24G and is subject to change in the future.
iii. A new 230 kV line between Porcupine TS and Wawa TS, built to operate at 500 kV in the future – Planned completion by 2030.
iv. Reactive devices identified in the voltage study:
    - One new -120 Mvar line reactor at Mississagi TS end for the new 500 kV line between Hanmer TS and Mississagi TS – Planned completion by 2029.
    - One new +/-100 Mvar STATCOM at Mississagi TS (230 kV) – Planned completion by 2029.
    - One new +/-100 Mvar STATCOM at Algoma TS – Planned completion by 2029.

In addition to the bulk reinforcement projects, the newly formed transmitter PUC Transmission, will build a new 230 kV double circuit line from Third Line TS to a new station named Tagona West TS which will

facilitate supply of electric power to the new Electric Arc Furnaces ("EAF") facility. Planned completion of the project is within the assessment study period.

The geographical boundaries of the East Lake Superior region are shown in Figure 2 below.

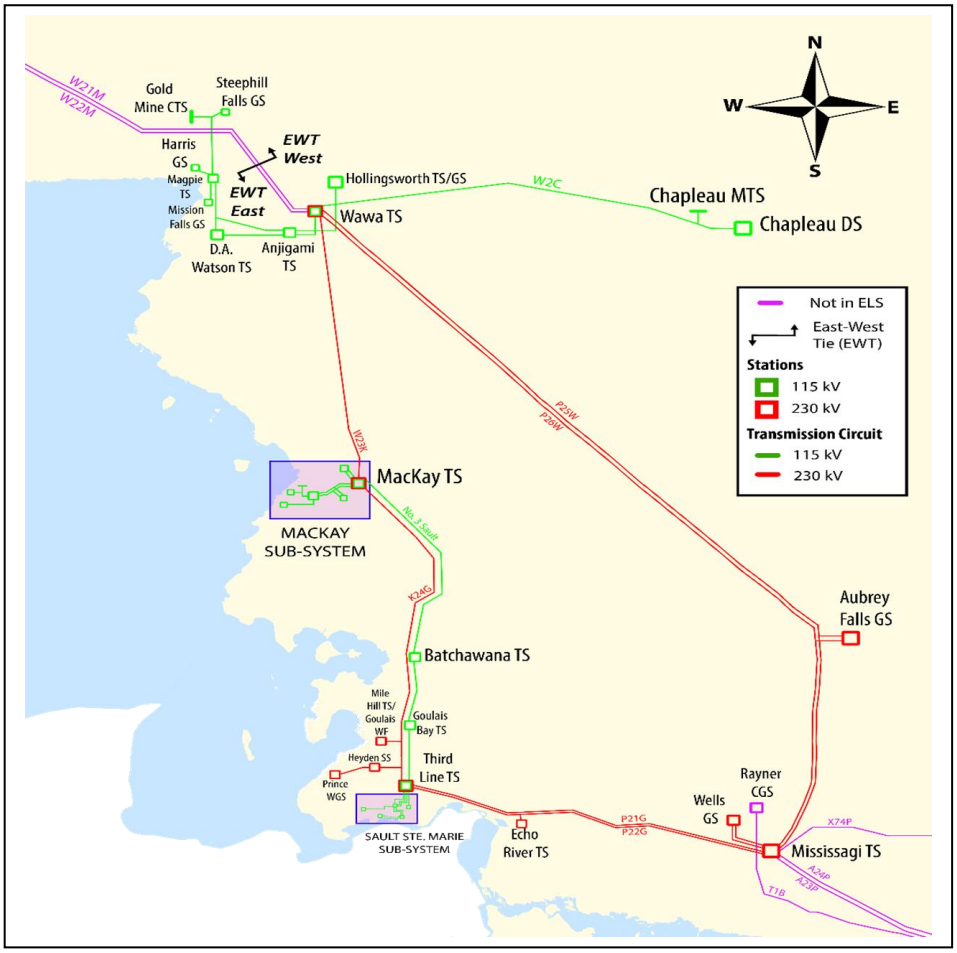

Figure 2: Map of East Lake Superior Regional Planning Area

The circuits and stations of the area are summarized in the Table 2 below:

Table 2: Transmission Station and Circuits in the ELS Region

44 kV circuits	115 kV circuits	230 kV circuits	Transformer Stations	Generation Stations
Anjigami No.1, Limer No.1	Sault No.3, Algoma No.1 / No.2 / No.3, Northern Ave 115kV, GL1SM, GL2SM, GL1TA, GL1TA, Leigh's Bay 115kV, Clergue No.1 / No.2, Mackay No.1 / No.2, Gartshore No.1 / No.2, Hogg 115kV, Andrew 115kV, Mission falls 115kV, Steephill 115kV, Harris 115kV, Magpie 115kV, High Falls No.1/No.2, Hollingsworth 115kV	P21G, P22G; P25W, P26W; K24G; W23K; **Planned ccts:** P23G, P24G; Third Line x Tagona W (double circuit)	Andrews TS, Anjigami TS, Batchawana TS, Chapleau DS, Chapleau MTS, Clergue TS, D.A. Figure 3: East Lake Superior Transmission Single Line Diagram

5. INPUTS AND DATA

The TWG participants provided information and input required for the preparation of the Needs Assessment report. With respect to the load forecast information, the OEB Regional Planning Process Advisory Group (RPPAG) recently published a document called “Load Forecast Guideline for Ontario” in October 2022. The objective of this document is to provide guidance to the TWG in the development of the load forecasts used in the various phases of the regional planning process with a focus on the NA and the IRRP. One of the inputs into the LDC’s load forecast that is called for in this guideline is information from Municipal Energy Plans (MEP) and/or Community Energy Plans (CEP). The list of all the Municipalities falling under the geographical boundaries of the region are given in Appendix E.

The information provided includes the following:

- The ELS region 10-year Load Forecast for all supply stations is inclusive of the inputs provided by the municipalities through their MEPs & CEPs and through LDCs engagement with the municipalities and communities.

- Known capacity and reliability needs, operating issues, and/or major assets requiring replacement/ refurbishment.
- Planned/foreseen transmission and distribution investments that are relevant to Regional Planning for the ELS region.
- Captured uncertainty in the load forecast as well as variability of electric demand drivers to identify any emerging needs and/or advancement or deferment of recommended investments.

6. ASSESSMENT METHODOLOGY

The following methodology and assumptions are made in development of this Needs Assessment:

6.1 Technical Assessments and Study Assumptions

The technical assessment of needs was undertaken based on:

- Current and future station capacity and transmission adequacy.
- System reliability and operational considerations.
- Asset renewal for major high voltage transmission equipment requiring replacement with consideration to “right-sizing”.
- Load forecast data provided by LDCs and industrial customers in the region.
- 115 kV circuit Sault No. 3 is operating in network configuration between Third Line TS and Mackay TS.
- Existing load at Tarentorous MTS is assumed to be moved to the new Tagona West TS by 2030.
- This assessment is based on extreme summer and winter peak loads. The sensitivity scenario was developed by adding a large load at different locations in the region to conduct an analysis to cover unforeseen developments such as large industrial loads or higher than expected EV charging demand.

The following other assumptions are made in this report:

- The 10-year study period for this Needs Assessment is 2024-2033.
- The Region is winter peaking; however this assessment is based on summer and winter peak loads to account for equipment ratings often being more limiting in the summer.
- Line and autotransformer capacity adequacy is assessed by using coincident peak loads in the area.
- Load serving station capacity adequacy is assessed by comparing the non-coincident peak load with the station’s normal planning supply capacity, assuming a 90% lagging power factor for stations having no low-voltage capacitor banks and 95% lagging power factor for stations having low-voltage capacitor banks.
- Normal planning supply capacity for Hydro One transformer stations is determined by the summer 10-Day Limited Time Rating (LTR) of a single transformer for Hydro One stations.

- Adequacy assessment is conducted as per Ontario Resource Transmission Assessment Criteria (ORTAC).

6.2 Information Gathering process

6.2.1. Load forecast:

The LDCs provided their load forecast for summer and winter season for all the stations supplying their loads in the ELS region for the 10-year study period including the inputs from the municipalities such as MEPs and CEPs. The IESO provided a Conservation and Demand Management ("CDM"), and Distributed Generation ("DG") forecast for the ELS region. The region's extreme summer/winter non-coincident peak gross load forecasts for each station were prepared by applying the LDC load forecast growth rates to the actual 2023 summer and winter peak extreme weather corrected loads. The extreme summer and winter weather correction factors were provided by Hydro One. The net extreme seasonal weather load forecasts were produced by reducing the gross load forecasts for each station by the percentage CDM and then by the amount of effective DG capacity provided by the IESO for that station. It is to be noted that as contracts for existing DG resources in the region begin to expire, the load forecast may show a decreasing contribution from local DG resources, and an increase in net demand. This extreme summer and winter weather corrected net load forecast for the individual stations in the ELS region is given in Appendix A. The region's extreme winter coincident net load forecast graph is provided in Figure 5. The graph shows the growth of the region within the study period of 2024 – 2033. In 2033, the Region's coincident peak is forecast to be approximately 762 MW.

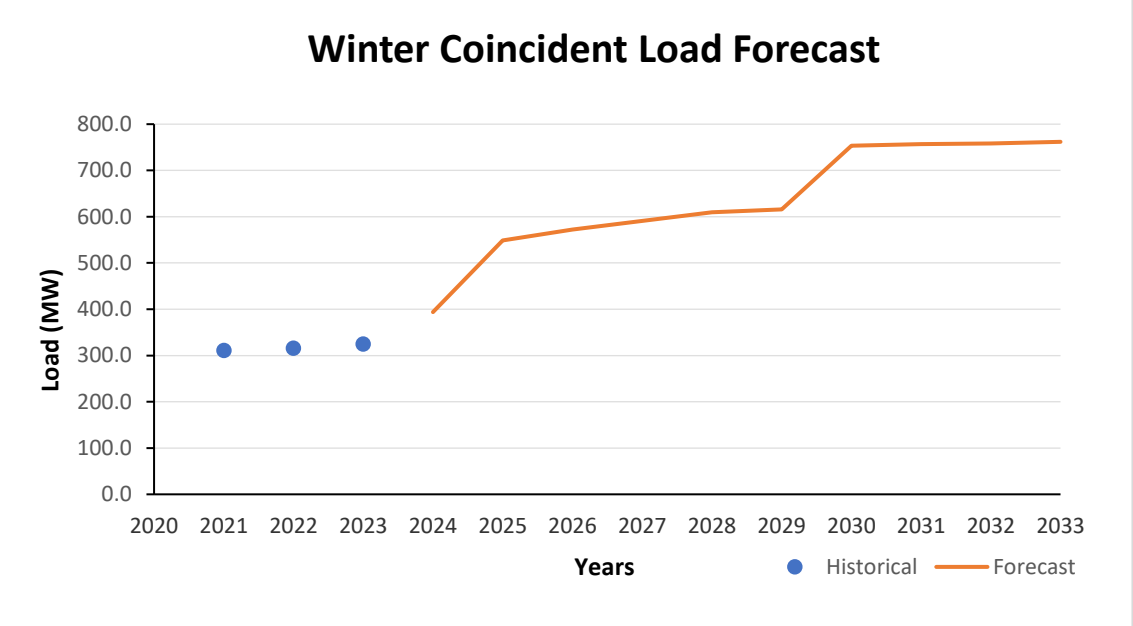

Figure 4: Winter Coincident Load Forecast

6.2.2. Sensitivity Analysis:

A sensitivity analysis was undertaken by the TWG to capture uncertainty in the load forecast as well as variability of drivers such as electrification. The NA recommendations are not necessarily linked to sensitivity scenarios; but rather the sensitivity is used to identify any emerging needs for consideration in developing recommendations. The impact of sensitivity analysis are provided in section 8 of this report.

6.2.3. Asset renewal Needs for Major HV Equipment:

Section 7.1 lists major HV transmission equipment planned and/or identified to be refurbished and/or replaced based on asset condition assessment, relevant for Regional Planning purposes. This includes HV transformers, autotransformers, HV breakers, HV underground cables and overhead lines.

6.2.4. System Reliability and Operational Issues:

Relevant information regarding system reliability and operational issues in the region as feedback provided by the IESO and Hydro One Operations during the NA phase.

7. NEEDS

This section describes emerging new needs identified in the Region and/or updates on previously identified needs since the completion of previous regional planning cycle.

Needs identified and discussed in the previous regional planning cycle, along with associated projects recently completed, as well as reaffirmed needs currently in progress, are briefly outlined below with relevant updates. These will not be discussed further in the report. These projects include:

1. Providing remote arming of Third Line TS Instantaneous Load Rejection ("ILR") scheme to the IESO – completed in 2023/2024.
2. Third Line TS – End-of-life P21G/P22G protection replacement: planned in-service year for the project is 2027.
3. Third Line TS – Autotransformer T2 replacement: planned in-service year for the project is 2027.
4. Echo River TS – Install new transformer and breaker replacement: project completed in 2024.
5. Sault No.3 – End-of-life Line replacement: planned in-service year for the project is 2026.
6. Batchawana TS – End-of-life components replacement: API has requested HOSSM to procure equipment and build the LV yard capable of operating at 25 kV in the future. The project is being executed with expected completion in Q4 2024.
7. Goulais TS – End-of-life components replacement: API has requested HOSSM to procure equipment and build the LV yard capable of operating at 25 kV in the future. API has also

requested for another feeder position to improve reliability within their distribution system. API and HOSSM are to continue coordination activities. Planned in-service year for the project is 2028.

8. Patrick St. TS – End-of-life 115 kV breaker replacement: planned in-service year for the project is 2028.
9. Northern Ave TS – End-of-life Transformer T1 replacement: planned in-service year for the project is 2030.
10. Clergue TS – End-of-life Metal clad switchgear replacement: planned in-service year for the project is 2028.
11. Hollingsworth TS – End-of-life protection replacement: planned in-service year for the project is 2031.
12. D.A. Watson – End-of-life Metal clad switchgear replacement: planned in-service year for the project is 2031.

Note: The planned in-service year for the above projects is tentative and is subject to change.

All near, and mid-term needs that are discussed as a part of this report are summarized in Table 3 below.

Table 3: Near/Mid-term Needs Identified in Previous RIP and/or this NA

Need Description	Recommended Plan/Update	Previous RIP Report Section	NA Report Section
Asset Renewal Needs			
St. Mary's MTS and Tarentorous MTS – station refurbishment/upgrade	Recommended for further review in the next phases of RP.	N/A	7.1.1
Station Capacity Needs			
Anjigami TS and Hollingsworth TS – transformer overload	Assess solution options via a Local Plan between API and HOSSM.	7.10	7.2.1
Third Line TS – 230/115 kV autotransformer reaches 90% of LTR upon the loss of companion unit	Continue to monitor the loading of the autotransformers at Third Line TS.	6.2	7.2.2
Tagona West TS – 230/115 kV autotransformer overload upon the loss of companion unit	PUC Transmission intends to implement manual load reduction to mitigate the need. Recommended for further study as part of the SIA and accordingly documented in the next phases of RP.	N/A	7.2.3
Transmission Line Capacity Needs			
Algoma No.1/ No.2/ No.3 – circuit overload after loss of any two Algoma circuits	Need can be mitigated by cross-tripping overloaded circuit using the Third Line RAS, rejecting all load at Patrick St. TS.	7.3	7.3.1

	Recommended for further review in the next phases of RP.		
Sault No. 3 – circuit overload	Need can be mitigated by cross-tripping Sault No.3 upon the loss of K24G (during a P25W or P26W outage) using Mackay Generation Rejection scheme. Recommended to review necessity of Sault No.3 cross-trip in the next phases of RP, in coordination with SIA for the new northeast bulk projects.	6.3.2	7.3.2
Voltage Performance			
Voltage violation at Third Line TS	The violations can be mitigated by using Load Rejection (LR) schemes and/or RAS at Third Line TS. Recommended to review the necessity Third Line TS LRs and RAS contingencies in the next phases of RP, in coordination with SIA for the new northeast bulk projects.	6.1.1	7.4.1
System Reliability, Operation and Load restoration Needs			
Third Line TS – 115 kV voltage limitations	Existing voltage limit at Third Line TS 115 kV bus is restricted to operate between 118 kV - 124 kV range. Recommended to monitor need until PUC Distribution replaces existing transformers with new units equipped with ULTC at St. Mary's MTS.	N/A	7.5.1

7.1 Asset Renewal Needs for Major HV Transmission Equipment

In addition to the previously identified asset renewal needs from the second regional planning cycle, the TWG has also identified new asset renewal needs for major equipment that are expected to be replaced over the next 10 years in the ELS Region. The list of major HV transmission equipment requiring replacement in the ELS Region is provided in table 4 in this section.

Asset Replacement needs are determined by asset condition assessment. Asset condition assessment is based on a range of considerations such as:

- Equipment deterioration due to aging infrastructure or other factors
- Technical obsolescence due to outdated design
- Lack of spare parts availability or manufacturer support

- Potential health and safety hazards, etc.

The major equipment information shared and discussed as part of this process is listed below:

- 230/115 kV autotransformers
- 230 kV and 115 kV load serving step down transformers
- 230 kV and 115kV breakers where:
  Replacement of six breakers or more than 50% of station breakers, the lesser of the two
- 115 kV transmission lines requiring refurbishment where:
  Leave to Construct (i.e., section 92) approval is required for any alternative to like-for-like

The Asset renewal assessment considers the following options for "right sizing" the equipment:

- Maintaining the status quo
- Replacing equipment with similar equipment with *lower* ratings and built to current standards
- Replacing equipment with similar equipment with *lower* ratings and built to current standards by transferring some load to other existing facilities
- Eliminating equipment by transferring all the load to other existing facilities
- Replacing equipment with similar equipment and built to current standards (i.e., "like-for-like" replacement)
- Replacing equipment with higher ratings and built to current standards

From Hydro One's perspective as a facility owner and operator of its transmission equipment, do nothing is generally not an option for major HV equipment due to safety and reliability risk of equipment failure. This also results in increased maintenance cost and longer duration of customer outages.

Table 4: Major HV Transmission Asset assessed for Replacement in the region (New)

Station/Circuit	Need Description	Planned ISD
St. Mary's MTS and Tarentorous MTS	Station Refurbishment/Upgrade	2030

7.1.1 St. Mary's MTS and Tarentorous MTS – Station Upgrade

St. Mary's MTS and Tarentorus MTS are 115/34.5 kV transformer stations owned and operated by PUC Distribution in the city of Sault Ste. Marie. Each station is supplied by two (2) 115 kV circuits from Third Line TS, has four (4) 30 MVA, 115/34.5 kV step-down transformers and four (4) 115 kV disconnect switches. All assets in both stations are approaching end-of-life and recommended for replacement in the near to mid-term planning horizon.

PUC Distribution retained a consultant to assess alternatives for station refurbishment/upgrade for both stations. As part of the assessment, alternatives to change primary supply voltage from 115 kV to 230 kV

at Third Line TS were investigated. The assessment also investigated retiring Tarentorous MTS and moving the station load from Third Line TS to the new Tagona West TS.

The TWG recommends to further review the need in the next Regional Planning phases.

7.2 Station Capacity Needs

A Station Capacity assessment was performed over the study period 2024-2033 for the 230 kV and 115 kV transformer stations in the Region using either the summer or winter peak load forecasts that were provided by the Technical Working Group. Based on the results, the following station capacity needs have been identified in the during the study period:

7.2.1 Anjigami TS and Hollingsworth TS – Transformer Overload

Anjigami TS has a 40 MVA, 115/44 kV transformer supplying a 44 kV circuit named Anjigami No.1. Hollingsworth TS has a 28 MVA, 115/11.5 kV transformer (T1), and a 28 MVA, 11.5/44 kV transformer (T2) supplying a 44 kV circuit, Limer No.1. Anjigami TS and Hollingsworth TS supply the same the load pocket. The 44 kV circuits are connected at Highway 101 SS forming a closed loop between the two stations. See figure 4 below.

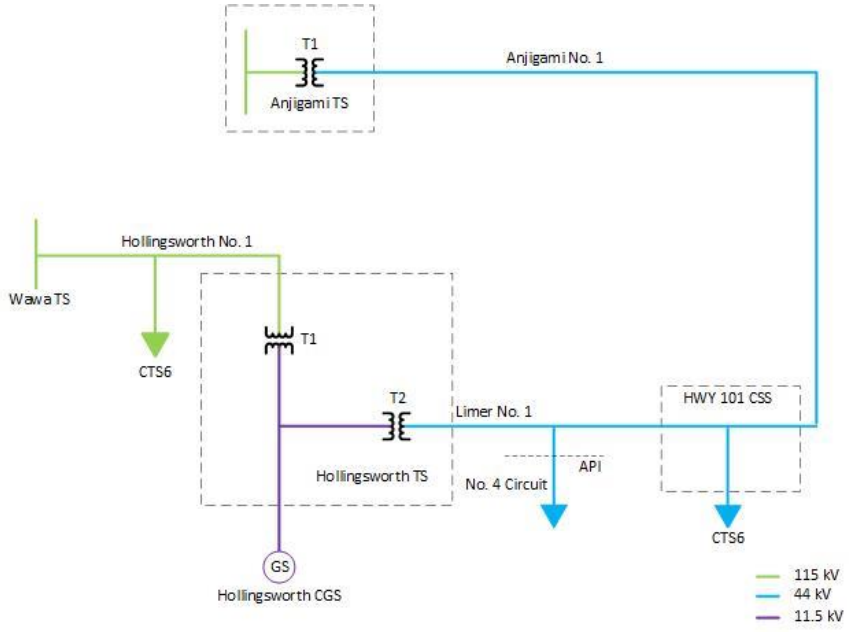

Figure 5: Anjigami TS and Hollingsworth TS - Single Line Diagram

The LDC supplied by the 44 kV circuit, API has recently experienced load growth, from 15 MW to 25 MW, in this pocket. As a result, a loss of supply from Anjigami TS results in thermal overload of both transformers and two (2) 11.5 kV disconnect switches at Hollingsworth TS, when the load exceeds 22 MW.

API will restrict their load to 22 MW to respect the thermal ratings of the equipment at Hollingsworth TS, as an interim measure. An industrial customer in the load pocket is also looking to increase their load from 1 MW to approximately 11 MW by year 2029. If all load increase materializes, a loss of supply from Hollingsworth TS will result in overload of transformer at Anjigami TS. Hence, both stations are at or approaching their maximum capacity to supply load.

A long-term solution is required to address the growing demand in the 44 kV pocket. The capacity needs are confined to customers in this 44 kV pocket. Hence, the TWG recommends further assessing potential solutions via a Local Plan between API and HOSSM.

7.2.2 Third Line TS – 230/115 kV Autotransformer Overload

Third Line TS has two (2) 250 MVA, 230/115 kV autotransformers presently supplying majority of the load in the city of Sault Ste. Marie. In the previous Regional Planning cycle, it was observed that loss of one autotransformer causes the companion autotransformer to be loaded close to its LTR thermal rating. As part of their asset renewal strategy, PUC Distribution is looking at an alternative to retire Tarentorous MTS and move load to the new Tagona West TS (section 7.1.1). If they decide to do so, the loss of an autotransformer will not result in overload of the companion unit, hence mitigating the emerging need. However, if Tarentorous MTS load is not moved to Tagona West TS, the same contingency will result in the companion autotransformer at approximately 90% LTR loading in year 2033.

In the previously RP cycle, the TWG recommended monitoring the total load supplied by autotransformers at Third Line TS. The TWG maintains the recommendation to monitor the loading of the autotransformers at Third Line TS.

7.2.3 Tagona West TS – 230/115 kV Autotransformer Overload

PUC Transmission will build a new 230/115 kV station called Tagona West TS to supply 300 MW of electric power to the new EAF facility through its 115 kV bus. Tagona West TS will connect to Third Line TS via two (2) 230 kV circuits and will have two (2) 200 MVA, 230/115 kV autotransformers that supply load to the 115 kV bus. The autotransformers will not have overload capability.

For the loss of one of the autotransformers at the new Tagona West TS the companion autotransformer will overload beyond its thermal rating under peak EAF load. PUC Transmission intends to have an agreement with their customer to manually reduce the EAF load so that it is within the thermal rating of their autotransformers under such circumstances. TWG recommends the mitigation measure to be reviewed in the SIA process and documented in the next phases of Regional Planning.

7.3 Transmission Lines Capacity Needs

All line and equipment loads shall be within their continuous ratings with all elements in service and within their long-term emergency (“LTE”) ratings with any one element out of service. Immediately following

contingencies, lines may be loaded up to their short-term emergency ("STE") ratings where control actions such as re-dispatch, switching, etc. are available to reduce the loading to the long-term emergency ratings. A Transmission Lines Capacity Assessment was performed over the study period 2024-2033 for the 230 kV and 115 kV Transmission line circuits in the ELS region by assessing thermal limits of the circuit and the voltage range as per ORTAC to cater this need. Based on the results, the following line capacity needs have been identified in the during the study period:

7.3.1 Algoma No.1/ No.2/ No.3 – 115 kV Circuit Overload

Patrick St. TS is supplied by 115 kV circuits, Algoma No.1, Algoma No.2 and Algoma No.3 from Third Line TS and connects to the local generation via 115 kV circuits Clergue No.1 and Clergue No. 2. Under normal operating conditions the Algoma circuits are adequately rated to supply Patrick St. TS load. However, overloading can be observed on the Algoma circuits under contingency conditions described below.

The loss of any two Algoma circuits or a failure of circuit breaker 214 at Patrick St. TS (loss of Algoma No.2 & No.3) will result in thermal overload of the remaining Algoma circuit beyond its STE rating. Currently, this need is mitigated by manual load curtailment at Patrick St. TS, when any of the Algoma circuits are out of service. A new Third Line Remedial Action Scheme ("RAS") is being installed at Third Line TS which will (i) enable load rejection capability under weak system conditions and (ii) facilitate the connection of the new EAF facility to the transmission network. The RAS is planned to be in-service by Q1 2025. With any Algoma circuit out of service, and the subsequent loss of another Algoma circuit, the new RAS will be capable to cross-trip the remaining circuit to prevent thermal overload. This will result in all load at Patrick St. TS being rejected. This is not a desirable outcome.

Though the need can be mitigated as described above, the TWG recommends to further review in the next Regional Planning phases and develop options requiring smaller load rejection.

7.3.2 Sault No.3 – 115 kV Circuit Overload

Sault No. 3 is a 115 kV circuit between Third Line TS and Mackay TS, currently operating radially out of Third Line TS. Planned refurbishment of the circuit is underway with expected completion in 2026. After refurbishment, the circuit will operate in a network configuration, as considered in this assessment. Under normal operating conditions there is no overload observed on the circuit. During an outage of P25W or P26W, the loss of K24G (the 230 kV parallel path), may result in an overload on Sault No.3. As part of the refurbishment, the Mackay TS – No. 3 Sault 115 kV – Generation Rejection Scheme (Remedial Action Scheme) will be modified to cross-trip Sault No.3 (open circuit at Mackay TS end) for loss of K24G.

It is recommended to review the necessity of this Sault No.3 cross trip in the next phases of Regional Planning and coordinated with the ongoing System Impact Assessments for the northeast bulk projects.

7.4 Voltage Performance

At the time of this assessment there is currently three unique schemes employed at Third Line TS:

1. Third Line TS – Loss of T1/T2 or P21G/P226 GLP Instantaneous Load Rejection Scheme
   - Status based scheme
2. Third Line TS – Under Voltage Load Rejection Scheme
   - 115 kV Voltage-sensing scheme
3. Third Line TS – Northwest Load Rejection Scheme (Sault Ste. Marie portion)
   - Receives a cascaded signal from Mississagi TS for loss of 230 kV circuits P25W and P26W, A23P and A24P and loss of S22A or X74P

7.4.1 Voltage Violation at Third Line TS

Condition 1: Today, the loss of P21G and P22G will result in a severe voltage decline at Third Line TS 230 kV and 115 kV buses. When the future 230 kV circuits between Mississagi TS and Third Line TS, P23G and P24G are in-service during the study period, a loss of P21G and P22G will no longer result in voltage violations at Third Line TS. The TWG recommends that the Third Line TS – Loss of T1/T2 or P21G/P226 GLP Instantaneous Load Rejection Scheme be reviewed in the SIA for the new circuits to verify if the need to monitor for contingency of P21G and P22G remains.

Condition 2: Two (2) 230/115 kV autotransformers, T1 and T2, supply the 115 kV bus at Third Line TS. Under an outage of either autotransformer at Third Line TS, the loss of the companion autotransformer will result in a voltage collapse at Third Line TS 115 kV bus. In this assessment, the load at Tarentorous MTS was moved to Tagona West TS, thereby reducing the load on the 115 kV system at Third Line TS. Even after this relocation of load, the Third Line TS – Loss of T1/T2 or P21G/P226 GLP Instantaneous Load Rejection Scheme is still required to mitigate voltage collapse. Since load rejection is not a desired mitigation method, the TWG recommend the need for further review in next phases of Regional Planning.

It is also recommended to review the necessity of the Third Line TS – Under Voltage Load Rejection scheme in conjunction with the Third Line TS - Loss of T1/T2 or P21G/P226 GLP Instantaneous Load Rejection Scheme. Review to be conducted in the next phases of Regional Planning.

It is further recommended to review the necessity and functionality of the Third Line TS – Northwest Load Rejection Scheme (Sault Ste. Marie portion). Review to be conducted in the next phases of Regional Planning and coordinated with the ongoing System Impact Assessments for the northeast bulk projects.

7.5 System Reliability, Operation and Restoration Needs

The transmission system must be planned to satisfy demand levels up to the extreme weather, median-economic forecast for an extended period with any one transmission element out of service. This section

assesses operational concerns and the Load Security and Load Restoration criteria for the Region over the study period 2024-2033 to cater this need**.**

7.5.1 Third Line TS – 115 kV Voltage Limitation

The 115 kV bus at Third Line TS is restricted to operate within a narrow range of 118 kV to 124 kV. The Operations groups at the IESO and Hydro One have requested a review of the voltage range. The limitation is due to a voltage sensitive load connected to the LV bus of Tarentorous MTS and the transformers not having Under Load Tap Changers ("ULTC") to regulate the bus voltage. As part of St. Mary's MTS and Tarentorous MTS station refurbishment/upgrade, PUC Distribution has decided to replace existing transformers with unit that have ULTC to regulate the LV bus voltage. This is expected to resolve the issue. The TWG recommends continuing to monitor the voltage limitation and further assess as part of the future SIA for station refurbishment for St. Mary's MTS and Tarentorous MTS.

7.5.2 Load Security

As per ORTAC load security criteria:

Criteria #1: With all transmission facilities in service, equipment loading must be within continuous ratings, voltages must be within normal ranges and transfers must be within applicable normal condition stability limits. This must be satisfied coincident with an outage to the largest local generation unit.

An outage of the largest generator, Wells G1 or G2 resulted in all equipment loading to be within continuous rating and voltages to be in normal ranges.

Criteria #2: With any one element out of service, equipment loading must be within applicable long-term emergency ratings, voltages must be within applicable emergency ranges, and transfers must be within applicable normal condition stability limits. Planned load curtailment or load rejection, excluding voluntary demand management, is permissible only to account for local generation outages. Not more than 150 MW of load may be interrupted by configuration and by planned load curtailment or load rejection, excluding voluntary demand management.

For all n-1 contingencies in the ELS region, this criterion is satisfied.

Criteria #3: With any two elements out of service, voltages must be within applicable emergency ranges, equipment loading must be within applicable short-term emergency ratings and transfers must be within applicable emergency condition stability limits. Equipment loading must be reduced to the applicable long-term emergency ratings in the time afforded by the short-time ratings. Planned load curtailment or load rejection exceeding 150 MW is permissible only to account for local generation outages. Not more than 600 MW of load may be interrupted by configuration and by planned load curtailment or load rejection, excluding voluntary demand management.

- For a double circuit loss of the new 230 kV circuits between Third Line TS and Tagona West TS, the maximum load lost by configuration would be 380 MW in year 2033 as per this assessment. This will be the largest load lost under an n-2 contingency for the Region. [Meets criterion]

- After the loss of both autotransformers at Third Line TS, a voltage violation is averted by rejecting no more than 150 MW of load. [Meets criterion]

For all n-2 contingencies in the ELS region, this criterion is satisfied.

7.5.3 Load Restoration

The transmission system is planned with design criteria in a way to ensure that the affected loads can be restored within restoration time provided.

- All loads must be restored within approximately 8 hours.
- Load interruption greater than 150 MW, the excess amount of load greater than 150 MW needs to be restored within approximately 4 hours.
- Load interruption greater than 250 MW, the excess amount of load greater than 250 MW needs to be restored within approximately 30 minutes.

In ELS region there are radial circuits and loads that are supplied by single transformers. There can be instances where load may not be restored within 8 hours as per ORTAC criteria. A local planning report was completed for the Batchawana TS and Goulais TS in the previous RIP cycle to assess supply options. Based on the analysis conducted, having a permanent Mobile Unit Substation ("MUS") connection facility will facilitate a faster restoration time upon transformer contingency.

At Echo River TS, HOSSM in consultation with API installed a hot-spare transformer to facilitate fast restoration, upon the loss of the main load serving transformer.

At Andrews TS, HOSSM has a tentative restoration plan to mobilize a MUS nearby in the event of a transformer failure.

8. SENSITIVITY ANALYSIS

The objective of a sensitivity analysis is to capture uncertainty in the load forecast as well as variability of electric demand drivers to identify any emerging needs and/or advancement or deferment of recommended investments. Due to the nature of load inquiries in the Region, the TWG agreed to assess sensitivity scenarios by adding a large load in different pockets of the ELS region.

For the analysis, a 200 MW load is applied at the following locations:

a. Double circuit tap to the new 230 kV circuits P23G/P24G
b. Direct connection to 230 kV bus at Tagona West TS
c. Direct connection to 230 kV bus at Mackay TS

Findings

The sensitivity analysis for winter and summer loading had similar results. Reactive support is required for all connection locations assessed.

a) Double circuit tap to new P23G/P24G circuits
   - There is no need that arises from this finding.

b) Direct connection to 230 kV bus at Tagona West TS
   - Loss of either 230 kV circuit between Third Line TS and Tagona West TS will result in the companion circuit being loaded over 90% of its thermal rating (600 MVA).
   - Loss of new P23G+P24G (n-2) will result in 95-98% of LTE rating for P21G and P22G. [Summer case finding]
   - If load connects to the 115 kV bus at Tagona West TS, new autotransformers will be required. Or else the new load will exacerbate the autotransformer overload discussed in section 7.2.3.

c) Direct connection to 230 kV bus at Mackay TS
   - P25W or P26W outage and subsequent loss of K24G (n-1-1) will result in overload of Sault No.3 circuit. However, this contingency can be mitigated by Mackay TS Generation Rejection scheme.
   - Loss of new P23G+P24G (n-2) will result in 85-90% of LTE rating for P21G and P22G. [Summer case finding]
   - Loss of P25W+P26W (n-2) will result in voltage change close to 10% at the Wawa and Mackay 230 kV buses. [loads not converted to voltage-dependent model]

As per the sensitivity analysis, no new needs arise due to the addition of a large load in the ELS region. However, the analysis does indicate a few emerging needs that can be monitored as the load in the Region grows. Based on the analysis findings no immediate action is required.

9. CONCLUSION AND RECOMMENDATION

The Technical Working Group's recommendations to address the needs identified are as follows:

Table 5: Needs which do not require further regional coordination

Sr.no.	Need	Recommendation
1	Anjigami TS and Hollingsworth TS – transformer overload	Assess solution options via a Local Plan between API and HOSSM.

Table 6: Needs which require further regional coordination

Sr.no.	Need	Recommendation
1	St. Mary's MTS and Tarentorous MTS – station refurbishment/upgrade	Recommended for further review in the next phases of RP.
2	Third Line TS – 230/115 kV autotransformer reaches 90% of LTR upon the loss of companion unit	Continue to monitor the loading of the autotransformers at Third Line TS.
3	Tagona West TS – 230/115 kV autotransformer overload upon the loss of companion unit	PUC Transmission intends to implement manual load reduction to mitigate the need. Recommended for further study as part of the SIA and accordingly documented in the next phases of RP.
4	Algoma No.1/ No.2/ No.3 – circuit overload after loss of any two Algoma circuits	Need can be mitigated by cross-tripping overloaded circuit using the Third Line RAS, rejecting all load at Patrick St. TS. Recommended for further review in the next phases of RP.
5	Sault No. 3 – circuit overload	Need can be mitigated by cross-tripping Sault No.3 upon the loss of K24G (during a P25W or P26W outage) using Mackay Generation Rejection scheme. Recommended to review necessity of Sault No.3 cross-trip in the next phases of RP, in coordination with SIA for the new northeast bulk projects.
6	Voltage violation at Third Line TS	The violations can be mitigated by using Load Rejection (LR) schemes and/or RAS at Third Line TS. Recommended to review the necessity Third Line TS LRs and RAS contingencies in the next phases of RP, in coordination with SIA for the new northeast bulk projects.
7	Third Line TS – 115 kV voltage limitations	Existing voltage limit at Third Line TS 115 kV bus is restricted to operate between 118 kV - 124 kV range. Recommended to monitor need until PUC Distribution replaces existing transformers with new units equipped with ULTC.

Executive Summary

Regional planning is a collaborative process that evaluates a range of supply resource and transmission options to ensure the electricity system remains reliable, affordable, and capable of supporting future growth. Developed with input from municipalities, Indigenous communities, utilities, and other regional stakeholders, these plans reflect the unique characteristics and needs of each planning region. The East Lake Superior region — encompassing the City of Sault Ste. Marie, the Township of Chapleau, and surrounding municipalities and districts extending from the Town of Dubreuilville in the north to the Town of Bruce Mines in the south — has a distinct electricity profile shaped largely by energy-intensive industrial activity and electrification initiatives.

Future electricity needs in the East Lake Superior region are expected to be driven primarily by industrial development and electrification initiatives rather than broad-based growth across the region. As a result, electricity system needs are localized and tied to specific areas of the system rather than widespread capacity constraints. With the inclusion of major system developments, including the 2022 Northeast Bulk Reinforcement Plan, no new medium- or long-term regional electricity needs are identified over the current planning horizon. However, a limited number of localized reliability and supply capacity needs are expected to emerge in the near term and are addressed through the recommendations in this plan.

A range of potential solutions was evaluated, including transmission and distribution reinforcements, local generation, demand-side resources, operational measures, and non-wires alternatives. The recommended approaches represent the most cost-effective and practical means of addressing identified system needs, while maintaining system reliability and ensuring infrastructure improvements are made at the appropriate time.

Implementation-Ready Actions

The following actions are recommended as near-term investments to maintain reliability and enable growth in the East Lake Superior region. Evaluated across a range of planning scenarios, these actions are considered implementation-ready and should proceed through development and implementation.

Chapleau Area – Supply Capacity
To maintain reliable electricity supply in the Chapleau area and support forecast growth, the IESO and the Technical Working Group (TWG) recommend a localized voltage support solution to address limitations on the existing supply path. Demand-side resources, including electricity Demand Side Management (eDSM), are also recommended to provide incremental support and help make the best use of existing system capacity at the lowest cost.

Chapleau DS – Station Capacity Monitoring
The TWG will continue to monitor load growth and system conditions at Chapleau Distribution Station (DS) and Chapleau DS2 to ensure the electricity system remains well-positioned to accommodate future growth. While no station capacity need has been identified under current planning assumptions, demand under higher-growth scenarios may approach available station capacity over

the longer term. Ongoing monitoring will help identify any emerging needs early and provide sufficient lead time to develop and implement appropriate solutions.

Algoma Area – Supply Reliability

To maintain reliable electricity service in the Algoma area, which is supplied by three transmission lines, a staged approach consisting of interim control actions, followed by enhancements to the existing Remedial Action Scheme (RAS)[1] is recommended. This approach addresses a contingency-driven limitation by improving the selectivity of load rejection over time, restoring compliance with planning criteria while striking a balance between operational measures and the timing of more complex and capital-intensive transmission reinforcements.

Sault Ste. Marie Area – Supply Reliability

Pursue the development and implementation of a cost-effective supply resource capable of meeting the identified reliability need. The IESO will advance this recommendation through appropriate procurement mechanisms, consistent with the performance requirements of the need. The capability of the resource must match the characteristics of the need, requiring a resource that is dispatchable when needed and capable of sustained operation for the duration of a contingency condition. This performance-based approach preserves flexibility with respect to the specific technology while providing a targeted and cost-effective solution. In addition to addressing reliability needs, such a resource can also provide broader system value through energy and capacity contributions under normal operating conditions.

Future Considerations and Optionality

In addition to implementation-ready actions, the IRRP identifies longer-term infrastructure options that could be considered if demand growth, system conditions, or supply resource availability evolve differently than currently expected. While these options are not required at this time, they inform future planning and system readiness as conditions evolve, preserving optionality and protect against overbuilding.

One such option is the potential addition of a third autotransformer at Third Line Transformer Station which is associated with the Sault Ste. Marie 115 kV system interface reliability need. While not required at this time, this investment would increase system redundancy and provide a longer-term infrastructure option should demand growth increase reliability requirements in the future.

Future infrastructure options will continue to be assessed as part of ongoing TWG reviews, considering updated demand forecasts, system performance, and the availability of supply resources.

During the preparation of this report, Hydro One Distribution identified a potential project at Chapleau Distribution Station (DS) involving the addition of a new transformer. This project is currently in the early scoping phase, with a tentative in-service timeframe of approximately 2029, and remains subject to further technical assessment, siting considerations, and internal approvals. This emerging development reinforces the need for ongoing monitoring of station capacity conditions identified in this plan.

[1] A Remedial Action Scheme or RAS is a scheme designed to detect predetermined system conditions and automatically take corrective actions that may include, but are not limited to, adjusting or tripping generation (MW and MVar), tripping load, or reconfiguring the system.

As this information became available late in the study process, its potential impact on system capacity and voltage performance in the Chapleau area has not been assessed. While it may influence future system needs, the recommended plan outlined in this IRRP remains appropriate based on available information. The TWG will continue to monitor this development and assess its implications as part of the Regional Infrastructure Plan (RIP) phase or future regional planning cycles.

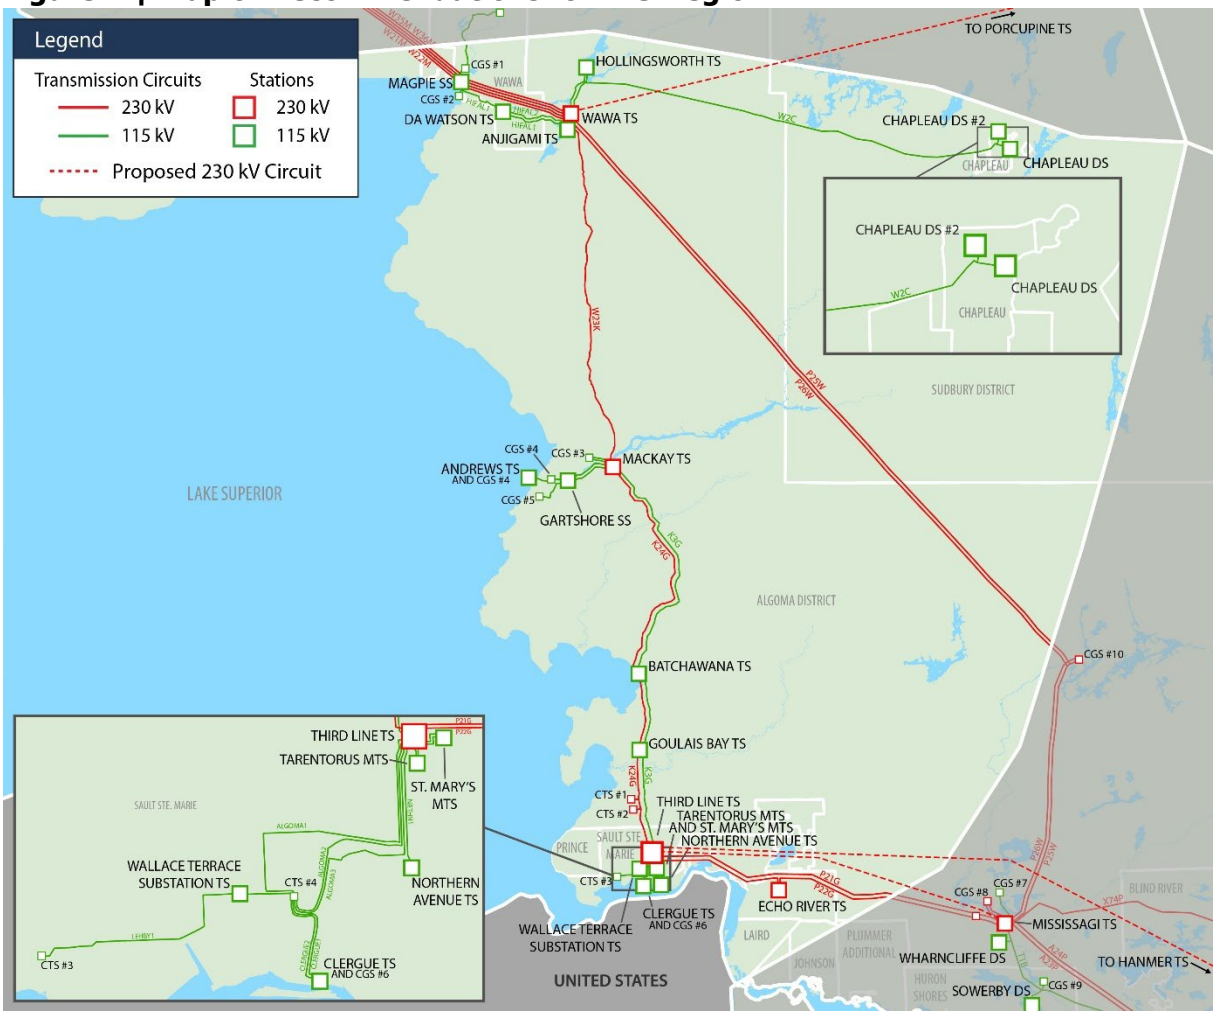
In addition, the ability to site new supply resources in the region is currently constrained by system conditions, including limits on inverter-based generation and congestion on key transmission elements. These constraints will be monitored and may be addressed through future planning as system conditions evolve. Where new strategic supply resources are recommended in plans, the IESO will further develop linkages to ensure procurement signals are clear to address system needs.

Implementation and Monitoring

Implementation of the recommended actions will proceed through established mechanisms, including Regional Infrastructure Plans and procurement processes, supported by continued co-ordination through the TWG.

System conditions, demand growth, and the performance of implemented solutions will be actively reviewed. Where conditions materially change, additional analysis and planning will be undertaken through future regional planning cycles to ensure continued reliability of the electricity system in the ELS region.

Conclusion



Overall, this IRRP provides a clear, proportionate, and flexible plan to address the identified electricity system needs of the ELS region. The recommended actions are designed to maintain near-term system reliability while enabling further customer and industry connections. The plan also preserves optionality to respond to future changes in demand, system conditions, and resource availability.

Table 1 | Implementation-Ready Actions

Action	Reinforcement Type	Needs Addressed	Implementation	Expected In-Service
Chapleau reactive power support	Transmission-side static reactive power support, with demand side measures serving as short-term supplement	Addresses voltage-limited supply capacity in the Chapleau area	Hydro One (reactive support); IESO (eDSM)	Near-term
Address Algoma 115 kV interface supply capacity need	Enhance existing RAS to support more flexible control actions; load rejection exemption framework	Mitigates contingency-driven thermal limitation at the Algoma 115 kV interface	Hydro One	Near-term

Action	Reinforcement Type	Needs Addressed	Implementation	Expected In-Service
Address Sault Ste. Marie 115 kV interface supply capacity need	Performance based supply solution with demand side measures	Addresses voltage instability limitations in the Sault Ste. Marie 115 kV area	IESO (lead); TWG support	Near- to mid-term
ELS region monitoring	Planning/monitoring	Preserves long-term flexibility and informs future infrastructure-based solutions	TWG	Ongoing

Figure 1 | Map of Recommendations for ELS Region

1. Introduction

1.1 Overview of Regional Electricity Planning

Regional electricity planning in Ontario is a structured process used to identify and address electricity needs at a regional level in a co-ordinated, reliable, and cost-effective manner. The regional planning process was formalized by the Ontario Energy Board (OEB) in 2013 and is carried out on a five-year planning cycle for each of Ontario's 21 planning regions. The process is undertaken collaboratively by the Independent Electricity System Operator (IESO), transmitters, and local distribution companies (LDCs) through a Technical Working Group (TWG). The IESO leads the Scoping Assessment and Integrated Regional Resource Plan (IRRP) stages of the process.

The regional planning process includes four key phases:

1. Needs Assessment (Led by the Transmitter)

The Needs Assessment is the first phase of regional planning and is led by the incumbent transmitter for the region. It evaluates the adequacy of the existing electricity system under forecast demand conditions to determine whether there are any emerging reliability or capacity concerns. The assessment applies applicable planning criteria and identifies whether electricity needs exist that may require further regional co-ordination. If no needs are identified, no further regional planning activities are required at that time.

2. Scoping Assessment (Led by the IESO)

Where needs are identified, the IESO leads a Scoping Assessment to determine the appropriate planning approach to address them. The Scoping Assessment confirms the nature and extent of the identified needs and recommends whether they should be addressed through an IRRP, a RIP, or other planning mechanisms. The Scoping Assessment also defines the geographic scope, time horizon, and level of co-ordination required.

3. Integrated Regional Resource Plan (Led by the IESO)

The IRRP is led by the IESO and developed in collaboration with transmitters, LDCs, and other members of the TWG. The IRRP assesses regional electricity needs over the near-, medium-, and long-term and evaluates a range of options to address those needs. Options considered may include transmission and distribution solutions, electricity demand-side management (eDSM), non-wires alternatives (NWAs), and generation resources. The IRRP culminates in recommended actions to address near- and medium-term needs and outlines monitoring or trigger-based approaches for longer-term needs.

4. Regional Infrastructure Plan (Led by the Transmitter)

Where the IRRP identifies transmission or distribution infrastructure solutions as recommended actions, these are carried forward into the RIP stage. The RIP is led by the transmitter and provides greater implementation detail, including preferred solution selection, siting considerations, technical

design, cost estimates, and engagement activities. The RIP supports regulatory approval and eventual construction of recommended infrastructure projects.

This IRRP represents the second cycle of regional planning for the ELS region.

1.2 Purpose of this IRRP

This IRRP assesses the reliability and adequacy of the electricity system in the ELS region over a 20-year planning horizon (from 2025 to 2044). The goal is to identify near-, medium-, and long-term needs, propose suitable options, and recommend actions to maintain a reliable and cost-effective electricity system while considering:

- projected electricity demand growth;
- infrastructure condition and capacity;
- opportunities for energy efficiency and NWAs; and
- emerging trends (e.g., electrification, distributed energy resources).

The outcome of this IRRP includes recommended infrastructure solutions, some of which will be reviewed further in the forthcoming RIP.

1.3 Description of the Area

The ELS region encompasses the City of Sault Ste. Marie, the Township of Chapleau, and surrounding municipalities and districts extending from the Town of Dubreuilville in the north to the Town of Bruce Mines in the south. Geographically, the region is surrounded by Lake Superior to the west, Highway 129 to the east, Highway 101 to the north, and St. Mary's River and St. Joseph Channel to the south, defined not only by physical geography but also by shared electricity infrastructure. The region includes the following:

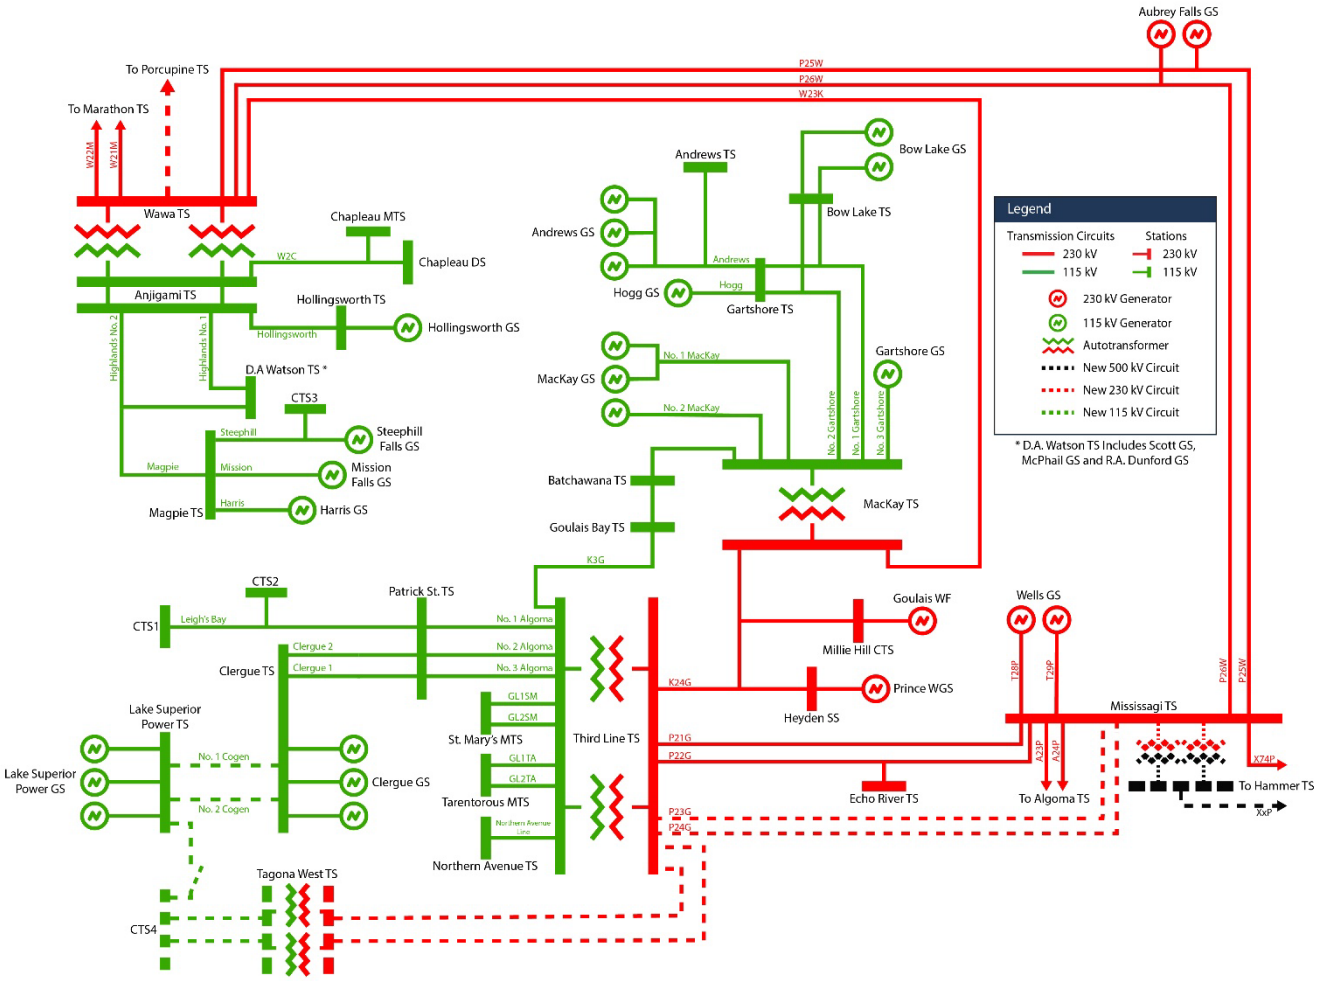
- Municipalities and Townships: Town of Bruce Mines, Township of Chapleau, Hilton Township, The Municipality of Huron Shores, Township of Jocelyn, Township of Johnson, Laird Township, Township of Macdonald, Meredith & Aberdeen Additional, Township of Plummer Additional, Prince Township, City of Sault Ste. Marie, Township of St. Joseph, Tarbutt Township & Tarbutt Additional, Township of Dubreuilville, and Municipality of Wawa.
- Indigenous Communities: Batchewana First Nation, Brunswick House First Nation, Chapleau Cree First Nation, Chapleau Ojibwe First Nation, Garden River First Nation, Michipicoten First Nation, Missanabie Cree First Nation, Mississauga First Nation, Serpent River First Nation, Thessalon First Nation, Métis Nation of Ontario, Bar River Métis, and Red Sky Métis Independent Nation.
- LDCs Operating in the Region: Algoma Power Inc., Hydro One Distribution and PUC Distribution Inc.
- Lead Transmitter: Hydro One Networks Inc. Transmission (HONI), Hydro One Sault Ste. Marie (HOSSM), and PUC Transmission Inc.

Figure 2 | Overview Map of the ELS Region[3]

1.4 Demand and Infrastructure Overview

The electricity demand in the region is expected to follow a winter-peaking pattern, driven by industrial development. Average annual growth is projected at 4.8% based on winter reference scenario and 5.7% based on summer reference scenario.

Electricity is supplied through a combination of:



- 230 kV and 115 kV transmission infrastructure, with electrical supply provided mainly through 230/115 kV autotransformers at Third Line Transformer Station (TS), Mackay TS, and Wawa TS, as shown in Figure 2.
- Local generation, including more than 1,200 MW of hydroelectric, wind, solar, and thermal generation.

[3] IRRP regions are defined by electricity infrastructure; geographical boundaries are approximate.

Over the planning horizon, potential demand growth from industrial development, mining activity, and electrification initiatives may require the evaluation of supply options and infrastructure upgrades.

Figure 3 is a single line diagram showing major electrical infrastructure in the region.

Figure 3 | Electricity Infrastructure in the ELS Region

1.5 Organization of this IRRP

This IRRP outlines the ELS TWG's plan to continue to maintain a reliable, affordable, sustainable electricity supply to support the region. This IRRP is structured as follows:

Section 2 — Summary of the recommended plan and near-/medium-term actions

Describes the IRRP within Ontario's regional electricity planning framework and outlines how it addresses identified electricity needs through co-ordinated planning.

Section 3 Planning process and methodology

Explains the regional planning process and summarizes how the IRRP was developed, including roles, responsibilities, and key planning steps.

Section 4 — Background and context for study scope

Provides context for electricity planning in the ELS region and defines the study scope, including system assets, interfaces, and planning assumptions.

Section 5 — Electricity demand forecast

Presents the development of the regional electricity demand forecast, including historical demand, forecast methodology, and planning assumptions.

Section 6 — Identified needs and system limitations

Identifies and categorizes electricity system needs based on forecast demand and system capability, including station, supply, refurbishment, and reliability needs.

Section 7 — Options considered and recommended solutions

Evaluates options to address identified needs and presents recommended actions based on technical, economic, and reliability considerations.

Section 8 — Community and stakeholder engagement

Summarizes engagement activities undertaken to inform stakeholders and incorporate local input into the regional planning process.

Section 9 — Conclusion and next steps

Summarizes the IRRP's findings and recommendations and outlines next steps for implementation, monitoring, and future planning cycles.

Appendices provide additional detail including technical studies, demand assumptions, and supporting engagement documentation.

2. The Integrated Regional Resource Plan

2.1 Overview of the Plan

This section presents the recommended IRRP for addressing electricity needs in the ELS region over a 20-year planning horizon. The plan includes a combination of near-term actions, future optionality, and ongoing monitoring activities to address emerging needs.

The recommendations are informed by a detailed needs assessment based on system capability, forecast demand, and applicable reliability criteria. The plan reflects input from the regional TWG, local stakeholders, Indigenous communities, and the IESO's planning assessments.

Electricity needs and corresponding solutions are grouped based on geography (local, regional, or bulk system-level), timing (near-, mid-, or long-term), and need type (e.g., station capacity, supply capacity, asset condition, load security, load restoration). In this IRRP, the focus is on a limited number of localized near-term supply capacity needs, with ongoing monitoring and future optionality to respond to changing system conditions. Where relevant, needs are linked to bulk system planning efforts to support co-ordinated and efficient infrastructure development.

2.2 Needs, Solutions and Timeframe

Types of Needs

This IRRP refers to a number of different need types and corresponding solutions. These needs and their solutions include:

- Station Capacity: Load transfers, station upgrades, or new transformer stations where required. In this IRRP, no near-term station capacity need is identified.
- Supply Capacity: Transmission circuit upgrades, reactive support, controlled load interruption, remedial action schemes, or non-wires solutions, depending on the nature of the need. In this IRRP, the identified near-term needs are primarily supply capacity needs.
- End-of-Life: Like-for-like or right-sized replacement of aging infrastructure, where relevant.
- Load Security: Transmission reinforcements, reconfiguration, or other measures to reduce the amount of load interrupted following major outages.
- Load Restoration: Mobile transformers, switching arrangements, or operational measures to improve restoration following outages.

Refer to Section 6.1 for further technical details.

Classification of Needs

Three main types of needs are discussed:

- Local Needs: Specific to one facility, interface, or community.
- Regional Needs: Affect multiple customers, communities, or areas within the region.

- Bulk System Needs: Linked to upstream transmission capability or broader provincial supply and transmission considerations.

Planning Timeframes

This IRRP covers three planning timeframes:

- Near-Term Plan: 0–5 years
- Mid-Term Plan: 6–10 years
- Long-Term Plan: 11–20 years

In this IRRP, the earliest identified needs are expected to emerge in the near term, beginning around 2028. No new distinct medium- or long-term regional electricity needs are identified over the planning horizon. Needs influenced by bulk system developments are co-ordinated accordingly.

2.3 Needs and Recommendations

Based on this analysis, the ELS IRRP recommends a broad range of solutions to address identified needs. Recommendations include:

- "Implementation-ready" or near-term actions to develop infrastructure such as new and expanded transmission stations to enable reliable supply for forecast demand across the region while improving system operability to a level comparable with the rest of Ontario, and
- "Future-consideration" or long-term actions, identified to preserve longer-term optionality and serve as a backstop if near-term supply resource solutions do not materialize or if system conditions change, including higher-than-expected demand growth. These actions would be monitored and revisited through future planning cycles as conditions evolve.

Table 2 summarizes system needs and corresponding recommendations.

Table 2 | Implementation-Ready Actions for the ELS Region

Need	Recommendation	Lead Responsibility	Required By
Voltage-limited supply capacity in the Chapleau area	Implement transmission-side reactive power support, with demand-side measures (eDSM) as interim support	Hydro One (reactive support); IESO (eDSM)	Near-term
Algoma 115 kV interface supply capacity	Enhance existing RAS to support more flexible control actions; load rejection exemption framework	Hydro One	Near-term

Need	Recommendation	Lead Responsibility	Required By
Sault Ste. Marie 115 kV interface supply capacity	Develop and procure a performance-based supply solution with demand side measures	IESO (lead), TWG support	Near to mid-term
ELS region system monitoring and long-term planning	Planning and monitoring to preserve long-term flexibility and inform future infrastructure-based solutions	TWG	Ongoing

Table 3 | Future-Ready Actions for the ELS Region

Need	Recommendation	Lead Responsibility	Required By
Sault Ste. Marie 115 kV interface supply capacity	New 230/115 kV autotransformer at Third Line TS	Hydro One	To be determined

2.3.1 Chapleau Area

A supply capacity need is expected to emerge in the Chapleau area, including Chapleau Distribution Station (DS) and Chapleau DS2, which are supplied by the 115 kV W2C transmission path. This need is driven by voltage limitations under peak conditions following the retirement of local generation, which reduce the load meeting capability of the W2C path.

The recommended approach is to implement reactive support to improve voltages in the area. This would directly address the underlying voltage limitation and replace the voltage support previously provided by local generation.

Demand-side measures and distributed energy resources, including additional eDSM, were also assessed and may provide modest short-term relief during the initial years following need onset. However, consistent with regional planning assumptions regarding achievable contribution levels, these resources are considered supplementary measures only and are not sufficient to independently address the identified supply capacity need.

In addition to the needs and solutions identified above, Hydro One Distribution identified a potential project during the preparation of this report involving the addition of a new transformer at Chapleau DS to accommodate incremental load from an existing customer. This project is currently in the early scoping phase, with a tentative in-service timeframe of approximately 2029. At present, no footprint exists within the existing station, and expansion options, including development on adjacent lands, are being explored.

Due to the timing of this information and its preliminary nature, the TWG has not assessed its impact on system capacity or the identified voltage limitations in the Chapleau area. As a result, the recommended plan for the Chapleau area remains unchanged. However, this development may influence future system needs, including the timing or scope of reinforcements. The TWG recommends that this project be monitored and further evaluated as part of the RIP phase or future regional planning cycles once additional information becomes available.

2.3.2 Algoma 115 kV Interface

The Algoma 115 kV interface, consisting of the Algoma No. 1, No. 2, and No. 3 transmission lines supplying radially connected industrial load, is subject to a contingency-driven thermal limitation. Under a recognized breaker-failure or sequential outage scenario, loading on the remaining in-service circuit exceeds applicable Ontario Resource and Transmission Assessment Criteria (ORTAC) and requires mitigation.

To address this limitation, enhancement of the existing RAS has been identified as the preferred long-term solution. The enhancement will improve the selectivity of the scheme by refining tripping actions to target individual load breakers, rather than disconnecting entire circuits. This more granular control will reduce the amount of load rejected under contingency conditions while ensuring that post-contingency loadings remain within ORTAC criteria.

Given the industrial nature of the load served and the low-frequency, contingency-driven nature of the limitation, customer agreements for controlled load interruption will be maintained as an interim measure until the RAS is implemented and placed in service. This approach provides a proportionate and practical means of maintaining compliance with planning criteria while avoiding significant transmission reinforcements under relatively stable demand conditions.

2.3.3 Sault Ste. Marie 115 kV System Interface

A contingency involving the loss of both Third Line autotransformers results in voltage instability on the Sault Ste. Marie 115 kV system. Under this condition, the remaining 115 kV network is unable to reliably serve load, resulting in a supply capacity limitation.

The recommended action is to pursue a cost-effective supply solution with performance characteristics aligned with the identified reliability risk. The capability of the resource must match the characteristics of the need, requiring a resource that is dispatchable when needed after a contingency, and capable of sustained operation for the duration of the contingency condition. This performance-based framing preserves flexibility with respect to the specific technology or acquisition approach, supports transparency with communities, and allows the need to be addressed, subject to demonstrated deliverability and applicable municipal and provincial siting requirements, and all other requirements and contractual obligations of any applicable procurement mechanism. No new infrastructure is required to maintain near-term reliability following completion of planned developments, allowing time to pursue this approach. At the same time, the addition of a third autotransformer at Third Line remains a future consideration and backstop option if a suitable supply solution does not materialize or if demand grows beyond current expectations.

2.4 Ongoing Initiatives

This IRRP is supported by ongoing transmission and station projects outside the scope of the recommendations in this plan. These initiatives form part of the broader planning context for the ELS region and include:

The 2022 Northeast Bulk Reinforcement Plan, which significantly strengthens bulk supply into northeast Ontario through new 230 kV and 500 kV infrastructure to support supply to the ELS region and more broadly, into northwestern Ontario, including:

- The Hanmer TS to Mississagi TS 500 kV transmission line project;
- The Mississagi TS to Third Line TS 230 kV transmission line project;
- The Porcupine TS to Wawa TS 230 kV transmission line project; and

Ongoing asset replacement and refurbishment projects across the region, including autotransformer and station upgrades at Third Line TS, Wawa TS, Batchawana TS, and Goulais Bay TS, as well as transmission line refurbishment at Sault #3 (K3G).

2.5 Regional Context and Key Planning Assumptions

Electricity demand within the ELS region is characterized by large, project-driven load additions, primarily associated with industrial activity, resource development, and electrification initiatives. Unlike regions experiencing steady population-driven growth, demand in ELS tends to increase through distinct step-changes occurring over relatively short lead times. As a result, many identified electricity system needs are driven by system configuration, contingency performance, and planning-criteria requirements, rather than pervasive growth across the network.

This IRRP reflects the implementation or advancement of several major system initiatives that establish the reference system for this planning cycle, including:

- The Northeast Bulk Reinforcement, which significantly strengthens bulk supply into northeast Ontario through new 230 kV and 500 kV transmission facilities and additional transformation capacity.
- The staged implementation of the Algoma Steel Electric Arc Furnace (EAF) project, culminating in full reliance on transmission-supplied load following completion of planned development phases.
- Ongoing asset replacement and refurbishment projects across the region, including autotransformer and station upgrades at Third Line TS, Wawa TS, Sault #3 circuit (K3G), Batchawana TS, and Goulais Bay TS.
- New and expanding industrial and mining-related load connections, incorporated into the regional demand forecast.

Collectively, these developments materially reinforce the ELS transmission system and address or defer previously identified longer-term constraints. With the inclusion of the Northeast Bulk Reinforcement Plan and planned asset replacements, no immediate electricity system needs are identified at the beginning of the study period, and no new or distinct medium- or long-term regional electricity system needs were identified over the planning horizon.

Accordingly, this IRRP focuses on a limited number of anticipated near-term supply capacity needs, with the earliest needs emerging later in the study period, beginning around 2028.

3. Development of the Plan

3.1 The Regional Planning Process

In Ontario, planning to meet the electricity needs of customers at a regional level is conducted through the regional planning process, which was formalized by the OEB in 2013. Regional planning assesses the interrelated needs of a region, which are defined by common electricity supply infrastructure over the near, medium, and long term, and results in a plan to ensure cost-effective and reliable electricity supply.

Regional plans consider the existing electricity infrastructure in an area, forecast demand growth and customer reliability, evaluate a range of potential options for addressing needs, and recommend actions to be undertaken. The process is carried out by the IESO in collaboration with the applicable transmitter(s) and LDCs.

The current regional planning process is conducted on a five-year planning cycle for each of the province's 21 planning regions and consists of four main components:

- **Needs Assessment** – Led by the applicable transmitter, the Needs Assessment screens for electricity needs in the region and determines if there are requirements for further regional co-ordination.
- **Scoping Assessment** – Led by the IESO, the Scoping Assessment determines the most appropriate planning approach for identified needs and defines the scope of any recommended planning activities.
- **Integrated Regional Resource Plan** – Led by the IESO, the IRRP proposes recommendations to meet the identified needs requiring co-ordinated regional planning.
- **Regional Infrastructure Plan** – Led by the applicable transmitter, the RIP provides further technical detail for implementing recommended wires solutions.

In addition to regional planning, there are related bulk system planning and distribution system planning activities. Bulk system planning typically considers the 230 kV and 500 kV transmission networks and examines province-wide issues, while distribution planning assesses the adequacy and reliability of the LDC's own network. Regional planning operates at the interface of these two processes. Further details on the regional planning process and the IESO's approach to it can be found in Appendix A.

For the ELS region, the Needs Assessment completed in October 2024 identified several electricity system needs requiring co-ordinated regional planning. The subsequent Scoping Assessment concluded that an IRRP was the most appropriate planning approach, given the nature of the identified needs and the potential to consider a range of solutions, including NWAs. This IRRP represents the outcome of that co-ordinated regional planning effort.

3.2 IESO's Approach to Regional Planning

The IESO leads the IRRP stage of regional planning and is responsible for facilitating co-ordinated assessment of electricity system needs and potential solutions. The IESO's approach to regional planning emphasizes:

- Integrated assessment of transmission, distribution, and local resource options.
- Proportionality, ensuring that solutions are aligned with the magnitude, timing, and drivers of identified needs.
- Flexibility and optionality, preserving future decision-making where uncertainty exists.
- Transparency and engagement, enabling communities and stakeholders to understand and provide input into planning decisions.

In developing this IRRP, the IESO worked closely with the ELS TWG to assess system performance under forecast demand conditions and applicable contingencies, consistent with the ORTAC, North American Electric Reliability Corporation (NERC) standards, and Northeast Power Coordinating Council (NPCC) criteria.

A wide range of potential solutions was considered, including transmission and distribution reinforcements, local generation, demand-side resources, operational measures, and NWAs. Options were evaluated based on technical feasibility, timing, cost-effectiveness, and their ability to directly address the underlying causes of identified system needs. Preferred approaches were selected where they provided the most effective and proportionate means of maintaining system reliability.

3.3 ELS Technical Working Group and IRRP Development

The development of the ELS IRRP was supported by the ELS TWG, which serves as the primary technical forum for regional planning co-ordination. The TWG is composed of representatives from:

- the IESO;
- transmitters serving the ELS region including Hydro One Networks Inc., Hydro One Networks Sault Ste. Marie LP., and PUC Transmission LP; and
- local distribution companies operating within the region including Algoma Power Inc., Hydro One Distribution and PUC Distribution.

The TWG was responsible for:

- providing and reviewing regional demand forecast inputs and system data;
- identifying system constraints and verifying study assumptions;
- reviewing technical study results and option assessments; and
- supporting co-ordination between regional and bulk system planning activities.

Throughout the IRRP development process, the TWG met regularly to review analysis results, confirm findings, and provide input on the identification of preferred solutions. The TWG also supported

engagement activities by helping to contextualize planning issues and respond to feedback received from communities and stakeholders.

The IRRP was developed through an iterative process, with findings from the needs assessment, technical studies, and engagement activities informing successive stages of analysis. This collaborative approach ensured that the final plan reflects a shared understanding of regional electricity system conditions and provides a co-ordinated path forward for addressing identified needs in the ELS region.

4. Background and Study Scope

4.1 Background

The ELS region is supplied by the provincial transmission system and is electrically bounded by the 230 kV transmission circuits from Wawa TS to the northwest and Mississagi TS to the southeast. The study reflects forecast electricity demand, including the effects of eDSM, distributed generation, and other planning assumptions relevant to the region.

The background for this planning cycle also reflects major developments already incorporated into the reference system and planning assumptions for the region. These include transmission reinforcements associated with the Northeast Bulk Reinforcement Plan, the staged completion of the Algoma Steel EAF project, and ongoing asset replacement and refurbishment activities affecting key regional facilities. Collectively, these developments materially strengthen the regional supply context and help address or defer previously identified longer-term constraints.

4.2 Study Scope

The scope of this IRRP was established through the Scoping Assessment process and focuses on electricity system needs requiring co-ordinated regional planning within the ELS region over the planning horizon. The assessment examines system performance under forecast demand conditions, applicable reliability criteria, and credible contingency scenarios to identify limitations that may affect the region's ability to reliably serve load.

The TWG, led by the IESO and supported by transmitters and local distribution companies serving the region, prepared the demand forecast, reviewed system conditions, assessed identified needs, and considered options to address those needs. The study examined:

- Bulk system connection points and their capacity to serve regional demand.
- Interfaces such as the East West Tie West/East and its operational constraints.
- Planned projects with approved investment plans or committed in-service dates.
- Single-line diagram representation of the system for clarity on supply configuration.
- 20-year demand forecast reflecting eDSM, Distributed Generation (DG), and Distributed Energy Resource (DER) contributions.

The load-meeting capability (LMC) and reliability of the existing transmission system, considering transmission facility performance including transformer ratings, line thermal limits, load security, and restoration capability.

Establishing needs and timing with LDCs and transmitters including any identified due to end-of-life asset replacement.

Establishing options and alternatives to address system needs including, where feasible and applicable, generation, transmission and/or distribution, and other approaches such as NWA including eDSM.

The assessment uses the applicable planning standards (e.g., ORTAC, NERC) and relevant asset condition data.

Consistent with the OEB's regional planning framework, this IRRP considers a broad range of potential solution types and emphasizes solutions that are technically feasible, timely, cost-effective, and proportionate to the nature and timing of the identified needs. Needs that can be addressed through local planning or asset replacement programs alone are outside the direct scope of this IRRP unless co-ordinated regional planning is required.

The scope was developed to ensure that the plan addresses all identified near-, mid-, and long-term needs in a co-ordinated and cost-effective manner. Additional high sensitivity studies were performed for these areas to test the robustness of the system to supply higher than forecast demand.

4.3 Related Bulk Planning Activities

Regional planning is informed by and co-ordinated with related bulk planning work undertaken by the IESO. This may include bulk planning studies that are underway in parallel with the IRRP, as well as completed bulk studies and associated transmission projects whose outcomes have been incorporated into the planning assumptions for the region. Where bulk transmission facilities interface directly with a regional system, the outcomes of this work can have a significant impact on regional planning decisions.

Bulk planning work may identify upstream transmission reinforcements, transformer expansions, interface upgrades, reactive compensation needs, or other system developments that affect regional supply capability, reliability, and future options. Findings and recommendations from relevant bulk planning work are incorporated into this IRRP where they affect the region.

4.3.1 Ongoing Bulk Planning Studies

Bulk planning studies underway in parallel with this IRRP form part of the broader planning context for the ELS region and may influence future supply capability, planning assumptions, and longer-term development pathways. Co-ordination between regional and bulk planning work helps ensure that assumptions remain aligned as both studies progress.

For the ELS region, the North of Sudbury Bulk Plan is particularly relevant. That work is proceeding in parallel with this IRRP and is expected to strengthen the broader transmission backbone supplying northeastern Ontario. In particular, reinforcements identified through the North of Sudbury Bulk Plan are expected to strengthen the Timmins end of the system and, in turn, support the performance and capability of the new Timmins to Wawa transmission line now under development.

As this bulk planning work nears completion on a similar timeline to the ELS IRRP, it represents an important part of the broader system context for the region and should continue to be co-ordinated with regional planning assumptions and future implementation activities.

4.3.2 Bulk Planning Outcomes Incorporated into this IRRP

This IRRP reflects the outcomes of previously completed bulk planning work that materially affects the ELS region, including the Northeast Bulk Reinforcement Plan and the Northern Ontario Voltage Study. These planning outcomes form part of the reference system and assumptions used in the regional needs assessment and options analysis.

For the ELS region, the Northeast Bulk Reinforcement Plan is particularly important because it provides upstream transmission capacity improvements that strengthen supply into northeast Ontario and improve the broader system conditions against which regional needs are assessed. The recommendations arising from the ELS study rely on upstream bulk transmission capacity that is enabled through the Northeast Bulk Reinforcement portfolio. The relevant reinforcements that support the ELS study include the new single 500 kV line between Mississagi TS and Hanmer TS (Northeast Power Line) and the new 230 kV double circuit line between Mississagi TS and Third Line TS (Northshore Link). The Northeast Bulk Reinforcement Plan supports the regional planning assumptions in this IRRP as it helps address the upstream system constraints in interfaces such as the Mississagi West/East and ensures reliable supply to the Sault Ste. Marie area. Both lines are essentially critical to supporting the load growth in the area and in providing additional capacity in the Northeast region.

Similarly, the outcomes from the Northern Ontario Voltage Study play a key role in the final recommendations in the ELS IRRP. These outcomes include system reactive compensation in Mississagi TS and Algoma TS, which have been used as an input and a study assumption into the plan. These reactive compensations inform and influence the options analysis and draft recommendations in this IRRP as they generally help improve post-contingency transient voltage performance in the region. They also benefit normal operation voltage control to reduce impact from load fluctuations. Without these devices, the options found in the IRRP would need to be reassessed to ensure that the needs in the region are fully addressed.

4.3.3 Ongoing Bulk Implementation Activities

Implementation of previously identified bulk planning outcomes is underway and forms an important part of the planning context for the ELS region. These activities are outside the direct scope of this IRRP, but they materially affect the regional supply context by strengthening upstream transmission capability and reinforcing the broader system on which the region depends.

In particular, three major transmission line projects associated with the Northeast Bulk Reinforcement are currently under development: the Northeast Power Line (Hanmer TS to Mississagi TS), the North Shore Link (Mississagi TS to Third Line TS), and the Timmins to Wawa Transmission Line (Porcupine TS to Wawa TS). Together, these projects strengthen the transmission supply to the ELS region and more broadly northeast Ontario.

These implementation activities are especially important for the ELS region because they strengthen supply into Wawa and Third Line, which are key supply points for the regional system. In combination with other system developments, they help establish the reference system against which the needs and recommendations in this IRRP have been assessed.

5. Electricity Demand Forecast

The ELS region load forecast establishes the foundation for identifying electricity system needs and developing planning options. The forecast is based on assumptions regarding population growth, economic activity, electrification trends, and other local drivers, as well as provincial planning standards and criteria. Peak demand forecasts consider both reliability requirements and the contribution from planned eDSM and DG.

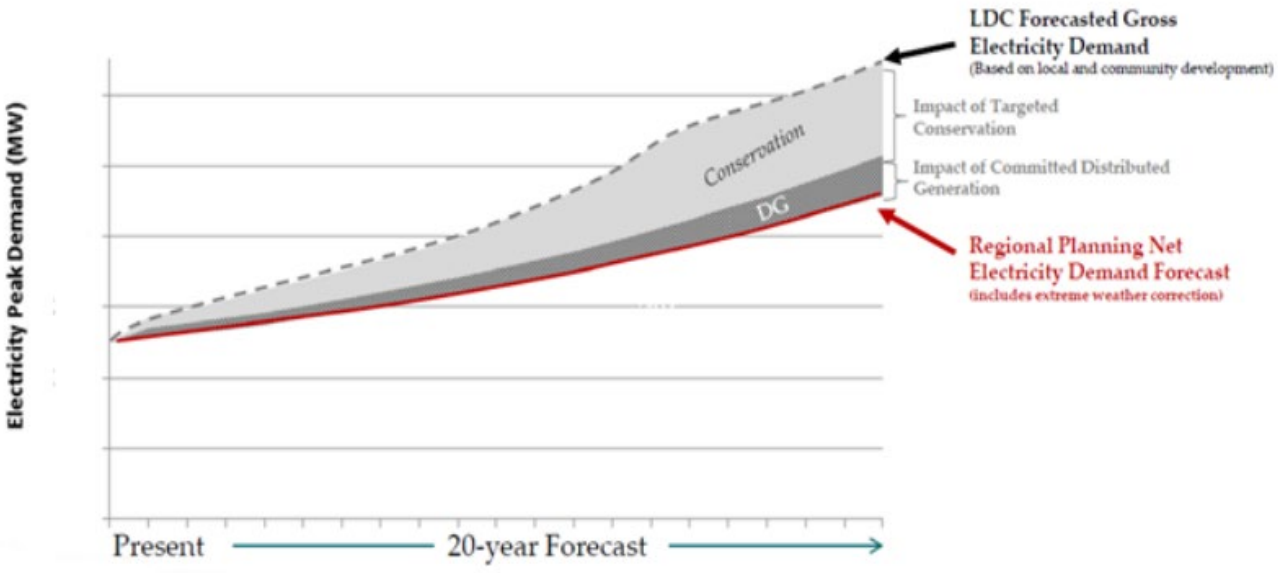
The forecast development process begins with a review of historical summer and winter peak demand to establish a baseline. LDCs then provide gross demand forecasts that incorporate anticipated customer growth and connection activity. Weather correction is then applied to develop an extreme weather forecast for planning purposes. Adjustments are subsequently made to reflect the expected contributions of eDSM and DG, yielding the net planning forecast. This forecast is used to assess system adequacy and identify potential needs. In addition to annual peak demand forecasts, hourly load profiles are created to support system studies and evaluate planning options.

The forecast was developed using a 20-year planning horizon for the years 2025–2044 and consists of two components: the distribution-connected forecast and transmission connected forecast.

- **Distribution-connected**: The distribution-connected forecast reflects demand served on the distribution systems in the ELS region and is based on information submitted by LDCs. The regional planning process relies on LDCs to consider municipal and regional official plans and Indigenous community development plans and translate them into electrical demand forecasts. Distributors have a better understanding of future local demand growth and drivers than the IESO, since they have the most direct involvement with their customers, connection applicants, and the municipalities and Indigenous communities they serve.
- **Transmission-connected**: The transmission-connected forecast reflects demand served directly from the transmission system. This typically consists of large industrial customers that have their own transformation stations. The transmission-connected forecast is informed by direct engagement with these customers.

Either coincident or non-coincident peaks are used to develop these forecasts. The coincident peaks refer to the sum of each station's demand in the region taken at the hour when the whole region's demand is at its maximum. Meanwhile, the non-coincident peaks refer to the sum of each station's demand in the region taken at the hour where they individually peak, regardless of whether or not these peaks occur at different times.

In this plan, non-coincident peak load was assumed at each station for the region.



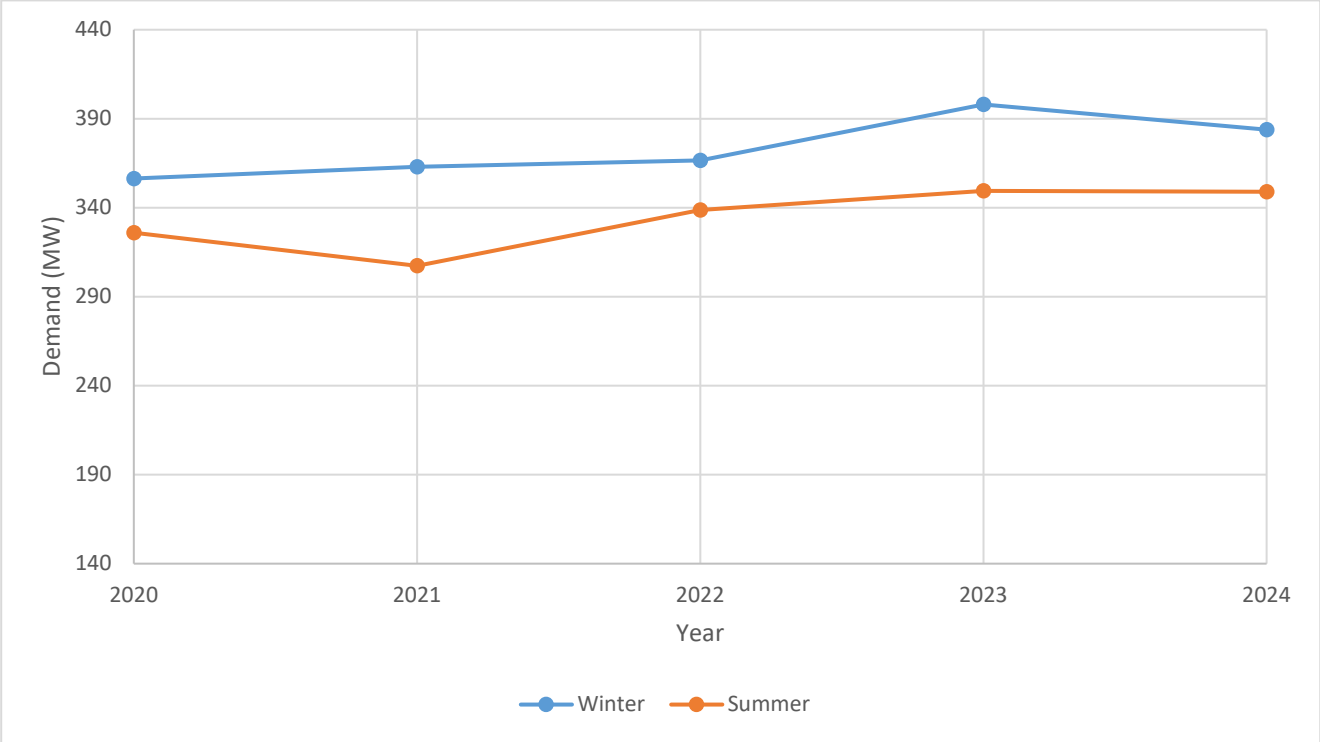
5.1 Demand Forecast Methodology

The methodology used to develop a 20-year IRRP peak demand forecast is shown in Figure 4. A gross demand forecast, which assumes normal weather conditions based on historical weather patterns (referred to as "normal weather"), was developed by the LDCs. This forecast was then adjusted to reflect the expected impact of extreme weather conditions for planning purposes.

Extreme weather conditions, as defined by the IESO, assume the worst observed weather over the previous 30 years. The forecast was then modified to reflect the expected peak demand impacts of provincial electricity demand side management programs and DG contracted through previous provincial programs, such as renewable Feed-In Tariff (FIT) and microFIT standard offer programs. The resulting planning demand forecast was used to assess electricity needs in the region.

The demand forecast methodology is also informed by the Load Forecast Guideline for regional planning, which was formalized by the OEB's Regional Planning Process Advisory Group. The development of the demand forecast is further explained in Appendix B.

Figure 4 | Illustrative Development of Demand Forecast

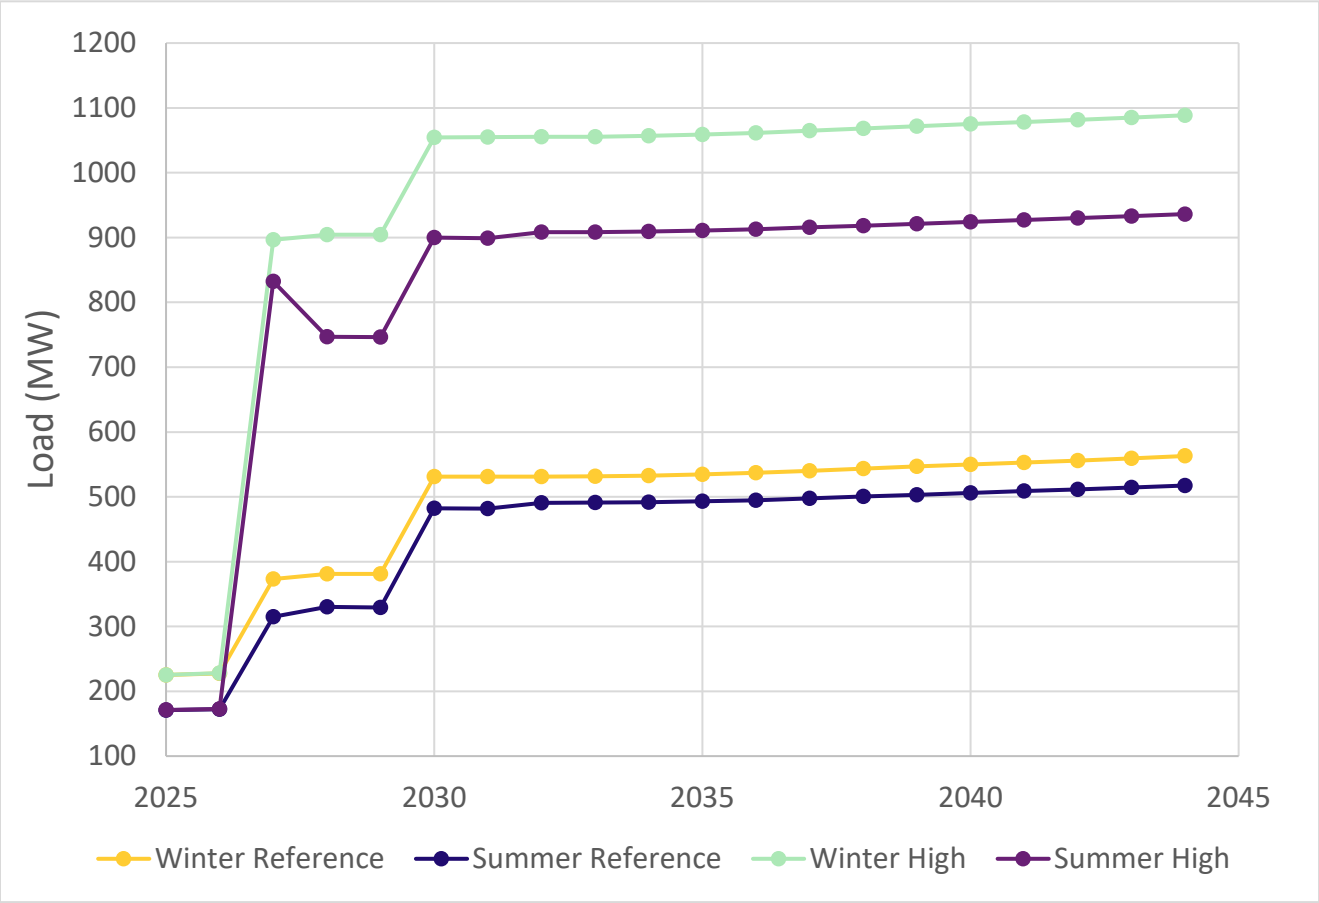


5.2 Historical Demand

Historically, the ELS region has been a winter peaking region where the peak hour for each year typically occurs in the evening, driven by electrical heating demand in the residential sector as access to natural gas is limited in the area.

The historical demand in the region for both seasons has been generally increasing, though demand has remained between 300 and 400 MW over the course of the years. Over the past five years, the demand for the region has averaged 375 MW in the winter and 335 MW in the summer. Figure 5 illustrates historical peak demand in the ELS region over the 2020 to 2024 period.

Figure 5 | Historical Peak Net Demand (2020-2024)



5.3 Gross Local Distribution Company Forecast

Each participating LDC prepared gross demand forecasts at the station level or at the station bus level for multi-bus stations. These forecasts account for expected changes in demand arising from efficiency improvements, rising electricity prices, and new or intensified developments. The LDC forecasts are developed based on their understanding of known local development plans and information from customer engagements. Their forecasts, however, do not include the effects of planned eDSM and DG, as they are incorporated separately by the IESO. A reference and high forecast were provided by each LDC. Additional details on each LDC's forecast methodology are provided in Appendix B.2.

The compiled distribution-connected forecasts were then adjusted to reflect extreme weather conditions. The impacts of eDSM and distributed generation were then applied separately, consistent with the forecast methodology described above. The resulting distribution-connected forecast is shown in Figure 6.

Figure 6 | Net Extreme Weather Distribution-Connected Forecast

5.4 Contribution of eDSM to the Forecast

EDSM[4] is a clean and cost-effective resource aimed to help meet the electricity needs in the province of Ontario by reducing electricity consumption and peak demand in the region. This is achieved through a combination of codes and standards amendments as well as eDSM programs, primarily the suite of Save on Energy programs, to maximize conservation results.

The reduction of demand from the codes and standards amendments is dependent on the revised codes and standards set by new or renovated buildings as well as regulation of minimum efficiency standards set by equipment used in different sectors including residential, industrial, and commercial areas.

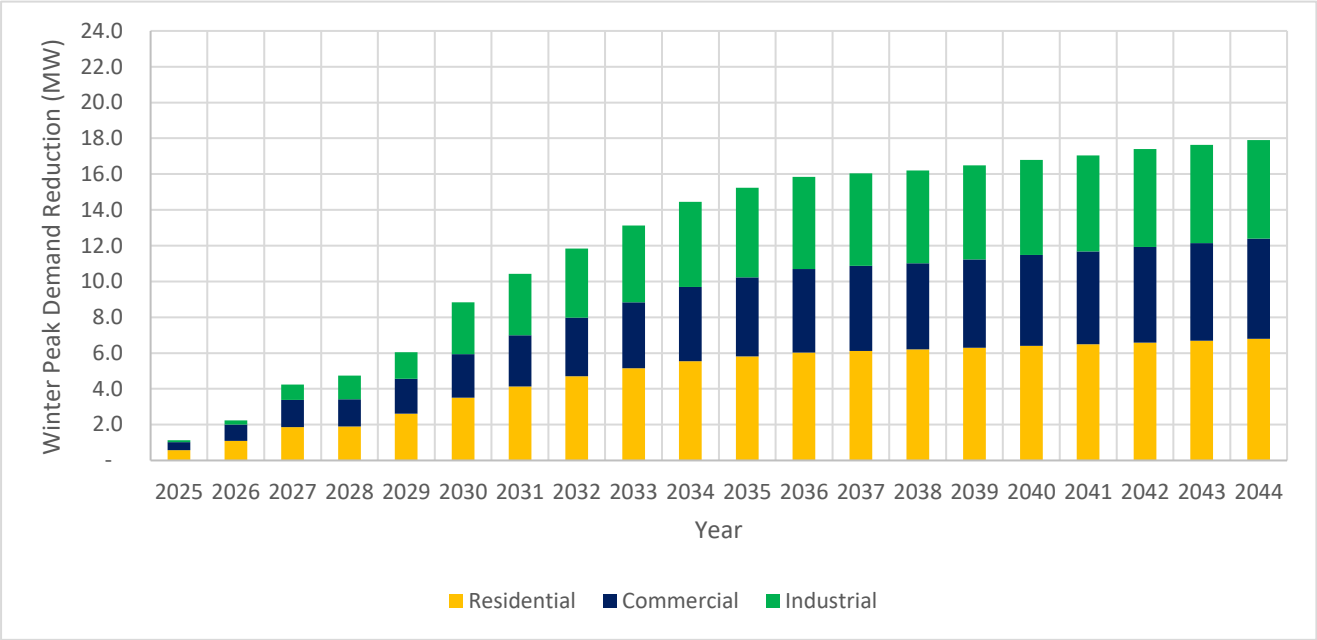
The estimated reduction of demand due to program-related activities is based on the IESO's 2025 Annual Planning Outlook eDSM savings forecast, which is informed by the IESO's 2021–2024 CDM Framework programs, the 2025–2027 Program Plan of the new 2025–2036 eDSM Framework, existing federal programs that reduce electricity needs in Ontario and expected long-term eDSM

[4] In alignment with the language of the November 7, 2024 directive to the IESO regarding a new program framework for 2025-2036, this IRRP uses the term "Electricity Demand-Side Management" ("eDSM"), replacing "Conservation and Demand Management" used in previous IRRPs and other IESO planning documents.

program savings aligned with the current Program Plan. Following the conclusion of the 2021-2024 CDM Framework, the new 2025–2036 eDSM Framework was launched in the beginning of 2025, which expands the scale and scope of the Save-On Energy programs including launch of the Home Renovation Savings programs for residential customers and various other new incentives.

As a result, Figure 7 and Figure 8 show the total contribution of eDSM for the ELS region in the winter and summer respectively under the reference scenario, reducing the total yearly peak demand for both seasons. They are divided into three sectors including residential, commercial, and industrial.

Figure 7 | Winter Reference Peak Demand Reduction Due to eDSM



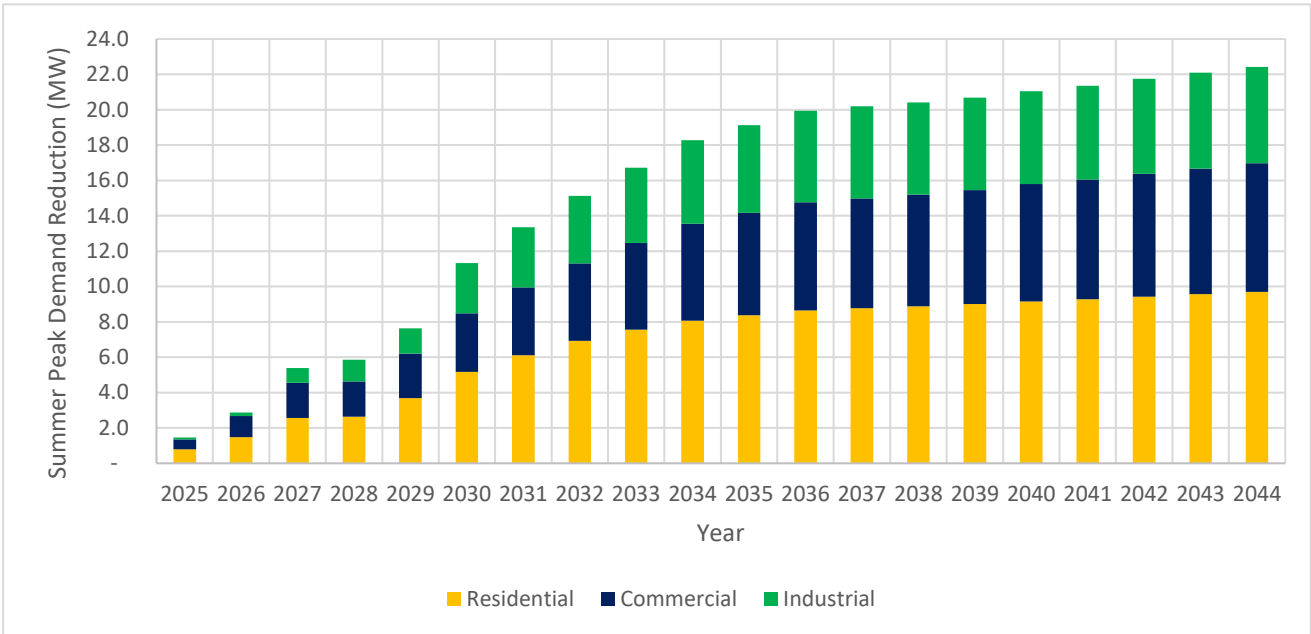


Figure 8 | Summer Reference Peak Demand Reduction Due to eDSM

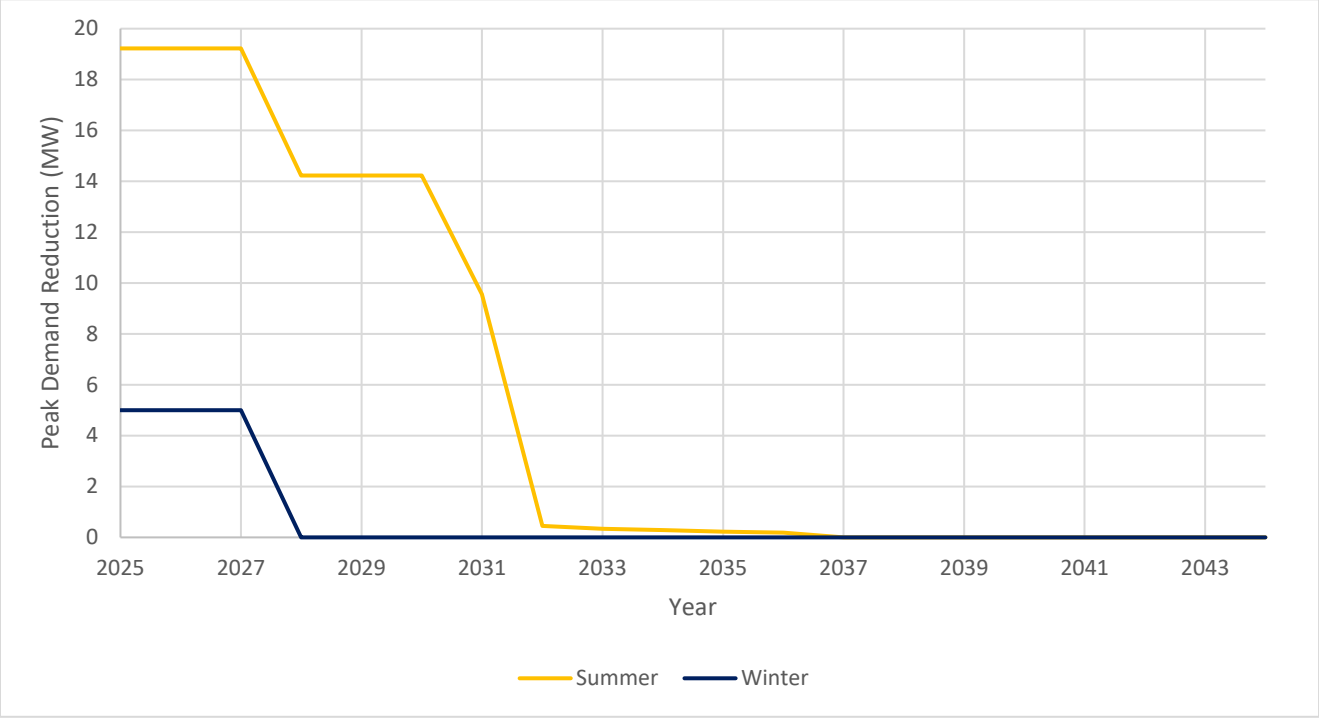
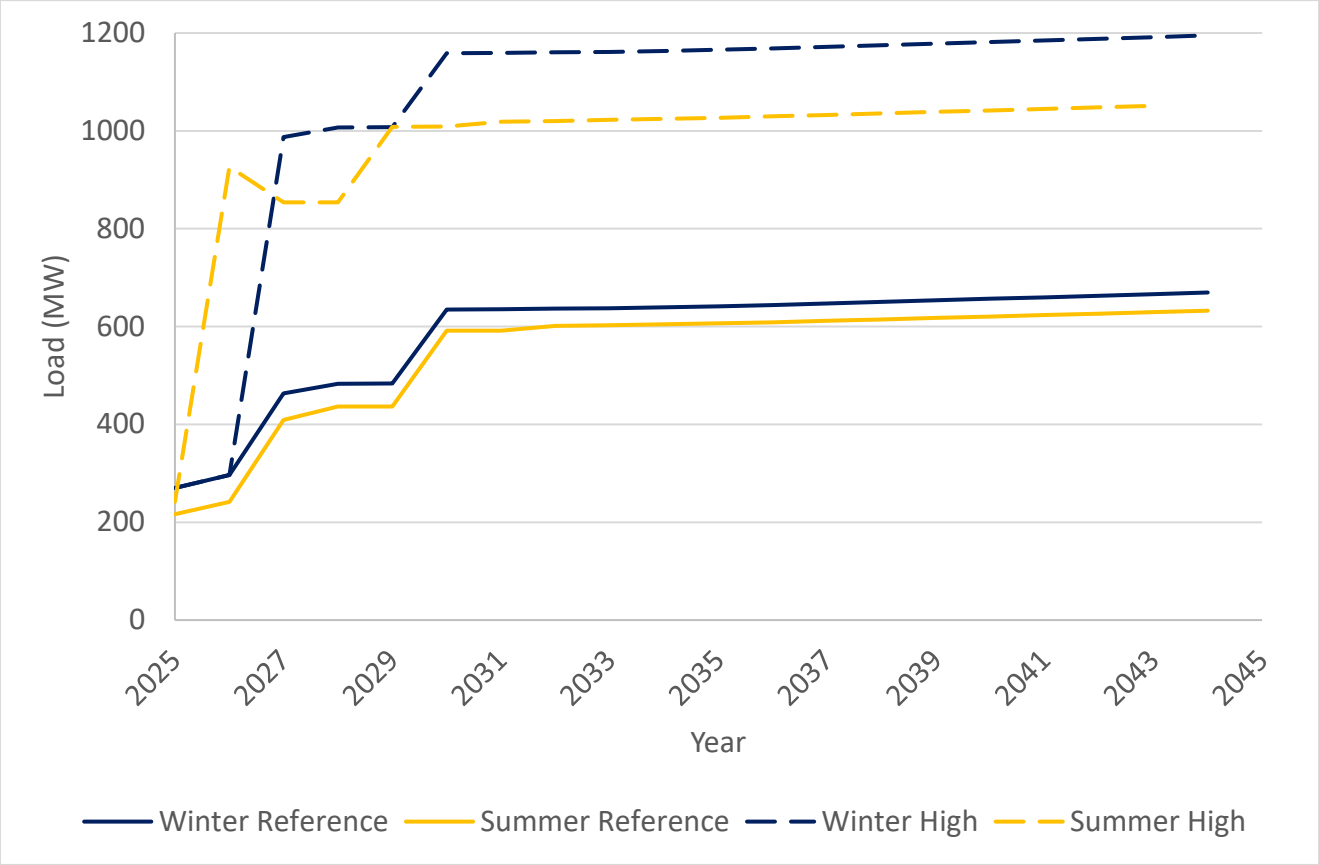


5.5 Contribution of Distributed Generation to the Forecast

Apart from eDSM resources, DG also plays a key role in reducing the electricity needs in the region. This includes resources contracted under the Ontario FIT and microFIT programs which were developed upon the introduction of the Green Energy and Green Economy Act in 2009. This act was aimed to expand renewable energy capacity across the province, encourage energy conservation and efficiency, and promote green jobs. These resources help offset peak demand requirements in regions such as the ELS region.

In Figure 9, the contribution of DG to the forecast is shown. This contribution is accounted for in the forecast, which further reduces the annual peak in addition to the contribution of eDSM. It is important to note that only facilities under contract with the IESO are accounted for and included into this forecast. As shown in Figure 9, the peak demand reduction over the years decreases. This is due to contracts expiring significantly in the middle of the next decade. The declining contribution of DG is expected to be addressed through continued implementation of the various Resource Adequacy Framework procurement mechanisms. Re-contracting of existing resources will be prioritized through upcoming windows of the Medium-Term Request for Proposals (RFP), the annual Capacity Auction and new procurement initiatives, such as the Local Generation Program. Repowering of existing resources reaching end of useful life is also being explored through the Long-Term RFP. If additional supply is required, procurement of new resources will be implemented.

Figure 9 | Peak Demand Reduction Due to DG



5.6 Planning Demand Forecast

After compiling the gross median forecasts from the LDCs and applying the weather correction factor and contributions of eDSM and DG, the net extreme forecast is achieved. Typically, the weather correction factor is first applied to the LDC forecast to obtain the gross extreme forecast. Then, the impact of eDSM and DG is deducted from the forecast to produce the net extreme forecast. The resulting net extreme weather demand forecast is then used to identify electricity system needs in the region and to inform the technical studies to develop options and recommendations.

The net extreme weather demand forecast for the ELS region is shown in Figure 10. This forecast includes the reference and high scenarios for each season and combines the distribution-connected and transmission-connected components of the forecast. In the winter reference scenario, the electricity demand grows significantly by 114% from 2026–2030 and stabilizes by year 2030. Also, its average annual growth rate throughout the planning period is approximately 5%. Similarly, in the winter high scenario, the same trend is observed. However, in the winter high scenario, demand could grow by 290% from 2026-2030, where the scenario encompasses potential customer connections in minerals processing, data centres, and construction. Its average annual growth rate throughout the planning period is also observed to be approximately 8%.

Figure 10 | Final ELS Net Extreme Weather Forecast

5.7 Hourly Forecast Profiles

In addition to the annual peak demand forecast, hourly demand profiles were also developed to support the evaluation of NWAs to address regional needs. These profiles were created for all 8,760 hours of the year over the 20-year forecast horizon for various stations and groups of stations. They were used to quantify the magnitude, frequency, and duration of needs. This supports the analysis of potential NWAs. The profiles are based on historical demand data, adjusted for variables that impact demand such as calendar day (i.e., holidays and weekends) and weather. They are then scaled to match the IRRP peak planning forecast for each year. Additional details on the hourly forecasting methodology are further provided in Appendix B.6

Note that these profiles are not intended to deterministically define hourly energy needs for NWAs. Instead, they provide a reasonable approximation of energy requirements for planning purposes, including estimating operating costs and selecting appropriate technologies. As consumer behaviour evolves, new businesses emerge, and electrification trends accelerate, demand patterns may shift significantly. The TWG will continue to monitor these developments as part of the ongoing planning process.

6. Electricity System Needs

This section summarizes the electricity system needs identified through the IRRP process for the ELS region. The assessment considers projected demand growth, electrification, and decarbonization trends, which are expected to increase pressure on the electricity system over the planning horizon, particularly during winter peak periods. The needs assessment methodology and the resulting electricity needs are described in the sections below.

6.1 Needs Assessment Methodology

Electricity needs were identified by the TWG based on an integrated assessment of planning demand forecasts, existing and forecasted system capability, the transmitter's identified asset replacement plans, and the application of established power system reliability standards and criteria, including ORTAC, NERC standards, and NPCC criteria.

Technical studies were conducted using industry-standard power system simulation tools to assess system performance under forecasted peak demand conditions and applicable contingency events. Based on this analysis, electricity needs were identified in the near-, medium-, and long-term timeframes and are categorized as follows.

Station Capacity Needs

Station capacity needs describe the electricity system's inability to deliver power to the local distribution network through regional step-down transformer stations during periods of peak demand. The capacity rating of a transformer station represents the maximum demand that can be reliably supplied and is constrained by station equipment.

Station capacity is typically determined based on the 10-day Limited Time Rating (LTR) of the station's smallest transformer, under the assumption that the largest transformer is out of service. In some cases, station capability may also be limited by the thermal or voltage constraints of upstream or downstream equipment, such as breakers, disconnect switches, low- or medium-voltage buses, or high-voltage circuits. Voltage drop limitations may further restrict station capacity independently of thermal ratings.

Supply Capacity Needs

Supply capacity needs describe the electricity system's inability to provide continuous electricity supply to a local area during peak demand conditions. These needs are defined by the LMC of the transmission system supplying the area.

LMC is determined by evaluating the maximum demand that can be served after accounting for the limitations of transmission elements—such as transmission lines, groups of lines, or autotransformers—when subjected to contingencies and criteria prescribed by ORTAC, NERC TPL-001-5.1, and NPCC Directory #1. LMC assessments are conducted using power system simulation analyses and may consider normal or extreme weather demand conditions, as applicable.

Asset Replacement Needs

Asset replacement needs are identified by the transmitter based on asset condition assessments and long-term asset management planning. These assessments consider a range of factors, including equipment deterioration due to age, weathering, or thermal stress; technical obsolescence associated with outdated designs; limited availability of spare parts or manufacturer support; and potential health and safety risks.

Asset replacement needs identified in the near- and early medium-term timeframes typically reflect condition-based information, while medium- and long-term replacement needs are often informed by the expected service life of equipment. As asset condition information is routinely updated, the timing of medium- and long-term replacement needs may change, and recommended need dates should be considered indicative.

Load Security and Load Restoration Needs

Load security and load restoration needs describe the electricity system's ability to minimize the impact of major transmission outages on customers. These needs are typically associated with severe but credible events, such as the loss of both circuits on a double circuit transmission line.

Load security refers to the total amount of customer demand that would be interrupted following a major transmission outage, while load restoration describes the system's ability to restore service to affected customers within reasonable timeframes. The specific load security and restoration requirements applied in this assessment are prescribed by ORTAC.

Based on the application of the needs assessment methodology described above, four electricity system needs were identified within the ELS study area. All identified needs are expected to emerge in the near-term, generally within the next five years, and therefore require timely action. The identified needs are limited to two categories: station capacity needs and supply capacity needs. With the inclusion of the Northeast Bulk Reinforcement, no new or distinct medium- or long-term electricity needs were identified over the planning horizon. Accordingly, the focus of this report is on addressing near-term system limitations, which are discussed in detail in the sections that follow.

6.2 Station Capacity Needs

Station capacity needs are determined by comparing forecast peak demand at step-down transformer stations with the available station capacity. For stations with multiple transformers, available capacity is typically defined using the 10-day LTR of the smallest transformer, assuming the largest transformer is out of service, in accordance with ORTAC. For single-transformer stations, available capacity is based on the transformer's continuous rating.

The asset owner is responsible for establishing transformer ratings. In most cases, the nameplate rating is used; however, in certain instances, a revised continuous rating may be calculated and applied.

Where feasible, load transfers between nearby stations are incorporated into the station-level demand forecast. These assumptions are based on information provided by local distribution company members of the TWG regarding transfer capabilities and normal operating practices.

Station capacity assessments consider both summer and winter peak demand conditions. While transformer thermal ratings are often lower in summer, increasing electrification and electric heating load can result in winter peak demand being more restrictive. As a result, both seasonal conditions are evaluated to identify the most constraining scenario.

Based on this assessment, no station capacity needs are identified in the ELS region under the Reference Scenario, as described below.

6.2.1 Chapleau DS Station Capacity Need

Based on the updated demand forecast and revised station capacity assessment methodology, Chapleau DS does not exhibit an existing or near-term station capacity need. Under the Reference Scenario, forecast station loading remains within available capacity for both summer and winter peak conditions throughout the study period. Under the High Growth Scenario, load increases more rapidly, with a station capacity need emerging in the late-2030s, driven primarily by summer peak demand.

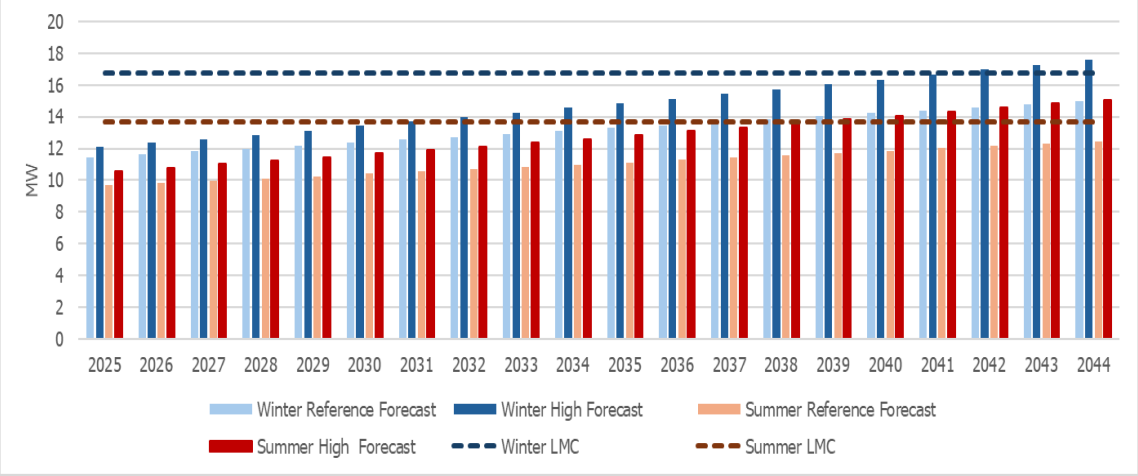
Earlier assessments identified a potential station capacity limitation at Chapleau DS based on preliminary assumptions related to power factor, treatment of local cogeneration output, and the use of nameplate continuous transformer ratings to define available capacity. These assumptions have since been refined, and the station capacity assessment has been updated to reflect revised demand forecasting inputs and current Hydro One Distribution planning criteria.

Specifically, updated power factor values provided by Hydro One Distribution were incorporated into the station-level demand forecast. In addition, the treatment of the local biomass cogeneration facility was revised such that only generation coincident with system peak demand is credited, rather than the facility's allocated capacity. The forecast was also adjusted to a new baseline by subtracting the difference between the previous and updated starting points, ensuring alignment with observed station loading conditions. Collectively, these refinements result in a more accurate representation of net peak demand at Chapleau DS.

Chapleau DS is supplied by a single step-down transformer (T2) with nameplate ratings of 7.5 MVA under natural cooling (Oil Natural Air Natural, ONAN) and 11 MVA under fan-assisted cooling (Oil Natural Air Forced, ONAF). As fan monitoring is installed at the station, the 11 MVA ONAF rating is considered available under normal operating conditions. Unlike earlier assessments, which implicitly relied on the transformer's nameplate continuous rating, the current assessment applies Hydro One Distribution's Planned Loading Limit (PLL) methodology, which permits defined levels of continuous transformer loading above the nameplate rating.

Consistent with Hydro One Distribution planning standards, the applicable PLL factors are 125% of the ONAF rating under summer peak conditions and 155–160% under winter peak conditions, resulting in available station capacities of approximately 13.75 MVA in summer and 17 MVA in winter. When assessed against these PLL-based ratings, forecast summer and winter peak demand remains within available station capacity throughout the study period under the Reference Scenario.

As a single-transformer supplied station, Chapleau DS does not meet firm N-1 capability under transformer outage conditions. In the event of a transformer outage, continued supply would rely on the deployment of a Mobile Substation Unit (MSU). The maximum available MSU size for the



Chapleau area is 15 MVA, which effectively defines the station's supply capability under contingency conditions. While reliance on a MSU reduces operating margins during peak periods, particularly in winter; this represents a contingency-driven limitation, rather than a firm station capacity deficiency under normal operating conditions.

Overall, with the incorporation of updated power factor assumptions, revised treatment of cogeneration output at system peak, baseline-aligned demand forecasting, and the application of Hydro One Distribution's PLL methodology, Chapleau DS does not exhibit an existing or near-term station capacity need under the Reference Scenario. Forecast summer and winter peak demand remain within available station capacity throughout the study period. While a station capacity need is indicated under the High Growth Scenario in the late-2030s, this sensitivity is used to test robustness and timing rather than to establish need. Accordingly, Chapleau DS does not have an identified station capacity need in this IRRP; however, higher-growth sensitivities suggest when a capacity need could emerge should demand materially exceed the reference forecast.

Table 4 | Summary of Station Capacity Assessment – Chapleau DS

Scenario	Limiting Season	Result
Reference	Winter	No station capacity need
Reference	Summer	No station capacity need
High	Winter	Capacity need in late-2030s
High	Summer	Capacity need in late-2030s

Figure 11 | Chapleau DS Demand vs. LMC

6.3 Supply Capacity Needs

Supply capacity needs in the ELS region are associated with limitations in the ability of the transmission system to reliably supply forecast demand under applicable contingency conditions. These needs are defined by the LMC of the transmission system supplying the area and are assessed in accordance with ORTAC, NERC TPL-001-5.1, and NPCC Directory #1 criteria.

LMC assessments were conducted using industry-standard power system simulation analyses to evaluate the maximum demand that can be reliably served while maintaining compliance with applicable contingency requirements. Where system reliability depends on local generation, sensitivity analyses were performed to assess the impact of generation outages, consistent with ORTAC requirements.

Based on this assessment, three supply capacity needs were identified in the ELS region. Each is linked to a distinct transmission supply interface or corridor, as described in the sections below.

6.3.1 Chapleau Area Supply Capacity Need (W2C Supply Path)

A supply capacity need is expected to emerge in the Chapleau area, affecting both Chapleau DS and Chapleau DS2, which are supplied via the 115 kV W2C transmission path. While the transmission facilities are capable of thermally supplying forecast load, the ability of the system to reliably serve peak demand is constrained by voltage limitations at the Chapleau end of the transmission line.

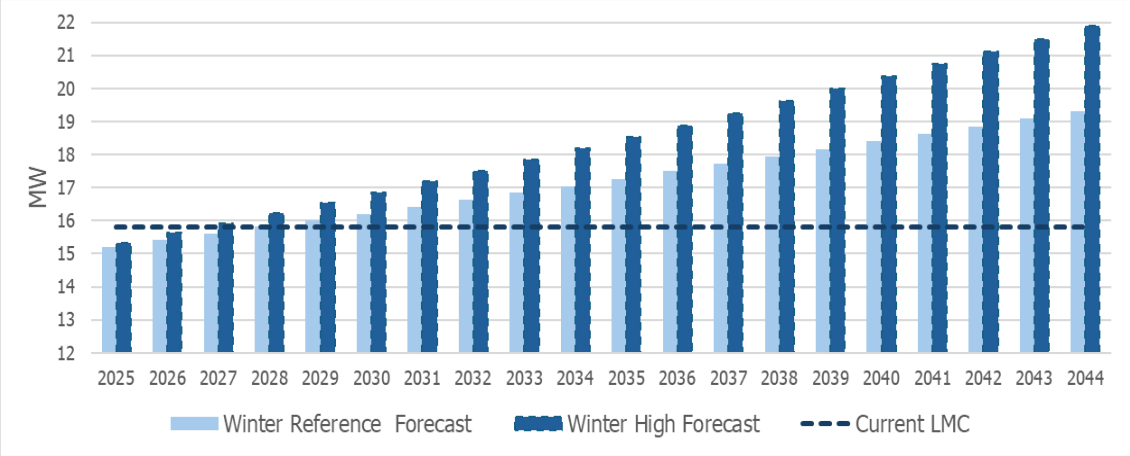
This supply capacity need is distinct from station capacity considerations identified in the previous section, as it is driven by voltage performance on the W2C transmission path rather than transformer thermal capability at Chapleau DS.

As load increases, voltages in the Chapleau area are reduced and fall below the minimum voltage levels specified in planning criteria. This limits the load meeting capability of the W2C supply path and results in a supply capacity shortfall.

The voltage-limited supply capacity need is driven by forecast demand growth in the Chapleau area and potential increased reliance on the transmission system in the event that approximately 5 MW of local biomass cogeneration does not continue beyond the current contract term. While the future status of this facility is uncertain and no confirmed retirement has been communicated, the assessment conservatively considers a reduction in local generation to test system capability and inform planning.

The Chapleau area supply capacity need is expected to emerge in the near-term planning horizon and increases over time as demand continues to grow.

Figure 12 | Chapleau Area Demand vs. LMC



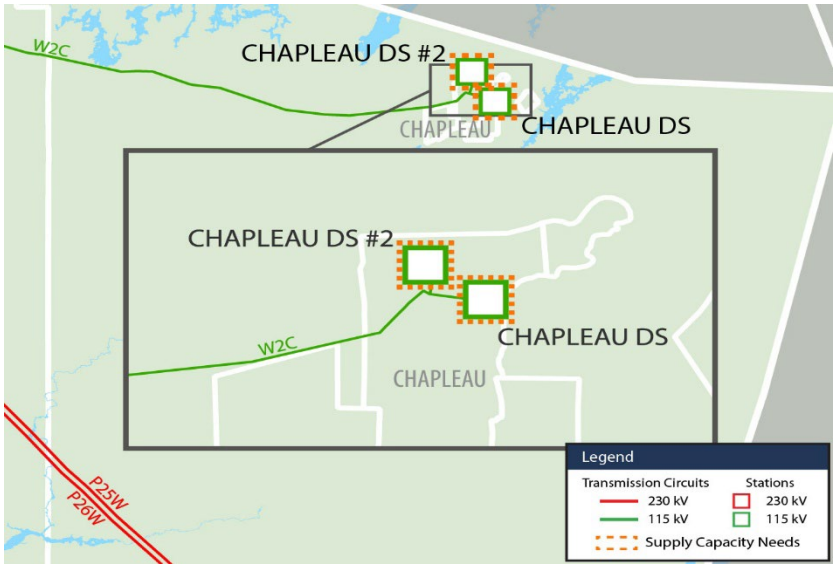


Figure 13 | Chapleau Area Need Map

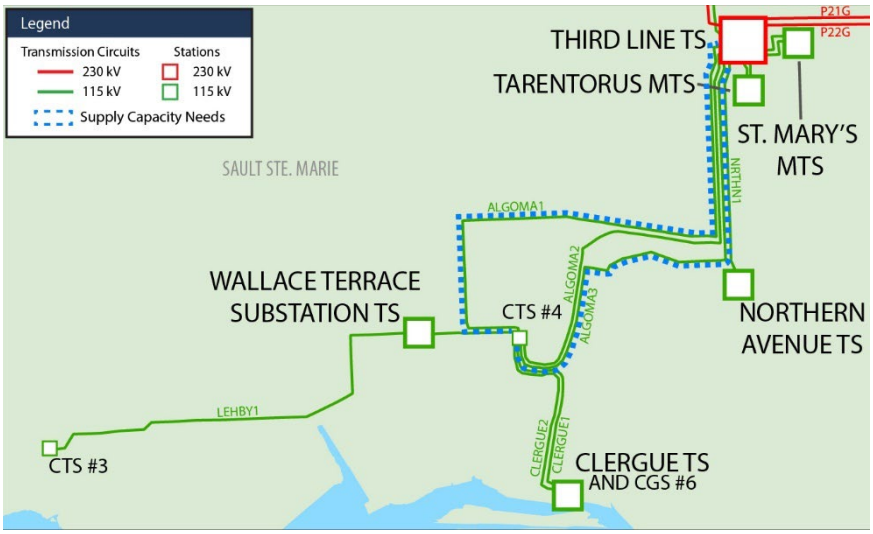
6.3.2 Algoma 115 kV Interface Supply Capacity Need

A supply capacity need was identified at the Algoma 115 kV interface, which supplies load at Patrick Street, Flakeboard, and Wallace Terrace through three 115 kV transmission circuits (Algoma 1, Algoma 2, and Algoma 3). The interface also includes Clergue Generating Station, a local hydroelectric facility that provides dependable capacity to support load within the area.

The Algoma 115 kV interface reflects an existing transmission limitation rather than a need driven by forecast growth. No transmission reinforcements, generation additions, or material load growth are forecast within the study horizon. Despite the stable demand outlook, the interface is unable to meet applicable planning criteria under certain contingency conditions due to limitations in transmission transfer capability.



The identified supply capacity limitation is driven by the thermal performance of the Algoma 115 kV transmission lines under credible breaker failure and multiple-element outage contingencies.

Specifically, the loss of two Algoma circuits results in the remaining circuit, Algoma 1, which has the lowest thermal rating, being required to supply the full area load. Under these conditions, post-contingency loading exceeds applicable emergency thermal ratings, limiting the ability of the transmission system to reliably supply load in compliance with planning criteria.

To manage this condition, a RAS is currently in place that trips load within the Algoma interface under specific contingency scenarios. However, operation of the RAS can result in the interruption of more than 150 MW of customer load, exceeding the maximum allowable load rejection specified in ORTAC. Accordingly, the Algoma 115 kV interface does not satisfy planning criteria under these contingencies, even though forecast demand does not exceed the calculated load-meeting capability when non-compliant load rejection is assumed.

The impact of this limitation is mitigated in the near-term by local generation support from Lake Superior Power (LSP), which supplies load within the broader Sault Ste. Marie 115 kV System interface. This support reduces net loading on the Algoma facilities under contingency conditions, lowering the likelihood of thermal overloads following multiple element outages. However, for the purpose of need determination in this IRRP, planning criteria are applied without reliance on contracted generation such as LSP as firm supply. As a result, while LSP improves actual operating conditions, it is not assumed to be available in the planning assessment due to the treatment of contracted generation in the supply outlook. On this basis, the Algoma 115 kV interface continues to exhibit a supply capacity need under applicable planning criteria and must be identified in this IRRP.

Figure 14 | Algoma 115kV Need Map

6.3.3 Sault Ste. Marie Interface Supply Capacity Need

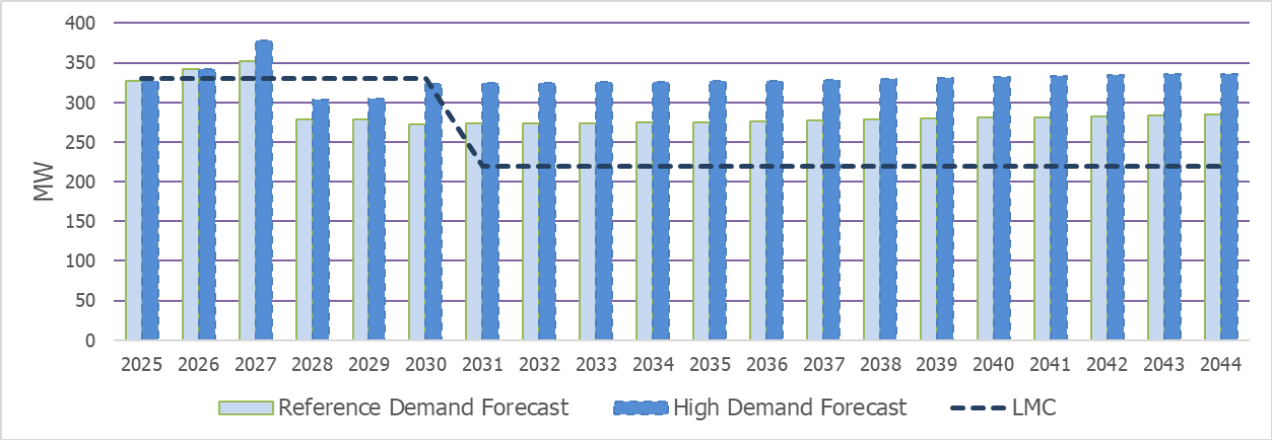
A supply capacity need has been identified for the Sault Ste. Marie 115 kV system interface, which supplies the majority of load within the Sault Ste. Marie area. The interface is anchored by Third Line TS, where power is transformed from the 230 kV system to the 115 kV system. For the purposes of this assessment, the interface includes the two 230/115 kV autotransformers at Third Line TS along

with the 115 kV transmission circuit from Mackay TS to Batchawana TS (K3G) [5] and associated downstream facilities.

Under normal operating conditions and single-contingency events, the Sault Ste. Marie 115 kV system is able to reliably serve forecast load and remains compliant with applicable planning criteria. However, a supply capacity limitation arises under a two-element contingency involving the loss of both autotransformers at Third Line TS.

Following the loss of both autotransformers, the 115 kV system must supply the full area load without support from the 230 kV system. Under these conditions, the remaining 115 kV network, including the K3G transmission line, is not sufficient to support the forecast demand. Voltage instability and thermal overloads limit the transfer capability of the interface, and as a result, the available supply is not sufficient to reliably serve load in accordance with planning criteria.

Figure 15 | Sault Ste. Marie Demand vs. LMC



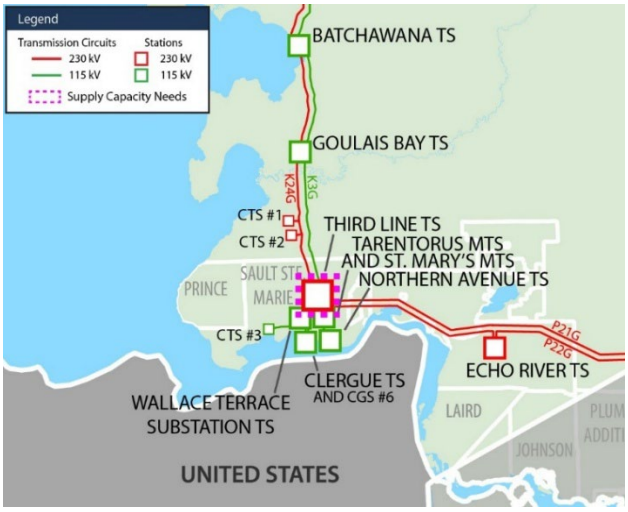


Figure 16 | Sault Ste. Marie Need Map

[5] For clarity, the 115 kV transmission circuit historically referred to as "Sault No. 3" has been re-designated as K3G following system updates.

6.4 Summary of Identified Needs

The identified needs were evaluated considering their timing, likelihood, and underlying drivers. The solution assessment therefore emphasizes proportional, flexible approaches that maintain compliance with reliability criteria while avoiding premature infrastructure investment.

Table 5 below provides an overview of all the Planning needs identified in this IRRP.

Table 5 | Summary of Planning Needs in ELS Region

Need	Need Date	2044 Need (MW)
Chapleau DS station capacity	None	n/a
Chapleau Area Supply Capacity Need (W2C Supply Path)	2028	5
Algoma 115 kV interface Supply Capacity Need	N/A	0[6]
Sault Ste. Marie Interface Supply Capacity Need	2030	95

[6] The Algoma 115 kV interface can accommodate the demand forecast under planning criteria, which permit the use of RAS schemes to trip up to 150 MW of load. However, the existing RAS is not sufficiently selective and can result in load rejection exceeding 150 MW, requiring updates to achieve compliance.

7. Plan Options and Recommendations

This section describes the solutions identified to address the electricity system needs outlined in Section 6 and presents the recommended actions for the ELS region.

A range of potential solutions were evaluated, including transmission, generation, demand-side, and operational alternatives. Options were assessed based on their ability to address the identified needs within the required timeframe, improve system reliability, accommodate future uncertainty, and be cost-effective to implement.

The recommended approaches reflect the most effective and practical means of addressing the underlying system limitations while maintaining compliance with applicable planning criteria.

As all identified needs are expected to emerge in the near-term, this section focuses on solutions that can be implemented within the required timeframe while preserving flexibility to respond to future changes in system conditions.

7.1 Solution Assessment Framework

Potential solutions were developed by the TWG and assessed to address the electricity system needs identified in Section 6. The assessment considered a range of solution types, including:

- transmission reinforcements or reconfigurations;
- station-level capacity additions or upgrades;
- local generation resources; and
- operational and NWAs, where feasible.

Each solution was assessed against key considerations including:

- effectiveness in addressing the identified need and maintaining compliance with ORTAC, NERC, and NPCC criteria;
- timing and deliverability;
- flexibility and scalability, particularly where needs increase in magnitude over time;
- cost-effectiveness, including capital and lifecycle considerations;
- consistency with broader system plans, including provincial planning outlooks and planned reinforcements such as the Northeast Bulk Reinforcement Plan.

The assessment framework recognizes that different solution types may be more appropriate for different needs. As a result, solutions were evaluated and compared separately for station capacity needs and supply capacity needs, as described in the sections below.

7.2 Plan Options and Recommendations for Station Capacity Needs

This section describes the approach used to assess and address station capacity needs in the ELS region and presents the options considered for identified and potential needs.

Station capacity needs arise when forecast demand exceeds the capability of transformer stations to supply load. These needs are typically addressed through two types of solutions. Wires solutions increase station capacity through transmission and distribution system investments, such as replacing or adding transformers, expanding existing stations, or developing new station infrastructure where required. NWAs reduce net peak demand to remain within existing station capacity. These may include demand-side measures, DG, or other local supply resources. However, NWAs are not suitable for all station capacity needs and are generally more dependent on the magnitude, timing, and duration of the constraint.

As a result, NWAs are first screened to determine whether they are technically feasible and appropriate for a given need. This screening considers the characteristics of demand growth, the nature of the underlying limitation, and the ability of NWAs to reliably address the constraint.

7.2.1 Plan Options and Recommendations for Chapleau DS Station Capacity Need

As described in Section 6.2, no station capacity need has been identified at Chapleau DS under the Reference Scenario within the planning horizon.

Consistent with the regional planning approach, implementation of station capacity solutions is typically advanced when forecast demand indicates a need within the required project lead time. Where potential needs are identified in the longer term or under sensitivity scenarios, options are reviewed at a high level and monitored through future planning cycles rather than advanced immediately. Under the High Growth Scenario, a potential station capacity need may emerge in the late-2030s, driven primarily by increased peak demand. This scenario has been assessed to provide insight into how the system may evolve under higher growth conditions and to support longer-term planning considerations. To inform this assessment, a range of potential options was reviewed at a high level, including both network-based solutions and NWAs.

A wires-based option involving Chapleau DS2 (Chapleau Municipal Station) was reviewed at a high level. This option would involve converting the existing 115 kV/4 kV Chapleau DS2 station to operate at a 25 kV secondary voltage, consistent with Chapleau DS, and transferring customers to the 25 kV system. This conversion would require replacement of existing transformers and associated modifications to feeders, protection, and control systems.

However, this work is not considered a capacity expansion option. Chapleau DS2 is an aging station with obsolete voltage configuration and is expected to require refurbishment or replacement in the near future. The proposed conversion would allow for the retirement of the aging Chapleau DS2 assets and enable all customers in the area to be served at a standardized 25 kV voltage level in alignment with Hydro One Distribution practices.

While the conversion does not materially increase system capacity, it would provide operational and reliability benefits by standardizing voltage levels across the Chapleau area. This would improve system flexibility, including enhanced ability to back feed circuits and respond to contingencies.

As such, this initiative is best characterized as an asset renewal and system modernization activity rather than a capacity solution. It is noted here for context but is not considered a plan option to address station capacity needs.

NWAs were also considered at a high level. While certain options may be technically feasible, their applicability is generally limited by the scale, timing, and location of the potential need, as well as available connection capacity within the existing distribution system. As such, NWAs were not identified as primary solutions for this need but may be reconsidered in future planning cycles.

Given the absence of a station capacity need under the Reference Scenario, no actions are required at this time. Load growth and system conditions will be reviewed through ongoing TWG activities, and station capacity solutions will be advanced when forecast demand indicates a need within project lead time.

7.3 Solutions to Address Supply Capacity Needs

This section describes the approach used to assess and address supply capacity needs in the ELS region and presents the options considered for identified needs.

Supply capacity needs arise when there are limitations in the ability of the transmission system to deliver sufficient power to a defined area under normal or contingency conditions. These needs are typically associated with transmission supply interfaces, where the amount of load that can be served is determined by the transfer capability of the interface and the availability of supply resources within the area.

To address supply capacity needs, a range of solutions is considered. These may include transmission reinforcements to increase transfer capability, such as new lines or autotransformers, or the addition of voltage support equipment to improve system performance. In many cases, local supply resources and NWAs can also play a role, particularly where they can be effectively located and operated to support the affected area.

The preferred approach in each case reflects the solution, or combination of solutions, that most effectively addresses the underlying limitation while maintaining compliance with planning criteria and remaining practical to implement. Given that supply capacity needs often affect a broader area and multiple stations, solutions are assessed with consideration of their ability to provide reliable and flexible support under a range of operating conditions.

The supply capacity needs assessed in this section include:

- The Chapleau area supply capacity need associated with voltage limitations on the W2C supply path.
- The Algoma 115 kV interface supply capacity need, driven by thermal limitations and non-compliant load rejection.
- The Sault Ste. Marie 115 kV System interface supply capacity need, driven by voltage instability under certain planning conditions.

Solutions were assessed based on their ability to improve load meeting capability, address voltage or thermal limitations, reduce reliance on non-compliant remedial actions, and maintain system reliability under applicable contingency conditions.

7.3.1 Plan Options and Recommendations for Chapleau Area Supply Capacity Need

As described in Section 6.3.1, a supply capacity need has been identified in the Chapleau area, driven by post-contingency voltage limitations on the W2C supply path. This near-term need requires a solution to address the underlying voltage limitation and maintain system reliability.

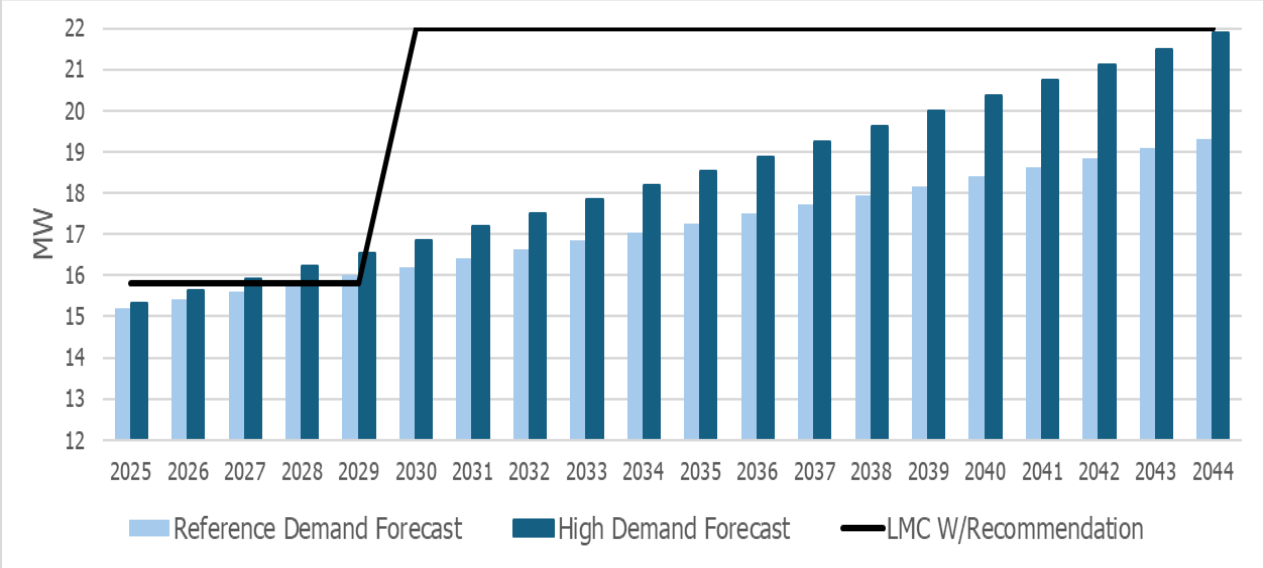
A range of potential options was considered, including transmission-based solutions, local supply resources, and NWAs. The preferred approach is the implementation of localized static reactive power support in the Chapleau area. Providing localized reactive support would improve voltage stability, increase load meeting capability, and restore voltage support previously provided by local generation. This approach directly addresses the underlying voltage limitation and provides a durable solution under contingency conditions.

The use of static reactive support represents a cost-effective and appropriate solution for the identified need. The specific sizing, siting, and configuration of the required equipment will be determined through the RIP, based on detailed technical and economic assessment.

Other options were also assessed to support the evaluation. NWAs, including combinations of wind generation, battery energy storage, and demand-side measures, may provide partial and short-term mitigation, particularly during the initial years following need onset. However, their applicability is constrained by technical limits on the system, including limited connection capacity at the distribution and transmission level, as well as voltage performance constraints on the W2C supply path. These constraints restrict the amount of additional generation or demand reduction that can be effectively integrated without further upstream reinforcement. As a result, NWAs could only be deployed in sufficient quantity to manage the need in the early-2030s and are not capable of providing a durable, long-term solution.

Local gas-fired generation was also found to be technically feasible, as it could provide firm supply and reactive capability. However, it represents a higher cost and less direct approach to addressing a voltage-driven need and was not advanced as the preferred solution.

Demand-side measures, including additional eDSM, may provide modest near-term load relief but are similarly insufficient to resolve the underlying constraint or provide sustained mitigation as demand increases.



Accordingly, the recommended approach is to implement localized static reactive power support in the Chapleau area. Supplementary measures may be considered to support system needs during initial implementation; however, a permanent voltage support solution is required to address the identified supply capacity limitation. The detailed design, sizing, siting, and implementation timing of this solution will be confirmed through a RIP led by Hydro One.

During the preparation of this IRRP, Hydro One Distribution identified a potential project involving the addition of a new transformer at Chapleau DS. This project is currently in the early scoping phase and remains subject to further assessment and confirmation.

As this information became available late in the study process, its potential impact on system capacity and voltage performance in the Chapleau area has not been assessed. This potential development is separate from the 4 kV to 25 kV conversion initiative in the Chapleau area. While it may influence future system needs, it does not change the recommended approach at this time.

The TWG will continue to monitor this development and assess its implications as part of the RIP phase or future regional planning cycles.

Figure 17 | Chapleau Area Need with Recommendation

7.3.2 Plan Options and Recommendation for Algoma Area Supply Capacity Need

As described in Section 6.3.2, the Algoma 115 kV interface supply capacity limitation is driven by thermal constraints on the transmission system under contingency conditions. Under these conditions, post-contingency loading on the remaining transmission circuits can exceed applicable emergency thermal ratings, requiring corrective action to maintain system reliability.

This condition is currently managed through a RAS, which mitigates overloads by shedding load within the Algoma area following specific contingency events. Under planning criteria, the use of RAS is acceptable provided that the magnitude of load rejection remains within allowable limits. However, the existing scheme may result in load rejection in excess of the thresholds specified under ORTAC, resulting in non-compliance with planning criteria.

The preferred approach is to enhance the existing RAS to improve its selectivity and operational performance. Enhancements would focus on enabling more granular load shedding, allowing the system to reject only the minimum amount of load required to mitigate post-contingency thermal violations. This directly addresses the source of non-compliance by reducing the magnitude of load interruption while maintaining the effectiveness of the protection scheme.

This approach is appropriate given that the underlying limitation is driven by thermal performance under specific contingency conditions rather than sustained peak demand. By improving the performance of an existing system protection mechanism, it provides a targeted and efficient solution and avoids the need for more capital-intensive transmission reinforcements. It also maintains system operability under contingency conditions while aligning with applicable planning criteria.

Due to the lead time required to design, implement, and commission RAS enhancements, including engineering design, protection system upgrades, testing, and co-ordination with system operations, an interim measure is required to ensure continued reliable operation of the system. In the near term, the TWG will work with impacted customers to establish a load rejection exemption framework. Under this approach, customers would acknowledge and accept load interruption levels exceeding standard planning criteria under defined contingency conditions, providing a temporary and transparent mechanism to manage system risk while longer-term improvements are implemented.

Transmission reinforcement options were also assessed, including uprating the Algoma transmission circuits to increase transfer capability into the area. To meet reliability requirements under both single- and double-contingency conditions, co-ordinated uprating of Algoma No.1 and Algoma No.3 would be required. While technically feasible, this approach would significantly increase project scope, cost, and constructability risk, while providing a less targeted solution to a contingency-driven limitation.

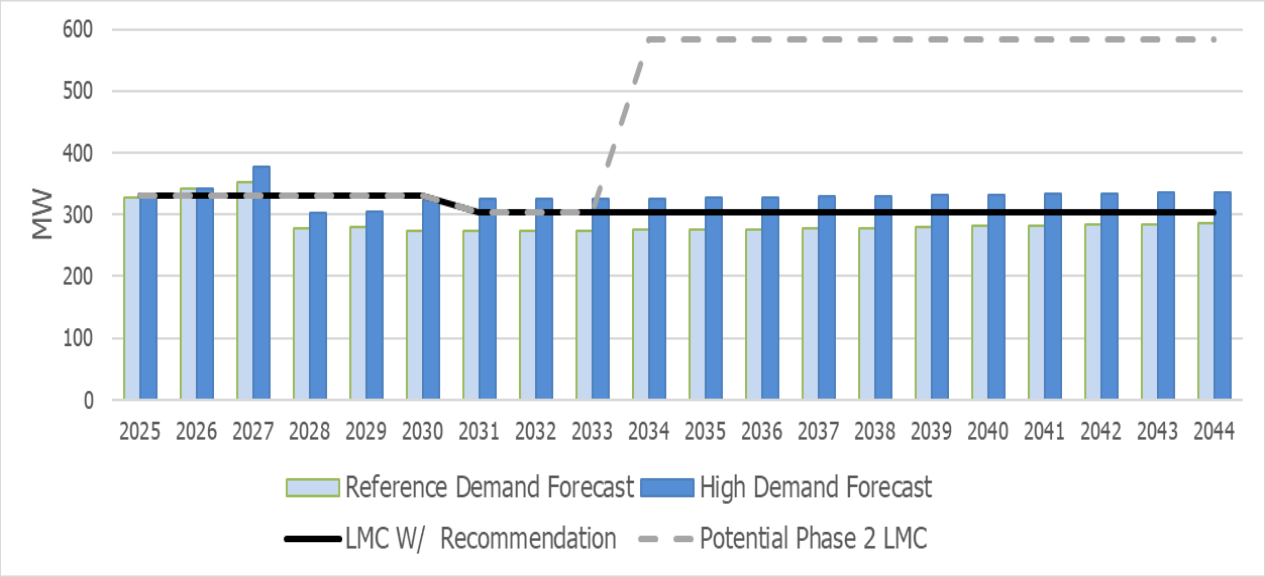
As demand in the Algoma area evolves beyond the conditions assessed in this IRRP, transmission reinforcement options may be revisited in future planning cycles or TWG reviews to confirm whether additional infrastructure is warranted.

Accordingly, the recommended approach is a staged solution consisting of an interim load rejection arrangement followed by targeted enhancements to the existing RAS to restore compliance with planning criteria.

7.3.3 Plan Options and Recommendations for Sault Ste. Marie Supply Capacity Need

As described in Section 6.3.3, the Sault Ste. Marie 115 kV system interface supply capacity need is driven by voltage instability following the sequential loss of both autotransformers at Third Line TS. Under this condition, the remaining 115 kV network is unable to maintain acceptable voltage levels and reliably serve load, and thermal overloads are also observed on the K3G transmission section. This need is expected to emerge in the near term and requires a solution to maintain system reliability.

A range of potential options was considered, including transmission reinforcements, local supply resources, and NWAs. The recommended action is to pursue a cost-effective supply solution with performance characteristics aligned with the identified reliability risk. The capability of the resource must match the characteristics of the need, requiring a resource that is dispatchable when needed after a contingency, and capable of sustained operation for the duration of the contingency condition. This performance-based framing preserves flexibility with respect to the specific technology or acquisition approach, supports transparency with communities, and allows the need to be addressed, subject to demonstrated deliverability and applicable municipal and provincial siting requirements.



The ability to implement new supply resources in the Sault Ste. Marie area is currently constrained by system conditions, including limits on connection capacity and restrictions on the integration of certain resource types. These constraints limit the amount and type of resources that can be connected and reliably contribute to system needs and will need to be considered in the design and implementation of any solution.

Other NWAs were also assessed. Resource combinations such as wind generation, battery energy storage, and demand-side measures were found to be technically constrained in the area and are not capable of providing the firm, dispatchable, and sustained performance required to address the identified reliability need. Demand-side measures alone are similarly insufficient, as they do not provide the level of firm capacity or reactive support required under contingency conditions. Load transfer options were also assessed and found to be infeasible due to network limitations and the absence of sufficient alternate supply paths.

A transmission-based solution involving the addition of a third autotransformer at Third Line TS was also assessed as a longer-term option. This approach would increase system redundancy, improve voltage performance, and fully eliminate the identified limitation; however, it involves higher cost and longer lead times. In contrast, a supply resource with the required performance characteristics provides ongoing system value by contributing energy and capacity to the system, while also addressing the local transmission reliability risk under contingency conditions. As a result, a performance-based supply solution represents a more cost-effective and flexible approach in the near term. The addition of a third autotransformer at Third Line TS is therefore considered a potential future consideration (Phase 2) reinforcement, the timing of which is not predetermined and would depend on future demand growth and system conditions. As demand and system conditions evolve, transmission reinforcement options may be revisited through future planning cycles and TWG reviews to confirm whether a wires-based solution is required. Supply constraints and congestion in the region currently limit inverter-based generation integration. These constraints limit the ability of certain resource types to address system needs, even when they may be otherwise cost effective. During outage conditions, congestion also results in curtailment of low-cost generation options, which add increased costs to the market. A review of demand and supply conditions in the 2028 to 2029 timeframe is recommended to confirm timing and identify the appropriate long-term approach.

Accordingly, the recommended approach is to pursue a cost-effective supply solution that meets the defined dispatchability, duration, and voltage support requirements to address the identified supply capacity need in the near term.

Figure 18 | Sault Ste. Marie Need with Recommendation

For illustrative purposes, the potential Phase 2 reinforcement (addition of a third autotransformer at Third Line TS) is reflected in the LMC projection in the mid-2030s to demonstrate its impact on system capability; however, the timing of this reinforcement is not predetermined and will depend on future system conditions and demand growth.

7.4 Summary of Recommended Actions and Next Steps

The TWG recommends the actions summarized in Table 6 below to meet needs identified in the ELS region IRRP.

Table 6 | Summary of Recommendations for ELS Region

Action	Reinforcement Type	Needs Addressed	Implementation	Expected In-Service	High Level Planning Cost Estimate ($)
ELS region monitoring	Planning/ monitoring	Preserves long-term flexibility and informs future infrastructure-based solutions	ELS TWG	Ongoing	-
Chapleau reactive power support	Transmission-side static reactive power support, with demand side measures serving as	Address voltage-limited supply capacity constraints in the Chapleau Area	Hydro One (reactive support); IESO (eDSM)	Near-Term	~ 8M

Action	Reinforcement Type	Needs Addressed	Implementation	Expected In-Service	High Level Planning Cost Estimate ($)
	short-term supplement				
Address Algoma 115 kV interface supply capacity need	Enhance existing RAS to support more flexible control actions; load rejection exemption framework	Mitigates contingency-driven thermal limitation at the Algoma 115 kV interface	Hydro One	Near-Term (interim); TBD (RAS)	~5M
Address Sault Ste. Marie 115 kV interface supply capacity need	Performance based supply solution with demand side measures	Address voltage instability limitations in the Sault Ste. Marie 115 kV area	IESO (lead); TWG support	TBD	-[7]
Address Sault Ste. Marie 115 kV interface supply capacity need - Long-Term	Ongoing planning assessment through TWG and planning cycles	Ensure long-term supply adequacy and determine need for wires solution (i.e. new autotransformer) at Third Line TS	ELS TWG	Ongoing/ Trigger-based	-

[7] Costs for a supply resource in the region would be offset by system benefits that would be realized by any resource

8. Community and Stakeholder Engagement

Engagement is critical in the development of an IRRP. Providing opportunities for input in the regional planning process enables the views and perspectives of the public, which for these purposes, refers to market participants, municipalities, stakeholders, communities, Indigenous communities, customers and the general public, to be considered in the development of the plan, and helps lay the foundation for successful implementation. This section outlines the engagement principles and activities undertaken to date for the ELS IRRP.

8.1 Engagement Principles

The IESO's External Relations Engagement Framework and is built on a series of key principles that respond to the needs of the electricity sector, communities and the broader economy. These principles ensure that diverse and unique perspectives are valued in the IESO's processes and decision-making. We are committed to engaging with purpose to foster trust and build understanding.

Figure 19 | The IESO's Engagement Principles

8.2 Engagement Tactics

To ensure that the IRRP reflects the needs of market participants, municipalities, stakeholders, communities, Indigenous communities, customers and the general public, engagement tactics involved:

- Leveraging the ELS engagement webpage to share information including engagement opportunities, meeting materials, input received and the IESO's response to feedback;

- Leading targeted discussions with key Indigenous communities and municipal staff to help inform the engagement approach for this planning cycle;
- Hosting public webinars at major junctions in the plan development to share plan details, understand feedback and answer questions, and;
- Providing written updates through email and IESO's weekly Bulletin updates to all subscribers.

8.3 Engagement Approach

Four public engagement webinars were held at major stages during the Scoping Assessment and IRRP development to give interested parties an opportunity to hear about its progress and provide comments on key components of the plan.

Public engagement webinars were attended by municipal staff, community representatives, businesses, Indigenous communities, and other interested parties and written feedback was collected following a comment period after each webinar. The four stages of engagement at which input was invited were:

1. The draft scoping outcome assessment report to share the planning approach before delving into the full IRRP study;
2. The draft engagement plan and electricity demand forecast to set the foundation of this planning work;
3. The electricity needs for the region and an overview of wired solutions and NWAs that could meet the needs; and
4. The detailed analysis of all feasible wired solutions and NWAs and draft IRRP recommendations.

Comments received during the development of the IRRP primarily focused on:

- Accounting for growth and economic development projects across the region;
- Ensuring climate impacts are accounted for throughout the development of the IRRP, and;
- Exploring alternative solutions, such as NWAs, to meeting the area's electricity needs.

Feedback received during the written comment periods for these webinars helped to guide further discussions throughout the development of this IRRP, as well as add due consideration to the final recommendations, and are outlined in the stages below.

Scoping Assessment

The ELS region was anticipated to experience significant electricity demand growth given earlier regional and bulk plans in this area. Additional local needs were identified in the Needs Assessment and shared during this milestone, confirming the approach to proceed with an IRRP. Email communications were sent to all subscribers of the ELS region, including municipalities, Indigenous communities, and those with an identified interest in regional issues, to announce the commencement of a new planning cycle and encourage participation on the ELS Scoping Assessment

report finalization. A public webinar was held in December 2024 to provide an overview of the regional electricity planning process, the draft report and proposed approach.

Feedback received during this milestone encouraged the IESO to consider co-ordination between the electric and gas sectors to help optimize the energy systems in ELS and to consider expanding participation in the TWG. The IESO welcomed any additional information and meetings to help inform the study as it progresses. The final Scoping Assessment report was posted in January 2025, identifying the need for a co-ordinated regional planning approach for the ELS region.

Demand Forecast

Following finalizing the Scoping Assessment, the TWG began the development of region's electricity demand forecast. IRRP recommendations are typically driven by the Reference Demand Forecast, which includes firm loads (current and planned), organic growth, residential, electrification and energy plans, and industrial growth. A High Growth Scenario was also developed to capture growth and trends that are less certain such as large-scale customer connections.

To achieve this, the IESO engaged with all municipalities to understand any key loads to engage, as well as with transmission-connected loads, to understand their growth plans and ensure it was captured in the draft forecasts. The draft forecasts were shared through the launch of a broader public engagement initiative. Communications to IESO subscribers of the ELS region ensured all interested parties were made aware of the opportunity for input.

During this milestone, key information shared was that the electricity demand is growing significantly with demand estimated to grow by 112%. The primary drivers of growth are electrification initiatives, including Algoma Steel's EAF transformation project. The reference forecast was ultimately used to drive recommended solutions, however the TWG will identify options for long-term electricity needs and high-growth scenarios, refining these options in future planning cycles and activating them as growth occurs.

Based on the feedback through this engagement initiative, a key priority was to ensure the IRRP considered climate impacts into the demand forecast and incorporated resiliency into recommended actions. The TWG ensures the forecast reflects extreme weather conditions in various scenarios, which includes the system's ability to respond to disturbances, and committed to ongoing discussions about resiliency throughout plan development. Additionally, feedback was centred around ensuring strong justification for new or upgraded infrastructure developments are provided. The TWG committed to evaluating wired solutions and NWAs and sharing the analysis as planning work advances.

Electricity Needs and Options Identification

During this milestone, the TWG initially identified a station capacity need and three supply capacity needs, each with unique system challenges. During targeted municipal discussions and the public engagement webinar, the TWG shared the types of options that are considered as part of the regional planning process to meet needs. The examples illustrated the range of options typically considered, with further analysis underway to determine which solutions would be most appropriate based on system needs and constraints.

Feedback at this stage of the engagement sought to further clarify the options analysis stage of the IRRP, particularly if NWAs would be considered and if options would be advanced on high demand projections. The TWG committed to sharing a detailed options analysis in the upcoming milestone. Additionally, feedback received urged to consider forward-looking climate projections. The TWG acknowledged the importance of accounting for temperature trends in the forecasting development and shared information about how extreme weather is included in this process.

Options Analysis and Draft Recommendations

During this milestone, the TWG shared the options analysis for all feasible wired solutions and NWAs and the draft recommendations through targeted municipal discussions and a public engagement webinar. Since the last webinar, the previously identified station capacity need at Chapleau DS was resolved based on updated information showing sufficient station capacity, leaving three supply capacity needs remaining. To meet the needs, the Technical Working Group drafted the following recommendations:

- Install a reactive device (capacitor) to improve supply capacity and voltage performance for the Chapleau area, supported by electricity demand-side management as an interim measure.
- Pursue generation options at the Sault Ste. Marie 115kV interface and monitor the load growth in the area to determine whether an additional autotransformer is required in the future.
- Obtain an operational measure exemption at the Algoma 115kV interface as enhancements to the existing RAS is implemented.
- Monitor load growth and system performance to identify timing on advancing additional system improvements if needed to maintain compliance with reliability criteria.

Feedback at this stage of the engagement sought to further clarify if deliverability constraints will impact the generation recommendation and linkages to other ongoing work in the region.

8.4 Involving Municipalities in the Plan

Throughout the IRRP engagement, valuable feedback was received from municipalities and incorporated into the final IRRP including:

- Enhancing webinar materials to share technical updates in a transparent and digestible manner;
- Including the latest energy plans on electrification, HVAC systems and electric vehicles, and transmission-connected customers in and around the Sault Ste. Marie area; and
- Providing details on linkages with ongoing and previous regional and bulk plans, including the 2022 Northeast Bulk Plan recommendations and ongoing Sudbury/Algoma regional plan.

8.5 Engaging with Indigenous Communities

The IESO remains committed to an ongoing, effective dialogue with Indigenous communities to help shape long-term planning across Ontario. This engagement was part of a broader commitment to fostering respectful relationships, ensuring transparency, and supporting informed participation in

integrated regional electricity system planning. Throughout the development of this plan, the IESO's engagement with Indigenous communities included inviting Indigenous communities to participate in online information sessions held on December 4, 2024, July 9, 2025, December 11, 2025 and June 4, 2026, as well as Indigenous-focused meetings that were held those same days, in order to provide additional opportunities to ask questions and provide input.

To share information about the planning activities and invite participation in the engagement process, outreach was made to the following Indigenous communities:

- Batchewana First Nation
- Brunswick House First Nation
- Chapleau Cree First Nation
- Chapleau Ojibwe First Nation
- Garden River First Nation
- Michipicoten First Nation
- Missanabie Cree First Nation
- Mississauga First Nation
- Serpent River First Nation
- Thessalon First Nation
- Métis Nation of Ontario
- Bar River Métis
- Red Sky Métis Independent Nation

Detailed non-confidential feedback submitted to the IESO and the IESO's responses can be viewed on the East Lake Superior Planning Engagement webpage. At a high level, the IESO received the following feedback:

- M'Chigeeng First Nation requested more detailed data from the IESO on Algoma Steel Foundry electrification to better understand regional impacts and reduce uncertainty. They emphasized prioritizing Distributed Energy Resources (DERs)—including wind, solar, hydro, and battery storage—as the primary solution to address regional supply needs. They expressed concern that demand-side management (eDSM) may not effectively reduce consumption given anticipated rapid load growth. The Nation also suggested the IESO explore a new transmission line from the Sudbury/Algoma region, supported by DERs along the north shore, to enable future distribution-level load transfers—similar to proposed lines in the Northeast (Hanmer TS → Mississagi TS → Third Line TS).
- Batchewana First Nation did not raise concerns but requested to remain engaged and informed, highlighting the importance of any infrastructure development within their traditional territory.

9. Conclusion and Next Steps

This IRRP outlines a needs-based, staged approach to meeting electricity system needs and maintaining a reliable and cost-effective electricity system in the ELS region over the planning horizon. The plan was developed through collaboration among the IESO, the ELS TWG, and regional partners, informed by detailed technical analysis and engagement with communities and stakeholders.

The needs assessment identified a limited number of near-term electricity system needs, primarily related to supply capacity limitations driven by voltage and thermal performance under applicable contingency conditions. These needs are largely attributable to existing system configuration, operational constraints, and planning criteria requirements rather than widespread forecast demand growth. With the inclusion of the Northeast Bulk Reinforcement, no new or distinct medium- or long-term regional electricity needs were identified over the planning horizon.

A broad range of potential solutions was considered to address the identified needs, including transmission and distribution reinforcements, local generation, demand-side resources, operational measures, and NWAs. Preferred approaches were selected based on their ability to address the underlying drivers of each need, their technical feasibility and deliverability within the required timeframe, and their relative cost, risk and alignment with system needs.

For the Chapleau area, the preferred approach is the implementation of localized transmission-side reactive power support to address voltage-limited supply capacity on the W2C supply path. This solution directly addresses the root cause of the constraint and provides effective and durable voltage support. Demand-side resources and DERs, including eDSM, were identified as having the potential to provide modest, short-term relief but only as a supplementary measure and not as a standalone solution.

For the Algoma 115 kV interface, the preferred approach is a staged solution consisting of interim customer arrangements for controlled load interruption, followed by enhancements to the existing RAS. This reflects the industrial nature of the load served and the low-frequency, contingency-driven characteristics of the limitation. This approach provides a proportionate and practical means of maintaining compliance with planning criteria while avoiding significant infrastructure investment under stable demand conditions.

For the Sault Ste. Marie 115 kV system interface, the preferred approach is to pursue a cost-effective supply solution with performance characteristics aligned with the identified reliability risk. The capability of the resource must match the characteristics of the need, requiring a resource that is dispatchable when needed after a contingency and capable of sustained operation for the duration of the contingency condition. This performance-based framing preserves flexibility with respect to the specific technology or acquisition approach and allows the need to be addressed in a targeted and cost-effective manner, while delivering broader system value through energy and capacity contributions under normal operating conditions.

Future infrastructure-based options, including the addition of a third autotransformer at Third Line, have been identified to preserve optionality and may be reconsidered in subsequent planning cycles should there be an increase in load, changes in system conditions, or evolving reliability expectations that warrant a permanent reinforcement.

Engagement undertaken throughout the development of this IRRP supported transparency and provided valuable input to inform planning assumptions and option screening. Engagement will continue beyond the publication of this plan as recommended actions progress and as future regional planning activities are undertaken.

9.1 Path Forward and Ongoing Monitoring

Consistent with the approach taken in previous ELS IRRPs, this plan establishes a clear path forward while maintaining flexibility to respond to evolving system conditions.

In the near-term, next steps include:

- Advancing the preferred solutions identified in this IRRP through appropriate implementation mechanisms, including RIPs and contractual arrangements, as applicable;
- Continued co-ordination among the IESO, transmitters, and LDCs to support timely implementation; and
- Ongoing monitoring of system performance, load levels, and operating conditions through the TWG activities to validate planning assumptions and confirm implementation timing.

Over the longer-term, the IESO and regional planning partners will continue to monitor:

- Changes in load levels, electrification trends, and local development activity;
- The performance and effectiveness of implemented solutions; and
- Emerging risks or constraints that may give rise to new or evolving electricity system needs.

Should system conditions materially change, the TWG will review to confirm timing and identify appropriate actions to maintain system reliability.

Overall, this IRRP provides a clear, proportionate, and flexible plan to address the identified electricity system needs of the ELS region, balancing near-term reliability requirements with longer-term adaptability and prudent investment.

Dear,

Subject: Regional Planning Status letter

This letter is in response to your request for a Planning Status letter. For the purposes of regional planning the province has been divided into 21 regions. A map showing details with respect to the 21 regions[1] and the list of Local Distribution Companies (LDCs) in each region are attached in Appendix A and B respectively. Hydro One Networks Inc. is the lead transmitter in 20 regions and Hydro One Distributions' service area belongs to the Burlington to Nanticoke, Chatham-Lambton-Sarnia, GTA East, GTA North, GTA West, Greater Bruce/Huron, Greater Ottawa, Kitchener-Waterloo-Cambridge-Guelph (KWCG), London, Niagara, North/East of Sudbury, Northwest Ontario, Peterborough to Kingston, Renfrew, South Georgian Bay (SGB) / Muskoka, St. Lawrence, Sudbury / Algoma, Toronto, East Lake Superior and Windsor-Essex regions.

Hydro One Distribution is connected to the following transformer and transmission connected distribution stations:

Burlington to Nanticoke: Brant TS, Caledonia TS, Dundas TS, Dundas TS #2 Jarvis TS, Lake TS, Nebo TS, Norfolk TS and Bloomsburg DS.

Chatham-Lambton-Sarnia: Duart TS, Kent TS, Lambton TS, Wallaceburg TS, Wanstead TS and Forest Jura DS.

East Lake Superior: Chapleau DS and Chapleau DS#2

GTA East: Cherrywood TS, Enfield TS, Thornton TS, Whitby TS, and Wilson TS.

GTA North: Armitage TS, Brown Hill TS, Holland TS, Kleinburg TS, and Woodbridge TS.

GTA West: Bramalea TS, Halton TS, Palermo TS, Pleasant TS, Oakville #2 TS and Trafalgar TS.

Greater Bruce/Huron: Centralia TS, Douglas Point TS, Goderich TS, Hanover TS, Owen Sound TS, Palmerston TS, Seaforth TS, St. Marys TS, Stratford TS, Wingham TS, Grand Bend East DS and Constance DS.

Greater Ottawa: Almonte TS, Arnprior TS, Bilberry Creek TS, Hawthorne TS, Longueuil TS,

[1] Hydro One Regional Planning

Orleans TS, South March TS, St. Isidore TS, Stewartville TS, Wilhaven DS, Wendover DS, South Gloucester DS, Russell DS, Rockland East DS, Rockland DS, Navan DS, Marionville DS, Manotick DS, Greely DS, Cumberland DS, and Clarence DS.

Kitchener Waterloo Cambridge Guelph (KWCG): Elmira TS, Fergus TS, Wolverton DS and Puslinch DS.

London: Aylmer TS, Buchanan TS, Clarke TS, Commerce Way TS, Edgeware TS, Highbury TS, Ingersoll TS, Longwood TS, Strathroy TS, Tillsonburg TS, Wonderland TS, and Woodstock TS.

Niagara: Allanburg TS, Beamsville TS, Crowland TS, Dunnville TS, Murray TS, Port Colborne TS, Thorold TS, and Vineland DS.

North/East of Sudbury: Crystal Falls TS, Dymond TS, Hearst TS, Kapuskasing TS, Kirkland Lake TS, North Bay TS, Ramore TS, Timmins TS, Trout Lake TS, Calstock DS, Cochran West DS, Fauquier DS, Herridge Lake DS, Hoyle DS, Iroquois Falls DS, Laforest Road DS, Mattawa DS, Monteith DS, Moosonee DS, Shiningtree DS, Smooth Rock Falls DS, Temagami DS 2, Verner DS, Warren DS.

Northwest Ontario: Barwick TS, Port Arthur TS, Dryden TS, Manitouwadge TS, Longlac TS#2, Red Lake TS, Auguasabon DS, White River DS, White Dog DS, Vermilion Bay DS, Valora DS, Slate Falls DS, Sioux Narrows DS, Shabaqua DS, Schreiber Winnipeg DS, Sapawe DS, Sam Lake DS, Red Rock DS, Pic DS, Perrault Falls DS, Nipigon DS, Nestor Falls DS, Murillo DS, Minaki DS, Margach DS, Marathon DS, Manitouwadge DS #1, Kenora DS, Keewatin DS, Jellicoe DS #3, Eton DS, Ear Falls DS, Crow River DS, Crilly DS, Clearwater Bay DS, Burleigh DS, Beardmore DS #2, and Agimak DS.

Peterborough to Kingston: Belleville TS, Dobbin TS, Frontenac TS, Gardiner TS, Havelock TS, Napanee TS, Otonabee TS, Picton TS, Port Hope TS, Sidney TS, Sharbot DS, Northbrook DS, Lodgeroom DS, Hinchinbrooke DS, Harrowsmith DS, Dobbin DS, Battersea DS, and Ardoch DS.

Renfrew: Cobden TS, Pembroke TS, Petawawa DS, Mountain Chute DS, Mazinaw DS, Forest Lea DS, Des Joachims DS, Deep River DS, Craig DS, and Cobden DS.

SGB/Muskoka: Alliston TS, Barrie TS, Beaverton TS, Bracebridge TS, Everett TS, Lindsay TS, Meaford TS, Midhurst TS, Minden TS, Muskoka TS, Orangeville TS, Orillia TS, Parry Sound TS, Stayner TS, Wallace TS, and Waubaushene TS.

St. Lawrence: Brockville TS, Chesterville TS, Crosby TS, Morrisburg TS, Smiths Falls TS, St. Lawrence TS, and Newington DS.

Sudbury/Algoma: Clarabelle TS, Elliot Lake TS, Espanola TS, Larchwood TS, Manitoulin TS, Martindale TS, Massey DS, North Shore DS, Sowerby DS, Spanish DS, Striker DS, Verner DS, Warren DS, Wharncliffe DS, and Whitefish DS.

Toronto: Agincourt TS, Fairchild TS, Finch TS, Leslie TS, Malvern TS, Richview TS, and Sheppard TS.

Windsor-Essex: Belle River TS, Keith TS, Kingsville TS, Lauzon TS, Leamington TS, Malden TS, South Middle Road TS, Tilbury West DS.

This letter confirms that the second cycle of the Regional Planning (RP) process for all the above regions was completed in 2023. The third planning cycle is currently underway, with Needs Assessments (NA) completed for 18 regions except N/E of Sudbury and Chatham/Lambton/Sarnia region (currently underway). The NA for all the regions, except Greater Bruce Huron region have confirmed that further regional coordination is/was required for the regions and advanced to the subsequent planning phases. The Integrated Regional Resource Plan (IRRP) is completed for 7 regions, Burlington to Nanticoke, Toronto, Windsor Essex, GTA North, Greater Ottawa, KWCG and East Lake Superior regions as part of the third cycle, ensuring coordinated long-term planning for these regions. Burlington to Nanticoke, Toronto, Greater Bruce/Huron, GTA North, and Windsor-Essex, have completed the final phase of the process, the Regional Infrastructure Plan (RIP), with their third-cycle RIP reports published in 2025-2026.

All the Regional Planning reports are available on Hydro One Regional Planning website.

A summary of the regional planning status, including needs and plans currently identified in each region that affects Hydro One Distributions' service area is provided below.

Table 1 - Regional Planning Status Summary

Region	Sub-region	2nd Cycle (2017-2023)				3rd Cycle (2022→)

Notes: (1): NA: Needs Assessment; SA: Scoping Assessment; IRRP: Integrated Regional Resource Plan; RIP: Regional Infrastructure Plan
(2): Note that St. Lawrence 2nd cycle NA was initiated two (2) months over the five (5) year period because of an error in oversight.
(3): All future completion dates are tentative based on Regional Planning Process timeline requirements.
(4):The IESO's recommended delaying the needs assessment for North/East of Sudbury until after the conclusion of the bulk plan. OEB agreed and granted extension to start NA in September 2026.

Burlington to Nanticoke:

- Brant TS: There is a need for additional area supply to be addressed through 230kV new stations near the existing Brant TS. This work is be planned for completion in 2032.
- Caledonia TS: Transformer T2 230/27.6 kV, 83 MVA is planned for replacement with a like-for-like unit in 2032.
- Dundas TS: There is a need for additional transformation capacity to be addressed either through building new DESN or upgrading the existing DESN to 230kV with larger transformers. This work is planned for completion in 2032.
- Jarvis TS: Transformers T3/T4 230/27.6 kV, 83 MVA is planned for replacement with like-for-like units in 2035.

- Lake TS: Transformers T3/T4 230/13.8 kV, 75 MVA and switchgear are planned for replacement with upgraded 100 MVA units in 2028.
- Norfolk Area Supply capacity: The total supply capacity of this area is limited due to the 115kV C9 and C12 circuits. It is recommended to continue with the load transfers out of the Norfolk area and provide additional new reactive support at Norfolk TS and open the LV bus-tie breakers at Norfolk TS and Bloomsburg DS as required and plan a BESS near Norfolk TS.
- The IESO will issue an IRRP addendum for the Hamilton sub-region and the Bronte TS supply area which may introduce new or modify current plans.

Chatham-Lambton-Sarnia:

- Kent TS: Transformer T2 230/27.6 kV, 75/100/125 MVA, along with switchyard and associated equipment are planned for replacement. T2 will be replaced with a like-for-like unit, with a planned in-service date by 2032.
- Forest Jura HVDS Capacity: It was recommended in 2nd cycle RIP to continue monitoring load growth and determine a plan to meet the capacity demand if required.

GTA East:

- Cherrywood TS: 230 kV breaker replacements, currently underway with planned in-service dates of 2033 and 2037.
- Thornton TS: Station capacity at Thornton TS T3/T4 (44 kV) is expected to be exceeded in the medium term. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.
- Whitby TS: Station capacity at Whitby TS T1/T2 (44 kV) is expected to be exceeded in the medium term. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.
- Wilson TS: Transformers T3/T4 230/44 kV, 75/100/125 MVA are planned for like-for-like replacement by 2031. Station capacity at Wilson TS T3/T4 & T7/T8 is expected to be exceeded in the medium term. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.
- T23C/T29C corridor exceeds the load security limit of 600 MW in 2032. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.

GTA North:

- Kleinberg TS: 44 kV Loads in the Northern area served by Kleinberg TS will be transferred to Northern York TS to manage loading. The planned in-service date is in 2031.
- Woodbridge TS: Transformer T5 230/44-27.6 kV, 75/125 MVA is planned for replacement with a like-for-like unit in 2032.
- Kleinburg TS Station Capacity: Adding 230/44kV DESN Kleinburg TS (T3/T4). The current planned in-service date is 2028.
- Northern York supply capacity: Building three new 230/44kV DESN - Northern York TS #1 with a planned in-service date is 2031, Northern York TS #2 with planned in service date in 2034 and Northern York TS #3 with planned in service date in 2035.
- Buttonville TS supply capacity: Adding 230/27.6kV DESN Buttonville TS #2. The current planned in-service date is 2030.

- P45/P46 line capacity: Upgrade the line between Parkway TS to Markham MTS, Markham MTS#4 to Buttonville TS and extend and build new 7km line from Buttonville TS to future DESN. Planned ISD is between 2031-2034.
- Kleinburg TS Supply reliability: Build Kleinburg to Kirby Transmission link with planned in service date between 2031-2032. Development of Kleinburg TS as a 500/230 transformer station by building 500kV and 230kV switchyards and installing three 500/230kV autotransformers, with provision for a fourth to accommodate longer-term demand. The planned in-service date is 2031-2032
- V71P/V75P: Install in-line breakers to resolve load security issue. The planned in-service date is 2030.

GTA West:

- Bramalea TS T1/T2: Transformers T1/T2 are expected to exceed capacity in the medium term. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.
- Bramalea TS T3/T4: Transformers T3/T4 230/44 kV, 83 MVA to be upgraded with 125 MVA units in the medium term. Balance T3/T4 load with Bramalea T5/T6 as interim solution to address station capacity need for T3/T4 DESN expected in 2035.
- Halton TS: Transformers T3/T4 230/27.6 kV, 75/125 MVA are planned for replacement in the near term. Station capacity at Halton TS is also expected to be exceeded in the near term. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.
- Pleasant TS T1/T2: The capacity of Pleasant TS T1/T2 DESN is expected to be exceeded in the near term. These transformers also require replacement and are planned for replacement with new standard transformers which have higher ratings to address the forecasted load growth.
- Pleasant TS T5/T6: Transformers T5/T6 230/27.6 kV, 75/125 MVA are planned for replacement in 2035. The T5/T6 DESN is also expected to have station capacity exceeded in the near term. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.
- Palermo TS T3/T4: Transformers T3/T4 230/27.6 kV, 50/67/83 MVA are planned for replacement in 2027 with larger capacity units.
- Load security scenarios of T38B/T39B corridor which will exceed load security limit of 600MW in 2029. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.

Greater Bruce/Huron:

- Seaforth TS: Transformers T1/T2 & T5/T6 110-28 kV, 25/33.3/41.7 MVA are planned for like-for-like replacement. The current planned in-service date is 2026.
- Bruce A TS – 500 kV ABCB circuit breakers will be replaced with new SF6 tank circuit breakers. The current planned in-service date is 2027.
- Owen Sound TS – T5 autotransformers (150/250 MVA) will be replaced with like-for-like unit. The current planned in-service date is 2032.
- Douglas Point TS – T3/T4 transformers (50/83 MVA) will be replaced with like-for-like units. The current planned in-service date is 2037.
- Stratford TS – T2 transformer (50/83 MVA) will be replaced with like-for-like unit. The current planned in-service date is 2038.

Greater Ottawa:

- South March TS: Transformers T1/T2 230/44 kV, 50/83 MVA are planned for replacement with upgraded 125 MVA units based on asset conditions and capacity needs. This work is planned for completion in 2029.
- Marionville DS Station capacity: Install a second Transformer to increase station rating. The planned in-service date is in 2029.
- Greely DS Station capacity: Install SCADA fan monitoring to increase T1 and T2 transformer rating. The planned in-service date is 2026.
- Rockland DS Station Capacity: Install SCADA fan monitoring to increase transformer rating. The planned in-service date is 2026.
- Rockland East DS Station capacity: Install SCADA fan monitoring to increase transformer rating. The planned in-service date is 2027.
- Kanata area transmission reinforcement. Planned in service date is in 2033.
- East Ottawa area: retiring Bilberry Creek TS, upgrading Orleans TS, and completing the associated 230 kV circuit and station connections to address the long-term needs in East Ottawa. The planned in-service date is 2029-2030.
- L2M line build – Projected to reach capacity in 2034. To be reviewed in next RP cycle.

KWCG:

- Puslinch DS: To address the station capacity need, it is recommended to implement distribution connected resources between 2030 and 2042. If load trends beyond the high forecast scenario, the integrated non-wires recommendation will be re-evaluated, and a new station may be required or may be more cost-effective.
- Wolverton DS: To address the station capacity need, Hydro One Distribution to continue with fan monitor upgrade to increase the station LTR by early 2027.

London:

- Aylmer TS: Station forecast is expected to exceed capacity in the near term. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.
- Buchanan TS: Autotransformers T2/T3 230/115 kV, are planned for replacement in 2033.
- Clarke TS: Transformers T3/T4 230/27.6 kV, 50/83 MVA are planned for replacement in 2034. Station forecast is expected to exceed capacity in the near term. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.
- Commerce Way TS: Station forecast is expected to exceed capacity in the near term. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.
- Edgeware TS: Station forecast is expected to exceed capacity in the near term. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.
- Strathroy TS: Station forecast is expected to exceed capacity in the near term. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.
- Tillsonburg TS: Station forecast is expected to exceed capacity in the near term. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.
- Wonderland TS: Station forecast is expected to exceed capacity in the near term. This need

and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.

- Woodstock TS: Station forecast is expected to exceed capacity in the near term. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.
- W44LC/W45LS Thermal Limits: For the loss of one of the W44LC or W45LS, the loading on the (Buchanan JCT x Edgeware JCT) section exceeds its post-contingency rating in the medium-Term. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.
- WT1T/W14 Thermal Limits: The loading on the (Cranberry JCT x ESWF JCT) and the (ESWF JCT x Tillsonburg JCT) exceeds its pre-contingency rating in the Near-Term. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.

Niagara:

- Allanburg TS: Transformers T7/T8 115/27.6kV, 50/83MVA are expected to exceed capacity in the near term. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.
- Crowland TS: Transformers T5/T6 115/27.6 kV, 50/83 MVA are planned for replacement with upgraded 230/27.6 kV 170 MVA units in 2031.
- Murray TS Transformer replacement and supply capacity: Existing 45/60/75 MVA T11/T12 transformers will be replaced with new 60/80/100 MVA units, and 45/75 MVA T13/T14 are planned for like for like replacement in 2032. At this time, the transformer replacement project and forecast will be both monitored and adjusted to ensure the station capacity meets the future load requirement.
- Connect new DESN near Beamsville TS – The current planned in-service date for this new DESN is 2027.

North/East of Sudbury:

- Kirkland Lake TS – Replacement of Instrument Transformers, P&C equipment, station service equipment and low voltage circuit breakers. The current planned in-service date is 2027.
- Hearst TS – Replacement of low voltage circuit breakers, switches, P&C Equipment. The current planned in-service date is 2030.
- Timmins TS – T2 transformer (50/83 MVA) will be replaced with standard like-for-like units. The current planned in-service date is 2035.
- Kapuskasing TS – Replacement of low voltage circuit breakers, switches, station service equipment and protections. The current planned in-service date is 2032.
- Dymond TS – Replacement of low voltage breakers, and associated P&C equipment. The current planned in-service date is 2034.
- Crystal Falls TS – T5/T6 transformer (42 MVA) will be replaced with like-for-like units. The current planned in-service date is 2034.
- Trout Lake TS – T3/T4 transformers (75/125 MVA) will be replaced with like-for-like units. The current planned in-service date is 2034.
- K1/K2 - Overhead Conductor replacement and circuit refurbishment between Kirkland Lake TS x American Barrick Jct. The current planned in-service date is 2026.
- A4H/A5H – Overhead Conductor replacement and circuit refurbishment between Tunis Jct. x Fournier Jct. The current planned in-service date is 2032.

Northwest Ontario:

- Pic Jct. x Manitouwadge Jct. 115 kV M2W Line capacity need. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.
- Margach DS, White Dog DS and White River DS station capacity need. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.

Peterborough to Kingston:

- Dobbin TS: Transformers T1/T2 are planned for replacement with upgraded 150/250 MVA units and decommissioning existing T5 units in 2028. T3/T4 are expected to exceed capacity in 2032.
- Gardiner TS: Transformers T1/T2 230/44 kV 75/100/125 MVA are planned for replacement with upgraded units in 2027.
- Napanee TS: Transformers T1/T2 230/44 kV 83 MVA is expected to exceed its LTR in the near term and additional capacity will need to be reviewed in the next phase of the regional planning cycle.
- Picton TS: Transformers T1/T2 230/44 kV 83 MVA are expected to exceed its LTR and have been identified for replacement with similar size units in 2026. The replacement units will be of similar size but will have higher LTRs due to modern designs, which will be enough to supply the future loads.
- Peterborough to Quinte West P15C/Q6S - New 230kV double circuit line from Clarington TS to Dobbin TS. The current planned in-service date is 2029.
- Belleville TS New DESN #2 – The current planned in-service date for a new 75/125 MVA 230/44 kV DESN is 2026.
- Port Hope TS – T3 and T4 transformers (50/83 MVA) will be replaced with like-for-like units. The current planned in-service date is 2036.
- Cataraqui TS - T1 and T2 230/115kV Autotransformers to be replaced with 150/200/250 MVA units. The current planned in-service date is 2032.
- Frontenac TS: Plan a new 230/44kV station in the West Kingston area in the near term.
- Hinchinbrooke HVDS: Projected to reach capacity in 2028. Offloading options are being considered to address overloading in the near term.

Renfrew:

- Des Joachims TS x Petawawa/Craig DS 115 kV D6 Line refurbishment – The current planned in-service date is 2027.
- Cobden HVDS - Projected to reach capacity in 2029. Consideration of SCADA to increase transformer rating.
- Cobden TS - Projected to reach capacity in 2033. This need and alternatives will be reviewed in the IRRP and RIP phases of the current RP cycle.

SGB/Muskoka:

- Alliston TS: Transformers T3/T4 230/44 kV, 83 MVA are planned for replacement with new like-for-like units in 2040. However, a new capacity need has been identified and will be studied in the current RP cycle.
- Bracebridge TS: Transformer T1 230/44 kV 83 MVA is planned for replacement with a like-for-

like unit in 2026.

- Everett TS: Transformers T1/T2 230/44 kV 83 MVA is expected to exceed its normal supply capacity in the medium term. This need will be reviewed in the next phase of the regional planning process.
- Midhurst TS: Transformer T4 230/44 kV 125 MVA is planned for replacement with a new like-for-like unit in 2034.
- Orillia TS: Transformer T2 230/44 kV 125 MVA is planned for replacement with a like-for-like replacement in 2026.
- Wallace TS: Transformers T3/T4 230/44 kV 42 MVA are planned for replacement with a like-for-like unit in 2034.
- Waubaushene TS T5/T6: Replace 230/44kV, 83MVAtransformers T5/T6 with new 230/44kV 125MVA units in 2028.
- E8V/E9V – Essa TS x Orangeville TS line section will be upgraded. The current planned in-service date is 2031.

St. Lawrence:

- Brockville TS: Transformers T1/T2 230/44 kV 125 MVA are planned for replacement with like-for-like units in 2034.
- Brockville TS: Installation of new LV Capacitor bank to mitigate the voltage issues on 44kV bus. The planned in-service date is in 2029.
- St. Lawrence TS: Existing five (5) 115 kV oil filled breakers are planned for replacement with new SF6 circuit breakers along with associated P&C equipment. This work is planned for completion in 2034.**Sudbury/Algoma:**
- Martindale TS: Transformers T25/T26 230/44 kV 125 MVA are planned for replacement with like-for-like units in 2032.
- Elliot Lake TS – T1 transformer (25/42 MVA) will be replaced with like-for-like unit, and T2 transformer (19 MVA) will be removed from service. The current planned in-service date is 2027.
- Clarabelle TS – T1/T2 transformers (125 MVA) will be replaced with like-for-like units. The current planned in-service date is in 2035.

Toronto:

- Leslie TS: The T1 and T4 transformers will be replaced with standard 230-27.6 kV 75/125 MVA units to address asset renewal needs. The planned in-service date is 2032.
- Agincourt TS: The existing T5 and T6 transformers will be replaced with like-for-like units to address asset renewal needs. The planned in-service date is in 2033.
- Fairchild TS: The existing T3 and T4 transformers will be replaced with like-for-like units to address asset renewal needs. The planned in-service date is in 2034.

Windsor-Essex:

- Lauzon TS: Transformers T7/T8 50/83 MVA units with upgraded 75/125 MVA units in 2032. Lauzon TS: Transformer T5/T6 - The current planned in-service date for replacement of these transformers with upgraded units is 2026.
- Kingsville-Leamington sub system: Construction of new 34 km double-circuit 230 kV Lakeshore

TS x Lauzon TS line plus associated Lauzon 230 kV switching facility to support new development in this area. The current in-service date is 2032.

- West Essex and Windsor sub-system supply capacity: Construction of new 22 km double circuit 230 kV from Lakeshore TS to supply the new Leamington DESN 5 and 6. The current planned in -service date is 2029.
- Coatsworth Area supply capacity: Construction of new Chatham-by-Lakeshore 230 kV double-circuit transmission line. The current planned in -service date is 2029.
- Construction of Chatham SS x Lambton TS 2-cct 230 kV line. The current planned in -service date is 2028.
- Construction of Longwood TS x Lakeshore TS 1-cct 500 kV line. The current planned in service date is 2030.
- Kingsville – Leamington Greenhouse supply stations: Construction of two new 75/125 MVA 230/27.6 -27.6 kV DESN stations (Leamington DESN 5 and 6). The current planned in service date is 2027.
- Coatsworth Area Greenhouse Supply Station: Construction of new Coatsworth Area 75/125 MVA 230/27.6 -27.6 kV DESN1. The current planned in -service date is 2029.
- Keith TS – Phase angle regulator PSR5 installed in the J5D interconnection will be replaced. The current planned in-service date is 2028.
- Low voltage concern about loss of Lauzon TS HV capacitor bank with autotransformer: Development of an appropriate 230 kV switching at Lauzon TS will mitigate this concern. The current planned in-service date is 2032.

East Lake Superior:

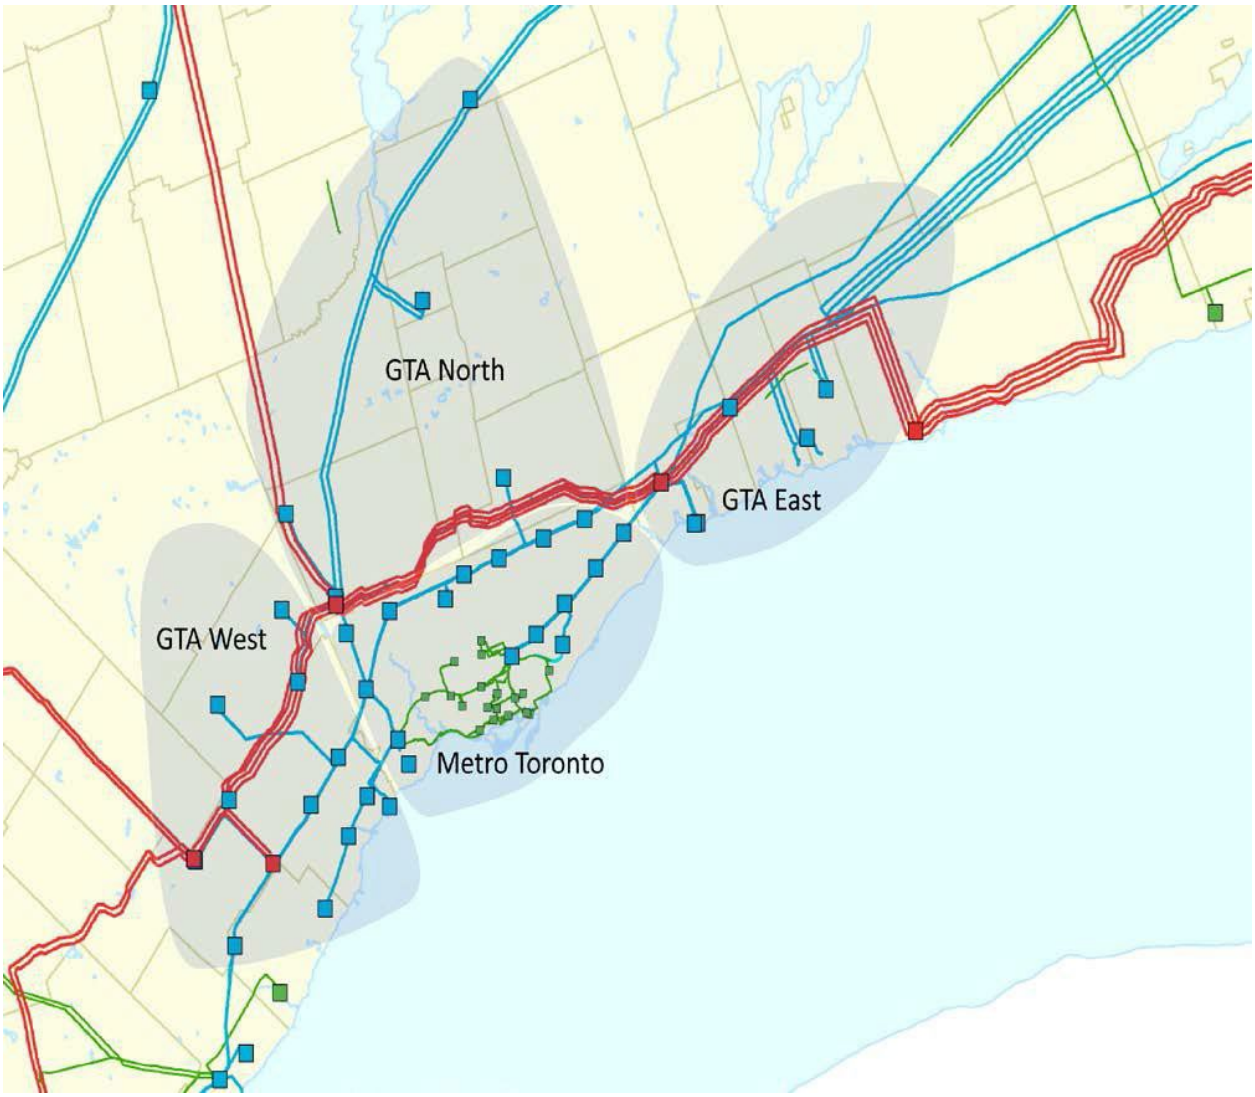
- Chapleau Area supply capacity need (W2C): System's ability to serve peak load is limited by the voltage at the end of the transmission line. Localized static reactive power support is recommended as preferred solution.

Hydro One Networks Inc. (Transmission) would like to acknowledge and thank you for your work and effort in support of the Regional Planning process. We look forward to continuing to work with you in the future. If you have any further questions, please feel free to contact me.

Sincerely,

Ajay Garg,
Director - Long Term Strategic Transmission System Planning
Hydro One Networks Inc.
Tel: (647) 242-2105
ajay.garg@HydroOne.com

Appendix A: Map of Ontario's Planning Regions



Northern Ontario

Southern Ontario

Greater Toronto Area (GTA)

Appendix B: List of LDCs for Each Region

[Hydro One as Upstream Transmitter]

Region	LDCs
1. Burlington to Nanticoke	• Burlington Hydro Inc. • GrandBridge Energy Inc. (Formerly Energy+ and Brantford Power) • Alectra Utilities Corporation (Formerly Horizon Utilities Inc.) • Hydro One Networks Inc. (Distribution) • Oakville Hydro Electricity Distribution Inc.
2. Greater Ottawa	• Hydro 2000 Inc. • Hydro Ottawa Limited • Hydro Hawkesbury Inc. • Ottawa River Power Corporation • Hydro One Networks Inc. (Distribution) • Renfrew Hydro Inc
3. GTA North	• Alectra Utilities Co. • Hydro One Networks Inc. (Distribution) • Newmarket-Tay Power Distribution Ltd. • Toronto Hydro Electric System Limited
4. GTA West	• Burlington Hydro Inc. • Hydro One Networks Inc. (Distribution) • Alectra Utilities Co. • Milton Hydro Distribution Inc. • Halton Hills Hydro Inc. • Oakville Hydro Electricity Distribution Inc.
5. Kitchener- Waterloo-Cambridge-Guelph ("KWCG")	• Alectra Utilities Corporation. • Enova Power Corporation. • Grandbridge Energy Inc. • Centre Wellington Hydro Ltd. • Hydro One Networks Inc. (Distribution) • Halton Hills Hydro Inc. • Wellington North Power Inc.

6. Toronto	• Alectra Utilities • Elexicon Energy Inc. • Hydro One Networks Inc. (Distribution) • Toronto Hydro Electric System Limited
7. Northwest Ontario	• Atikokan Hydro Inc. • Fort Frances Power Corporation • Hydro One Networks Inc. (Distribution) • Synergy North • Sioux Lookout Hydro Inc.
8. Windsor-Essex	• E.L.K. Energy Inc. • Entegrus Powerlines Inc. (Chatham-Kent) • EnWin Utilities Ltd. • Essex Powerlines Corporation • Hydro One Networks Inc. (Distribution)
9. East Lake Superior [Hydro One Sault Ste. Marie L.P. is the Lead Transmitter for the region]	• Algoma Power Inc. • Hydro One Networks Inc. (Distribution) • PUC Distribution
10. GTA East	• Elexicon Energy Inc. • Oshawa PUC Networks Inc. • Hydro One Networks Inc. (Distribution)
11. London Area	• Entegrus Powerlines Inc. • ERTH Power Inc. • Hydro One Networks Inc. (Distribution) • London Hydro Inc. • Tillsonburg Hydro Inc.

12. Peterborough to Kingston	• Eastern Ontario Power Inc. • Elexicon Energy Inc. • Hydro One Networks Inc. (Distribution) • Kingston Hydro Corporation • Lakefront Utilities Inc.
13. South Georgian Bay/Muskoka	• Hydro One Networks Inc. (Distribution) • Alectra Utilities • InnPower • Orangeville Hydro • Elexicon Energy • Lakeland Power • EPCOR Electricity Dist. Ontario Inc. • Newmarket-Tay Power Distribution Ltd. • Wasaga Distribution Inc.
14. Sudbury/Algoma	• Greater Sudbury Hydro Inc. • North Bay Hydro • Hydro One Networks Inc. (Distribution)
15. Chatham-Kent/Lambton/Sarnia	• Bluewater Power Distribution Corporation • Entegrus Power Lines Inc. (Chatham-Kent) • Hydro One Networks Inc. (Distribution)
16. Greater Bruce/Huron	• Entegrus Powerlines Inc. • ERTH Power Corporation • Hydro One Networks Inc. (Distribution) • Festival Hydro Inc. • Wellington North Power Inc. • Westario Power Inc.

17. Niagara	• Canadian Niagara Power Inc. [Port Colborne] • Hydro One Networks Inc. (Distribution) • Grimsby Power Inc. • Niagara Peninsula Energy Inc. • Niagara-On-The-Lake Hydro Inc. • Alectra Utilities Co. • Welland Hydro-Electric System Corporation
18. North of Moosonee [Five Nations Energy Inc (FNEI) is the Lead Transmitter for the region]	• Distribution in this region is provided by FNEI
19. North/East of Sudbury	• Northern Ontario Wires Inc. • Hearst Power Distribution Company Limited • North Bay Hydro Distribution Ltd. • Hydro One Networks Inc. (Distribution) • Greater Sudbury Hydro Inc.
20. Renfrew	• Hydro One Networks Inc. (Distribution) • Ottawa River Power Corporation
21. St. Lawrence	• Cooperative Hydro Embrun Inc. • Hydro One Networks Inc. (Distribution) • Rideau St. Lawrence Distribution Inc.

SECTION 1.3 – SPF – THIRD-PARTY REPORTS

1.3.1 INTRODUCTION

In support of the Application and, where applicable, to satisfy the terms of the OEB-approved Settlement Proposal from Hydro One's previous application (see Exhibit A-02-04), Hydro One engaged independent experts to undertake benchmarking studies, process reviews, asset condition analyses, and other reports. The reports included in the System Plans are provided in Table 1.

Table 1 - Reports included in the System Plans by Section

Section	Attachment	Report	Hydro One Sponsor
SPF Section 1.6	1	Customer Engagement Overview Report – Innovative Research Group (IRG)	Spencer Gill
TSP Section 2.3	1	Transmission Capital Project Execution Review (ESource)	Scott Vicary
	2	Transmission Wood Pole Benchmarking Study (Guidehouse and First Quartile)	Scott Vicary, Donna Jablonsky
DSP Section 3.3	1	2026 Hydro One Vegetation Management Study – CN Utility Consulting Inc (CNUC)	Paul Ankrett, Aimee Oabel
	2	Distribution Pole and Substation Transformer Benchmarking Study (Guidehouse and First Quartile)	Paul Ankrett, Peter Faltaous
	3	AMI 2.0 - Project Execution Process Review (ESource)	David Paish
	4	Practices of Distribution Loss Reduction Approaches in North America – Electric Power Research Institute (EPRI)	Peter Faltaous
	5	Vulnerability Assessment and System Hardening (VASH) Study (Guidehouse)	Spencer Gill
	6	Hydro One Networks Inc. Electrification Study 2030-2050 – Environmental Resource Management (ERM)	Peter Faltaous
GSP Section 4.3	1	2024 Fleet Operations Benchmarking Report (Utilimarc)	Chris Iveson
	2	Hydro One Fleet Lifecycle Study (Utilimarc)	Chris Iveson
	3	Helicopter Lifecycle Analysis Report (Utilimarc)	Chris Iveson
	4	Hydro One Fleet Investment Strategy Report – Analysis of Funding Outcomes (Utilimarc)	Chris Iveson
	5	Building Condition Assessment Review (JLL)	Julie Ricketts Daniel
	6	Enterprise IT Spending & Staffing Benchmark (Gartner)	Kevin Marcotte
	7	Enterprise IT Maturity Assessment (Gartner)	Kevin Marcotte

The reports included in Exhibits A, C, E and F of the Application are provided in Table 2.

Witness: Paul Ankrett, Kathleen Burke, Kevin Dickinson, Peter Faltaous, Lyndsay Fulton, Spencer Gill, Chris Iveson, Donna Jablonsky, Kevin Marcotte, Anthony Nava, Aimee Oabel, Ogbomah Osiemi, Julie Ricketts Daniel, Scott Vicary

Table 2 - Reports included in Exhibits A, C, E, and F

Exhibit	Attachment	Report	Hydro One Sponsor
A-04-01	1	Benchmarking, Productivity, and Incentive Regulation Parameter Study for Hydro One Networks' Joint Rate Application (Clearspring)	Kathleen Burke
A-06-01	1	US GAAP to IFRS Conversion Impact Review (PwC)	Ogbomah Osiemi
C-05-01	1	Working Capital Requirements of Hydro One Networks Inc.'s Transmission Business (Guidehouse)	Anthony Nava
C-05-01	2	Working Capital Requirements of Hydro One Networks Inc.'s Distribution Business (Guidehouse)	Anthony Nava
E-05-01	2	Supply Chain Practices Report (Wood Mackenzie)	Chris Iveson
E-04-02	1	Common Corporate Costs Benchmarking Study (ESource)	Anthony Nava
E-04-08	1	Report on Corporate Cost Allocation Review (Atrium)	Anthony Nava
E-06-01	2	Compensation Benchmarking Study (Mercer)	Lyndsay Fulton
E-06-01	3	Management and Non-Represented Role Benchmarking and Compensation Study (WTW)	Lyndsay Fulton
E-07-01	1	Hydro One Pension Plan – Actuarial Valuation as at December 31, 2024 (WTW)	Ogbomah Osiemi
E-07-01	2	Hydro One Inc. Projected 2026-2032 Benefit Cost Under FASB ASC 715-20-50 (WTW)	Ogbomah Osiemi
E-07-02	1	Hydro One Sault St. Marie Pension Plan – Actuarial Valuation as at December 31, 2025 (Mercer)	Ogbomah Osiemi
E-07-02	2	Projected 2026-2028 Pension Expense under US GAAP & IAS19 (Mercer)	Ogbomah Osiemi
E-08-01	1	Electric Utility Plant Depreciation Rate Study BU 210, 220, and 300 Transmission, Distribution and Common Business Units at December 31, 2024 (Alliance)	Anthony Nava
F-01-01	1	Hydro One Networks Inc. Cost of Capital Study (Concentric)	Kevin Dickinson
F-01-01	2	Credit-Focused Capital Markets Analysis (Utility Credit Consultancy LLC)	Kevin Dickinson

1.3.2 INFORMATION ABOUT THIRD-PARTY EXPERTS

Information about the third-party experts listed in Tables 1 and 2 is summarized below.

1.3.2.1 ALLIANCE CONSULTING GROUP (ALLIANCE)

Report: Electric Utility Plant Depreciation Rate Study BU 210, 220, and 300 Transmission, Distribution and Common Business Units at December 31, 2024

Witness: Paul Ankrett, Kathleen Burke, Kevin Dickinson, Peter Faltaous, Lyndsay Fulton, Spencer Gill, Chris Iveson, Donna Jablonsky, Kevin Marcotte, Anthony Nava, Aimee Oabel, Ogbomah Osiemi, Julie Ricketts Daniel, Scott Vicary

Alliance was engaged to provide a utility plant depreciation study. Alliance has experience completing a similar engagement in Hydro One's prior rate application.

Alliance is a U.S.-based firm that has conducted over 365 depreciation studies for regulated and non-regulated electric, gas, steam, water, wastewater, cable and communications utilities across the U.S. and Canada since 2004.

1.3.2.2 ATRIUM ECONOMICS

Report: Report on Corporate Cost Allocation Review

Atrium was engaged to provide an evaluation of Hydro One's affiliate cost allocation methods. Atrium's personnel have conducted affiliate cost allocation, overhead capitalization rate, and shared asset allocation reviews for utilities throughout North America. Atrium's primary consultant has experience completing similar engagements in Hydro One's last joint transmission and distribution rate application.

1.3.2.3 CLEARSPRING ENERGY ADVISORS (CLEARSPRING)

Report: Benchmarking, Productivity, and Incentive Regulation Parameter Study for Hydro One Networks' Joint Rate Application

Clearspring was engaged to conduct total cost benchmarking, industry productivity trend research, and analysis and recommendations in respect of certain revenue escalation parameters. Clearspring has extensive research experience in relation to Ontario's electricity sector and experience in completing similar engagements in Hydro One's prior rate applications.

Clearspring is an energy economics consulting firm with significant experience in the electric utility industry including performance-based ratemaking, econometric cost and reliability benchmarking, data analysis, long range load forecasting, and DSM analysis.

1.3.2.4 CONCENTRIC ENERGY ADVISORS (CONCENTRIC)

Report: Hydro One Networks Inc. Cost of Capital Study

Concentric Energy Advisors (Concentric) was engaged to perform a cost of capital study to assist Hydro One in assessing whether the current cost of capital remains appropriate for purposes of setting the capital structure in Hydro One's next rate application.

Concentric is a management consulting and economic advisory firm, focused on the North American energy industry. Based in Marlborough, Massachusetts, and with offices in Washington, D.C., and Calgary, Alberta, Concentric provides financial, economic, regulatory, and strategic advisory services to energy and utility clients across North America. Concentric has provided expert testimony on the cost of capital issues in more than 100 regulatory proceedings in Canada and the U.S. over the past five years.

1.3.2.5 CN UTILITY CONSULTING OF CANADA (CNUC)

Report: 2026 Hydro One Vegetation Management Study

Eocene's Canadian subsidiary, Wright Canada Holding, Inc. (operating as CN Utility Consulting of Canada (CNUC)) was engaged to complete a distribution vegetation management benchmarking study. CNUC has experience completing similar engagements in Hydro One's prior rate applications.

Founded in 1999, CNUC has spent the last two decades providing utility vegetation management consulting services and establishing themselves as industry experts on utility vegetation-related issues, practices, standards and requirements across North America.

1.3.2.6 ENVIRONMENTAL RESOURCES MANAGEMENT (ERM)

Report: Hydro One Networks Inc. Electrification Study 2030-2050

ERM was engaged to develop electrification scenarios for Hydro One's distribution system. ERM has supported distribution networks in Canada and internationally on assessing the impact of electrification on their networks.

ERM is a global sustainability consultancy with established expertise in long-term electricity system modelling, high-resolution load modelling, and future energy scenario development.

1.3.2.7 ELECTRIC POWER RESEARCH INSTITUTE (EPRI)

Report: Practices of Distribution Loss Reduction Approaches in North America

EPRI was engaged based on its experience supporting North American utilities across transmission and distribution, including asset performance, efficiency, and benchmarking initiatives.

EPRI is an independent, nonprofit organization that conducts research and development to address the technical, operational, and environmental challenges of the electric power industry. Founded to serve the public interest, EPRI brings together utilities, manufacturers, academia, and government partners to advance the generation, delivery, and use of electricity through objective, science-based research. As a nonprofit, it operates without commercial bias, emphasizing independence and rigor in its analysis while not advocating for any specific company or technology. Its mission is to help ensure that electric power is safe, reliable, affordable, and environmentally responsible, ultimately improving quality of life. Through collaborative programs, thought leadership, and technical expertise, EPRI plays a central role in guiding innovation, informing policy and planning, and supporting the industry's transition to a more resilient and sustainable energy future.

1.3.2.8 E SOURCE

Reports:

i. Transmission Capital Project Execution Review
ii. AMI 2.0 Project Execution Process Review
iii. Common Corporate Costs Benchmarking Study

E Source, formerly the UMS group, was engaged to provide three benchmarking reports. E Source has experience completing similar engagements in Hydro One's prior rate applications.

E Source (which acquired UMS Group in November 2023) is a leading provider of utility benchmarking services, with over 36 years of experience conducting comparative performance assessments for the global utilities industry. E Source has supported multiple assessments and global benchmarking programs on six continents, working with state and provincial utility commissions and more than 300 electric, gas, and water utilities. E Source leads Global Learning and Benchmarking consortia and maintains "real time" proprietary cost and operational performance data correlated to industry best practices, supported by analytical frameworks.

1.3.2.9 GARTNER

Reports:

i. Enterprise IT Spending & Staffing Benchmark
ii. Enterprise IT Maturity Assessment

Gartner was engaged to perform Enterprise IT benchmarking. Gartner has experience completing similar engagements in Hydro One's prior rate applications.

Gartner is a global research and advisory company, founded in 1979 with over 20,000 associates in 85 offices around the world serving over 13,000 client experiences in approximately 90 countries and territories. Gartner specializes in providing senior leaders with business insights, advice and tools they need to achieve their mission-critical priorities and build the organizations of tomorrow. Gartner's insights are developed through rigorous proprietary research methodologies to ensure insights are independent and objective.

1.3.2.10 GUIDEHOUSE CANADA LTD (GUIDEHOUSE) AND FIRST QUARTILE

Reports:

i. Transmission Wood Pole Benchmarking Study
ii. Distribution Pole and Substation Transformer Benchmarking Study
iii. Vulnerability Assessment and System Hardening (VASH) Study
iv. Working Capital Requirements of Hydro One Networks Inc.'s Transmission Business
v. Working Capital Requirements of Hydro One Networks Inc.'s Distribution Business

Guidehouse was engaged to complete several benchmarking and working capital studies because of their expertise in benchmarking, access to relevant data through First Quartile Consulting (First Quartile), and their experience completing similar engagements in Hydro One's prior rate applications.

Guidehouse is a consulting firm that provides advisory services, including work related to utility asset management and transmission and distribution (T&D) cost benchmarking.

1.3.2.11 INNOVATIVE RESEARCH GROUP (IRG)

Reports: Customer Engagement Overview Report, and the following appendices:

i. Phase I Low Volume Focus Group Report
ii. Phase I Large Business Customer In-Depth Interview Report
iii. Phase I Stakeholder In-Depth Interview Report
iv. Phase I First Nations Leadership In-Depth Interview Report
v. Phase I Métis Nation of Ontario Leadership In-Depth Interview Report
vi. Phase I Planning Placemat
vii. Phase I Survey Results Report
viii. Phase II Planning Placemat
ix. Phase II Survey Results Report

IRG was engaged to complete a two-phase customer engagement study. IRG is an expert in public opinion research and consultation and has experience completing similar engagements in Hydro One's prior rate applications.

IRG is a full-service market research firm founded in 1998 with expertise in stakeholder and public engagement, public affairs research, marketing and brand research, and corporate affairs and communications. Based in Vancouver and Toronto, IRG works closely and collaboratively with clients to create consultations that generate wide engagement and actionable results.

1.3.2.12 JONES LANG LASALLE AMERICAS, INC. (JLL)

Report: Building Condition Assessment Review

JLL was engaged to perform a building condition assessment review because of its extensive experience evaluating building condition assessments across diverse industries and asset types.

JLL is a global professional services firm specializing in real estate and investment management. Their Projects and Development services group provides expert technical due diligence, including the preparation and peer review of building condition assessments for institutional owners across North America. JLL's experience spans properties from small utility substations to multi-million-square-foot portfolio assessments for Fortune 500 companies, including institutional investors, pension funds, and government entities.

1.3.2.13 MERCER

Reports:

i. Compensation Benchmarking Study
ii. Hydro One Sault St. Marie Pension Plan – Actuarial Valuation as at December 31, 2025
iii. Projected 2026-2028 Pension Expense under US GAAP & IAS19

Mercer was engaged to conduct a compensation benchmarking study, consistent with prior applications, ensuring methodological continuity and comparability. Mercer was also engaged by Hydro One to conduct the pension valuation and projected pension expense forecast for Hydro One's Sault St. Marie business segment.

Witness: Paul Ankrett, Kathleen Burke, Kevin Dickinson, Peter Faltaous, Lyndsay Fulton, Spencer Gill, Chris Iveson, Donna Jablonsky, Kevin Marcotte, Anthony Nava, Aimee Oabel, Ogbomah Osiemi, Julie Ricketts Daniel, Scott Vicary

Mercer has extensive experience performing compensation benchmarking and market analyses for utilities operating within regulatory and rate-setting frameworks, leveraging deep industry expertise in utility sector compensation structures, market practices, and regulatory requirements. Mercer's experience with regulatory standards and requirements, combined with access to comprehensive utility industry compensation data, support the development of benchmarking analysis with the level of rigor and credibility for rate application purposes.

1.3.2.14 PRICEWATERHOUSECOOPERS LLP (PWC)

Report: US GAAP to IFRS Conversion Impact Review

PricewaterhouseCoopers LLP (PwC) was engaged to provide a revenue requirement impact and risk analysis with the transition from US GAAP to MIFRS. PwC has experience completing a similar engagement in Hydro One's prior rate application.

PwC is an Ontario limited liability partnership that provides professional services (such as advisory services) and is a member firm of PricewaterhouseCoopers International Limited, each member firm of which is a separate legal entity.

1.3.2.15 UTILIMARC

Reports:

i. 2024 Fleet Operations Benchmarking Report
ii. Hydro One Fleet Lifecycle Study
iii. Helicopter Lifecycle Analysis
iv. Hydro One Fleet Investment Strategy Report – Analysis of Funding Scenario Outcomes

Utilimarc was engaged to perform several benchmarking and lifecycle studies given its unique position to provide utility-specific fleet benchmarking and ready access to extensive data from many North American utilities to enable meaningful results. Utilimarc has experience completing similar engagements in Hydro One's prior rate applications.

Utilimarc provides an end-to-end business intelligence platform that delivers the insights needed to optimize fleet. Founded in 2001, Utilimarc began building products and services focused on benchmarking and optimizing the operational efficiency of utility fleets. Since then, it has developed a business intelligence platform that streamlines data management, and provides actionable insights and analyses. Utilimarc manages data and optimizes fleet for 85% of investor-owned utilities in North America and reports on over 300,000 fleet assets.

1.3.2.16 UTILITY CREDIT CONSULTANCY LLC

Report: Credit-Focused Capital Markets Analysis

Utility Credit Consultancy was engaged to provide an independent assessment of the capital markets context underlying Hydro One's proposed capital structure, with a particular focus on credit ratings and the perspective of investors.

Utility Credit Consultancy is a management consulting and economic advisory firm that focuses on the North American energy industry. Based in Orleans, Massachusetts, Utility Credit Consultancy provides financial and strategic advisory services related to credit analysis and credit ratings to utility and other clients across North America.

1.3.2.17 WILLIS TOWERS WATSON (WTW)

Reports:

i. Management and Non-Represented Role Benchmarking and Compensation Study
ii. Hydro One Inc. Projected 2026-2032 Benefit Cost Under FASB ASC 715-20-50

WTW was engaged to provide several compensation and benefit cost studies, consistent with prior applications, ensuring methodological continuity and comparability.

WTW brings extensive utility sector expertise, having supported over 100 utilities in the past year, and provides market intelligence on compensation competitiveness, emerging practices and program design.

1.3.2.18 WOOD MACKENZIE

Report: Supply Chain Practices Report

Wood Mackenzie Inc. (Wood Mackenzie) was engaged to conduct a review of Hydro One's supply chain strategies for mitigating inflationary pressures in relation to industry best practices.

Wood Mackenzie is a leading global research and consultancy firm with deep expertise in the energy and utilities sectors. Wood Mackenzie Supply Chain Consulting (SCC), formerly PowerAdvocate, utilizes proprietary cloud-based software solutions and bespoke consulting services to enable its clients to leverage data analysis and assist them in navigating an ever-changing marketplace. SCC has dozens of concurrent North American utility clients for which it advises on operating model and leading-edge supply chain practices.

SECTION 1.4 – SPF – PRODUCTIVITY FRAMEWORK

1.4.1 INTRODUCTION

Hydro One's commitment to achieving incremental and continuous productivity improvements is central to the planning and execution of work programs across the Company. Hydro One continues to execute its comprehensive and rigorous process for productivity, which develops, implements, monitors and measures productivity initiatives that reduce costs while maintaining or improving service quality and work outputs (the Productivity Framework). The Productivity Framework has resulted in significant cost savings and benefits to customers since its inception. From 2023-2025, Hydro One realized $517.7M in productivity savings across its Transmission and Distribution businesses and is planning to achieve an additional $586.0M of savings in 2026 and 2027 (see Section 1.4.3 below), with these efforts continuing throughout 2028-2032.

The Productivity Framework was previously reviewed as part of EB-2021-0110 by an external independent consultant, Concentric Energy Advisors (Concentric), who concluded that it is an effective program which stands out as a strong and robust program compared to that of utility peers. Hydro One continues to use the same Productivity Framework.

This exhibit is organized as follows:

- **Section 2** describes the Productivity Framework and prior validation of it, productivity governance, and the methodology and review process.
- **Section 3** describes Hydro One's productivity efforts and results in the current rate term.
- **Section 4** addresses productivity in the 2028-2032 rate term, including the re-setting of baselines and an overview of productivity savings for this period.

1.4.2 PRODUCTIVITY FRAMEWORK

Hydro One's Productivity Framework is a process, with internal governance, for:

i. identifying and developing productivity initiatives (which are internally approved as the initiatives qualify for the program);

ii. approving the initiative-level methodologies by which savings are to be measured;
iii. the ongoing tracking, reporting and auditing of performance; and
iv. integrating savings into the business plan.

The main goal of the Productivity Framework is to achieve and demonstrate continuous improvement in work execution and also to manage, and achieve, the proposed capital and OM&A productivity factors and supplemental stretch factor on capital for both the Transmission and Distribution businesses, as described in Exhibit A-04-01. All productivity factors are applied on a top-down, cumulative basis to the revenue requirement, reflecting the ongoing benefit to customers of Hydro One's productivity program.

Any incremental OM&A productivity achievements under the framework, beyond the productivity and supplemental stretch factors, will be tracked as part of the Earnings Sharing Mechanism (ESM) proposed in this Application, as further described in Exhibits A-04-01, G-01-01 and G-01-03. For capital, once the in-service additions and the rate base are approved as part of this Application, holding everything else constant, any incremental productivity can reduce in-service additions relative to OEB-approved levels forecasted. Customers could thus benefit in the long term via a planned rate base that would otherwise be higher. Customers are also receiving up front benefits in 2028 from previous rate period savings that are continuing.

1.4.2.1 VALIDATION OF PRODUCTIVITY FRAMEWORK

As noted above, Concentric previously reviewed the Productivity Framework and prepared a report entitled "Hydro One Productivity Framework Review" filed in EB-2021-0110, Exhibit B-01-01, Attachment 2**.**

Based on its review, Concentric concluded that the Productivity Framework is a robust, well defined, transparent, and effective productivity program at identifying and quantifying sustainable productivity improvements and driving benefits that can be considered true productivity gains. Concentric also noted that Hydro One may be more challenged to

continue to find new initiatives and cost savings going forward over the long term that meet the rigorous standards of the framework.[1]

The Productivity Framework, including its elements, operation and governance process, has remained consistent with the framework Concentric reviewed and validated, and will continue to be used going forward.

1.4.2.1.1 PRODUCTIVITY GOVERNANCE

The Productivity Framework is currently managed and maintained by the Enterprise Transformation Office (ETO), which oversees its implementation to ensure that productivity savings for all initiatives are appropriately and accurately approved, measured and reported. All productivity initiatives must be reviewed and approved by the ETO before any savings can be reported against the established targets. The ETO reviews all productivity initiatives to ensure they are consistently and appropriately documented, including detailed description/logic, identified systems/dependencies, clear calculation methodology/data sources, and review and approval by a VP or a delegate. This approval process ensures that each productivity initiative is carefully tracked using a detailed and robust calculation methodology to ensure savings are verifiable and auditable.

Each month, the executing Line of Business (LOB) reports productivity achievements in relation to plan commitments, and the ETO subsequently reports the results to senior executives.

1.4.2.1.2 METHODOLOGY AND REVIEW PROCESS

Hydro One evaluates expected productivity savings on an annual basis, in parallel with, and as an input into, its business planning process. Through the planning process, each of Hydro One's LOBs is asked to identify incremental productivity initiatives that can produce savings. In consultation with the ETO, the LOBs are required to demonstrate that each proposed initiative has an objective baseline as well as a defined and auditable measurement methodology.

[1] EB-2021-0110, Exhibit B-01-01, Section 1.4, Attachment 2, Hydro One Productivity Framework Review, June 23, 2021, p. 6 of 36

Once these points are demonstrated, the ETO works with initiative owners to validate specific planning assumptions to quantify demonstrable savings in the Company's annual business plan and the associated investments. The savings embedded in the plan result in actual reductions in the costs required to achieve desired outcomes, which would otherwise not have been attainable if the initiatives were not identified. Each LOB then plays an integral role in the implementation process to ensure execution of Hydro One's productivity initiatives. LOBs also report on productivity savings monthly, with the reported savings verified by the ETO using the approved baseline and calculation methodology. The program's results are also audited annually by Hydro One's external auditors.

1.4.3 PRODUCTIVITY EFFORTS AND RESULTS IN CURRENT RATE TERM

1.4.3.1 OVERVIEW

Since the inception of the program, Hydro One has used the Productivity Framework to achieve significant savings and provide benefits to customers, and it will continue to do so. Customers have received, and continue to receive, the benefit of sustained productivity improvements. OM&A-based productivity savings from previous initiatives have contributed to the sharing of earnings with customers through the ESM. Transmission and Distribution capital savings reflect the ability to efficiently replace or find alternate replacement opportunities for aging assets to serve customers while mitigating rate impacts. The ongoing savings from these initiatives are now considered part of regular business planning practices and have been incorporated into the OM&A and capital plans, as costs would have otherwise been higher in this Application.

The section below describes the savings achievements so far in the current 2023-2027 rate period, which includes 2023-2025 actuals and forecasts for 2026 and 2027. During this rate period, Hydro One has achieved significant productivity savings, including continuing to identify new savings initiatives that generate incremental year-over-year savings and provide value to customers and other stakeholders.

1.4.3.2 PRODUCTIVITY RESULTS IN CURRENT RATE TERM

Over the 2023 to 2027 rate term, Hydro One has achieved, and expects to further achieve, overall productivity savings under its Productivity Framework as shown in Table 1 below:

Table 1 - Breakdown of Productivity Savings by Line of Business ($M)[2]

Transmission Productivity	Actual	Actual	Actual	Plan	Plan
Line of Business	**2023**	**2024**	**2025**	**2026**	**2027**
Asset Management	7.7	2.6	1.8	1.0	0.0

[2] Rounded figures within tables may not sum precisely due to rounding.

Attachment 1 to this exhibit lists each productivity initiative for the Transmission and Distribution businesses for 2023-2025 actuals, as well as plan for 2026 and 2027.

Hydro One Transmission

As shown above, Hydro One Transmission achieved productivity savings of $44.3M in 2023, $62.4M in 2024, and $102.4M in 2025, driven by initiatives across capital, OM&A and revenues.

Capital: Hydro One Transmission achieved capital savings of $23.0M in 2023, $42.5M in 2024, and $71.1M in 2025. These savings were primarily driven by labour efficiencies in the execution of end-of-life component replacement and refurbishment projects within Stations and Transmission Lines, lower project costs enabled by environmental assessment (EA) modernization, planning efficiencies for transformer replacements and right-sizing, and procurement savings. For example, the EA Modernization initiative reduced project costs by working with the Ministry of the Environment, Conservation and Parks (MECP) to amend the Class EA and align assessment thresholds with federal requirements. Similarly, the Transformer Right-Sizing initiative reduced costs through an equipment replacement strategy that incorporates design optimizations and more efficient configurations while maintaining equivalent service levels, generating savings compared to like-for-like replacements.

OM&A: OM&A initiatives generated savings of $5.8M in 2023, $8.4M in 2024 and $8.8M in 2025. The savings were driven by lease reductions, PCB bottom filled bushings initiatives, renegotiation of the CapGemini contract, and the use of x-ray breaker inspections.

Revenues: Incremental secondary land use revenues generated savings of $15.5M in 2023, $11.6M in 2024 and $22.4M in 2025.

Hydro One Distribution

Hydro One Distribution achieved productivity savings of $69.6M in 2023, $87.1M in 2024, and $152.0M in 2025, driven by initiatives across capital and OM&A.

Capital: Hydro One Distribution achieved capital savings of $28.4M in 2023, $40.7M in 2024 and $114.3M in 2025. These savings were driven by operational improvements supporting storm restoration resulting in faster restoration times and reduced outage durations; lower labour hours per unit in Field Business Centre and in trouble calls ultimately leading to faster response times and improved customer satisfaction; proactively refurbishing underground cables using a silicon fluid injection rather than replacing them to extend the useful life and reduce cable related outages; refurbishing poles rather than full replacements; and price efficiencies through contract management of procurement of services and materials.

OM&A: Hydro One Distribution achieved OM&A savings of $41.1M in 2023, $46.4M in 2024, and $37.7M in 2025. The savings were driven by utilization of contractors to perform PCB testing and inspections, reducing labour hours per km through more efficient defect vegetation clearing, increased eBilling enrolment, which allows customers to access their bills and information faster, lower labour hours per trouble call, and lease reduction.

As the above results demonstrate, Hydro One has achieved significant productivity savings relative to the updated initiative-level baselines since 2023. Customers have directly benefited from the incremental OM&A savings as the associated cost reductions have contributed to Hydro One's ESM, resulting in a refund to customers.

Hydro One remains committed to identifying new productivity initiatives for the benefit of customers and other stakeholders. This commitment is reflected in the unidentified stretch

targets in 2026 and 2027 (see Table 1 above), which are over and above defined initiative-level savings identified through the integrated business planning process.

However, as savings from existing initiatives become embedded in the business, identifying additional initiatives that meet the Productivity Framework's rigorous standards and eligibility criteria becomes increasingly challenging. In connection with identifying and achieving new productivity savings under the Productivity Framework, as well as other types of cost savings or efficiencies, Hydro One commenced an Enterprise Cost Optimization (ECO) program during the current rate term. This program has been a strategic, enterprise-wide initiative to identify, develop and implement cost control efforts while delivering safe, reliable and affordable service to customers. The program was established in response to inflationary pressures on labour, materials and contracted services, among other things. Since its inception, the program has delivered savings through a variety of initiatives, some of which qualify as productivity savings under the Productivity Framework, while others generate savings but do not satisfy the Framework's eligibility criteria.

Initiatives under the ECO program contributed approximately $37.2M to the total productivity savings of $254.3M achieved in 2025 as shown in Table 2. This contribution demonstrates the significant role the ECO program has played in supporting Hydro One's productivity and cost management objectives.

Table 2 - Breakdown of 2025 ECO Driven Savings embedded in Productivity ($M)

ECO driven savings embedded in Productivity	Total Productivity
2025A	**2025A**
37.2	254.3

In 2025, Hydro One achieved $123.6M in total savings through the ECO program and in 2026, Hydro One has planned $66.6M in additional savings. Table 3 below summarizes Hydro One's ECO initiatives by Transmission and Distribution. Savings opportunities for 2027 are being evaluated and developed, but have not yet been finalized.

Table 3 - Breakdown of ECO Savings by Line of Business ($M) [3]

	2025A	2026P
Transmission	**89.9**	**43.9**
Revenue	16.0	6.5
Capital	66.1	30.8
OM&A	7.9	6.6
Distribution	**33.7**	**22.6**
Capital	16.8	9.6
OM&A	17.0	13.1
Total ECO	**123.6**	**66.6**

1.4.4 PRODUCTIVITY IN THE 2028-2032 RATE TERM

Hydro One's Productivity Framework will continue to benefit customers through the current rate term and into the 2028-2032 rate period. Under the proposed Custom IR Framework for Transmission and Distribution (Exhibit A-04-01), productivity and supplemental stretch factors will provide direct and upfront reductions for customers and create meaningful incentives for Hydro One to identify and achieve incremental productivity improvements. Additionally, as the productivity factors and supplemental stretch factors on capital are proposed to be applied on a cumulative basis, productivity achievements will be embedded in the rate base. Productivity savings will be tracked and corroborated at the initiative-level using Hydro One's Productivity Framework. The maturity and established standards of that Framework are important considerations in assessing reasonable productivity expectations for the 2028-2032 rate term.

Hydro One has operated a rigorous Productivity Framework for many years. As discussed in Section 1.4.2, Concentric found that the Framework drives benefits that can be considered true productivity gains and is robust, well-defined and transparent relative to utility peers. In the earlier stages of a productivity program, readily identifiable opportunities can generally be captured more easily. Over successive rate periods, new initiatives are progressively more difficult to identify. Consistent with this principle,

[3] Rounded figures within tables may not sum precisely due to rounding.

Concentric recognized that, having already achieved significant savings, Hydro One may be more challenged over the long term to identify new initiatives and cost savings that meet the rigorous standards of the existing Framework.[4]

Those standards appropriately require demonstrable reductions in the cost of delivering the same or greater output. Accordingly, cost avoidance, work deferral and reduced output do not, on their own, qualify as true productivity under the Framework. If capital and OM&A productivity requirements materially exceed reasonably achievable opportunities, Hydro One may be required to defer or reduce work that supports safety, reliability, growth and customer benefits. Such work deferrals or reductions are undesirable since they may lead to challenges in improving reliability or accommodating customer growth and/or benefits. .

For these reasons, and as reflected in the proposed capital and OM&A productivity factors and supplemental stretch factors described in Exhibit A-04-01, Hydro One's objective is to provide customers with a level of productivity savings commensurate with the last rates proceeding and reasonably achievable through a mature, independently validated framework. The rate-setting framework should continue to incentivize achievable productivity without embedding assumptions at levels that would effectively require necessary work or system outputs to be reduced.

Hydro One will continue to pursue cost savings and operational improvements across the business. As demonstrated by ECO, initiatives that do not satisfy the Productivity Framework's criteria for true productivity can still generate meaningful customer value through cost containment, avoided costs and other efficiencies. Over time, experience with these initiatives may inform whether the criteria or scope of the Productivity Framework should be reassessed while preserving the rigor, transparency and customer benefits of the existing Framework.

[4] Ibid

1.4.4.1 UPDATING AND RESETTING BASELINES

Under the Productivity Framework, Hydro One will update and reset the baselines of its productivity initiatives to 2027 actuals for the 2028-2032 rate term.

This update and reset of baselines will achieve the following:

- demonstrate a clear link to continuous improvement during the 2028-2032 period relative to prior proceedings;
- assist in aligning the Productivity Framework and the Custom IR Framework to the OEB's incentive regulation framework;
- align with industry best practices;
- embed the historical achievements of existing initiatives in the new baseline, to measure and report only incremental savings over and above the prior and continuing savings from those initiatives. This will further challenge Hydro One to identify and deliver on new and incremental savings initiatives going forward in 2028, while prior initiatives will also continue to deliver savings that are embedded into the business plan; and
- simplify the governance and reporting process.

1.4.4.2 OVERVIEW OF PRODUCTIVITY SAVINGS FOR 2028-2032

Hydro One's current productivity plan is expected to achieve approximately $325.7M of savings in 2027 between Transmission and Distribution based on the current measurement approach under the Productivity Framework. This is the equivalent of reducing revenue requirement by approximately $56M and $58M in 2028, for Transmission and Distribution respectively. In other words, if Hydro One had not implemented these forecasted initiatives, while holding output constant, 2028 revenue requirement would be higher by these amounts. As these efficiencies have become embedded in normal business practices, customers will continue to benefit from them through lower rates both today and in future rebasing periods.

In addition, and incrementally, customers will receive the benefit of the value of the stretch factors and supplemental stretch on capital in revenue requirement, derived using the methodology detailed in Exhibit A-04-02 and Exhibit A-04-03. For Transmission and

Distribution respectively, this translates to a total of approximately $37M and $125M of revenue requirement reductions across 2029-2032. Hydro One will strive to achieve these savings through new initiatives and incremental improvements to existing initiatives relative to their updated 2027 baselines, recognizing that identifying additional productivity opportunities has become increasingly challenging. To the extent these savings are achieved, customers will benefit again through lower revenue requirements at rebasing in 2033.

In summary, the Productivity Framework provides customer benefits both today and in the future. Customers receive upfront revenue requirement reductions during the rate period, and any achieved productivity savings will be reflected in 2033. Any incremental OM&A and capital savings beyond those embedded in this Application will provide further customer value through a lower future revenue requirement, with incremental OM&A savings also shared with customers through the ESM during the rate term.

HYDRO ONE NETWORKS INC.
2023-2027 Transmission and Distribution Productivity Summary

		LOB	Initiative	Measurement and Expected Benefit	2023A	2024A	2025A	2026B	2027P
TRANSMISSION	Capital	Asset Management	Transformer Right Sizing	Lower costs from reduced equipment requirements at a Transformer Station. Cost savings while maintaining like-for-like service.	7.7	2.6	1.8	1.0	-
		Capital Portfolio Delivery	Continuous Improvement Model (CIM)	Lower labour hours per Unit. Lower costs per unit to construct and commission portfolio of Capital Portfolio Delivery projects at Transmission Stations. Lower labour hours per unit in Tx Lines Projects and Tx Lines Programs.	6.7	2.0	17.9	9.2	9.5
			Bell Standard Solution Concrete Testing Modernization Pre-built racks	(Historical Cost - New Cost) * # of Units. Cost reduction per bell fiber entrance installation, contest test and pre-built rack implementation.	-	0.6	0.8	1.1	1.1
			Telehandler Lifting Foundation Optimization Temporary Portable Access Roads Pre-cut Cable Trench Midsun Animal Abatement	(Historical Cost - New Cost) Cost savings from implementation of measures to generate efficiencies, including utilzation of telehandlers, foundation optimization, temporary access roads, pre-cur cable trench and updates to animal abatement equipment.	0.4	0.2	1.1	1.0	1.1
			CAPE ADI	Lower labour hours per Update. Reduced labour time required for updates to the CAPE database througfh automation.	-	-	0.4	0.2	0.2
			Crane vs Climb	(Crane daily cost * # days crane not used) + float moves/other misc costs saved Lower costs from reduced usage of cranes, by implementation of climb procedures.	-	-	0.4	-	-
			Environmental Assessment Modernization Initiative	Lower costs for environmental assessments resulting from Hydro One working with the Ministry of the Environment and Parks (MECP) to amend the Class EA to align EA thresholds with those of the federal government.	-	20.1	25.5	41.0	32.5
			Field Marked Print (FMP) Scanning Enhancement	(# documents directly uploaded) * cost per document scanned Reduction in external scanning costs by implementing new process and IT changes.	-	0.1	0.1	0.1	0.1
			Non-Productive Idling (NPI) Reduction	(baseline NPI ratio - current NPI ratio) * engine runtime * # vehicles * litres consumed per idle hour * average cost per litle of fuel. Reduced fuel consumption through reduction of non-productive idling (NPI).	-	0.1	0.0	0.1	0.1
			PML Meters Redundancy Savings	Savings per PML meter not used (material + labour) * # of units Reduced costs from removing redundant PM:L meters, which are replaced by protection relay programming capabilities to extract telemetry data from existing protection relays.	-	0.3	0.7	0.3	0.3
			Shieldwire Contracts	Lower Cost per Unit Savings in the Shieldwire capital replacement program as a result of outsourcing.	-	2.8	1.1	-	-
			Engineering OT Reductions	Lower % of overtime hours - Historical Baseline vs Actual. Lower costs from reduction in overtime.	1.0	0.5	1.4	1.0	1.0
			Reduce Perimeter Hydro Vac excavations	Hydro-Vac costs * reduced count of Hydro-Vac excavations. Reduced usage of Hydro-Vac equipment by having field staff trained on how to use available information, including station drawings and cable locates. This results in lower costs.	0.3	3.7	5.5	4.0	4.0
		Digital and Technology Services	Server Build Automation	Lower labour hours per server build. Savings through the usage of automation.	-	-	0.1	0.1	0.1
			SAP Functional Partnership Savings	Lower cost per Partnership Agreement Reduced SAP costs from bundling 10 partnership agreements together, instead of proceeding individually for each.	-	-	-	0.2	0.2
		Fleet	Electric Vehicles	Fuel Savings Lower operational costs from using electric vehicles instead of gas based vehicles.	0.0	0.0	0.1	0.1	0.1
			Ford Special Pricing	Rebate per Vehicle * # of vehicles. Reduced vehicle unit costs as a result of collaboration with vendor.	0.2	-	-	-	-
			Traction Parts Savings	Total vendor invoiced amount * % rebate Reduced heavy duty parts costs as a result of a rebate negotiated with vendor.	0.0	0.0	0.0	0.0	0.0
			Rental Savings	Historical Cost - New Cost Elimination of unneccessary rentals, which in turn drives reduction in rental costs.	-	-	0.2	0.9	0.9
		Supply Chain	Procurement	Lower Cost per Unit - Historical Baseline vs Actual Savings are estimated at a category level based on historical spend, expected and achieved negotiated savings, and updated per business plan assumptions.	6.8	9.5	14.1	7.9	9.9

SECTION 1.5 – SPF – PERFORMANCE MEASUREMENT AND OUTCOMES

1.5.1 INTRODUCTION

Hydro One is committed to achieving the goals underpinning the TSP and DSP. To give effect to this commitment, Hydro One has aligned its planning, execution and reporting functions around performance outcomes that are consistent with the OEB's Renewed Regulatory Framework (RRF) outcomes. The RRF outcomes relate to Customer Focus, Operational Effectiveness, Policy Responsiveness and Financial Performance. Hydro One's overall performance against these targets is reported by means of regulatory scorecards for each of the transmission and distribution businesses, as well as through Hydro One's Team Scorecard and Operational Scorecard.

In the sections that follow, Hydro One describes its performance measurement process, including governance and methodologies used for each of the measures.

1.5.1.1 PERFORMANCE MEASUREMENT STRUCTURE, PROCESS, AND GOVERNANCE

Hydro One is focused on performance measurement and planning. Hydro One's budgeting and performance measurement processes ensure that cross-functional stakeholders, such as various lines of business, its Finance and Regulatory Affairs groups, the Executive Leadership Team (ELT) and Operations Managers, are equipped with up-to-date information to drive business decisions and achieve performance targets.

The Regulatory Scorecards found in TSP Section 2.5, TSP Section 2.10 Attachment 3, and DSP Section 3.5 detail Hydro One's and Hydro One Sault Ste. Marie's (HOSSM) historical performance in each area and establish performance outcomes that have been targeted over the 2028 to 2032 period. Hydro One is committed to achieving the performance outcomes for each measure. As noted in SPF Section 1.7, the investment plan will drive performance towards these outcomes, ensuring regulatory compliance, and balancing customers' needs and preferences, the asset and system needs, and rate impacts. The Regulatory Scorecards are made up of performance measures that enable

Hydro One to monitor, track and demonstrate performance relative to outcomes that are valued by its customers.

There are a number of internal stakeholders that are directly engaged in and have responsibility for overseeing or implementing Hydro One's performance measurement and monitoring process. Details of this process are set out in Hydro One's Performance Reporting Governance Framework, a copy of which is provided in Attachment 1.

1.5.2 TRANSMISSION AND DISTRIBUTION SCORECARDS OVERVIEW

Hydro One has four scorecards that it uses to assess its performance relative to the OEB's RRF outcomes. As discussed above these scorecards are used internally, as well as to communicate results and targets to the OEB.

For Transmission, Hydro One proposes to continue to file the Transmission OEB Scorecard approved in EB-2021-0110 (see TSP Section 2.5). In addition, HOSSM proposes to continue to file its scorecard approved in EB-2018-0218 (see TSP Section 2.10 Attachment 3). For Distribution, Hydro One will continue to file both the Electricity Distributor Scorecard that the OEB requires from all electricity distributors and the Distribution OEB Scorecard approved in EB-2021-0110 (see DSP Section 3.5), which provides measures offering additional granularity in the areas of Customer Satisfaction, Cost Control and System Reliability.

TSP Section 2.5 and TSP Section 2.10, Attachment 3 discuss each measure in Hydro One's and HOSSM's respective scorecards. The discussion provides the definition of the measures, historical performance over the current rate period and targets for the forthcoming rate period. These sections also address proposals to modify or eliminate certain measures.

DSP Section 3.5 discusses each measure in the Electricity Distributor Scorecard and the Distribution OEB Scorecard. The discussion provides the definition of the measures, historical performance over the current rate period and targets for the forthcoming rate period. This section also addresses proposals to modify or eliminate certain measures.

PERFORMANCE MEASUREMENT GOVERNANCE

The Ontario Energy Board (OEB) assesses Hydro One's transmission and distribution rate applications using a performance- and outcomes-based approach, as established in the OEB's Renewed Regulatory Framework (RRF). The RRF outlines four performance outcomes (customer focus, operational effectiveness, public policy responsiveness, and financial performance), which articulate the OEB's goals of aligning the interests of customers and utilities. The outcomes are supported by key principles in the RRF, which include the expectation of continuous improvement, robust integrated planning and asset management that pace and prioritize investments, strong incentives to enhance utility performance, ongoing monitoring of performance against targets, and customer engagement to ensure utility plans are informed by customer expectations.

Performance scorecards are used to capture the four outcomes and the key principles of the RRF, assess alignment between a utility's rate application and the RRF, and assess the alignment of the utility's interests with those of its customers. This document describes how Hydro One tracks and reports performance outcomes on its scorecards in alignment with the OEB's performance- and outcomes-based approach.

PERFORMANCE PRINCIPLES & MEASURES

The OEB requires Hydro One to report on its performance using a variety of measures contained in scorecards that are either developed or required by the OEB. For distribution rate applications, Hydro One uses the following scorecards: (i) the *OEB Electricity Distributor Scorecard (A)*; and (ii) the *Hydro One Distribution Scorecard (B)*. The Electricity Distributor Scorecard is produced by the OEB using Hydro One Distribution's annual Reporting and Record-keeping Requirements (RRR) filings. The Distribution Scorecard provides measures in addition to those in the Electricity Distributor Scorecard.

For transmission revenue requirement applications, Hydro One uses the following scorecards: (i) the *Hydro One Transmission Scorecard (C)*; (ii) the *Hydro One Sault Ste. Marie Limited Partnership Scorecard (HOSSM)*; and (iii) Hydro One's *Limited Partnerships (LP) Scorecards*.

Together, these seven scorecards are referred to as the regulatory scorecards. At the overall corporate level, Hydro One uses the Team Scorecard and Operational Scorecards. The interactions between the various scorecards are shown below in Figure 1.

The regulatory scorecards are organized around the four RRF outcomes, and each outcome informs subsequent "performance categories," which are evaluated, for the most part, using quantitative measures that are tracked over time and compared with targets that are specific to either the industry, Hydro One, or both. The regulatory scorecards include the complete list of measures used to track and report performance improvements.

PLANNING FOR PERFORMANCE OUTCOMES

To meet the targets in the regulatory scorecards, Hydro One incorporates the RRF principles and associated measures into its planning, execution, and reporting functions. RRF principles are integrated into Hydro One's corporate objectives and business plan, and specific measures from each of the Distribution and Transmission regulatory scorecards are included in Hydro One's internal scorecards - the Team Scorecard and the Operational Scorecards.

Figure 1 below shows how the RRF principles are incorporated into the performance reporting process for the regulatory scorecards, Hydro One's Team Scorecard, and Operational Scorecards.

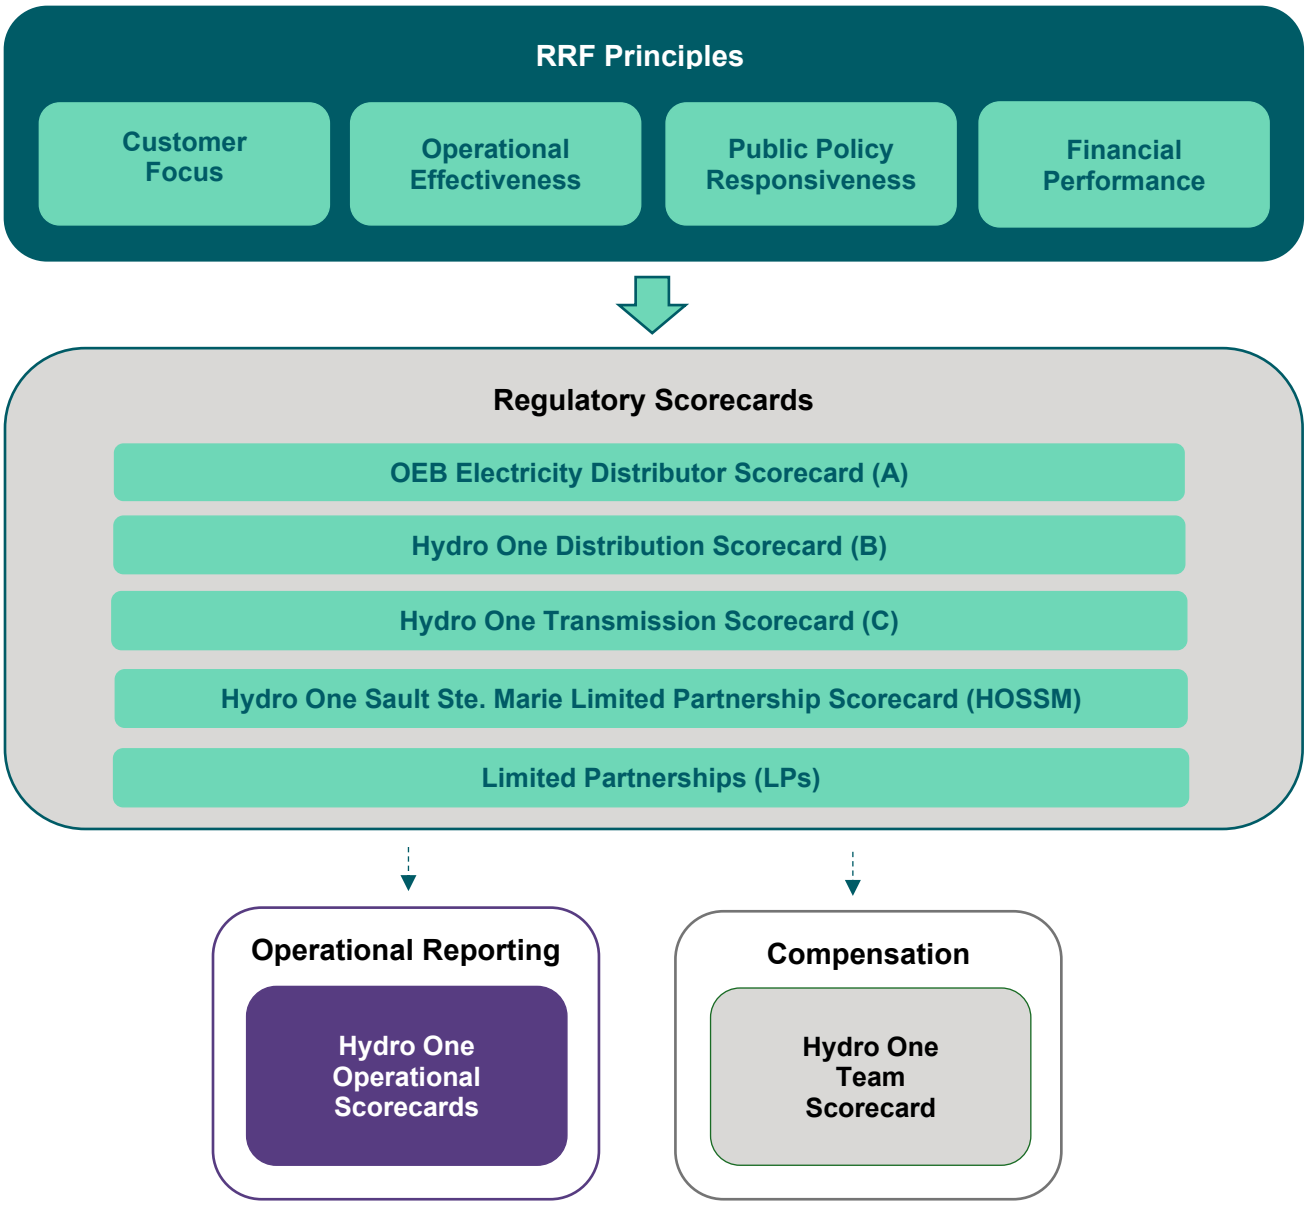

Figure 1: Performance Reporting Scorecards & Interactions

GOVERNANCE FOR REPORTING & DEVELOPMENT OF MEASURES AND TARGETS

Hydro One's governance framework is designed to support the key RRF principles of continuous improvement, robust integrated planning and asset management, strong incentives to enhance performance, ongoing monitoring of performance against targets, and customer engagement to inform rate applications. The framework focuses on two primary activities: (i) performance reporting; and (ii) measure and target development.

The primary stakeholders supporting the governance framework are listed in Table 1:

Table 1 - Stakeholder Accountabilities

Business area	Accountability
Operations	Historical performance
System Planning	Investment strategy and prioritization
Regulatory Affairs	OEB RRR process
Finance	Financial reporting

SECTION 1.6 – SPF – CUSTOMER, STAKEHOLDER AND INDIGENOUS COMMUNITIES ENGAGEMENT

1.6.1 INTRODUCTION

Hydro One serves 1.5 million predominantly rural residential, seasonal and small business customers (including customers in Indigenous communities), and over 8,000 large business customers, including commercial and industrial customers, local distribution companies, and transmission-connected end-users and generators. Through its distribution network, Hydro One serves approximately 26% of the total number of electricity customers in Ontario. Hydro One's transmission system delivers electricity to 98% of customers in the province. Both systems cover vast geographical areas and serve a diverse customer base throughout the province.

This Exhibit describes Hydro One's strategy and approach to customer engagement that places customers and their needs at the core of investment and operational decisions. The following sections describe:

- the multi-phase application-specific customer engagement study conducted by Innovative Research Group (IRG) and the results of it; and
- the various other forms of ongoing customer engagement carried out by Hydro One, including through: the Customer Contact Centre; large customer account management and oversight committees; customer satisfaction research; Indigenous engagement, including engagement with First Nations communities and Métis organizations; external relations; and the Office of the Hydro One Ombudsman.

1.6.2 CUSTOMER ENGAGEMENT OVERVIEW

Hydro One's approach to customer engagement comprises two primary streams: a multi-phased study conducted by independent expert consultant IRG for this Application, and ongoing engagement activities that continually inform planning and operations across the organization.

To identify customer needs and preferences in preparation for its 2028 – 2032 investment planning process and this Application, Hydro One engaged IRG to develop and conduct a customer engagement study (IRG Study). IRG employed a two-phased approach, engaging customers in advance of the investment planning process, in mid-to-late 2024, and again after draft investment plans were prepared, in late 2025. This allowed Hydro One to develop and finalize investment plans that are informed by customer input and have been refined based on specific investment trade-offs to achieve outcomes valued by customers.

Hydro One understands that the IRG Study is the largest customer engagement documented at the OEB to date.[1] In total, over 100,000 customers participated in the IRG Study through various types of activities, including focus groups, in-depth interviews, telephone surveys, and online surveys. The activities also included conversations with First Nations Chiefs or their representatives, Métis Nation of Ontario regional representatives, stakeholders and municipalities.

The Transmission System Plan, Distribution System Plan and General Plant System Plan (TSP, DSP, GSP and collectively the System Plans) are closely aligned with customer needs and preferences. The IRG Study results indicate strong support for Hydro One's proposed investment plans. As stated in the IRG Overview Report: "Overall, feedback collected from more than 100,000 customers shows that there is strong support across all customer types for a level of investment at or above Hydro One's 2028-2032 draft plans."[2] Depending on customer type, 68% to 88% of customers support spending at or above the level of investment included in the plans.[3] Similar levels of support were observed for categories of investments in the transmission and distribution systems, as well as shared services.[4]

[2] SPF Section 1.6 Attachment 1, IRG Overview Report p. 3
[3] SPF Section 1.6 Attachment 1, IRG Overview Report p. 3 and p.14
[4] SPF Section 1.6 Attachment 1, IRG Overview Report p. 14-18

Customers consistently supported Hydro One investing at the level of the draft plan (or higher) to ensure a reliable, resilient and future-ready system at a reasonable rate.[5] Customers are in favour of replacing poor condition distribution and transmission assets to improve reliability or reduce risk of outages related to severe weather.[6] Customers also see value in investing in reducing risk of critical facility asset failure to enable field operation and in modernizing technology capabilities to enhance services and improve efficiency.[7]

Customer feedback from both phases of the IRG Study was integrated directly into, and informed, the preparation and finalization of the investment plans as described in Section 1.6.3 below.

The IRG Study is further described below, and IRG's reports detailing the study are included as Attachment 1, with the IRG Overview Report providing an overview of the study and its results.

In addition to the results of the above application-specific IRG Study, Hydro One's investment plans are also informed by customer feedback from other forms of ongoing engagement. These other forms of engagement include conversations with residential and small business customers through the Customer Contact Centre, in-depth conversations with large customers through the Account Executives, ongoing customer satisfaction research, and regular dialogue with industry stakeholders and consumer groups. These ongoing customer engagement activities are further described in Section 1.6.4 below.

1.6.3 THE IRG STUDY

1.6.3.1 TIMING AND PROCESS

As detailed in the IRG Overview Report, the IRG Study was a two-phased process that gave all customers the opportunity to participate in Hydro One's investment planning process. Figure 1 below depicts the integrated customer engagement and investment

[5] SPF Section 1.6 Attachment 1, IRG Overview Report p. 20
[6] SPF Section 1.6 Attachment 1, IRG Overview Report p. 15-17
[7] SPF Section 1.6 Attachment 1, IRG Overview Report p. 17-18

planning process and timing. This integration and the impacts of the customer engagement process on investment planning are further discussed in the System Plans Framework (SPF) section 1.7, TSP section 2.7, DSP section 3.7 and GSP section 4.7.

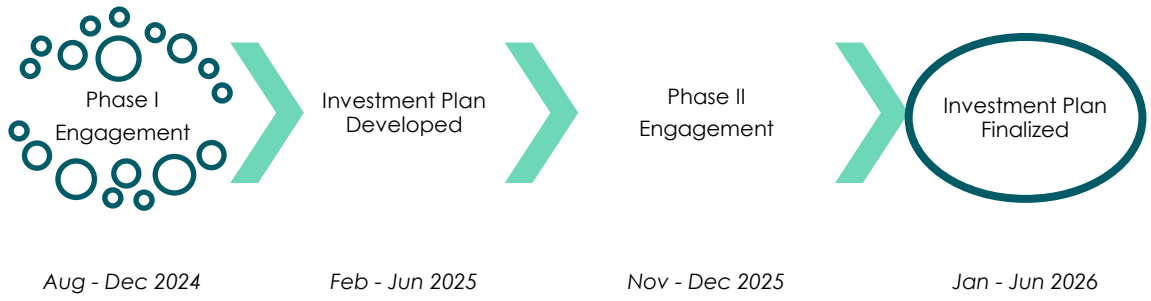

Figure 1: Integrated Customer Engagement and Investment Planning Process

Phase I took place in mid-to-late 2024, prior to the beginning of the investment planning process for the years 2028-2032, and focused on identifying customer needs and preferences to inform the initial stages of investment planning. Phase II was carried out in late fall 2025 and provided customers with an opportunity to provide specific feedback on Hydro One's draft investment plans, including on significant investment trade-offs in the plans. The Phase II results informed and were incorporated into the final investment plans submitted in this Application.

1.6.3.2 BROAD PARTICIPATION

Given the variety and number of Hydro One's customers, as noted further above, the IRG Study needed to obtain feedback from a broad range of customers.

Hydro One's distribution customers fall into three categories: (i) Residential and Small Business (GS<50kW) customers; (ii) Commercial and Industrial (C&I) customers (<2MW); and (iii) Large Distribution Accounts (LDA), or Key Accounts (>2MW). Customers directly connected to the transmission system are made up of: (i) Electricity Generators who deliver power to the transmission system; (ii) Distributors who deliver power to direct customers; and (iii) End-users such as mining and industrial enterprises that use the

power themselves at transmission level voltage. In addition, both systems serve First Nations and Métis customers in different areas of the province.

The IRG Study included a range of outreach methods tailored to the different customer segments above. Hydro One's distribution customers – both residential and non-residential – were invited to participate in the IRG Study and thus have input into the distribution and transmission system planning process and resulting investment plans. They include:

- (Primary and seasonal) residential customers
- First Nations and Métis customers
- Small business customers (GS<50kW)
- C&I Customers (50kW – 2MW)
- LDA (>2MW)

The following customers who are directly connected to Hydro One's transmission system (including Hydro One Sault Ste. Marie's system), as well as customers that are served by other Ontario Local Distribution Companies (LDCs), also had the opportunity to participate in the IRG Study and thus have input into the transmission system planning process and resulting investment plan:

- Transmission-connected end-users
- Transmission-connected generators
- Transmission-connected LDCs
- Residential customers outside of Hydro One's distribution territory
- Small Business customers outside of Hydro One's distribution territory

As further detailed in the IRG Report, and shown in Figure 2 below, over 100,000 customers from all segments participated in a variety of engagement activities throughout both phases of the IRG Study.

Customer/Stakeholder Group		Phase I			Phase II	Total
		Focus Group	In-depth Interview	Online Survey	Online Survey	
		Aug 2024	Aug - Oct 2024	Nov - Dec 2024	Nov - Dec 2025	
Hydro One Distribution & Transmission Customers	Residential (including Seasonal)	59	-	6,053	94,611	**100,723**
	First Nations On-Reserve Residential	-	-	426	793	**1,219**
	Small Business	27	-	477	2,791	**3,295**
	Commercial & Industrial	-	9	311	368	**688**
	Large Distribution Accounts	-	11	61	53	**125**
Hydro One Transmission-Only Customers	Other LDC Residential	-	-	1,019	2,071	**3,090**
	Other LDC Small Businesses	-	-	-	305	**305**
	Large Transmission Accounts	-	17	72	73	**162**
Indigenous Leadership	First Nations Leadership	-	18	-	-	**18**
	Métis Nation of Ontario Leadership	-	8	-	-	**8**
Stakeholders	Association Stakeholders	-	9	-	-	**9**
	Municipality Stakeholders	-	9	-	-	**9**

Figure 2: Overview of IRG Study Customer Engagement Activities[8]

In respect of customers of other LDCs, they were given the opportunity to directly participate in the IRG Study during both phases of the customer engagement. These customers were able to identify their needs and outcome priorities and to comment on investments in Hydro One's draft Transmission System Plan and General Plant System Plan, including proposed price increases. This was accomplished through representative surveys of electricity customers in Ontario that are outside of Hydro One's distribution territory via online research panels. Phase I included a representative online survey. Phase II included both a representative online survey and an open call to participate via an open-access link on Hydro One's website.[9]

Hydro One also obtained and incorporated meaningful input from First Nations representatives. All First Nations customers were invited to complete an online survey in Phases I and II of the IRG Study. On-reserve First Nations residential customers received a separate workbook in both phases to reflect the First Nations Delivery Credit. In addition, First Nations Chiefs or delegates had the opportunity to provide input into the investment

[8] SPF Section 1.6 Attachment 1, IRG Overview Report p. 6 – 7 and p. 14
[9] SPF Section 1.6 Attachment 1, IRG Overview Report p. 7 and p.13

planning process and share their communities' specific needs and preferences during Phase I. Hydro One further reached out to the Métis Nation of Ontario (MNO), whose views were considered throughout the engagement. MNO representatives were invited to discuss the needs and outcome preferences. Likewise, stakeholders and municipalities across Ontario had opportunities to provide their input into Hydro One's investment planning process.

Through the broad range of customer engagement activities in the IRG Study, Hydro One developed a strong understanding of the specific outcomes that its distribution and transmission customers value and care most about, as well as the level of spending and mix of investments that customers would most like to see included in Hydro One's investment plans. This customer feedback was an important and direct input into Hydro One's investment planning process. Consequently, Hydro One's planned transmission, distribution, and general plant capital investments are aligned with and responsive to the needs and preferences of its customers.

1.6.3.3 PHASE I: CUSTOMER NEEDS AND PREFERENCES

Phase I of the IRG Study focused on customers' general needs and outcome preferences for the electricity system. Customers expressed high levels of satisfaction with the electricity service they receive and identified reasonable rates and reliable electricity as the top priorities across all customer segments.[10] C&I, LDA, and other LDC Residential customers also indicated meeting growing electricity demand as a top priority.[11]

After obtaining customer input on general needs and outcome priorities, customers were invited to provide feedback on high-level investment trade-offs in Phase I. Hydro One's planners identified a range of illustrative investment categories that have historically comprised a material portion of controllable investment in prior plans. The intent of this part of the engagement was to provide early insight into the types of investments that customers value most and their general willingness to pay, in advance of the investment planning process.

[10] SPF Section 1.6 Attachment 1, IRG Overview Report p. 8
[11] SPF Section 1.6 Attachment 1, IRG Overview Report p. 9

While reasonable rates are of importance to customers, they also indicated that they value and are willing to pay for investments that maintain or improve performance on reliability, resiliency, enabling economic growth and system visibility where costs for these benefits are within the directional bill impacts provided.[12] A majority or near majority of customers across all customer types supported investments to achieve various outcome objectives. There was variation amongst the customer types in terms of level of support for proactive investments, with stronger support being demonstrated by residential customers and LDA customers, for example.

The needs and outcome preferences of on-reserve First Nations residential customers, and their feedback on high-level investment trade-offs, largely aligned with the results from other customer segments. Affordability and reliability were identified as top priorities. First Nations customers are generally willing to pay more to invest in maintaining or improving reliability.[13] While First Nations customers are slightly less willing to pay more to make these investments than residential customers, they still support investments in the electricity system and are willing to accept potential bill impacts.[14]

Customer feedback and key findings from Phase I were provided to Hydro One's planners for their consideration in developing the draft investment plans for the distribution, transmission, and general plant systems. Throughout the spring and summer of 2025, planners reviewed this customer feedback and incorporated it into the development of the draft investment plans as described in SPF section 1.7, TSP section 2.7, DSP section 3.7 and GSP section 4.7.

The sections immediately below provide further details regarding the Phase I customer feedback, including preferences for specific investments in respect of the distribution and transmission systems.

[12] SPF Section 1.6 Attachment 1, IRG Overview Report p. 10 – 12
[13] SPF Section 1.6 Attachment 1, IRG Overview Report p. 10
[14] SPF Section 1.6 Attachment 1 Appendix 6, Hydro One Phase I Planning Placemat, p. 155-157

1.6.3.3.1 Distribution system

As described in the IRG Overview Report, key customer feedback in respect of distribution included the following:

- A majority of customers support Hydro One making necessary investments in the distribution system to improve or maintain current levels of reliability related to the distribution grid.[15]
- A majority of customers want Hydro One to make targeted investments to improve reliability for customers who experience significantly poorer reliability than average.[16]
- A majority of customers want Hydro One to make investments to make the system more resilient to severe weather events as part of the ongoing replacement of old or failing equipment. A plurality of customers support Hydro One in making proactive investments to make the system more resilient to severe weather events.[17]
- A plurality of customers support Hydro One making proactive investments to enable anticipated growth and accommodate new connections and service upgrades in a timely manner.[18]
- A majority of customers want Hydro One to make proactive investments in technology to accommodate customer requests and improve system visibility.[19]

1.6.3.3.2 Transmission system

As described in the IRG Overview Report, key customer feedback in respect of transmission included the following:

- A majority of customers want Hydro One to make investments to either maintain or increase current levels of reliability related to the transmission grid.[20]

1.6.3.4 PHASE II: FEEDBACK ON THE DRAFT INVESTMENT PLANS

After Hydro One had developed its draft 2028-2032 investment plans, Phase II of the IRG Study, over the late fall of 2025, gave customers an opportunity through an online survey

[15] SPF Section 1.6 Attachment 1, IRG Overview Report p. 10
[16] SPF Section 1.6 Attachment 1, IRG Overview Report p. 10
[17] SPF Section 1.6 Attachment 1, IRG Overview Report p. 11
[18] SPF Section 1.6 Attachment 1, IRG Overview Report p. 11
[19] SPF Section 1.6 Attachment 1, IRG Overview Report p. 12
[20] SPF Section 1.6 Attachment 1, IRG Overview Report p. 12

to provide feedback on the draft plans, including specific investment trade-offs included in the plans. Distribution customers were asked to provide their feedback on the distribution, transmission and shared services investment trade-offs. Transmission customers and other LDC customers were asked to provide their feedback on the transmission and shared services investment trade-offs. As part of Phase II, IRG engaged with over 100,000 customers.

In respect of Distribution, Transmission and Shared Services, customers were presented with investment trade-offs relating to the following areas and objectives:

- Distribution: (i) overall system reliability; (ii) managing the impacts of severe weather; and (iii) targeted reliability;
- Transmission: (i) keeping pace with transmission renewal; and (ii) stewardship of transmission system; and
- Shared Services: (i) maintaining buildings and facilities; and (ii) information technology.

In respect of the above areas, customers were generally given options to choose between spending at the level of the draft plan, higher than the plan, or lower than the plan, with associated impacts on outcomes. The specific investment trade-off questions and options presented are described in the IRG Overview Report and further detailed in their Phase II results report.

As noted in the IRG Overview Report, the Phase II results indicated that customers value the proposed investments in the electricity system and are supportive of Hydro One's draft investment plans. Across all customer types, most customers support Hydro One spending at or above the level of investment included in the draft plans.[21] They are willing to accept bill increases in exchange for prudent investments in the distribution and transmission systems.

[21] SPF Section 1.6 Attachment 1, IRG Overview Report p. 14

Some differences exist between customer segments regarding the specific level of investment, and corresponding bill impact, they prefer. The results included that most on-reserve First Nations residential customers support the proposed investments in the electricity system and support Hydro One spending at or above the level of investment included in the draft plans.[22] This includes support for the proposed investments in overall distribution system reliability, managing severe weather, targeted reliability improvements, keeping pace with transmission renewal and system stewardship, as well as maintaining buildings and facilities and making technology investments.[23]

The sections immediately below provide further details regarding the Phase II customer feedback, including their preferences for specific investments in the distribution and transmission systems.

1.6.3.4.1 Distribution system

As described in the IRG Overview Report, key customer feedback in respect of distribution included the following:

- Across all customer types, most customers support Hydro One spending at or above the level of investment in the draft plan as it relates to distribution investments in overall system reliability, managing severe weather, and targeted reliability improvements.[24]
- Customers support the investments included in the draft plan regarding the replacement of distribution assets in poor condition, such as overhead lines, transformer stations and underground cables to improve day-to-day reliability. A plurality of customers supports a level of spending more than the draft plan to further reduce the risk of outages.[25]
- Regarding investments to manage the impacts of severe weather on the distribution system, customers support the level of investments in the draft plan with respect to relocating or reinforcing vulnerable power lines with more resilient

[22] SPF Section 1.6 Attachment 1, IRG Overview Report, p. 14
[23] SPF Section 1.6 Attachment 1, IRG Overview Report, p. 15 - 18
[24] SPF Section 1.6 Attachment 1, IRG Overview Report p. 15
[25] SPF Section 1.6 Attachment 1, IRG Overview Report p. 15

equipment, clearing more overgrown trees and brush than historically, and more installation of automated “intelligent switches”. A plurality of customers would like to see an increased level of investment beyond the level in the draft plan.[26]

- For investments to achieve targeted reliability, customers support the level of investment in the draft plan, including in respect of investing in community-scale and individual customer batteries to target reliability improvements for individual customers and communities that experience the poorest reliability. [27]

1.6.3.4.2 Transmission system

As described in the IRG Overview Report, key customer feedback in respect of transmission included the following:

- Across all customer types, most customers support spending at or above the level of investment in the draft plan as it relates to keeping pace with transmission renewal, and stewardship of the transmission system. [28]
- Customers expressed strong support for the replacement of aging and deteriorating transmission system assets to manage the risk of equipment failure and support growth across the province. These include the replacement of transmission station transformers and breakers, and high-impact underground transmission cables.[29]
- Customers also expressed strong support for investments to enhance Hydro One’s stewardship of the transmission system. A majority of customers support the draft plan, including replacing at-risk transmission lines, reinforcing wood poles and extending the life of steel towers and accelerating the clearing of overgrown trees.[30]

1.6.3.4.3 Shared Services

As described in the IRG Overview Report, key customer feedback in respect of Shared Services (general plant) included the following:

[26] SPF Section 1.6 Attachment 1, IRG Overview Report p. 15
[27] SPF Section 1.6 Attachment 1, IRG Overview Report p. 16
[28] SPF Section 1.6 Attachment 1, IRG Overview Report p. 16
[29] SPF Section 1.6 Attachment 1, IRG Overview Report p. 16
[30] SPF Section 1.6 Attachment 1, IRG Overview Report p. 17

- Across all customer types, most customers support Hydro One spending at or above the level of investment in the draft plan as it relates to shared investments in maintaining buildings and facilities, and information technology.[31]
- A majority of customers support the draft plan level of spending to address at-risk building components, making at-risk sites more resilient to severe weather, and repair and retrofit field offices to meet modern and accessibility standards. [32]
- A majority of customers support the draft plan level of information technology spending, to maintain the current state of technology systems, enhance customer service, improve operational efficiency, and protect the grid from physical and cyber attacks. [33]

The Phase II results were presented to Hydro One's planners. The planners then used this customer feedback to help inform the finalization of the proposed investment plans. This allowed Hydro One to ensure the final plans for 2028-2032 take into account, and are responsive to, customer needs and preferences, including customer feedback on specific investment trade-offs.

Overall, as described above, the Phase II customer feedback confirmed strong customer support for Hydro One's draft investment plans across its various customer types, resulting in a decision to generally maintain the draft plan spending levels, with minor adjustments in selected investment areas.

SPF Section 1.7.4.5.2 further describes the integrated nature of the customer engagement process and the investment planning process. TSP Section 2.7.4.4.2, DSP Section 3.7.5 and GSP Section 4.7.2.1 further describe how the final proposed capital expenditure plans reflect the customer feedback and will achieve the outcomes valued by customers.

Following customer engagement and further investment plan review, Hydro One further refined and repaced certain investments to balance customer priorities, system needs,

[31] SPF Section 1.6 Attachment 1, IRG Overview Report p. 17
[32] SPF Section 1.6 Attachment 1, IRG Overview Report p. 17
[33] SPF Section 1.6 Attachment 1, IRG Overview Report p. 18

execution considerations, and affordability. This adjustment is further described in DSP Section 3.1.1.

1.6.4 ONGOING CUSTOMER, INDIGENOUS COMMUNITIES AND STAKEHOLDER ENGAGEMENT ACTIVITIES

In addition to the IRG Study, Hydro One regularly engages with and obtains feedback from its customers through a variety of other channels and methods. This allows Hydro One to gain a solid understanding of what different customer segments expect from their electricity provider and where the company can make improvements to its services for customers. As applicable, feedback from other forms of customer engagement (besides the results of the IRG Study) was also taken into account during, and helped inform, the investment planning process.

To ensure Hydro One maintains a regular view of its customers' needs and preferences, Hydro One engages with customers via the following avenues on an ongoing basis to monitor customer expectations and evolving service trends:

- Customer Contact Centre (Section 1.6.4.1 below);
- Large Customer Account Management and Oversight Committees (Section 1.6.4.2 & 1.6.4.3 below);
- Customer Satisfaction Research (Section 1.6.4.4 below);
- Indigenous (First Nations and Métis) Engagement (Section 1.6.4.5 below);
- External Relations (MPPs, Agencies, and Municipalities) (Section 1.6.4.6 below); and
- Office of the Hydro One Ombudsman (Section 1.6.4.7 below).

1.6.4.1 CUSTOMER CONTACT CENTRE

Residential and small business customers work with the Customer Contact Centre (CCC) when they have a question about their service or bill. Whether the customer contacts Hydro One by phone, e-mail, chat, or mail, these interactions are monitored closely, and any concerning trends are escalated and analyzed to ensure Hydro One's performance is continuously improving, and distribution system outcomes are aligned with customer needs and preferences.

Customer interactions are actively monitored for quality control purposes to ensure Hydro One customers receive quality service and the timely and accurate information they need. Feedback is also received through the Customer Relations Centre, which addresses escalated calls that require more detailed investigation and resolution.

DSP Section 3.5.2.1 shows the historical performance of the service quality and customer satisfaction. These are important metrics on Hydro One's performance scorecard which inform operational decisions. Details on investments in respect of Customer Contact Centre can be found in Exhibit E-03-04, Distribution Customer Care OM&A.

1.6.4.2 LARGE CUSTOMER ACCOUNT MANAGEMENT

1.6.4.2.1 Distribution

Hydro One provides large distribution-connected customers (including C&I and LDA customers) with a comprehensive and structured support framework. This includes access to expert analysts and, in many cases, a dedicated single point of contact. The team assists customers with a wide range of matters, including new connection requests, power quality and reliability, energy billing and cost of power, and participation in industry programs.

This proactive and relationship-focused approach enables a strategic understanding of customer needs and preferences, which in turn informs Hydro One's distribution planning and investment decisions. By maintaining strong partnerships with customers, it ensures that the voice of the customer is reflected in system planning priorities and operational enhancements.

Over time, the Key Account Management model has evolved to offer more personalized and responsive service. The shift toward increased single-point-of-contact support reflects both the growing complexity of the electricity sector and the expanding expectations of large customers. This model strengthens strategic alignment between Hydro One's customer service, operational teams, and system planning functions.

Witness: Spencer Gill; Matthew Jackson

Hydro One's Key Account Management representatives engage regularly with customers to review operational experiences, identify emerging needs, and develop targeted action plans. Where these plans lead to new or modified connection facilities or infrastructure investments, the assigned representative works directly with the customer to ensure a shared understanding of the process, including connection timelines, cost estimates, and capital cost recovery agreements.

In addition, Hydro One actively monitors and analyzes customer inquiries and case management activities. This data-driven approach supports continuous improvement and ensures that Hydro One remains responsive to the evolving needs of its large distribution customers.

Overall feedback from ongoing engagement with large distribution customers remains consistent with the results of the IRG Study. Reliability and power quality continue to be identified as top priorities. Many large distribution customers expect substantial growth in electricity demand and are looking to Hydro One to facilitate the necessary capacity increases and streamline the connection process.

This feedback is provided to the Planning team to inform investment decisions. Given that affordability is a key priority, Hydro One's Key Account Management representatives actively provide guidance on available cost mitigation strategies to help customers manage potential impacts where possible. Hydro One is also proposing investments in technology to support large distribution customers by providing enhanced data and insights to help them make informed and cost-effective decisions. Please see GSP Section 4.11 G-GP-07 for the investment details on the customer operations enablement tool.

1.6.4.2.2 Transmission

Hydro One Account Executives provide large transmission-connected customers with a single point of contact at Hydro One for all types of interactions, including matters related to customer connection requests, sustainment and system development plans and

projects, and concerns regarding service levels or power reliability and quality and advocate for them across the organization. This approach facilitates a consistent and more comprehensive reporting of customer needs and preferences for use by planners, operators, and customer service teams – feedback that is considered when making transmission planning and investment decisions.

Account Executives meet with their customers on a regular basis to ensure that the needs and preferences of customers are identified and discussed, and action plans are developed to address them. If an action plan results in new or modified connection facilities and/or asset needs, the Account Executive will directly communicate with the affected customer(s) to ensure a common understanding of the related connection process and contractual requirements, such as connection cost estimates and capital cost recovery agreements.

Hydro One's Account Executives and Customer Operating Support team proactively engage with transmission customers to review and support planned outage activities to minimize impacts on customers and to optimize opportunities for both Hydro One and customers to plan and execute work on their respective facilities. The outcomes of these discussions are used as inputs to the Integrated System Operations Center (ISOC) Transmission System Outage (TSO) process to coordinate multiple work activities on the same equipment during a single outage, as discussed further below. Account Executives also participate in the ISOC's meetings with transmission customers to discuss planned outages and work as part of the regional planning process. The ISOC's Outage Planning Group works directly with transmission customers to efficiently plan real-time outage operations, coordinate planned outages so Hydro One or the customer can complete required work, to respond quickly to unexpected outages, and to coordinate switching activities.

Account Executives organize bi-annual customer meetings throughout the province to coordinate outage planning activities. These meetings are a key activity in Hydro One's TSO process. The ISOC sends reports, customized for individual customers that provide a rolling, one-year window of the planned outages that will affect the customer's delivery

point. These reports contain information on outage start and end dates, the equipment involved, purpose, recall time and schedule profile. The reports provide an opportunity for customers to provide feedback. The Outage Planning Group also provides information on Hydro One's plans, particularly with respect to outages, for the balance of the year and/or the next scheduling year. During these meetings, transmission customers may bring forward their own maintenance plans for their facilities, with a view to scheduling or bundling outages in a manner that minimizes the frequency and duration of outages for both the utility and the customer.

1.6.4.3 OVERSIGHT COMMITTEES

Hydro One has established several oversight committees to ensure that the ongoing operational needs and preferences of these transmission customer groups are accounted for in a timely fashion. Coordination with other entities is especially important for effective and aligned health and safety oversight. While the specific purpose of these oversight committee meetings is not to direct investment plans, these oversight committees provide an early insight as to future investment needs more generally, and this can be useful information for investment planning purposes. Hydro One has established and maintains a number of oversight committees as follows.

1.6.4.3.1 SARNIA AREA RELIABILITY OVERSIGHT COMMITTEE

The Sarnia Area Reliability Oversight Committee consists of Hydro One staff and industrial and generation-connected customers and LDCs in the Sarnia Chemical Valley area. Chemical Valley customers include a large number of facilities and refineries with very sensitive manufacturing processes. The industry in the Sarnia area is particularly concerned with reliability and power quality such as loss of supply, loss of redundancy, and voltage fluctuations that can result in possible widespread health and safety issues such as gas flares and can cause very costly damage to customer manufacturing equipment and halt their processes. This committee meets twice a year to identify issues regarding reliability in the Sarnia Area and to review proposed annual work plans to ensure that issues will be addressed appropriately, having regard for the environmental and safety concerns of these customers.

1.6.4.3.2 TORONTO HYDRO OVERSIGHT COMMITTEE

Hydro One holds quarterly Oversight Committee meetings with Toronto Hydro-Electric System Limited to identify and resolve issues and to coordinate efforts on capital projects and other matters. This forum allows the two utilities to coordinate their operations in a safe and efficient manner.

1.6.4.3.3 BRUCE POWER OVERSIGHT COMMITTEE

Hydro One facilitates and participates in a switchyard oversight committee with Bruce Power. This committee assists the parties in overseeing and coordinating matters of mutual interest, such as interface equipment, procedures and policies that pertain to Hydro One equipment at Bruce Power's nuclear generation facilities. This committee ensures the safe and efficient operation of switchyards at Bruce Power's site in Bruce County, which supplies approximately 30% of Ontario's electricity. The collaboration helps maintain compliance with legal requirements and allows for the efficient coordination of capital projects and other matters. This committee meets approximately three times each year.

1.6.4.3.4 METROLINX OVERSIGHT COMMITTEE

Hydro One's Metrolinx Working Group provides a forum to review issues arising during the large-scale transportation infrastructure work that Metrolinx is undertaking in Ontario. The working group reviews and addresses customer escalations arising from the Metrolinx work program and ensures that issues are addressed in a timely manner.

1.6.4.3.5 HYDRO OTTAWA OVERSIGHT COMMITTEE

The Hydro Ottawa Oversight Committee provides a forum for Hydro Ottawa and Hydro One to meet as needed to identify and resolve any issues, and to ensure safe and efficient operations between Hydro One and Hydro Ottawa. Meetings also allow the parties to coordinate efforts relating to capital projects and other matters.

1.6.4.3.6 ALECTRA OVERSIGHT COMMITTEE

The Alectra Oversight Committee provides a forum for Alectra and Hydro One to meet twice a year to identify and resolve any issues, and to ensure safe and efficient operations

between Hydro One and Alectra. Meetings also allow the parties to coordinate efforts relating to capital projects and other matters.

1.6.4.3.7 OPG OVERSIGHT COMMITTEE

Hydro One facilitates and participates in switchyard oversight committees and plant group meetings with Ontario Power Generation (OPG). These committees assist the parties in overseeing and coordinating matters of mutual interest, such as interface equipment, procedures and policies that pertain to Hydro One equipment at OPG's sites across the province. There are five active committees: Nuclear Switchyard Oversight Committee, Northeastern Plant Group meeting, Northwestern Plant Group meeting, South Central Plant Group meeting, and South Eastern Plant Group meeting. The purpose is to ensure the safe and efficient operation of switchyards at OPG's hydroelectric and nuclear generation facilities, help maintain compliance with legal requirements, and allow for the efficient coordination of capital projects and other matters. These committees each meet three times per year.

1.6.4.4 CUSTOMER SATISFACTION RESEARCH

Hydro One collects feedback from customers through a comprehensive customer satisfaction research program. This research includes both transactional satisfaction and perception studies, with the majority conducted by independent, expert customer research firms. Some surveys and "voice of the customer" analysis are conducted in-house as part of ongoing efforts to capture real-time customer insights in a cost-effective manner. The customer satisfaction research program is informed by industry best practices.

Hydro One conducts transactional surveys on an ongoing basis to measure customer satisfaction after a specific experience or touchpoint. These surveys contact a subset of Hydro One customers after they have had an interaction with the company to determine how well its customer service met their expectations. Transactional surveys monitor customer needs and preferences, monitor trends, help address transactional concerns in a timely fashion, and inform process improvements. These surveys measure operational effectiveness for the contact centre, the myAccount customer online portal, website experience, service upgrades, new connections, outage management, and forestry work.

Hydro One also conducts perception surveys on a regular basis to measure customers' perceptions of the company as a whole. These surveys are an opportunity for customers to communicate what matters to them, voice their concerns, and express their expectations for future service. They monitor how well the company meets customers' expectations and how well the company delivers on critical success factors. These perception surveys are conducted monthly for residential and small business customers and annually for Commercial and Industrial, Large Distribution and Large Transmission customers.

The trending of results from both transactional and perception research over time assists Hydro One in driving deeper customer understanding, enhancing customer centricity, and identifying areas to improve customer satisfaction.

In addition to the surveys commissioned by Hydro One, Hydro One subscribes to secondary research studies and partners with leading research firms to identify best practices and gain segmentation insights that help us enhance customer experience.

Survey results, customer feedback and research studies are shared with the relevant lines of business through multiple channels. Hydro One uses these findings to continuously improve business practices and stay informed about the trends that matter most to its distribution and transmission customers. The Customer Satisfaction scores serve as important performance measures and are included in various scorecards (as described in TSP Section 2.5.3.2 and DSP Section 3.5.2.3).

1.6.4.5 INDIGENOUS COMMUNITIES ENGAGEMENT

For several decades Hydro One has built partnerships with First Nations communities and Métis organizations through ongoing engagement, collaboration and partnership initiatives across its operations, maintenance activities and customer service. Hydro One regularly seeks input from First Nations and Métis groups to understand their specific customer needs and preferences with respect to its distribution and transmission systems.

1.6.4.5.1 INDIGENOUS CUSTOMERS

Hydro One serves Indigenous communities across Ontario through its Distribution and Transmission businesses. The distribution network provides electricity to 89 First Nations communities, including 23,000 First Nations residential customers living on reserve, and serves many Métis customers across the province while engaging with the Métis Nation of Ontario (MNO) and its 31 Métis Chartered Community Councils. Hydro One serves the First Nations communities through 104 distribution feeders and 84 distribution stations, which are supplied through 73 transmission delivery points, including 50 transmission lines and six direct connections to high-voltage stations. Hydro One's transmission assets are located on the reserve lands of 24 First Nations communities and within the traditional territories of Indigenous communities across Ontario.

As Indigenous communities continue to invest and expand in housing, community facilities, economic development and critical infrastructure, reliable electricity service plays an increasingly important role in supporting long-term growth and prosperity. Hydro One is committed to working in partnership with Indigenous communities to understand their unique needs, priorities and evolving energy requirements.

Through ongoing and meaningful engagement, Hydro One maintains partnerships with Indigenous communities across the province. The company remains focused on being a trusted partner by supporting community objectives, enabling infrastructure development, and helping ensure the electricity system can meet growing demand.

Through these efforts, Hydro One continues to strengthen partnerships with Indigenous communities while supporting their aspirations for sustainable growth and economic opportunity.

1.6.4.5.2 ONGOING ENGAGEMENT

Hydro One is committed to building long-term, transparent and respectful partnerships with Indigenous communities across its service territory. Through ongoing engagement that extends beyond individual projects, the company works collaboratively with communities to understand local priorities, address concerns, and support economic and community development goals.

Regular dialogue helps ensure Hydro One's system investments, planning activities and service delivery continue to meet the evolving energy needs of Indigenous communities while providing safe, reliable electricity that supports community growth.

In addition to formal engagement activities, Hydro One maintains a continuous presence in communities through participating in community-led events, gatherings and forums to deepen partnerships, gather feedback on emerging priorities, and support informed decision-making that reflects community needs. This ongoing collaboration helps Hydro One to respond to local priorities, enhance the customer experience, and remain a trusted partner of choice for Indigenous communities.

Hydro One also partners with Indigenous organizations, including the Gord Downie & Chanie Wenjack Fund and Four Seasons of Reconciliation, to provide cultural awareness and learning opportunities for employees, supporting respectful and effective engagement across all aspects of the business.

SPF Section 1.6 Attachment 2 addresses Hydro One's Indigenous Relations Policy and steps taken by Hydro One to address the needs and preferences of Indigenous communities.

1.6.4.6 EXTERNAL RELATIONS

Hydro One's Government and Stakeholder Relations group supports the Company's engagement with governments, municipalities, industry associations, and other external stakeholders to build and maintain constructive relationships and informed dialogue on matters affecting customers and communities. Through ongoing engagement, Hydro One

gains insight into stakeholder priorities and perspectives, communicates upcoming and in-flight plans and initiatives, and seeks opportunities to address concerns and advance shared objectives.

The group engages with stakeholders in a manner that is inclusive, transparent and respectful of stakeholder perspectives on matters of mutual concern. Engagement is undertaken through the following areas:

- **Government Relations and Partnerships** engages with the Ontario and federal governments, elected officials, government staff, industry associations and key external stakeholder groups that represent sectoral thought leadership and large customer segments. Engagement also occurs through Hydro One's industry association memberships and participation in key industry events.
- **Community & Municipal Relations** engages with local communities and municipal leaders. The Community Relations team leads engagement, consultation, and communications in support of major capital projects, ensuring that local stakeholders are informed and engaged throughout the project lifecycle. Municipal Relations oversees Hydro One's ongoing relationships with municipalities, acting as the point of contact for elected officials and municipal staff, maintaining regular dialogue to understand and support local priorities.
- **Energy Policy** is responsible for developing Hydro One's position on proposed legislative and regulatory changes. Energy Policy supports the Company's advocacy efforts by managing relationships with industry associations, leading responses to public consultations, and conducting research on market developments across North America.

Through these engagement activities, Hydro One stays informed of issues the key stakeholders and their constituents or members may have, and coordinates assistance on behalf of the Company. These engagement activities also help inform decision-making, identify and respond to emerging issues, and support the effective planning and delivery of programs and investments across the province.

1.6.4.7 OFFICE OF THE HYDRO ONE OMBUDSMAN

When customers do not feel that a response or decision made by Hydro One was appropriate or fair, they can reach out to the Office of the Hydro One Ombudsman (the Office). The Office addresses these specific customer issues, and also performs systemic investigations. These investigations can highlight where changes are needed to better meet customers' needs and preferences. The customer service teams work with the Office on a regular basis to understand any underlying trends of concern which may have arisen, which can then assist the customer service teams to better align how it works with its residential and commercial customers.

Appendix 9: Phase 2 Survey Results Report

1. Introduction & Overview of Findings

Innovative Research Group Inc. (INNOVATIVE) was engaged to help design, execute, and document the results of Hydro One's customer engagement as part of its Joint Rate Application (JRAP) to the Ontario Energy Board (OEB) for the years 2028 to 2032.

This customer engagement sought to build off the learnings from Hydro One's previous engagement efforts, with an emphasis on increasing customer participation and offering ample opportunities for feedback to be collected. Between August 2024 and December 2025, over 100,000 customers participated in this engagement – surpassing any previous customer engagement efforts documented at the OEB.

Overall, feedback collected from more than 100,000 customers shows that there is strong support across all customer types for a level of investment at or above Hydro One's 2028-2032 draft plans.

In fact, depending on customer type, between 68% and 88% of customers support spending at or above the level of investment included in the 2028-2032 draft plans.

Overall support for the draft plans (Draft plan + Spend more)

Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers		
Residential n=94,611 (90,000)	First Nations On-Reserve Residential n=793 (775)	Small business n=2,791 (2,790)	Commercial & Industrial n=368 (350)	Large Dx Accounts n=53	Other LDC* Residential n=2,071 (2,000)	Other LDC* Small Business n=305 (300)	Large Tx Accounts n=73
75%	77%	70%	68%	70%	82%	80%	88%

Similar levels of support are also observed for categories of investments in the transmission and distribution systems, as well as shared services.

Distribution Investment Trade-Offs
Across all customer types, a majority selected a level of investment at or above Hydro One's draft investment plan as it relates to distribution investments in overall system reliability, managing severe weather, and targeted reliability improvements.

Transmission Investment Trade-Offs
Across all customer types, a majority selected a level of investment at or above Hydro One's draft investment plan as it relates to transmission investments in keeping pace with transmission renewal, and stewardship of the transmission system.

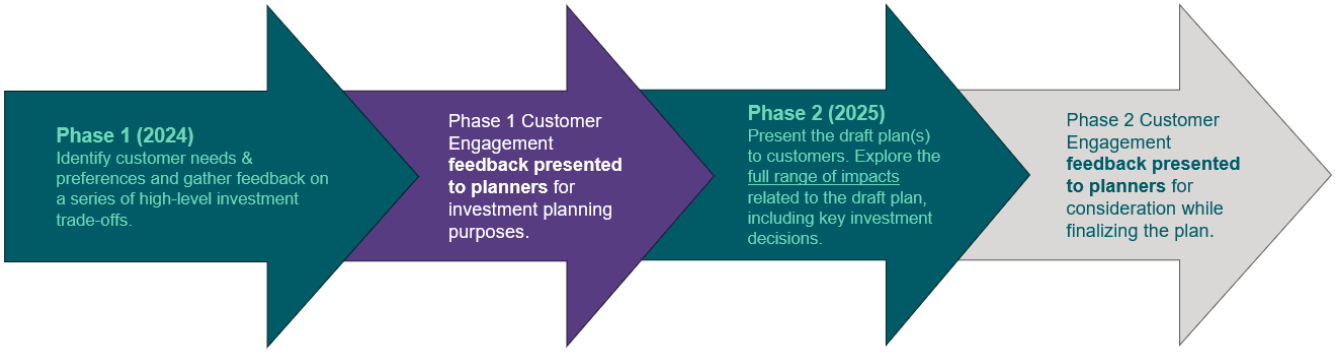
Shared Investment Trade-Offs
Across all customer types, a majority selected a level of investment at or above Hydro One's draft investment plan as it relates to shared investments in maintaining buildings and facilities, and information technology.

Approach to Meaningful Customer Engagement

This customer engagement was designed to be responsive to both the best practices in customer engagement and, importantly, the OEB's guidelines for a "consumer-centric" approach to rate applications, as laid out in the

*Local Distribution Company

Renewed Regulatory Framework for Electricity (RRF)[1] and the *Handbook for Utility Rate Applications (Handbook)*[2]. A key excerpt from the Chapter 2 Filing Requirements for Electrical Distribution Rate Applications formed the foundation for much of the focus of this customer engagement:



> *"Distributors must be able to demonstrate how customer needs and priorities were factored into the utility's decision-making process, particularly for aspects such as prioritizing capital investments, or weighing the tradeoffs between costs/bill impacts and reliability or other services."*
> *Chapter 2, Filing Requirements for Electricity Distribution Rate Applications, Page 11*

Customer Engagement Principles

INNOVATIVE developed a process built on five key principles:

1. Create open, voluntary processes that allow all customers an opportunity to participate
2. Leverage research techniques that ensure a representative sample of customers are engaged, ensuring the generalizability of the findings
3. Provide customers with the context necessary to provide informed feedback
4. Do not expect customers to be electricity experts – focus on outcomes rather than technical questions
5. Allow customers the opportunity to provide open-ended feedback

To achieve these principles, Hydro One's 2028-2032 customer engagement was conducted in two phases with clear and documented opportunities to incorporate customer feedback into the investment planning process.

Phase 1 took place between August and December 2024. In this phase, INNOVATIVE engaged with customers, community leaders, and stakeholder groups to identify customer needs and preferences, and to gather feedback on a series of high-level investment trade-offs covering both the distribution and transmission systems. Phase 1 included a series of focus groups and interviews to understand customer needs and preferences and then a series of surveys to quantify customer needs, preferences, and high-level investment trade-offs.

In February 2025, both qualitative and quantitative feedback received from customers in phase 1 was presented to Hydro One planners to provide initial customer input into the development of draft investment plans for the

[1] OEB Renewed Regulatory Framework for Electricity Sections 2.4.2, 5.0, and 5.0.4.
[2] Handbook for Utility Rate Applications (October 13, 2016)

distribution and transmission systems. This quantitative survey feedback was summarized in a “planning placemat” that was shared with all planners.

Based on the insights gained in phase 1, INNOVATIVE then developed the phase 2 online survey that centered around key investment decisions, as well as providing the necessary background to capture informed customer feedback. The online survey was customized for different customer types and rate classes with estimated bill impacts provided.

The **phase 2** survey was conducted in November and December 2025. In this phase, INNOVATIVE engaged with over 100,000 customers to gather feedback on Hydro One’s draft 2028-2032 investment plans, including key investment decisions. These investment choices covered both the distribution and transmission systems, as well as shared services.

In January 2026, quantitative feedback received from customers in phase 2 was presented to Hydro One planners for consideration while finalizing the draft investment plans. Like in phase 1, this feedback was summarized in a “planning placemat” that was shared with all planners.

Summarized below are the results of both phases of customer engagement, with a focus on quantitative, generalizable results. Detailed results can be found in the attached appendices.

2. Phase 1: Focus on Needs and Preferences

In phase 1, Hydro One and INNOVATIVE set out to develop an understanding of **customer needs** and **preferences**, as well as gain preliminary insights on more specific investment areas that could be further explored in phase 2. High-level investment trade-off questions were asked relating to both the distribution and transmission systems.

2.1. Methodology Overview

Phase 1 was divided into two sub-phases – one qualitative (phase 1a) and one quantitative (phase 1b).

Phase 1a (Qualitative)

Low-Volume Focus Groups

Phase 1a began with INNOVATIVE conducting a series of virtual focus group sessions to explore residential, seasonal, and small business customer priorities and preferences when it comes to the electricity service that they receive from Hydro One.

Twelve focus groups with a random selection of residential, seasonal, and small business customers from across Hydro One's service territory took place over a three-week period in **August 2024**. In total, 86 customers participated in these focus group sessions.

Large Business One-on-One Interviews

Between **August and September 2024**, INNOVATIVE conducted a series of 37 one-on-one interviews with a random selection of commercial & industrial (C&I), large distribution (LDA), and large transmission (LTX) customers. The purpose of these interviews was to allow large business customers an opportunity to share their needs, preferences, and priorities as it relates to the service they receive from Hydro One.

Industry Association and Municipality One-on-One Interviews

In **October 2024**, INNOVATIVE conducted a series of one-in-one interviews with 9 industry associations and 9 municipalities who either directly or indirectly serve Hydro One transmission or distribution customers. The purpose of these interviews was to allow industry associations and municipalities an opportunity to share the needs and preferences of their organization or members as they relate to Hydro One's Joint Rate Application covering the years 2028 to 2032.

First Nations Leadership One-on-One Interviews

Between **August and October 2024**, INNOVATIVE invited leaders from all 89 of the First Nations served by Hydro One to participate in an interview. From this, INNOVATIVE conducted a series of 18 one-on-one interviews with First Nations leadership. The purpose of these interviews was to allow First Nations leaders to share their understanding of their communities' needs, preferences, and priorities as it relates to the electricity service they receive from Hydro One.

Métis Nation of Ontario (MNO) Leadership One-on-One Interviews

Between **September and October 2024**, INNOVATIVE invited leaders from all 9 Regional Councils as well as 30 local Community Councils to participate in an interview. From this, INNOVATIVE conducted a series of 8 one-on-

one interviews with MNO leadership. The purpose of these interviews was to allow MNO leaders to share their understanding of their citizens' needs, preferences, and priorities as it relates to the electricity service they receive from Hydro One, either directly or indirectly.

Phase 1b (Quantitative)

Telephone Reference Surveys

As part of a rigorous "sample validation" process to understand whether and where differences exist between customers who have provided their email to Hydro One and the full population of customers, telephone reference surveys were conducted for all low-volume customer types. This included residential (both primary and seasonal), First Nations On-Reserve residential, and small business.

The telephone reference surveys allow us to compare responses on core demographics, firmographics, and environmental controls that may impact outcomes. This exercise allows us to identify any sample differences that may be corrected for with weighting, focusing on differences that meaningfully impact the overall results of the online surveys. No further weighting adjustments were made to the online surveys based on demographics, firmographics, or environmental controls measured in the telephone reference surveys.

Online Surveys

A random selection of low-volume customers (residential including seasonal, First Nations On-Reserve residential, and small business) and all large business customers (commercial & industrial, large distribution accounts, and large transmission accounts) with an available email were invited to participate in an online survey to further understand customer needs and preferences and gather feedback from customers on a series of high-level investment trade-off questions.

Responses from other LDC residential customers were collected through an online research panel.

In total, over 8,000 customers completed the phase 1b online survey. Below is a summary of participation by customer type:

Customer Type		Online Survey
Hydro One Distribution & Transmission Customers	**Residential (including Seasonal)**	6,053
	First Nations On-Reserve Residential	426
	Small Business	477
	Commercial & Industrial	311
	Large Distribution Accounts	61
Hydro One Transmission-Only Customers	**Other LDC Residential**	1,019
	Large Transmission Accounts	72

2.2. Customer Needs and Preferences

The phase 1 results indicate that customers tend to be satisfied with the services they receive from Hydro One with a majority of customers across all customer types saying they are either very or somewhat satisfied.

Satisfaction with Hydro One	Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers	
	Residential n=6,053 (5,000)	First Nations On-Reserve Residential n=426 (400)	Small business n=477 (450)	Commercial & Industrial n=311 (300)	Large Dx Accounts n=61	Other LDC* Residential n=1,019 (1,000)	Large Tx Accounts n=72
Satisfied	85%	89%	79%	82%	89%		85%
Neither	9%	8%	13%	8%	7%		8%
Dissatisfied	6%	3%	8%	9%	5%		6%
Don't know	<1%	1%	1%	1%	--		1%

When asked if there is anything Hydro One could do to improve its services, most customers do not identify any specific needs. Among those who do, the top responses include decreased outages, lower rates, address/proactive tree trimming, communications during outages, and improving customer service.

% Mentioned		1st most common response	2nd most common response	3rd most common response
Hydro One Distribution & Transmission Customers	**Residential**	Decrease outages (9%)	Lower rates (9%)	Address/proactive tree trimming (7%)
	First Nations On-Reserve Residential	Lower rates (7%)	Decrease outages (6%)	Improve outages response times (3%)
	Small Business	Lower rates (10%)	Decrease outages (5%)	Address/proactive tree trimming (4%)
	Commercial & Industrial	Decrease outages (9%)	Improve customer service (4%)	Upgrade/better maintain infrastructure (3%)
	Large Dx Accounts	Decrease outages (15%)	Communication during outages (10%)	Building capacity/ addressing growth (7%)
Hydro One Transmission-Only Customers	**Other LDC Residential**			
	Large Tx Accounts	Improve customer service (19%)	Decrease outages (13%)	Improve information sharing (7%)

*Local Distribution Company

2.3. Outcome Priorities

As part of phase 1, customers were presented with a list of potential investment priorities that Hydro One could focus on and were asked to select up to three of the most important priorities.

Reasonable rates and reliable electricity are top priorities for all customer types. Meeting growing demand for electricity is a top priority for Commercial & Industrial, Large Distribution, and other LDC Residential customers.

% selected in top-3 priorities		1st most frequently selected priority	2nd most frequently selected priority	3rd most frequently selected priority
Hydro One Distribution & Transmission Customers	**Residential**	Reasonable rates (80%)	Reliable electricity (69%)	Ensuring safety (40%)
	First Nations On-Reserve Residential	Reasonable rates (76%)	Reliable electricity (49%)	Ensuring safety (38%)
	Small Business	Reasonable rates (82%)	Reliable electricity (52%)	Enhancing the grid for new technology (37%)
	Commercial & Industrial	Reasonable rates (83%)	Reliable electricity (67%)	Meeting growing demand (39%)
	Large Dx Accounts	Reasonable rates (75%)	Reliable electricity (69%)	Meeting growing demand (43%)
Hydro One Transmission-Only Customers	**Other LDC Residential**	Reasonable rates (76%)	Meeting growing demand (59%)	Reliable electricity (57%)
	Large Tx Accounts	Reliable electricity (81%)	Reasonable rates (61%)	Ensuring safety (53%)

2.4. High-Level Investment Trade-Offs

After collecting customer input on general needs and outcome priorities, the phase 1 survey presented a series of high-level investment trade-offs. Hydro One distribution customers – those who receive distribution services from Hydro One – had the opportunity to comment on both distribution and transmission related questions. Hydro One transmission-only customers – those who do not receive distribution services from Hydro One – were only presented with transmission-related questions.

Distribution System Trade-Offs

High-Level Reliability

The phase 1 results indicate that a majority of customers want Hydro One to make investments to either improve or maintain current levels of reliability related to the distribution grid. Across all customer types, a plurality of customers want Hydro One to make investments to improve reliability rather than just maintain reliability.

High-Level Reliability	Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers	
	Residential n=6,053 (5,000)	First Nations On-Reserve Residential n=426 (400)	Small business n=477 (450)	Commercial & Industrial n=311 (300)	Large Dx Accounts n=61	Other LDC* Residential n=1,019 (1,000)	Large Tx Accounts n=72
Improve reliability	68%	48%	58%	55%	75%		
Maintain reliability	19%	28%	21%	27%	16%		
Defer investments	7%	11%	11%	9%	3%		
Don't know	6%	14%	10%	9%	5%		

Targeted Reliability Improvements

A majority of customers want Hydro One to make targeted investments to improve reliability for customers who experience significantly poorer reliability than average.

Targeted Reliability Improvements	Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers	
	Residential n=6,053 (5,000)	First Nations On-Reserve Residential n=426 (400)	Small business n=477 (450)	Commercial & Industrial n=311 (300)	Large Dx Accounts n=61	Other LDC* Residential n=1,019 (1,000)	Large Tx Accounts n=72
Make targeted investments	78%	66%	73%	70%	87%		
Minimize investments	12%	19%	16%	15%	10%		
Don't know	10%	15%	11%	15%	3%		

*Local Distribution Company

Responding to Severe Weather

A majority of customers want Hydro One to make investments to make the system more resilient to severe weather. Across all customer types, a plurality want Hydro One to proactively invest rather than make the investments as part of ongoing replacement.

Responding to Severe Weather	Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers	
	Residential n=6,053 (5,000)	First Nations On-Reserve Residential n=426 (400)	Small business n=477 (450)	Commercial & Industrial n=311 (300)	Large Dx Accounts n=61	Other LDC* Residential n=1,019 (1,000)	Large Tx Accounts n=72
Proactively invest	64%	45%	62%	51%	67%		
As part of ongoing replacement	23%	28%	23%	32%	23%		
Minimize investments	7%	17%	8%	8%	5%		
Don't know	5%	10%	6%	8%	5%		

Enabling Economic Growth

A plurality of customers in all customer types want Hydro One to make proactive investments to enable anticipated growth and accommodate new connections and service upgrades in a timely manner.

Enabling Economic Growth	Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers	
	Residential n=6,053 (5,000)	First Nations On-Reserve Residential n=426 (400)	Small business n=477 (450)	Commercial & Industrial n=311 (300)	Large Dx Accounts n=61	Other LDC* Residential n=1,019 (1,000)	Large Tx Accounts n=72
Proactively invest	52%	50%	48%	44%	62%		
Only as growth materializes	34%	29%	35%	34%	31%		
Don't know	14%	20%	16%	22%	7%		

*Local Distribution Company

Evolving Customer Requests & System Visibility

A majority of customers want Hydro One to make proactive investments in technology to accommodate customer requests and improve system visibility.

Evolving Customer Requests & System Visibility	Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers	
	Residential n=6,053 (5,000)	First Nations On-Reserve Residential n=426 (400)	Small business n=477 (450)	Commercial & Industrial n=311 (300)	Large Dx Accounts n=61	Other LDC* Residential n=1,019 (1,000)	Large Tx Accounts n=72
Proactively invest	69%	57%	63%	61%	77%		
Limit/delay investments	20%	28%	25%	22%	16%		
Don't know	11%	15%	13%	17%	7%		

Transmission System Trade-Off

Transmission Renewal

The phase 1 results indicate that a majority of customers want Hydro One to make investments to either increase or maintain current levels of reliability related to the transmission grid.

Transmission Renewal	Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers	
	Residential n=6,053 (5,000)	First Nations On-Reserve Residential n=426 (400)	Small business n=477 (450)	Commercial & Industrial n=311 (300)	Large Dx Accounts n=61	Other LDC* Residential n=1,019 (1,000)	Large Tx Accounts n=72
Increase reliability	48%	37%	43%	30%	41%	37%	56%
Maintain reliability	34%	38%	36%	45%	46%	35%	36%
Accept more risk	10%	12%	11%	12%	8%	20%	3%
Don't know	7%	13%	9%	13%	5%	8%	6%

*Local Distribution Company

3. Phase 2: Feedback on Hydro One's Draft Investment Plans

In phase 2, after Hydro One had developed its draft 2028-2032 investment plans, INNOVATIVE gathered feedback on the draft plans, including key investment decisions. These investment choices covered both the distribution and transmission systems, as well as shared services. All feedback was collected through an online survey customized for different customer types and rate classes, with estimated bill impacts provided.

After providing background information and introducing customers to the draft plans, they were asked about their preferences regarding key investment decisions. They were also asked for their preferences on the overall plans, and before doing so they had the opportunity to review the cumulative impact of their earlier choices on key investment decisions and make any adjustments.

3.1. Methodology Overview

Online Survey

In phase 2, all Hydro One distribution customers and large transmission customers with an available email address on file were invited to participate in the phase 2 online survey via direct email outreach. For those without an email address on file, an open-access survey link was made available. Customers who accessed the survey through the open link could verify themselves and were routed into the "representative" stream, where their account information was appended to their survey results for segmentation and weighting purposes.

Customers who chose not to verify their account information or were unable to do so could still participate by self-selecting the appropriate survey version (residential including seasonal, First Nations On-Reserve residential, or small business) and were included in the "voluntary", unverified stream. Results from the feedback collected through the voluntary stream are detailed in **Appendix 9**.

Transmission-Only customer results for other LDC residential and other LDC small business customers were collected through online research panels.

Other LDC customers could also participate through the open-access survey link. Those entering through this route self-selected the residential or small business survey version and were included in the voluntary stream rather than the representative sample. Results from the feedback collected through the voluntary stream are detailed in **Appendix 9**.

Phase 2 Participation

As part of phase 2, INNOVATIVE engaged with over 100,000 customers. Below is a summary of participation by customer type:

Customer Type		Online Survey
Hydro One Distribution & Transmission Customers	Residential (including Seasonal)	94,611
	First Nations On-Reserve Residential	793
	Small Business	2,791
	Commercial & Industrial	368
	Large Distribution Accounts	53
Hydro One Transmission-Only Customers	Other LDC Residential	2,071
	Other LDC Small Business	305
	Large Transmission Accounts	73

3.2. Overall Support for Hydro One's Draft Plans

The phase 2 results indicate that, across all customer types, most customers support Hydro One spending at or above the level of investment included in the 2028-2032 draft plan(s).

Overall support for the draft plans	Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers		
	Residential n=94,611 (90,000)	First Nations On-Reserve Residential n=793 (775)	Small business n=2,791 (2,790)	Commercial & Industrial n=368 (350)	Large Dx Accounts n=53	Other LDC* Residential n=2,071 (2,000)	Other LDC* Small Business n=305 (300)	Large Tx Accounts n=73
Spend more	25%	28%	21%	16%	23%	37%	35%	33%
Draft plan	50%	49%	49%	52%	47%	45%	44%	55%
Spend less	16%	11%	21%	22%	26%	12%	15%	8%
Other	3%	2%	4%	5%	2%	1%	1%	3%
Don't know	6%	9%	5%	5%	2%	6%	4%	1%
Draft plan + Spend more	**75%**	**77%**	**70%**	**68%**	**70%**	**82%**	**80%**	**88%**

3.3. Investment Trade-Offs

Customers were invited to provide feedback on a series of key investment decisions. Hydro One distribution customers – those who receive distribution services from Hydro One – had the opportunity to comment on both

*Local Distribution Company

distribution and transmission related questions. Hydro One transmission-only customers – those who do not receive distribution services from Hydro One – were only presented with transmission-related questions.

Distribution System Trade-Offs

The phase 2 results indicate that, across all customer types, most customers support Hydro One spending at or above the level of investment included in the 2028-2032 draft distribution investment plan as it relates to overall system reliability, managing severe weather, and targeted reliability improvements.

Below is a summary of the three distribution investment trade-offs, including a description of the types of investments included.

Overall System Reliability

Investments in overall system reliability included repairing or replacing overhead line defects, maintaining, repairing, or replacing major stations' equipment, and replacing or repairing underground cables.

Overall system reliability	Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers		
	Residential n=94,611 (90,000)	First Nations On-Reserve Residential n=793 (775)	Small business n=2,791 (2,790)	Commercial & Industrial n=368 (350)	Large Dx Accounts n=53	Other LDC* Residential n=2,071 (2,000)	Other LDC* Small Business n=305 (300)	Large Tx Accounts n=73

Transmission System Trade-Offs

The phase 2 results indicate that, across all customer types, most customers support Hydro One spending at or above the level of investment included in the 2028-2032 draft transmission investment plan as it relates to keeping pace with transmission renewal and stewardship of the transmission system.

Below is a summary of the two transmission investment trade-offs, including a description of the types of investments included.

Keeping Pace with Transmission Renewal

Investments in keeping pace with transmission renewal included replacing major transmission station equipment and replacing high-impact underground transmission cables.

Keeping pace with renewal	Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers		
	Residential n=94,611 (90,000)	First Nations On-Reserve Residential n=793 (775)	Small business n=2,791 (2,790)	Commercial & Industrial n=368 (350)	Large Dx Accounts n=53	Other LDC* Residential n=2,071 (2,000)	Other LDC* Small Business n=305 (300)	Large Tx Accounts n=73

*Local Distribution Company

Stewardship of the Transmission System

Investments in stewardship of the transmission system included replacing at-risk transmission lines, reinforcing wood poles and extending the life of steel towers, and clearing overgrowth trees and brush.

Steward-ship of the system	Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers		
	Residential n=94,611 (90,000)	First Nations On-Reserve Residential n=793 (775)	Small business n=2,791 (2,790)	Commercial & Industrial n=368 (350)	Large Dx Accounts n=53	Other LDC* Residential n=2,071 (2,000)	Other LDC* Small Business n=305 (300)	Large Tx Accounts n=73
Spend more	30%	28%	25%	20%	21%	33%	33%	37%
Draft plan	51%	52%	51%	54%	66%	48%	47%	58%
Spend less	19%	20%	24%	25%	13%	19%	20%	5%
Draft plan + Spend more	**81%**	**80%**	**76%**	**75%**	**87%**	**81%**	**80%**	**95%**

Shared Service Trade-Offs

The phase 2 results indicate that, across all customer types, most customers support Hydro One spending at or above the levels of investment included in the 2028-2032 draft distribution and transmission investment plans as it relates to shared investments in maintaining buildings and facilities, and information technology.

Below is a summary of the two shared service investment trade-offs, including a description of the types of investments included.

Maintaining Buildings and Facilities

Investments in maintaining buildings and facilities included addressing at-risk building components, making at-risk sites more resilient to severe weather, and repairing or retrofitting field offices.

Maintain-ing Buildings and Facilities	Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers		
	Residential n=94,611 (90,000)	First Nations On-Reserve Residential n=793 (775)	Small business n=2,791 (2,790)	Commercial & Industrial n=368 (350)	Large Dx Accounts n=53	Other LDC* Residential n=2,071 (2,000)	Other LDC* Small Business n=305 (300)	Large Tx Accounts n=73
Spend more	25%	24%	21%	16%	19%	34%	32%	29%
Draft plan	51%	55%	50%	55%	60%	46%	45%	48%
Spend less	24%	21%	29%	29%	21%	20%	23%	23%
Draft plan + Spend more	**76%**	**79%**	**71%**	**71%**	**79%**	**80%**	**77%**	**77%**

*Local Distribution Company

Information Technology

Investments in information technology included maintaining the current state of technology systems, enhancing customer service, improving operational efficiency, and protecting the grid from both cyber and physical security threats.

Informa-tion Technology	Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers		
	Residential n=94,611 (90,000)	First Nations On-Reserve Residential n=793 (775)	Small business n=2,791 (2,790)	Commercial & Industrial n=368 (350)	Large Dx Accounts n=53	Other LDC* Residential n=2,071 (2,000)	Other LDC* Small Business n=305 (300)	Large Tx Accounts n=73
Draft plan	73%	72%	67%	68%	68%	70%	69%	77%
Spend less	27%	28%	33%	32%	32%	30%	31%	23%

Note: There was no 'Spend more' option provided in this investment trade-off.

3.4. Diagnostic Measures

After providing their feedback on Hydro One's draft investment plans, respondents had the opportunity to provide feedback on the survey itself, both in terms of their overall favourability towards the customer engagement and the amount of information it provided.

Across all customer types, a majority of customers said they have either a very or somewhat favourable impression of the customer engagement they completed.

Impression of engage-ment	Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers		
	Residential n=94,611 (90,000)	First Nations On-Reserve Residential n=793 (775)	Small business n=2,791 (2,790)	Commercial & Industrial n=368 (350)	Large Dx Accounts n=53	Other LDC* Residential n=2,071 (2,000)	Other LDC* Small Business n=305 (300)	Large Tx Accounts n=73
Favourable	79%	76%	79%	78%	89%	89%	84%	90%
Unfavourable	12%	11%	13%	14%	9%	7%	11%	7%
Don't know	8%	13%	8%	8%	2%	4%	4%	3%

Across all customer types, a majority of customers said that they feel Hydro One provided just the right amount of information in the customer engagement.

Amount of Information	Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers		
	Residential n=94,611 (90,000)	First Nations On-Reserve Residential n=793 (775)	Small business n=2,791 (2,790)	Commercial & Industrial n=368 (350)	Large Dx Accounts n=53	Other LDC* Residential n=2,071 (2,000)	Other LDC* Small Business n=305 (300)	Large Tx Accounts n=73
Too little	7%	8%	7%	8%	4%	6%	7%	11%
Just the right amount	78%	80%	80%	85%	91%	84%	82%	85%
Too much	15%	12%	13%	8%	6%	10%	10%	4%

*Local Distribution Company

4. Summary

Hydro One's 2028 to 2032 customer engagement collected feedback from more than 100,000 customers, Indigenous leaders, municipalities and industry associations, becoming the single largest customer engagement documented at the OEB to date.

This customer engagement built off Hydro One's previous engagement efforts, while seeking to engage more customers in the process.

Overall, this engagement saw customer participation increase by more than double Hydro One's 2023 to 2027 customer engagement, growing from approximately 48,000 in Hydro One's 2023 to 2027 customer engagement to more than 100,000 now.

This increase in engagement included significantly increased First Nations participation. In the phase 2 surveys, participation among First Nations on-reserve residential customers increased more than threefold relative to the 2023 to 2027 engagement – from 261 customers to 793 customers.

Additionally, all 89 of the First Nations served by Hydro One were invited to participate in a one-on-one interview to provide their feedback prior to the development of Hydro One's draft investment plans. Likewise, leaders from all 9 Metis Nations of Ontario Regional Councils, as well as 30 local Community Councils were invited to provide feedback in the same manner. This approach ensured that feedback could be incorporated early into Hydro One's planning process, prior to the development of the draft plans.

This customer engagement also included significantly increased participation among large businesses, including commercial and industrial customers and large distribution accounts, signaling a high degree of interest in the application among large businesses.

In addition to significantly boosting customer participation, this engagement also expanded the scope of investment trade-offs presented to customers. This expanded scope included, for the first time, investment trade-offs in shared services, including information technology and facilities, as well as operational spending, including vegetation management. This expanded scope allowed customers to provide feedback on a wider range of investment decisions that Hydro One was considering compared to previous customer engagements.

Overall, phase 1 of this customer engagement demonstrated that most customers tend to be satisfied with the services they receive from Hydro One and do not identify any specific needs, but that reasonable rates and reliable electricity are among the top priorities for all customer types.

Overall, phase 2 demonstrated that Hydro One's draft distribution and transmission investment plans contain the right balance of investment and rate impacts. That is, feedback collected from customers shows that there is strong support across all customer types for a level of investment at or above Hydro One's draft plans.

2. Introduction

Innovative Research Group Inc. (INNOVATIVE) was engaged by Torys LLP on behalf of its client, Hydro One Inc. (Hydro One), to gain a deeper understanding of the needs and preferences of customers, specifically as it relates to Hydro One's Joint Rate Application to the Ontario Energy Board (OEB) covering the years 2028 to 2032.

As part of this engagement, INNOVATIVE conducted a series of focus group sessions to explore residential, seasonal, and small business customer priorities and preferences when it comes to the electricity service that they receive from Hydro One.

These focus groups were conducted over a three-week period in August 2024. INNOVATIVE engaged with residential, small business, and seasonal customers of Hydro One in separate groups via the Teams video-conference platform.

The focus groups were led by a trained moderator who followed a structured discussion guide and presented short stimuli to facilitate conversation.

This report summarizes the key findings based on these discussions. In general, our approach is to report representative verbatim comments and offer interpretation and/or commentary where necessary. Verbatim responses are shown in blue italics.

Please Note: Qualitative research does not hold the statistical reliability or representativeness of quantitative research. It is an exploratory research technique that should be used directionally. In focus group research, the value of the findings lies in the *depth* and *range* of information provided by the participants, rather than in the *number* of individuals holding each view.

Focus Group Customer Recruitment Process

Residential, small business (GS<50) and seasonal customers were recruited over email using a customer list provided by Hydro One. A random selection of participants was invited to complete a screening survey. Qualified participants were selected to ensure that customers from a range of demographic or firmographic groups participated.

Residential and seasonal customers who participated in the focus groups received a $100 cash incentive as compensation for their time. Small business customers who participated in the groups received a $120 cash incentive.

3. Methodology

Twelve focus groups with residential, small business (GS<50) and seasonal customers from across Hydro One's service territory took place between August 13th and August 28th, 2024. Where possible, INNOVATIVE segmented these participants into service area groups to ensure the discussion remained relevant to their communities. The details of each of these groups can be found in the table below.

Date	Focus Group Times	Number of Participants	Customer Type	Service Area
August 13th, 2024	5:30 pm – 7:30 pm	7 participants	Residential	West
	7:30 pm – 9:30 pm	7 participants	Residential	West Central
August 14th, 2024	5:30 pm – 7:30 pm	6 participants	Residential	Central
	7:30 pm – 9:30 pm	8 participants	Residential	East Central
August 15th, 2024	5:30 pm – 7:30 pm	7 participants	Residential	East
	7:30 pm – 9:30 pm	8 participants	Residential	North
August 20th, 2024	5:30 pm – 7:30 pm	9 participants	Seasonal	All regions
	7:30 pm – 9:30 pm	7 participants	Seasonal	All regions
August 22nd, 2024	5:30 pm – 7:30 pm	9 participants	Small Business	East, Central, and East Central
	7:30 pm – 9:30 pm	5 participants	Small Business	West
August 28th, 2024	5:30 pm – 7:30 pm	6 participants	Small Business	West Central
	7:30 pm – 9:30 pm	7 participants	Small Business	North

4. Key Findings

Residential Customers

Participants were generally familiar with Hydro One.

Most participants recognized Hydro one's role as their electricity provider and generally understood their role in the distribution system. However, many participants expressed surprise when they learned about the breakdown of their electricity bill, particularly the portion allocated to Hydro One.

Most expressed satisfaction with the level of service.

Overall, most customers expressed satisfaction with Hydro One and could not immediately identify any gaps in the service. In terms of reliability, most participants were generally satisfied, with a few who encountered frequent outages expressing a strong desire for improvement. Many participants attributed their satisfaction to Hydro One's customer service and efforts to restore power when outages do occur.

Despite strong satisfaction, many participants felt that electricity prices remain high.

Many rural customers acknowledged that their remote locations contributed to higher costs due to the complexities of servicing these areas. However, they also felt that increased rates in comparison to other utilities should be accompanied by improved reliability.

Reliability was a core measure of Hydro One's performance.

Most customers viewed reliability as the most important indicator of Hydro One's performance, with strong emphasis on its impact on community safety, and access to essential services. While occasional outages, especially in rural areas, were generally accepted, frequent or poorly timed unplanned outages drew frustration.

Generally, customers were split on whether they would be willing to pay more for enhanced reliability.

Some participants were not willing to pay more for increased reliability as they expected reliability to be a standard feature of their service. Others felt that reliability was critical that they would be open to paying more for meaningful improvements.

Many customers highlighted the need to upgrade Hydro One's infrastructure and modernize the grid.

Participants emphasized the need to upgrade Hydro One's infrastructure to prepare for the growing demand from electric vehicles and emerging technologies, as well as to better withstand extreme weather events. While some acknowledged that storm-related outages may be unavoidable and praised Hydro One's response times, they expressed a preference for prioritizing long-term investments in grid modernization.

Residential customers were split on whether they anticipate their electricity usage to change.

Participants had mixed views on electric vehicles (EVs), with some open to purchasing them and others skeptical about their reliability in rural areas due to inadequate infrastructure. While some showed interest in solar panels and battery storage, many hesitated because of uncertainty about the technology and felt Hydro One should provide more education on these options.

Seasonal Customers

Most were familiar with Hydro One.

Most participants were aware that Hydro One is their local electricity provider and responsible for restoring power during outages. However, familiarity with Hydro One's role in the broader electricity system was not immediately known by most.

Most seasonal participants were satisfied with the service they receive from Hydro One.

Generally, most participants were satisfied, and beyond reliability, could not point to many specific areas for improvement.

Most participants were heavily focused on reliability, especially when it comes to more prolonged outages.

Participants were generally satisfied with the reliability they experience, however, point to more prolonged outages as an area of concern, especially in the face of more frequent severe weather.

Because of the importance of reliability, some were willing to pay more for improvements, but the associated costs should be controlled and prudent.

Some participants supported modest rate increases if they lead to improvements in reliability and are accompanied by clear communication about progress and spending. Others, however, questioned why improved reliability isn't already guaranteed given the costs they currently pay.

In the absence of seasonal rates, many participants were focused on the cost of their electricity bills.

Among some customers, there was a degree of frustration with electricity costs. Some felt that their electricity bills have been rising and the quality of service has not been keeping up with increased costs.

Many participants said they would like to see Hydro One provide additional guidance and advice on reducing their bills.

Most welcomed the idea of Hydro One providing enhanced advisory services, especially focused on ways to reduce electricity bills.

Small Business Customers

Most were generally familiar with Hydro One's responsibilities and satisfied with the services they receive.

Most participants knew that Hydro One is their local electricity provider and were satisfied with their overall experience with the utility.

While most were satisfied with reliability, some were concerned about frequent and extended outages in recent years due to extreme weather.

Most participants were generally satisfied with the reliability of service they receive. Many small businesses emphasized the critical importance of reliability for their operations. Customers mentioned that inaccurate outage time estimates make planning difficult and costly.

Some small business customers seek more support from Hydro One to reduce energy consumption.

Some small business customers seek more support from Hydro One to manage electricity costs, suggesting subsidies or incentive programs to reduce energy consumption and improve affordability. Additionally, they noted that off-peak rates often don't align with their operational needs and seek targeted programs to help reduce peak usage costs.

Participants had mixed opinions about whether the rates were reasonable.

Opinions on whether current rates were reasonable were mixed, with some finding them high relative to other expenses. Small businesses expressed a need for reduced rate programs due to operational constraints during off-peak hours. Concerns were also raised about Hydro One's spending on employee benefits.

Many felt that Hydro One needs to invest more to plan for severe weather conditions.

Many agreed that Hydro One needs to invest in more resilient equipment and plan for severe weather conditions. Participants stressed the importance of improved equipment maintenance, more proactive preventative measures and addressing the economic and health impacts of outages during extreme weather.

Expectations of future consumption were mixed with a call for Hydro One's assistance to help customers invest in technologies.

Opinions were mixed regarding future consumption, with some expecting increases due to business expansion and others anticipating decreases due to investments in energy-efficient technologies like heat pumps. Recommendations for Hydro One included supporting investments in energy-efficient technologies by working with the government to provide incentives, educational programs, and assistance with upgrades.

5. Residential Customers

5.1 Familiarity with Hydro One

The focus group discussion began by assessing participants' understanding of Hydro One's role within the electricity system. This was followed by the moderator's explanation of Hydro One's responsibilities, including its role in transmission and distribution, and participants' reactions to this information.

A majority of participants, without prompting, recognized Hydro One as the utility in charge of electricity transmission, distribution, infrastructure, and maintenance. However, some have a more limited understanding, believing Hydro One's responsibilities were confined to regional distribution.

> *"Hydro One does transmission all across the province. Hydro One doesn't do any generation. Transmission is the biggest part of the business, and it is also a local distribution company for all of our communities, and it is only some of the bigger communities that have their own distribution system."*
>
> *"They are supposed to supply the infrastructure, and the power to get the electricity to our sites."*
>
> *"They are responsible for keeping the [electricity] lines off the roads."*
>
> *"I think they're one of the they're the main distributor of hydro across the province."*

5.2 General Satisfactions and Needs

Following the opening discussion, participants were asked to reflect on their overall satisfaction with Hydro One's services and highlight areas where they felt improvements could be made.

Overall satisfaction with Hydro One

A majority of the participants expressed satisfaction with Hydro One and could not immediately identify gaps in service.

> *"I'm with Hydro One from 2021 and I don't remember a day when the power went, and I really have to think of what I'm going to do now. So yeah, they're doing pretty good."*
>
> *"I'm pretty happy with the way that they get our service back up and running, and keep us informed… So, I think it's pretty good."*
>
> *[When asked if there's any way Hydro One could serve them better] "I think they're doing the best that they can. There's not much you can say."*
>
> *[When asked if there's any way Hydro One could serve them better] "No, not really. I mean, maybe provide education on how to use electricity more efficiently… but other than that I can't really think of anything."*

Meanwhile, some other participants, though satisfied, felt like improvements could be made.

> *"I think satisfied is a very, like, middle ground. I also do think that there's room for improvement among things that they do. So, I'm not saying, 'It's wonderful, it's great,' but I'm satisfied if that makes sense."*

"Satisfied is kind of bare minimum. If the power's on, I'm happy. If it's not on, I'm not happy. Is it too expensive? Of course it is, but other than that, I would say I'm satisfied."

Reliability

Most participants acknowledged the occasional outage but remain generally satisfied with the overall reliability of the service they receive.

"I appreciate that knowing that the Hydro backups there and knowing that that 90% of the time it's very reliable and it runs everything."

"I'm very happy… We have very, very little power outages here considering we are rural and a lot of old lines."

"In general, I'd say that I'm fairly happy, but since we moved from Hamilton ON and I can definitely recall that we would have less disruptions in Hamilton area than we would here."

However, some participants who encounter frequent outages expressed a strong desire for improvement.

"At least once a week, the hydro goes off for a few seconds. Everything shuts down, and then it all starts up again. I think [Hydro] is expensive for us and I don't understand why."

"Now that I'm a Hydro One customer, we were always having power outages [almost all the time] and Hydro One is the only one that we've always had a power outage with. It's probably more windy or whatever"

Aging Infrastructure

Some participants noted that poles and other equipment installed by Hydro One are visibly aging and show concern about the potential implications.

"We have a lot of wind around here and when it's really windy, [the electricity] constantly flips. So yeah, I think if they could uh get rid of some of this old infrastructure they have and, you know, put some new stuff in, it might help."

"The poles and the equipment here are older than I am. They were put in in the 30s, 40s and 50s and they're becoming beyond unattainable and without maintenance, that reliability is definitely going to disappear."

"They are doing a good job working in the storms and getting the power back on, but there is that infrastructure that really needs to be looked at a lot more."

Communication

Most participants expressed general satisfaction with Hydro One's communications but noted that their accuracy of estimated time of restoration can be unreliable. Some residential customers reported experiencing outages on unexpected days instead of the planned times, which leaves them unprepared or causes inconvenience.

"I like about Hydro One is they are very good at communicating. They follow up and check, which I do really appreciate that from them as well as their communication."

"I've had really good experiences with Hydro One… The communication is always very good. It's very prompt. I get notifications by text as well as by email…. They check in, they make sure we're okay. They're very quick to respond."

"For the most part, I do receive reliable, stable electricity now. When you have a storm… it still goes to maybe a little brownout for a moment or something flickers. But if we do lose the electricity, Hydro One is pretty good… they communicate about working on it or when they expect to be able to have some Hydro service back to your community."

"There's the other issue where when Hydro One will send us a letter saying they're putting the Hydro off for a certain amount of time, but then they don't, they pick a different day, and they don't tell us… So, it's off for three or four hours and we had no idea [so] could not plan for that... We have a sub pump and if the Hydro's off for too long, we can float our basement. So, it's nice to know about these ahead of time."

Billing Structure

Some participants expressed a need for a more transparent billing structure that clearly reflects the impact of their consumption on their bill, with some indicating that despite adopting careful consumption practices, they have not observed significant changes in their bills.

"I don't really think it's reasonable and I just find that I can't. This year, my cooling systems been down, so I've been around 80C at all summer and I'm using less electricity, but my bills are essentially the same every month as they were last summer."

"I know [my bill] is going to go up in my dollar value even though my usage goes down."

Customer Service

Most participants attributed their satisfaction with Hydro One primarily to the company's strong customer service and the efforts of its crews to restore power when outages do occur.

"We have outages a couple times a year, and the guys get out there and hustle to get the electricity back up, they do a good job. They're probably in the worst weather when these things happen. I'm pretty happy with the way that they get our service back up and running and keep us informed."

"I am satisfied with their service. They do a good job especially since they tried during the pandemic and their bills are descriptive."

"We are always having power outages. I think they do an OK job because they do try to restore the power as fast as they can."

"They've been very fast at fixing things. There was an accident the other day and somebody hit a hydro pole, and it was back in no time."

5.3 Rates

During the discussion about satisfaction with Hydo One, the moderator provided a breakdown of a typical residential customer's bill and outlined the percentage that goes to Hydro One. Participants

shared their views on these rates, discussing whether Hydro One's share of the price they pay was reasonable or unreasonable.

Some participants found it surprising that only a small share of their electricity bill goes to Hydro One. Conversely, a minority of participants were aware of this breakdown and recognized that it is outlined on their bills.

> *"I mean, I've only paid 2 bills so far and I was quite surprised at the broken down costs and how high they were. And now to find out that only 34% is actually going to my hydro bill, I'm pretty disappointed. That's not acceptable… I definitely think it could be less."*

Many participants acknowledged the inherent value of electricity, and the difficulties associated with serving rural areas.

> *"I think it is [value for money] considering that I am more rural, I do think that considering all of the elements that go into what they do, I think that $56 a month for my household and my family is a is probably a fair average."*

> *"I'm at the end of a line and that's running everything in my house. So yes, I think I get value for money, and I mean there aren't a lot of other options here."*

In considering value, some customers assessed cost-effectiveness by comparing prices from other provinces and countries.

> *"Yes, I think I get value for money. There are a lot of provinces that don't have time of use. I try to use off peak as much as possible."*

A few participants who consider the price unreasonable felt it is unfair that different parts of the province pay different amounts for electricity.

> *"I kind of live by the premise that if a gallon of gas is a dollar in Cornwall, it should be a dollar in Kenora. Everything is already set up [and the] distribution lines are already there. So why should I pay more than someone [else] that's closer to where they're where they're picking it up from? I don't understand."*

> *"I think that across this province they should be getting the same kind of services and reliability that they get Southern Ontario, if we were paying the same price. Others should be getting that same sense of security that we have here."*

Among residential customers, perceptions of the fairness of electricity rates were varied. There does appear to be variance in perceptions depending on region. In this case, customers in the Northeast Zone were generally less satisfied with the rates they pay for electricity.

> *"I don't really think it's reasonable and I just find that I can't. My cooling system has been down…and I'm using less electricity, but my bills are essentially the same every month as they were last summer."*

> *"I know whether we're here or not and everything is shut down, I'm still paying that that fee, that same price every month."*

> *"The bill itself is colorful, and it's got a ton of data on it, but I wonder if it's truly customer friendly. I can break it down and press on the colors. But I don't know that the average [customer] really understands the bill. And so, I think I'm paying too much."*

A few participants who have adopted newer technologies, such as heat pumps, noted the impact these have on their electricity rates.

> *"We got a heat pump, and I have to say, I've been very happy since then and I would say I get good value because it dropped my bill probably by 35-40%."*

5.4 Reliability

The next part of the discussion started by evaluating the significance of reliability and explored what it means to customers. For many customers, reliability is the primary factor they use to evaluate how well Hydro One is doing. Participants emphasized the importance of reliability, particularly in terms of community well-being. On a personal level, good reliability is seen as a convenience, but on a broader scale, it is essential for safety and ensuring access to electricity for critical needs in the communities served by Hydro One.

> *"I would say good reliability is expected, and without it, I don't think Hydro One would be successful as a company."*

> *"For me, the number one thing is reliability. Without reliability, there's no business. We're not making money. I would even be willing to pay more to ensure [there are] more redundancies and things like that."*

> *"For me personally, reliability is about convenience. But when I think about the community at large, its critical people need to feel safe, and they need to be able to access the electricity for a variety of reasons."*

When discussing reliability, many participants expressed satisfaction despite experiencing occasional outages. Many recognized that some outages will be unpreventable, especially in more rural and remote areas.

> *"I definitely think that for me personally, it doesn't bother me a ton when we have shorter outages. There is I guess a little bit of nostalgia. Thinking back to being a child and having a power outage, it's this big thing and everyone engages together during those types of experiences."*

> *"I think the number of outages, and I'm thinking back over the past few years… We haven't had many unscheduled outages."*

However, some voiced frustration regarding unplanned outages, particularly those that are frequent or occur during severe weather conditions.

> *"We have outages in the middle of February for six hours when you are out in the country, water can freeze and all of these other realities of country living. So, we do not appreciate that."*

> *"In the summer months, if the power were to go out and I was worried about stuff in the fridge. But in the winter, if I'm snowed in, which is typically when the power goes down, then I need to have some kind of backup thing, which I really don't want."*

> *"Thinking about reliability, I think the number of outages and I'm thinking back over the past few years, we have many unscheduled outages throughout the year."*

Most participants noted that the duration of outages significantly impacts their experience with unreliable service and shaped their perception of its unpleasantness.

> *"When they do schedule power outages, they always do them like for four to six hours at a time on a time when it's your weekend like so I don't understand why they can't do it during the regular working week when these people are working except they bring in all these people to work on a Sunday for four to six hours."*

> *"When the power cuts out and my battery backups have run out, I lose access to my services. So, if I am unable to fulfill the agreements within the contract, then there's penalties that will be applied for the missed service, that is that has occurred."*

Some participants identified inadequate reliability as a direct consequence of perceptions around aging and poorly maintained infrastructure. However, they also acknowledged that replacing older infrastructure would likely be costly, with the financial burden eventually passed on to customers.

> *"if [outages] are recurring outside of Mother Nature because the grid is failing it's got nothing to do with bad weather. Now I've got a concern because it's more infrastructure related as opposed to uncontrolled by a Thunder shower or a storm that is causing the power outage.]*

> *"I think if they could get rid of some of this old infrastructure they have and put some new stuff in, it might help [reduce outages]."*

> *"It would be maybe nicer to see some updated infrastructure, but I imagine that the cost to do that would be very high and there would be no way to avoid having that trickle down to us."*

> *"The outages are because of the wind and that sort of thing you know"*

5.5 Hydro One Priorities

Following the discussion about reliability, the discussion shifted towards Hydro One's priorities.

The moderator shared how Hydro One was entirely funded by the rates paid by its customers and that it was required to file a rate application with the Ontario Energy Board. Participants were then asked what they thought should be Hydro One's priorities in the next 5 to 10 years.

In this portion of the conversation, many similar themes emerged from the initial section on satisfaction with Hydro One's service and where improvements could be made.

Communication

While many participants acknowledged Hydro One's efforts in customer communication through text alerts and outage maps, some suggested these tools could be better utilized. They also called for more accurate estimates for power restoration times and more precise notifications about outage locations.

> *"Communication with customers, which I think they're trying and they're they have, you know, their texting and their outage maps and whatever, but maybe that could be utilized better also?"*

> *"I think they should be more accurate with their estimated time of fixing the prodigy, and they also need to be more accurate in their notifications of where their power is out."*

Focus on Reliability

While many customers identified reliability as a top focus, they are split on whether they would be willing to pay more for improvements.

> *"The thing about reliability, I think it's top priority… We're in the 21st century. You should not have to pay extra for it… Reliability is a kind of quality, and I get annoyed when I'm told 'Well, we can give you better quality if you pay more for it.' No, that should be part of your product, everything should be high quality."*

> *"I want to maintain the level that I've had with them, and I don't want to see rising cost for it."*

> *"The funding to Hydro One has to change, it can't just come from us."*

When it comes to reliability, some customers said they want assurance that Hydro One has a plan in place to handle growth while also maintaining existing levels of reliability.

> *"I think they should supply the power reliably and also plan ahead for growth in the neighborhood."*

> *"They definitely need to be looking at how they're going to maintain [reliability] as well, like to keep the levels that we expect… as well as being able to grow into the areas as we're expanding in… need to have plans that are achievable and that are not going to raise our rates astronomically… last thing you want is one more bill going up."*

When asked directly, many participants expressed that Hydro One should invest in bringing reliability up to the Ontario average. Some said that Hydro One should strive to exceed the average.

> *"People aren't going to be able to continue on without air conditioning because our bodies can't regulate the heat… So, do we need to just bite the bullet now for our future generations and get ourselves to a par with the rest… and get us more consistent across the board? I say, yeah, it's an investment for a future."*

> *"And I would personally want to pay a little bit extra to know that other people wouldn't be in in very dangerous situations."*

> *"Bringing yourself to average should just be a basic thing. It shouldn't be, 'try to exceed everybody else.'"*

> *"We're part of Ontario as well. We should be reaping the same benefits as anybody else and any other part of Ontario."*

Some also emphasized the need for cautious spending, as any investment would impact the rates customers pay. A few were concerned about how much it would cost to bring reliability in line with the Ontario average. For these customers, price increases can only be justified if there are subsequent increases in service quality.

> *"So, any anything they do in in that aspect, ultimately it will, it will come down to like, you know, delivery, bills and everyone has to share it. So, in that perspective, they have to be really careful when they're spending on such a thing."*

> *"But on this conversation, and I agree with [participant], right, that being fair and equitable, however, do I, I and I live rural kind of, you know, do I want to pay for someone who to have*

equitable service, who has decided to live way out in Timbuktu, and that's going to significantly increase my bill?"

"'Oh, you scored well on all these metrics, so therefore you get to raise your prices.'
It should be more like you are responsible to service people at a certain level and your family to do so, and if you can make a good business case that you need to raise prices in order to get that service level up, that makes more sense to me."

However, for some participants that had stable electricity, they didn't perceive bringing reliability up to the Ontario average as a significant priority.

"We don't really have any complaints, so I don't know if striving to close a gap that I don't really notice is important."

Addressing Growth

Many participants expressed concerns that Hydro One's current infrastructure would not be able to handle future demand for electricity, particularly with the rise of electric vehicles (EVs). They emphasizes the need for significant investments in upgrading infrastructure to ensure reliability, especially as capacity constraints increase with increased EV adoption. However, there was a concern regarding higher rates to build additional infrastructure to address increased demand.

"They're current infrastructure because I again, I don't believe it would sustain EVs either."

"Now I'm in agreement there, but you know, we have to make investments, not have an outdated system."

"So there's gonna have to be a monumental investment in a upgrading the infrastructure."

"However, there was a concern regarding increasing rates due to the increasing demand for EVs."

Some participants expressed a need to improve the grid for the future, particularly with the rise of EVs and emerging technologies. They emphasized that infrastructure is not adequately prepared for these changes and highlighted the importance of making improvements for future generations.

"I think we need to leave it in a better situation because of the future of the EV and like was already mentioned, I'm the world is changing, and I don't think our grid is ready for it.
So I think it does need to be improved for the future generations."

"Well, you know, I'm in my opinion it's only gonna get worse in terms of because the, the, the generation that's coming up, they're all technology based. And I'm still about the investing if they have to invest in upgrade the grid so that it can manage the load because it's not gonna get any better this generation that's coming up."

Managing Electricity Prices

A few customers said that Hydro One should try to find a way to deliver electricity in a more efficient manner to manage the costs. These customers suggested that Hydro One should prioritize investments that make a tangible difference for consumers.

"Adopt various ways and to deliver electricity to end users. Maybe in a in a cheaper way."

"So, my focus is or would be just on spend money that makes a difference to us as customers and not difference to things that people are doing that are nice."

Some customers expressed their desire for Hydro One to keep rates affordable by controlling their executive salaries and voiced their needs for transparency. For them, rate increases should be predictable and gradual.

"And else has said like no significant increases in cost to the Customer, especially kind of seeing like executive salaries being reported."

"So, I would want to see transparency on those numbers that the executives are making and reasoning behind it."

"If they're going to consider upping costs, that's going to have a huge impact on everyone… more so on those that don't have bigger incomes. And when these hear that the executives at Hydro One are making $1.5 million a year, how can they possibly think that they should increase cost to us? Our regular Joes, don't have that kind of money."

"But, but that's the kind of thing I would want is a predictability and stability, that kind of stuff."

Extreme Weather

Many echoed concerns about the changing climate and more intense storms, emphasizing the need for Hydro One to prepare for these shifts.

"I would echo kind of the thoughts that have come up so far.
Just thinking about the changing climate, the more stressed storms that we're having, umm, the increase that we're going to see with more electric vehicles, all of those things came to mind right away. And I definitely think that, yeah, just being prepared for those shifts that have already started would be a good use of money."

"I've always assumed since I moved here in in experienced more outages that I'm considered rural because before I never if we did have it, it was a blip in a city. Some of them are storm related. You can get it, but maybe we need to do something about the infrastructure so that it can withstand better or utilize resources better for putting power."

Some participants suggested that Hydro One should invest in strengthening infrastructure to better withstand increasingly severe weather. This improvement would also involve clearing trees away from power lines and ensuring availability of staff to resolve power outages.

"So in in looking at that, sure, I think Hydro should be hardening the lines or hardening the system because we're only at dissipating worse weather coming. Part of that is strengthening some of the transmission and transmission towers and distribution towers, but also part of that is the forestry aspect and clearing trees away from the lines."

"But if they invest in something that's more sustainable, then of course it will lessen the power outages so that that so that we're not getting 12 power outages, maybe we'll get three."

"Well, I do want to reiterate the equipment is incredibly important I think across this province, everybody should have their equipment updated. We have more and more weather bombs

happening all the time. I think they have to be sure that their staffing is in place so that their clients are not without power for too long."

However, some said that power outages that happen during storms are beyond Hydro One's control, especially since these storms don't happen regularly. They appreciated that Hydro One restores power within a reasonable time. However, their concern is not about handling those occasional outages but rather prioritizing the allocation of resources. They prefer that those limited funds be directed towards expanding and upgrading the grid for future needs

"Where I mean, to [participant]'s point, when the power goes out on our house, all it's driven by a bad storm. And if they happen two or three times a year, that's not something that Hydro can control and they get the power up within a reasonable [time] and published or communicated amount of time."

"That isn't a concern of mine. It's more that we put that money because it's not an unlimited resource. It's, you know, there's limits and I'd rather it be used to expand the grid for future needs."

While preemptively replacing outdated infrastructure might incur upfront costs, some suggested that investing in more resilient technology could ultimately lead to long-term savings.

"Yes, it would be a good big cost up front to go through and replace everything preemptively. But if the technology and the capacity to withstand storms and everything else is that much better, maybe in the long run, that's actually a cost savings rather than just doing a section here and a section there."

They emphasize the need for thorough studies to determine where enhancements would have the most impact, suggesting that areas with less storm impact and quicker restoration could potentially be prioritized lower for upgrades.

"How much we have to do is what should be thoroughly studied. Everything right, you have to look at how much the major impact, where it is more focused on and let's say there are areas where the storms impact is like, you know, not too much, but like Hydro One can restore the services quickly even today then maybe those areas they can leave."

5.6 Future Expectations and Plans

The moderator asked participants about future changes in their own electricity usage. Regarding electric vehicles (EVs), opinions were mixed. While some participants indicated they might consider purchasing electric vehicles in the near future, many others expressed skepticism regarding their reliability in rural areas, particularly in the absence of adequate infrastructure.

"So that would be that you know, a change that may happen if you know the system is able to support it. But the way things are now, I just don't see how that's going to happen, unfortunately."

"We just don't have the infrastructure in place yet for that."

"I'm not sold on electric vehicles yet. I drive to Ottawa three days a week and electric vehicle today in bad weather probably isn't getting me home if I can't charge it in Ottawa, most parking lots can't support it."

Participants noted that energy consumption can vary based on personal life changes, such as retirement, moving, or downsizing home. Those changes might lower their usage.

> *"If I downsize and leave our home that that will change my consumption because I'll move to you know, a smaller living space versus you know, a home that has myself, my wife, two dogs and three sons."*

> *"But probably in another 10 to 12 years, I'm hoping to be able to retire. We may find a smaller house, at which point my usage will go down. Will we find a newer house? Most likely more energy efficient."*

Some participants indicated that they would aim to be more energy efficient if given the opportunity.

> *"I don't go to extremes, but if I have to buy a new appliance, I always look at the energy rating and I'm always trying to find something that's going to use less energy."*

> *"If I find out about better ways of doing things, I would certainly be open to that."*

A few participants mentioned that the costs are too high and suggested that incentives should be offered.

> *"If there was enough rebate available for it, possibly because I'm the sole income owner in the home recently, my past my husband passed away. So, it makes things difficult to be able to do so many upgrades without that extra income."*

> *"We have looked into alternative, umm ways to produce hydro too like solar, but it's so expensive to put in and maintain that we've just stayed without, yeah."*

Some participants showed interest in installing solar panels or battery storage. However, many hesitated, particularly with battery storage, due to uncertainty about the technology's current state or lack of knowledge. While people are more familiar with solar panels, they felt Hydro One should take a more proactive role in educating the public about these technologies. Participants expressed a desire for more information, noting the difficulty in finding reliable sources despite actively searching.

> *"I'd be open to different options if they were to send me some information on things that would be more cost efficient."*

> *"To generate some power, I'd be open to all of those things if somebody wanted to educate me on it and show me how I could either be saving money or making money on, I'm open to those things for sure."*

> *Because yeah, I didn't know that about the batteries and it's an interesting concept.*

> *"The battery technology is not there at this point. Solar is the cheapest way to charge batteries because it they charge like 14 hours a day, not 100%, but they charge all the time."*

> *"Here are the batteries, but you got to figure out how to do this yourself... I want somebody who can come out who can actually assess what's happening in my house and give me some good professional advice."*

> *"I would like information from whoever's going to give me information at this point, because it's been very difficult to gather information and I've been actively looking for information and I found somebody now who's going to hopefully come and give me some good advice around this."*

For some participants, word of mouth was crucial in determining the success of the technology. They said that knowing a neighbor has adopted a technology would increase the likelihood of trying it themselves as this demonstrated a proven record.

> *"I like being able to have a group of people who could talk about what they do and what's successful. And I think that's important. And I think if you know that your neighbor is doing it like you said, then you're more likely to try it yourself."*

The moderator shifted the discussion to the importance of Hydro One investing in efforts to reduce carbon footprints.

A few participants emphasized the need for Hydro One to invest wisely and demonstrate the benefits of their spending.

> *"They need to prove that they're worth the money they're spending on them.*
>
> *"The other thing is if they do invest in new technologies that will prove them and also kind of be an example for homeowners to follow suit, especially if they have proved the technologies and kind of honed to them and optimized them."*

Meanwhile, some participants noted that the energy industry has historically contributed to the climate crisis and should play a role in addressing it. They emphasized that both industries and households need to work towards reducing their carbon footprints.

> *"Some would say in the past this industry, umm, the energy industry has contributed to, you know, the climate crisis. So they should help solve it."*
>
> *"Every industry and every household as well should be trying to reduce the carbon footprint."*

For few individuals, reducing carbon footprints did not rank as a priority.

> *"So, I just maybe it would be over time if I knew a little bit more, but at this point I've never thought about it. It's just not on my radar as important."*

6. Seasonal Customers

6.1 Familiarity with Hydro One

Most participants stated that Hydro One's primary responsibility is to ensure reliable and affordable electricity, maintain equipment, and restore power following outages.

> *"They are responsible for providing electricity at a rate that householders and cottage owners can afford it."*

> *"Think their role has been to try to deliver reliable electricity to rural residents and to some communities throughout the province, from generators like OPG and others."*

6.2 General Satisfaction and Needs

Following the introductory discussion, participants were asked to comment on their level of satisfaction with the service they receive from Hydro One, as well as the areas of services that Hydro One could do better.

Reliability

Reliability is one of the main factors that customers use to determine their overall satisfaction. Most said that they are quite satisfied, experiencing an appropriate number of outages and noting that Hydro One has historically reacted quickly when issues occurred.

> *"I can't even tell you the last time we lost power. Very reliable."*

> *"[Power restoration] almost instantaneously this summer it has been much better."*

> *"I'm pretty satisfied. I do like the text messages to know that power has been out in the area."*

> *"Quite satisfied. I don't remember the last time there was an outage… Overall, no major issues that stand out in my mind."*

> *"We're quite happy… We've had them come in, take down trees. We lose power at least 4 or 5 times a year, and they react quite quickly. I think they do a great job."*

However, some said that they are dissatisfied with reliability, noting that outages have become longer in duration. These longer duration outages are seen as more of a concern than brief interruptions that are quickly resolved.

> *"It's getting worse from the standpoint that the outages are longer, a little blip is no big deal."*

> *"Alright, very dissatisfied. This year's probably been our best year. We've had four or five outages of at least 12 hours previous years, been much more serious outages, probably because many of the distribution lines and long-haul lines go cruel cross countries."*

Cost/Billing

Some participants commented on what they perceive to be high delivery charges. Some felt that the services they receive are not adequate for the price they pay. Many expressed their desire to have

seasonal rates back as they find it harder to accept lower-quality power supply after the elimination of the seasonal rate, especially when compared to more urban service levels.

> *"And with the elimination of the seasonal rate, it's a little harder to swallow a lower quality power supply then one would get in the city."*

> *"I wasn't there when they did have the seasonal rates, but I have heard about it and I do think that that is something that would be very important to bring that back for people that, yeah, just it's very costly and then for me to start thinking about these alternative ways to keep things running."*

> *"Little delivery charges are exorbitant, and they're not commensurate with the delivery of the service, you know."*

Participants also expressed their surprise to learn that they would still have to pay for delivery charges even when they were not using their properties.

> *"First of all, I will say I thought we'd save a whole bunch of money by not having the cottage open when it wasn't. We weren't using it, but it turns out you get Hydro bills anyways, even though you're not using any."*

> *"Uh, I've noticed that the cost is quite high, and I was really tracking, you know, compared to home where my monthly hydro bill is about $100. Uh, you know, for a seasonal property with not a lot of power usage, we don't have big appliances or a large cottage."*

Although acknowledging the necessity of having electricity and accepting the associated costs, some commented that they have been seeing an increase in their bills.

> *"We have to have it, and it costs what it costs, so I don't really quibble about it, but I have had a sense that those costs have crept up quite a bit."*

Outage Communication

While most participants said they find the current outage notification system to be helpful, others expressed frustration with what they perceive to be incorrect time estimates for power restoration. They said that they prefer Hydro One to be honest about the time estimates rather than overpromising.

> *"I do like the text messages to know you know that power has been out in the area."*

> *"Oh yeah, you know, to [participant]'s point, power's going to be back on in four hours and then four hours later, I get another text that it's going to be another 7 hours."*

> *"I would rather them just be real with me and say, you know, it's going to take us six hours to figure out what's wrong…If you're up there in the winter, you you're making decisions on whether you need to drain your plumbing. You know, there are major economic impacts to losing the heat."*

Many participants said they appreciate the mobile app that allows them to report outages and get updates on maintenance and emergency response.

> *"One of the features that we really appreciate is the storm warning storm tracking, being able to report storms through the app, you know, and outages and to get text alerts for those outages."*

Maintenance

Many said they are satisfied with how Hydro One performs its preventative maintenance. Some noted Hydro One's preventative efforts, such as cutting down trees and clearing brush along the roads during the summer to avoid future problems. While most said they do not interact with Hydro One frequently, they appreciate the annual tree inspections and proactive action on large, older trees on their property.

> *"You know, there's also the preventative, we see them cutting down trees in advance, you know, a future problem that are to come on the side of the road clearing bushes and trees, you know, throughout the summer."*

> *'That's the, you know, I don't have a lot of interaction with them, but they do come every annually and do a tree inspection."*

> *"Uh, we have some old large old trees on the main lot, which they're proactive at investigating and taking action where required."*

6.3 Rates

Following the discussion about customer needs, the discussion shifted towards Hydro One's rates.

To begin with, the moderator asked how much of their monthly bill customers believe went to Hydro One. The moderator then shared a short description of Hydro One's portion of the electricity bill. Participants were then asked if they thought the price they paid for electricity was reasonable or unreasonable. They were then asked if they thought they received good value for the price they paid for electricity.

Some participants expressed their frustration at having seasonal rates eliminated.

> *"With the elimination of the seasonal rate, it's a little harder to swallow a lower quality power supply than one would get in the city."*

> *"I do think that this [seasonal rates] is something that would be very important to bring that back… It's very costly and then for me to start thinking about these alternatives ways to keep things running, I don't have the money."*

Some mentioned that they did not like having to pay even if they did not use electricity.

> *"I just think about it from time to time when I see that I'm at the cottage for two days in the month and then my Hydro, there is more expensive than my home where I'm home every day doing all kinds of things."*

> *"I've noticed that the cost is quite high - and I was really tracking compared to my home where my monthly hydro bill is about $100 - for a seasonal property with not a lot of power usage. We don't have big appliances or a large cottage… The cost does sting a bit."*

In terms of value for money, a few believed that they are getting value for what they pay to Hydro One.

> *"I would say probably yes. Given the outages we get, we're paying pretty low prices in Ontario."*

However, others said they were paying for high delivery costs without an improvement in services.

> *"I don't have anything to compare it to, like I know all that I'm paying at a hell of a lot more for power now than I did just handful of years ago, and nothing's changed on my end."*

"Most of my neighbors have generators, so they're used to the power going out very frequently and for long days in the wintertime. And so that's a huge frustration for me, especially when I look at the delivery charge on my bill and I'm thinking, what am I actually paying that for if that's supposed to be going into building and maintaining the infrastructure? They're not doing a great job at that, so a lot of frustration there."

"Delivery charges are exorbitant, and they're not commensurate with the delivery of the service."

A few mentioned that there were no comparable options as they had to stay with Hydro One.

"There's no competition or anything like that, so I'm stuck paying this bill on that."

"We don't have other options, not all of us can go fully solar or install winter vine or any of these alternatives. We're rural consumers. We're pretty much locked into Hydro One."

Some participants mentioned that, despite more frequent outages in rural areas, energy prices in Ontario are relatively low. However, they suggested that the Ontario Energy Board and Hydro One should explore alternative pricing models other than time-of-use pricing.

"No dispute that they should be there, but how we should pay them the entire energy Board and Hydro One and move to time of use and time of day type billing. I think we should need more creative models that have been tried in other jurisdictions to account for these delivery charges."

Some participants expressed a desire for more proactive engagement with Hydro One. They mentioned that they would appreciate Hydro One approaching them with a range of options and solutions, acknowledging their challenges and offering ways to help offset costs.

"So, to answer your question first, yeah, I like I would love them to be more proactive with options and come to me and say here, you know, we know you've got these challenges, but we've got this whole litany of things that we can help you with to offset your cost things."

6.4 Hydro One Priorities

Following the discussion about reliability, the discussion shifted towards Hydro One's priorities.

The moderator shared how Hydro One was entirely funded by the rates paid by its customers and that it had to file a rate application with the Ontario Energy Board. Participants were then asked what they thought should be Hydro One's priorities in the next 5 to 10 years.

Maintaining or Improving Reliability

For most seasonal participants in the focus groups, reliability is the single most important area of focus.

Seasonal participants were most concerned about the length of outages, but they also emphasized the importance of being informed about the cause of the outage.

"Yeah, it's the length of the outage is key."

"Also useful to know on the Hydro One outage map, what was the cause of the outage"

"Yeah, it's definitely there's a lot more activity on our island Facebook when an outage is ongoing and the umm, there's restoration keeps moving out, but we don't feel like that's poor delivery of service."

Some agreed that Hydro One should invest to improve reliability. However, these customers want to see a clear improvement and only modest price increases. Some also expressed a desire for Hydro One to communicate where they were against their current expectations and how they would be using customers' money.

> *"If there was a visible increase in reliability, I don't think I'd have a problem with that. I again, I would think it would have to be a modest increase, but you know then then you get into the issue of what's modest."*

> *"I'd be willing to give the money if they document how they actually use it."*

> *"And before Hydro One was to increase the rate to increase reliability, I would like to know where are they against their current expectations? Have they allowed the system to become less resilient over time and is that's now a cost to just bring it back up to where it was supposed to be?"*

6.5 Future Expectations and Plans

Future Consumption

Many participants said that they are already finding ways to reduce their energy consumption. They also noted that they are now more cautious and considerate about their electricity usage.

> *"I think we're more cautious about like maybe cautious is the right word, certainly more considerate about how we use power."*

> *"So right now the only way that it makes sense to start introducing something like solar or small wind or anything like that, frankly, is to cut the cord completely and just say, OK, fine, I'm not going to be dealing with hydro at all anymore."*

Advisory Services

Some participants expressed a preference for Hydro One to take a more proactive approach to connecting them options to address their future energy needs. However, they cautioned against charging extra just to provide tips and advice and emphasized that Hydro One needed to clearly demonstrate the benefits of any actions, whether cost or managing their electricity usage.

> *"I'd love to see them be proactive and come with ideas."*

> *"I think, yeah, I think they do play a primary role, but it has to be self-funding and showing some net benefit or it's worthless."*

New Technologies and Innovation

Few participants said they are actively considering adopting new technologies, like heat pumps and solar panels. Some participants acknowledged that while they feel these technologies are important, they might not personally be the "target audience" for them.

> *"So, I think there's room for that innovation. I don't think we're really the target market and as far as you know, Tesla batteries and things like that."*

Some participants suggested that funding innovation and new technologies should not be passed down to customers unless there is clear and demonstratable customer value.

> *"But we don't want that to come back to our level that we need to fund that. I think that sort of needs to be hived off by Hydro One to where we're investing in innovation."*

> *"Needs to be Innovative, needs to invest in innovation, but they need to kind of prove the case before they can download those costs to us."*

Most participants preferred that Hydro One follow established practices rather than trying to "reinvent the wheel".

> *"Hydro One has not been known for it doesn't have a mandate to date for innovation. It would be nice to see the regulator, the OEB or the province, though, invest separately in small companies, say like Bullfrog power and other companies to do these Innovative things like micro grids, vehicle to grids and so forth."*

7. Small Business Customers

7.1 Familiarity with Hydro One

Each focus group discussion started by gauging participants' awareness of Hydro One's role in the electricity system. It was then followed by the moderator explaining Hydro One's role in the system and seeking participants' reactions to it.

Most participants recognized that Hydro One handles the transmission and distribution of electricity, with many stressing the importance of reliability in its services.

> *"But certainly, it should be a source of electricity to provide fair, reliable and equitable service to all communities within the province of Ontario."*

> *"Uh, yeah, I would say just a reliable and safe transmission of electricity for the province."*

Besides delivering electricity, Hydro One is seen to be responsible for maintaining the distribution system.

> *"I think Hydro One is responsible for electricity transmission and distribution, and they're also responsible to make sure you know if there's any alright trees or any branches kind of in the way of the lines to make sure that it's cleared and take care of it."*

Additionally, some noted that Hydro One's role is to ensure that electricity remains affordable and support the development of new renewable energy programs.

> *"Yeah, I would, I would say providing electricity, infrastructure for electricity and maybe putting electricity back into the grid going the opposite way from solar and renewable energy and developing maybe renewable energy programs and, yeah, innovating for electricity hydro delivery."*

> *"What everyone has said, but I also think part of the role should be to make it affordable."*

A few participants mentioned that outage communications including estimates for power restoration are part of Hydro One's responsibilities. They also said they value the guidance provided to businesses on how to handle outages.

> *"I find helpful that Hydro One is the way they manage the network or the system, particularly in times of outage the way they communicate power outages and estimates for time right you know estimates of time for recovery, uh so you know managing the network but also helping people understand how to how to you know stay in business or manage outages so."*

7.2 General Satisfaction and Needs

Following the introductory discussion, participants were asked to comment on their level of satisfaction with the service they receive from Hydro One, as well as the areas of services that Hydro One could do better.

Reliability

Opinions on whether Hydro One is doing a good or bad job primarily depended on the reliability of their service. Most participants said they are satisfied with the reliability of service that they currently experience.

> *"I just wanted to say that the way that we know that Hydro One is doing a good or a bad job depends on the service or reliability."*
>
> *"I think you could judge it by, I mean the service we're receiving and if it's everybody has Hydro and then that would go with the outages and also the services that they provide."*
>
> *"Well, just to come back on how do I know they're doing a good job? It's a question of reliability. Yeah, I'd say 90%."*
>
> *"I think you know, compared to many other places internationally, even they're just in North America, like we're really fortunate to have a pretty secure and reliable system that we do."*

However, some felt that reliability can be problematic during severe weather events. Some participants reported experiencing frequent and extended outages in recent years, and despite recent improvements in reliability, there is concern about whether it will be sustained.

> *"Every time that the thunder cracks, the Hydro's gone. So that's my not satisfied, which is true of the summer often and through the winter a fair amount every time we get a storm, we have no hydro and in the spring the Ottawa River here floods and then we again have no Hydro."*
>
> *"Climate change is certainly something that we can argue about the effects… It seems to be in the last few years, storms have been more severe."*

Electricity Costs and Billing

For many participants, the cost of their electricity bill is among their top concerns. Some participants voiced dissatisfaction, saying that Hydro One's delivery costs were higher than the costs of some other utilities or regions.

> *"But you know the cost of Hydro is really expensive and for businesses like it's definitely a takes a big bite out of our you know our profits and our operational costs for sure."*
>
> *"It's like the as compared to other states like our price is still very much higher than normal other places."*

However, some said they could not really assess whether Hydro One was doing a good job or a bad job because there are no direct comparables. These customers highlighted the monopoly of having Hydro One as the sole electricity provider and expressed a desire for more options to compare services.

> *"And secondly, is there like a no comparison like there's Hydro One and Hydro 1. So if we have like a good doing, good job versus not doing good job, how we had to compare that like you can't compare with the Hydro One with Hydro One."*
>
> *"It's a monopoly. We don't have a choice if we if we want the lights on, this is who we gotta go to."*

Interactions with Hydro One

Most customers reported having minimal interactions with Hydro One. In most cases, the only interactions they may have involve paying their bills.

> *"My bill is automatic payment from my account, finished and never call them. No issues, only I've called them when there's no power."*

> *"Thankfully we haven't had any issues with Hydro, so it's been very minimal at this point and I do use the online platform quite a bit."*

Some small business customers said they are looking for more support in managing electricity costs, expressing interest in subsidies, incentives, or programs that can help offset costs and make service more affordable.

> *"If there were programs where there's either subsidies or cost-effective ways of servicing a premise that would be interesting."*

> *"So, I'm gonna say that would be great if they were more reasonable or reduced or offset somehow or there would be more opportunities to offset costs, whether it be incentive programs, something other."*

Some participants mentioned that the current pricing structure, including time-of-use pricing, does not align well with their current business operation hours. They felt that Hydro One could do more to help them navigate these challenges, including managing their peaks.

> *"You know the time the high peaks and the low peaks or whatever is not always beneficial to us, that's for sure just and by nature of sort of how our business operates."*

> *"It's quite expensive at the peak period, you know on a percentage basis, it'd be great if they had programs that they could share and maybe subsidies to help you offload your peak."*

Communications

When discussing communications with Hydro One, many participants acknowledged the importance of proactive communications during outages.

> *"Things have been improved dramatically, so for us it's more the steady supply, the predictability. It's knowing when there will be disruptions."*

> *"The communication that comes to you when there is an outage and the expected recovery time frame makes a big difference... in being able to communicate back to our customers or tenants."*

Many stated that they are very satisfied with Hydro One's communication efforts, especially during outages. Participants were generally pleased with Hydro One's quick response to power outages and appreciate receiving timely notifications via email and text.

> *"Things that we get like emails and stuff, tell us that power is off like that comes right on my phone. So, we need to know that immediately, yeah."*

> *"They're out here pretty quick and we get notifications through emails, and it works great that way. So, we're really happy with the with the response with if there's any power outages, I get that on my phone immediately."*

"If there's a storm in, in Ontario, I don't know about it. But so, I got text messages that I think quite responsive saying there's a storm coming or we're planning a plan service outage. So, I feel that as a remote customer that I'm informed about things."

Some participants stressed the importance of accurate restoration times and note how inaccurate estimates can negatively impact their operations.

"I think last year about five or six times and all of those six days I lost my business because of that. I lost lots of sales, plus I had to pay my employees all the wages because I don't know because they don't give you particular time when the power doesn't come back."

With regards to general communications, some participants expressed positivity with Hydro One's website and educational resources. They mentioned that the website is both clear and easy to navigate.

"I think more just from like a technology point of view like the website has gone better, email communications, things like that."

"And with bills that there is a lot of extra information like how to save money or other, and strategies to improve your insulation or different, just different really, it's mostly money saving, but just really practical tips that I find are helpful."

Customer Service

Beyond the reliability they experience, many participants evaluate Hydro One through the lens of customer service. Specially, some evaluate Hydro One based on the time it takes to receive a response from customer service when they have an issue or concern.

"I would say the most important thing for me, having many Hydro One accounts is customer service. So, wait times on the phone. Maybe the hours that they're open and you know if they're friendly - customer service."

"Yeah, I think it's normal or nice but depends on time - customer service - whether you're picking the call or not and how quickly you are picking the call depends on that also."

Among those who have interacted with Hydro One's customer service team, most find the service to be friendly and helpful.

"Anytime I've spoken to them on the phone like service, why is they've been wonderful."

"I've taken on the role of commercial property owner fairly recently… I've had to deal with them and there were some issues at the beginning, and they were so supportive and really helpful. So, it's been a good relationship."

"Anytime we've contacted Hydro One, they're right on top of it."

When asked specifically what Hydro One could better serve them, some participants said Hydro One should take on a more proactive advisory roles to help small businesses be more energy efficient, educate them about energy conservation programs and provide subsidies to enroll in those programs.

"Something that Hydro One could do is like educational programs like provide educational resources about energy conservation and efficient use."

"I do think there is an accountability on organizations like Hydro One to actively work with people and organizations to be as efficient as they can be."

"Education about the options that are available to us – I think that's the main thing… On website maybe, or even grants, or just educate the customer about some of the systems that are available."

"I think it would be really nice to have a human being come to the premise and suggest ways to reduce hydro usage."

System Maintenance

Many participants also emphasized the importance of continued need for more preventative maintenance since some areas experienced frequent outages during storms due to older hydro lines and surrounding trees. They recommended that Hydro One continue maintaining the systems.

"Also, we live in a rural community… so there is a significant number of trees and stuff that are all around Hydro lines are older and we do get a lot of outages during storms and stuff because trees will fall and because of where we're located, they're not in a hurry to come and fix them."

"I do agree with like the cutting down of the trees like the preventative maintenance as opposed to the responding."

7.3 Rates

Following the discussion about customer needs, the discussion shifted towards Hydro One's affordability.

To begin with, the moderator asked how much of customer's monthly electricity bill went to Hydro One. A short description of Hydro One's portion of the electricity bill was then shared. Participants were then asked if they thought the price they paid for electricity was reasonable or unreasonable and whether they felt that they received good value for the price they pay for electricity.

Most customers were not aware of how much of their monthly electricity bill goes to Hydro One. There were mixed views about whether what they are paying is reasonable or not.

Many customers tied value to reliability. Those that experience good reliability were more likely to say that they receive good value for the price they pay.

"I would say reasonable just because we like the reliability of the service. Like, we barely get any outages and stuff, and since it is a necessity, that's like a really like, great value for us in the sense that we don't have outages, and we can continue to operate."

"If you need it and it helps you function in your daily life, then it's providing the service."

Additionally, some viewed value-for-money through the lens of how quickly Hydro One crews can respond when there is an outage.

"Delivery and the accessibility to have somebody assist when they're sending issues."

"So, I think yes in that, any time we've ever had outages here, they have been responded to very quickly that maybe it's just our proximity to Hamilton. There's lots of crews around as opposed to a very rural area, but our point of view, it's good value."

Some participants felt that the price they pay for electricity is reasonable when compared to other services and utilities like water.

> *"And when I look at our Hydro costs, look at our water cost, look at our property taxes, it is in line, it looks like relative to other expenses we have that it's reasonable."*

However, some felt that the rates they currently pay are higher than other jurisdictions or for other utilities that are seen to be similar.

> *"I'm paying a lot less within the city than I am for my rural property, so for me, no, I'm not getting a good value."*

> *"I don't feel like outages are corrected as quickly as I would like them to be and I mean I understand that we are kind of outside of town limits, but if I can get the same product from Enbridge for a cheaper cost and they don't engage with me just like I'm not engaging with Hydro One, then why would I not pick that option?"*

One participant noted that they are concerned with Hydro One employee salaries. They expressed a desire for Hydro One to make cost-saving adjustments like those faced by other sectors and businesses.

> *"But for sure, like Hydro One, employees have like some very, very, very good perks that probably are like more than necessary... I think people would like to see that Hydro One is sort of you know having to tighten their belts just like everybody else on certain things and that their employees would understand that as well."*

7.4 Reliability

Most participants expressed that the reliability they experience is acceptable, often describing it as dependable, and meeting their expectations.

> *"[Reliability] It's always there. It's very seldom it's out… Hydro is always there was us really."*

> *"Why we feel it's acceptable?... Because they have been reliable in the past. Because you can depend on them, you assume that's a level of acceptability."*

> *"I've had no real issues with the reliability, especially on the three-phase."*

For many, power outages can have serious consequences for their business. Participants described the challenges of managing staff during power outages, noting that staff remain on site with limited tasks to perform without power. They highlighted the lack of backup generators as a significant issue, leading to potential losses of products and spoilage due to outages. They mentioned that inaccurate power restoration estimates make planning difficult and costly.

> *"My staff still stays because you're waiting on it [power] to come back. So, you are paying staff to basically sit around and you can find some jobs for them to do, but there's only so much that can be done without power, especially in our industry."*

> *"So basically, we cannot do anything because we don't have any backup generator or anything."*

> *"So, I'm the impact would be like potentially the loss of livestock. As I said, the loss of our product and stock."*

"Reliability is a big thing, especially for us. Like if you don't have power, we're pretty much pooched to work with hand tools."

7.5 Hydro One Priorities

Following the discussion about reliability, the discussion shifted towards Hydro One's priorities.

The moderator shared how Hydro One was entirely funded by the rates paid by its customers and that it had to file a rate application with the Ontario Energy Board. Participants were then asked what they thought should be Hydro One's priorities in the next 5 to 10 years.

Reliability

For most, reliability remains one of their top priorities. Some participants suggested that Hydro One's primary focus should be on reducing the number of outages, especially more prolonged instances.

"I would say is to keep the capacity to where, like and [participant]'s case, eliminate those brownouts."

"I think the priority should be the fixing the blackouts and the brown outs on the current customers."

"Priority should be on making sure that our existing services are more reliable and dependable."

When asked whether they would be willing to pay more to improve reliability, many customers were torn. Some felt that reliability is so critical that they would be willing to pay more, within reason.

"I would say at the end of the day, it's got it be reliability and the unfortunate part is it comes with a cost."

"It's also a safety issue…People under health situations and stuff like that, I don't see that you can take that risk even if it's going to cost you more."

While others felt that everything should be viewed through the lens of affordability.

"I don't get why it's an either-or question though. Well, I mean, well, you constrain for more reliability and at the same time look for less expensive ways of you achieving them."

Many customers felt that Hydro One's reliability should be more on par with the Ontario average. Some customers felt that rural areas receive services that are inferior to those in major metropolitan areas, despite contributing the same taxes and electricity rates. They suggested that rural services should either match or exceed those provided in urban areas.

"So, if we are with for Hydro One, we are paying more than the smaller power companies and reliability should be at least on par."

"You know, I think that more rural areas often feel like our services don't match those of the major metro areas, and yet we still have our regular taxes and all kinds of other things that we have to contribute to. So, we should absolutely try and match it or be better than it."

Some participants felt that Hydro One should prioritize reducing the length of outages, rather than the number. For these customers, they see longer outages as having a more significant impact on their business operations.

"I'd say of those that you mentioned, I would say that duration of outages would be you know anything that's gonna be safety impact safety or you know damage people's goods."

While some felt that the focus should be on the length of outages, customers would like to see Hydro One focus on all aspects of reliability, including length, frequency and communications. Some noted that proactive replacement and maintenance of equipment are crucial.

"Yeah, I also think like all the above that you mentioned reduced outages, reduced duration of outages, increased communication, all that should be a priority."

"Umm, uh, I don't think there's any business owner who just waits until everything breaks before you replace it…. And you also need sufficient personnel to maintain that a lot of the times, getting back up after a storm is entirely reliant on how many crews are available."

Maintaining and Upgrading Infrastructure

Some participants suggested improving and maintaining equipment to prevent major issues (e.g., burying wires, replacing old components), especially during extreme weather events. Some felt that increased maintenance could further reduce the overhead costs and allow Hydro One to invest more in improving reliability.

"Just because you know, whenever there are weather events, that's when I notice we get the most outages and things like that."

"So, I feel that Hydro One needs to look at their own infrastructure at where they can save money so that they have more money to put into improving hydro poles, improving brownouts, having more manpower to deal with power outages or preventative cutting of trees."

Some participants were concerned that Hydro One will not be able to keep up with the growing demand. Some said that they would like to see Hydro One work with the provincial government to address the growth in demand.

"I cannot see how the lines that they have in this area are going to be able to support all of the green technology electric vehicles without breaking down because they can hardly support the power that needs to be distributed now."

"They need to say, you know, maybe sit down with government and or and tell the people that, yeah, we have to have all this power for what we need to generate for the for the coming future."

Extreme Weather Preparation

While customers generally understood that severe weather-related outages are often beyond Hydro One's control, many still wanted to see the company invest in areas it does have influence over.

"Except for reliability, I don't have any problems. I mean, they can't predict the weather."

"I mean, like if I if we have a huge windstorm and a whole bunch of trees come down, I don't consider Hydro ones responsible for that."

"I think extreme weather is something that's not going to be decreasing, and so it's just prudent to look to what the future will hold and invest more money expecting more of it."

"I think as climate changes, and the weather becomes more extreme. People are going to start getting injured or killed and they'll need to have reliable power sources to help prevent that from happening."

Many agreed that Hydro One should invest in more resilient equipment and plan for extreme weather conditions, even if it involves higher costs.

"I would think it would be beneficial to invest in sturdier equipment to help prevent the issues."

"And so, it's just, it's just prudent to look to what the future will hold and invest more money expecting more of it."

"Hydro is not just a privilege it you know it's a human right. And so, when it comes right down to the to that, I think that looking at the general health and safety of the public, it should be #1 in terms of how any kind of changes are implemented in the system."

To prepare for more frequent severe weather, some customers also felt that Hydro One should undertake more preventative maintenance, such as trimming trees and the use of resilient equipment.

"I feel like it's important, but you can do a lot and spend a lot of money to prevent things, but if you don't do other things that go with it, like trimming the trees and other things, it's not gonna make it flawless."

Costs

Many suggested Hydro One keep the costs affordable and look for other ways to reduce costs. They recommended exploring cost efficiencies.

"And just making sure it's more accessible to all incomes."

"So, looking at ways to reduce that cost efficiencies, what's what are other competitors doing that they're not doing?"

"If there are opportunities to kind of make sure that our consumption can go down or we can save by the idea that I guess was passed on earlier about maybe storing electricity when it is cheaper and then using it at a higher peak time."

7.6 Future Expectations and Plans

Customer views of the future are mixed. Some anticipated increased electricity usage as their business operations evolve, while others expect a decrease due to investments in heat pumps and other energy-saving technologies.

"I would say that our electricity use would decrease because we're investing in efficient means of say heating or using electricity, but at the same time you know business is expanding and we're purchasing more property. So I would say it's going both ways."

"We're also doing like planning on doing expansions with our grain dryer set up, which takes a ton of electricity."

"So by retrofitting a newer windows, adding exterior insulation, adding mini splits, I've already done energy modeling. I can slash the energy consumption by about 70 to even 80%."

In terms of investing in new technologies, cost remains the primary barrier for many small business customers. Some felt that Hydro One could play an increased role in helping customers navigate newer technologies like heat pumps and solar panels, including government incentives and equipment leasing opportunities.

> *"If there was more of an availability of grants, and somehow even loans."*
>
> *"Probably more of government to be able to supply, you know grants and that type of thing that would probably promote more things like that."*
>
> *"Yeah, work with the government to give small businesses incentives to make changes to reduce."*

Additionally, some felt that Hydro One could provide education on energy-efficient technologies and assist with upgrades and investments in those technologies. Initiatives can include offering a generator rental program, connect customers with electricians, facilitate rental or purchase costs, and offer a payment plan to support with installation.

> *"Education about the options that are available to us."*
>
> *"I suggested earlier, but if they would come with a program where I could, I could rent a standby generator, for instance, from the on the monthly basis"*

Some customers also noted that they would like Hydro One to provide more information on their electricity usage and tailor tips on how to save on their bills.

> *"I do think that they can work with individual customers and small businesses to highlight based on usage and what they know about our organizations already highlight ways in which we can reduce our costs and use it."*
>
> *"And as far as I'm just thinking like about tips and things on ways to make money, they do have that on the website, like just different articles how to save money in different ways."*

Some customers felt that it is important for Hydro One to reduce their own carbon footprint, however, they weren't sure how much that would cost or how it would be achieved. Other customers were more focused on cost and improving reliability and felt that any focus on reducing Hydro One's carbon footprint would take away from those priorities.

> *"Is very important because if, like federal government spending so much money on that and other companies had to play their part in that too."*
>
> *"So, we have to rely that whatever they do, their engineers that they have in place, that they're gonna that that's their responsibility. Not for me to tell them what to do."*
>
> "*In my opinion, it doesn't affect the overall experience of Hydro, so if they put money into that, they're taking away from actually like the reliability, everything like that for something I'm not seeing value."*

2. Methodology

Innovative Research Group Inc. (INNOVATIVE) was engaged by Torys LLP on behalf of its client, Hydro One Inc. (Hydro One), to gain a deeper understanding of the needs and preferences of customers, specifically as it relates to Hydro One's Joint Rate Application to the Ontario Energy Board (OEB) covering the years 2028 to 2032.

As part of this engagement, INNOVATIVE conducted qualitative research to uncover specific electricity needs, outcomes and priorities from Hydro One large business customers in order to inform planners for the 2023 – 2027 draft investment planning process.

This report summarizes the results of a series of in-depth interviews with large business customers, including commercial & industrial (C&I), large distribution (LDA), and large transmission (LTX) customers.

Approach to Large Business Customer Engagement

Hydro One provided INNOVATIVE with account details and contact information of Hydro One's C&I, LDA, and LTX customers. INNOVATIVE invited a random selection of customers within each customer group to schedule a meeting with INNOVATIVE to share their business' needs and preferences as they relate to Hydro One's Joint Rate Application covering the years 2028 to 2032.

INNOVATIVE began sending initial invitations to customers to participate in an interview on August 12th, 2024. Customers who had not yet signed up to participate in an interview received up to two subsequent reminder emails from INNOVATIVE between August 21st, 2024 and September 25th, 2024. Customers who had not signed up were also contacted directly by their Hydro One account representative or another staff member to encourage participation. This outreach led to 37 interviews being completed via videoconference or telephone.

Customer Group	Completed Interviews
C&I Customers	**9** customers
LDA Customers	**11** customers
LTX Customers	**7** *end-users* **5** *generators* **5** *local distribution companies (LDCs)*

Interviews were approximately 45 minutes in length and were conducted by a trained moderator following a discussion guide. In appreciation of the time provided by participants, INNOVATIVE provided a $150 cheque for each participating business.

About this Report

This report summarizes the key findings based on these interviews. In general, our approach is to report representative verbatim comments and offer interpretation and/or commentary where necessary. Verbatim responses are shown in blue italics.

Please Note: Qualitative research does not hold the statistical reliability or representativeness of quantitative research. It is an exploratory research technique that should be used for directionally. In interview-based research, the value of the findings lies in the *depth* and *range* of information provided by the participants, rather than in the *number* of individuals holding each view.

3. Key Findings

Commercial & Industrial Customers

Most are satisfied or neutral towards the overall service that they receive from Hydro One.

Overall, most customers do not identify any significant issues with the services that they receive. When asked about their overall satisfaction with Hydro One, many emphasize the importance of consistent, reliable service.

Many identify improvements to communication as an area they would like Hydro One to focus.

Some customers say that they would like a dedicated point of contact to streamline interactions as they note challenges in their communications with Hydro One.

Most are satisfied with current levels of reliability and efforts made by Hydro One to restore power quickly.

Reliability is consistently seen as critical for commercial & industrial customers, with significant consequences of poor reliability. While some report more frequent outages, many of these customers have backup power systems in place to reduce disruptions from outages if they do happen.

Customers are largely willing to pay more for Hydro One to make investments to maintain or improve reliability and build resiliency to severe events.

Most customers say they are willing to pay more to maintain or improve current levels of reliability and many support Hydro One making investments in greater resiliency to severe events.

Many customers anticipate an increase in electricity demand over the next five to ten years and support Hydro One making investments to meet growing demand.

For some, they expect their demand to increase *significantly*. Several customers emphasize the importance of Hydro One making investments to accommodate increasing demand while maintaining current levels of reliability.

Large Distribution Customers

Most express satisfaction towards the overall service they receive from Hydro One.

When asked about their overall satisfaction with Hydro One, many customers focus on strong reliability, communication, and appreciation for their dedicated point of contact at Hydro One.

Some customers desire stronger communication with Hydro One, especially around response times.

Some report slow or infrequent communications with the utility, expressing a desire for clearer, more consistent, or more timely communications.

Many are satisfied with current levels of reliability, with some noting significant improvements over the last several years.

Nearly all customers describe the consequences of poor reliability as severe and having significant financial and operational consequences. However, current reliability is generally described as strong, with very few noting frequent unplanned outages.

Power quality is of significant importance to some Large Distribution customers.

Some customers identify significant problems with voltage fluctuations, which in some cases lead to equipment damage or disruptions to operations.

Customers are generally prepared to pay more to ensure that current levels of reliability are improved or maintained.

While a few customers emphasize the importance of cost competitiveness, most customers say they will pay more to ensure reliability, recognizing its importance to their operations. Many express concerns about the increasing frequency of severe weather, and several agree that Hydro One should make investments in greater resiliency.

Many recognize the need for Hydro One to make investments to proactively address growth.

Most customers anticipate an increases in their own electricity use over the next five to ten years, with many emphasizing the importance of preparing the grid for growth across the province.

Large Transmission Customers

Nearly all customers are satisfied with the services they receive from Hydro One.

Many describe their relationship with Hydro One as positive, open, and collaborative. Still, some would like Hydro One to make further efforts to have regular and personal interactions with their company.

Customers would like to see Hydro One focus on improving communications.

When it comes to improving communications, there is a particular focus on outage planning, project timelines, and coordination with Hydro One's operations. Some customers mention a desire for further automation or modernization of communications, especially around the status of service interruptions.

Most customers are satisfied with current levels of reliability, with some recognizing Hydro One's ongoing efforts to make improvements.

Across all types of LTX customers (Generators, End-Users, and LDCs), customers emphasize the severe operational or financial consequences of poor reliability. Overall, reliability is seen as acceptable and consistent.

Customers are consistently willing to pay more to maintain or improve current levels of reliability.

Citing the significant costs associated with poor reliability on their operations, customers are willing to pay more to ensure service remains at current levels or improves.

Customers want Hydro One to proactively address growing demand in the next five to ten years.

Many customers emphasize the importance of Hydro One making investments to support increasing demand without compromising reliability and expect their own demand to grow over the next five to ten years.

4. Commercial & Industrial Customers

4.1. Respondent Profile

The organizations that participated in the discussion span various industries, including manufacturing, transportation, education, and agricultural operations. Responsibilities of participants include managing, tracking, and optimizing energy usage, as well as billing. Additionally, there were some participants from energy and facilities management teams overseeing utility consumption for Ontario municipalities. Most participants note that their energy demand remains relatively consistent throughout the year, with some fluctuations during the winter or summer months.

> *"We're manufacturing – we're a company that extrudes [REDACTED]… So, we're high energy user. Most of our energy is used to drive a few very large horsepower motors in our plant, and we use typically about 850-kilowatts an hour when our plant's running at in a stable mode."*
>
> *"It's a family farm operation that's been in the family for close to 150 years… I do most of the accounting and bookkeeping for the farm"*
>
> *"I basically oversee the contracts, and the facility guys are the hands-on and deal with most of the contractors and everything. I oversee it and pay bills."*
>
> *"I'm the project lead for energy and facilities for [REDACTED]. I take care of all of our utility billing, energy management side of it. I don't pay the bills, our accounting department does, but I do set up any new accounts. I also work with our retailer who's the wholesaler for our utilities through Hydro One."*
>
> *"It fluctuates a little bit [demand], because in the wintertime it's darker and if we have growing lights, there is more power required. But in general, it's pretty much the same all year long."*
>
> *"The peak demand in the winter for heating is less than the peak demand in the summer for air conditioning."*
>
> *"Harvest time, it'll be a lot more used, so we have a high peak through probably October, November, December, and then it kind of levels off."*

4.2. Satisfaction with Hydro One

Overall satisfaction with Hydro One

Most customers express satisfaction with Hydro One, mentioning no significant issues and meeting expectations when it comes to providing electricity.

> *"I'd rate them fairly high."*
>
> *"No complaints here. Yeah, we're satisfied… On a scale of 1 to 10, probably at 7 or so."*
>
> *"They do a good job, all in all. Really, the litmus test is that when people turn on something that uses electricity and it works. They've met the bar."*

Some customers express indifference, stating that they know anything different, and mention some areas for improvement.

"I guess we don't know anything different, so I guess neither satisfied or unsatisfied. I guess that we're kind of used to it."

"I would give it a 3 [out of five], but my only reason why I don't 5… is there's still some tweaks that are needed. Out of all of our accounts, not all of them have been set up with smart meters yet. The online platform does not work very often."

Overall, very few customers expressed dissatisfaction with the service they receive, reporting problems with communication between the business and utility.

"We had a lot of issues with Hydro One trying to connect the building and getting service… There is no other place I can go… I'm stuck with them… The service I get from Hydro One is terrible."

How Hydro One can better serve organizations and their energy needs

Several customers suggest improving communication by providing a dedicated point of contact to streamline interactions, as they note challenges in contacting Hydro One and experiencing slow response times.

"Communication can be a little tough. It would be nice to have sort of a better regional point of contact rather than having to go though sort of the business customer centre every time, which can take several days to hear back from."

"We don't have regular communications with them, so I wouldn't say we have much of a relationship."

"I tried calling them and couldn't really get through their phone system. So now, I just email. I don't think they're very easy to get a hold of, to be honest…communication and administration can be tightened up a whole lot."

"Just like having a solid key contact for the organization…just someone that can direct you to the proper channels to go through."

Other customers feel that Hydro One could improve their cost-effectiveness to minimize rate increases and remain competitive globally.

"I guess get more cost effective. Get quicker at giving us upgrades."

"Just be efficient so we have efficient because we gotta compete in the global market. And if our costs are higher than the United State or Brazil or China or whatever, we can't compete."

"We're pushing so many businesses out of Ontario because of high fees like they're doing right now… people can't afford these fees… I think if you charge what is right, you'll have continued customers.'"

4.3. Rates

Where electricity fits within monthly expenses

For many commercial & industrial customers, electricity bills represent a significant portion of monthly expenses.

"It's a fairly big impact… It's like $20,000 or $30,000 a month, I think."

"Our biggest facilities sort of consumers are rinks and arenas, and 3 out of 5 are Hydro One, so that would be making up significant portion of our monthly utility budget… It's the highest."

"It's always the most by a lot… $325,000 to $350,000 a year, so I don't know where that puts in the scale of businesses. But when I look at that, I don't have a water bill for $350,000 or a gas bill for that matter."

Value for price

Most customers feel that the price they pay for electricity is reasonable given the importance of electricity or for the amount of energy they use.

"For the power that I'm using, I think it's relatively good."

"It's comparable to what we're getting with Utilities Kingston as far as sort of commodity cost goes."

"I'm not unhappy with pricing… If you look at energy costs, it's still pretty reasonable in terms of what you can achieve with that power once you put it to work through a piece of equipment."

"It's a function we need. We need electricity to run our [equipment]… to run the compressors, to make [REDACTED]… to run the pumps, to pump the water… keep the lights on in the buildings."

However, some customers express concerns about the price that they pay for electricity.

"I don't think it should be as exorbitant as it is… We switched all [bulbs] to LED, which did make a 30% savings and it's [price] still 2 ½ times for the heating. So, I think it's excessive."

"Affordability is huge… If you look at our hydro bills, it's really not affordable."

"Pricing of hydro right now is at a record high, and we have no service and no reliability."

Billing

Some customers express frustration with specific billing issues related to billing cycles, consolidating multiple bills, and net metering.

"Going through the summary billing, I'm downloading close to 300 PDFs a month… If there was an option to just download like Enbridge where you can just download your monthly bills and it comes out in a spreadsheet, that would be fantastic."

"Just the net metering billing. The way it's set up is we can never actually get our bills to zero with net metering even if we are over producing... Utilities Kingston, for example, if you generate $1,500, say of electricity in a billing period, and your bill is $1,400, then you completely nullified your bill, and you've got $100 credit for next month. Whereas, with Hydro One, only certain portions of the bills are eligible for credits… So, Utilities Kingston is much more preferable in that regard."

"I get four different bills. So, it would be much better if they were itemized on one bill, which I have talked to them about. They're like, well, you need to do this and put this in the subject line and send this out, and it took me several emails just to try and get them all dated the same time. I'm like, I don't have time to go online constantly checking for a hydro bill for four different locations here."

"When we tried to change our billing day to be in line with our demand schedule… there was no action and response saying, 'it is what it is.' And the reason that they gave me was, it was something along the lines of that for Hydro One to manage their billing, they had to have so many people on each day of the month, so that they had consistent cash flow or whatever they were looking at. But in them saying that straight up, and not making any bones about it, an absolute disregard for any of the consumers of the

product. It had everything to do with their banking and it was all about them. There was no we. There was no us there."

4.4. Reliability

Importance of good reliability

Reliability is seen as critical for customers, as power outages directly impact their ability to operate. The consequences of poor reliability are significant, with some customers facing operational shutdowns, disruptions to municipal services, or even the loss of livestock or crops.

"Each time I lose power, I can't operate anything in my building."

"For our hundred-day season (winter), it's paramount...If we do not have electricity, we can't turn the [REDACTED]… We have a night operation, so we can't turn the lights on at night."

"We can't function without electricity… Without power, we don't have wi-fi and we've had days where we've had a day of no wi-fi… If there's no hydro, we're kind of screwed all across the board."

"It would mean the majority of the municipal workforce going home for the day if we're experiencing power outages. It would mean disruptions to traffic, big municipal disruptions."

"We'd have dead animals [without power]. So, we have standby generators at most of our locations because if the power goes out, and we don't have standby power, we have dead livestock pretty quickly."

Current levels of reliability

Customers are generally satisfied with the current levels of reliability, with many mentioning that they rarely experience outages. They also emphasize that Hydro One works quickly to restore power during outages.

"It's reliable 90%... There is always power, like we have two sources of backup."

"I've always been impressed with their service when there is an outage… They've all been pretty reliable and certainly work with you to try to get you back online as soon as possible."

"The brownouts from 5 to 10 years ago don't seem to be happening as frequently."

"I feel like reliability wise, we don't really have many power outages, which we're thankful for."

"Sometimes you do have an emergency, but we have our own backup power system, so we're never without power for any length of time."

Some customers note more frequent outages, with some locations experiencing outages two to three times a month. Others mention issues with outdated grid infrastructure causing power fluctuations. However, many participants note that they have backup power systems in place to ensure continuity during outages.

"Depends on the location. There are some locations that hardly ever go out of power off the grid, and then there's other locations, probably two or three times a month. Mostly outages for 20 minutes to an hour… But then the generator just works."

"Actually, we do lose power semi regularly… I have two generators on site which do kick in occasionally… Short little blips, like an hour, half an hour, 20 minutes, 10 minutes, whatever."

"The grid where I'm on presently… dates back to 1967 and has barely been updated. It could be a sunny day here and my whole building will drop to one phase… It burns all the lights, it's hard on the HVAC system, it's hard on my compressors… This will happen once a month."

For a number of customers, maintaining consistent voltage levels is important, especially when running sensitive electronic equipment. While some customers explicitly mention issues with power quality, for most, it is not a top-of-mind issue.

"It's important if we're running equipment on the system… The bigger concern is the consistency of the voltage levels on the lines because it can do damage to some of the electronic equipment… Any of that fluctuation, if it's delicate equipment, it can be affected."

"The fluctuations where it's a quick fluctuation or blip that goes through, and it's a little but more than what can be absorbed, then all the computers go off. All of the point of sale goes down."

"We do experience some of that, but honestly, I would probably say like 20% of the time it's really not a huge issue."

4.5. Hydro One Priorities

Areas Hydro One should focus in the next five to ten years

When asked what Hydro One should focus on in the next five to ten years, the main areas that customers mention include providing reliable power and the need for increased capacity.

"I would certainly be prioritizing stability of the network… We just need more robust systems, and we have a quickly aging infrastructure."

"Probably increasing local capacity for solar installation. We're really looking at doing some big projects… and we're not always getting the approval for capacity at the local distribution."

"Please give us more power. That would be the biggest thing… We are producing more than 50% our own power not because we want to, but because there's no power."

"Length of the outages is key because that's when it becomes disruptive. Everybody can live with 1 minutes to 5 minutes, nobody can live with an hour or more."

Maintaining or improving reliability

Most customers want Hydro One to make investments to maintain or improve reliability, even if it means higher costs.

"I think the reliability is reasonable now… Stay reliable, or at least the same reliability."

"I would say that investing in maintaining the right reliability since we have quite good reliability now …it wouldn't be worth it to pay less and it impact the reliability."

"For us in the business…reliability much more than price."

"[When asked about the trade-off between reliability and affordability] Reliability, yes."

Closing the gap with the Ontario average

Some customers express a desire for Hydro One to make investments that would close the gap on reliability performance between Hydro One and the average Ontario local distribution company, emphasizing the importance of reliable electricity for their business.

> *"[When asked whether Hydro One should make investments to get closer to the Ontario average] Very important."*
>
> *"I think that would be very important goal to have. I mean, as I said for us in the business reliability, much more than price."*
>
> *"Yes. [They should make investments in] outages and capacity… increasing the infrastructure so that we can reliably continue to run our buildings effectively."*

Addressing growth

Several customers highlight the importance of Hydro One making investments that enable both the maintenance of current reliability and the accommodation of increasing demand for electricity.

> *"We have plans for future growth on our property and obviously we'll need hydro at them. Keep in mind the way it looks right now is that hydro needs can't be met, and they're not that reliable. So, it's a tall order for you guys to be able to say, 'We need to ramp up by 25% in Ontario in the next 5 years.'"*
>
> *"[When balancing growth and reliability] I think the reliability is going to be more important. It's great if we can install more heat pumps at more buildings, but it doesn't help if they're constantly blacking out."*
>
> *"Very important… I don't think that it would be worth to pay less for prices and it impact the reliability only because we have so many public use facilities. If the reliability wasn't as up to par or as good as it is today, we'd probably be experiencing a lot of service disruptions and service issues."*

Many customers report increasing capacity and infrastructure as a key area they want Hydro One to focus on to meet future energy needs.

> *"We switch more and more to electric heat. Our demand is just wild and we're really wanting to get off the natural gas and it's not always an option at this point [due to grid limitations]."*
>
> *"We definitely need more capacity on the grid… We are missing out continually on grant programs because we're unable to install renewable energy systems because there's just no capacity on the grid."*
>
> *"You're gonna have to get a lot more grid or more services within the grid. If everybody's gonna want all this hydro out there… I think they're just gonna need a lot more infrastructure in their grid."*

Resiliency to severe events

For some customers, severe weather events have little to no impact on them.

> *"In terms of extremes, we haven't been affected yet."*
>
> *"80% of it [reliability issues] is old equipment and 20% is related to weather."*

While for others, events such as increased rainfall, storms, and flooding have started to have a greater impact on reliability. There is growing concern that these severe weather events are becoming more common, leading to more disruptions in some areas.

> *"It's kind of the same. Maybe in the last one year period, there have been more severe rain… Rain and winds definitely impact things here with hydro and even wi-fi."*
>
> *"In our area, and I think in most areas, there's still a lot of dead trees along the road that come down and take it through ice storms and wind storms, and that kind of stuff."*
>
> *"We've been having increasing flooding and…well…increased precipitation which is increasing flooding in our low-lying areas. Also, just more frequent and intense storms which has increased the number of power outages we're seeing in our area."*
>
> *"We have a lot of trees, so that leads to actually it's not the storms itself, it's the trees falling over during the storms that are impacting the infrastructure."*
>
> *"That's about as important as the reliability piece. If we've got three-day long blackouts, as a result of a storm, we're seeing some problems."*
>
> *"Every building has got a genset system because you can't count on it [Hydro One] … We live in Canada. We've got weather patterns and so on and so forth. I find it rough that everybody's gonna invest $100,000 into backup systems because [Hydro One] can't supply."*

Many customers suggest that Hydro One should increase investment in more resilient equipment or facilities to better withstand severe weather. Suggestions include burying lines and more proactive tree trimming to help further mitigate weather-related disruptions.

> *"Absolutely. I think future proofing everything as much as possible and anytime anything's up for renewal or new construction is considered."*
>
> *"I think it should be strategically. They should look at the location and look at the vulnerabilities."*
>
> *"I have often wondered if you could put all the lines underground, it would get rid of a lot of ice and snow issues."*
>
> *"I really do believe that a whole bunch of our power should be underground in Canada."*
>
> *"Yeah, I would guess so. They used to do a lot more tree trimming than they used to, and most of the weather-related stuff is trees coming down… They used to be a lot more active on that."*

4.6. Future Expectations and Plans

Anticipated changes in electricity usage

Some customers expect their electricity usage to remain relatively steady, with no significant increases anticipated in the next five to ten years. For some, their focus is on improving efficiencies within their current operations rather than growth.

> *"I personally never had a desire to just keep growing and growing. I think it's more important to do what you're doing and do it well and try to gain efficiencies within what you're already managing."*

"No, we don't expect it to change much more apart from just continuing on our net zero transition plan and continuing to electrify more heating systems."

"Smaller electricity demands, and that's based on the technologies that we're using… Things like that increase the efficiency so that we end up making more [REDACTED] with the same amount of electricity."

On the other hand, many customers anticipate an increase in electricity demand, with some anticipating a near doubling of their demand in the next five to ten years due to projected growth in their business operations.

"It'll [demand] increase at least 20%, maybe to 30%."

"Probably will use more because we're going to expand."

"There's some huge expansions coming up in the next five years here, where we will need the power."

"Probably will increase… But if we could somehow make it work to generate some of our own power, we would if it was feasible."

"I would say almost double to be quite honest… Only because of our growth projection… We're going to see a lot more development going through within the next 5 to 10 years in all of our surrounding towns."

Organization's investments to transition from fossil fuels to electricity

Some customers either already do not use a lot of fossil fuels or are actively transitioning away from fossil fuels by adopting things like electric heating systems, LED light retrofits, heat pumps, or electrified equipment. Some have set net-zero carbon footprint goals.

"We don't use a lot of fossil fuels."

"With [REDACTED] target of net 0 by 2040, we are switching over more and more to electric heating, and so we are seeing those electrical consumption increases as well."

"We're definitely looking to go towards more electrification here…We've done all the LED retrofits in all of our facilities already."

"It's a pretty comprehensive program… Anytime any fossil fuel fired heating equipment is up for replacement, we're looking at switching that to heat pumps."

"Our goal going in every year is not to turn on the diesel compressors because it costs so much money… We would like to use the electric generators. We are continuing down the road of reducing consumptions."

Others may have explored electrification options but have found them to be cost-prohibitive given their specific circumstances. These customers express interest in transitioning away from fossil fuels if it was more cost effective for them to do so.

"We did that by putting in LED lighting. We have looked into geothermal heating. We've looking a lot and had different companies coming in, and we actually aren't able to do it based on the specs and bridge and all the stuff. I've got all the costs on it. We've tried."

"Haven't given much thought to that because I guess initially you would say, 'Well that'd be crazy,' cause it probably wouldn't be cost effective… We are kind of motivated by making money... But if a better way of electricity comes in that's more economical to use than gas, then we would switch to electricity."

Organization's investments in new technology

Some customers have already invested in renewable energy solutions or prepared their facilities for technology like solar panels and energy-efficient equipment.

> *"We do have a net metering contract for some solar panels … Energy efficient appliances, it's just standard now… as soon as there's something more efficient, you switch those out. So, we try to keep up with the technology if we know there's going to be a saving."*
>
> *"We're electrifying our fleet. We just finished… really big solar feasibility study on 25 different sites and we're hoping to explore the possibility of virtual net metering."*
>
> *"We've invested well enough that we've invested the last three barns that we built. We've designed and engineered the trusses to take solar if we decide to do that."*

Others have plans to invest in renewable energy sources or new technologies like solar panels, windmills, or battery storage systems.

> *"What one of our big goals is environment, or environmentally friendly sources of hydro…windmills or solar panels. Some way of connecting those into the grid and being able to utilize them efficiently."*
>
> *"The battery storage and the Cogen facilities. Those would be things that we would look at… where we have battery storage and then we put it back into the grid when the grid needs it."*
>
> *"We would love to have the option of virtual net metering. Right now, we can only use electricity that is generated on site for that site…we've got a lot of unused area, we've got a lot of big open roofs with building that has a fairly low demand. So, if we're able to produce offsite and sort of have municipal wide account pool for that net metering, that would be amazing."*
>
> *"Thought, but we haven't started. We haven't looked into it yet... We haven't talked about solar but we have been exploring."*

Importance of Hydro One reducing their own carbon footprint

Several customers believe it's important for Hydro One to take steps to reduce their own carbon footprint.

> *"I think that it sends a good signal to their customers… If we all do a little bit, it does add up… I think technologies that would fit, I'd be receptive and encouraging for them to look into things like that."*
>
> *"If our electric provider is not net zero, then we aren't really either. So that is very important."*
>
> *"I think if we can't do something about climate change, and I do believe it's changing… But anything we can do to compensate for that or reverse it, I think we have to be trying to do."*
>
> *"I think it's very important, because our emissions are basically reflected on the cleanliness of the grid…It would be interesting to see them invest a little bit more in efficiency program for commercial customers, because if we're conserving energy and consuming less, there's more room on the grid."*
>
> *"If it makes hydro more affordable, then it's worthwhile… I'm all for it, and I've even done eco-footprint tests and everything else. But at the end of the day, what they do, only people see how it affects the bottom line."*

At the same time, some customers are not concerned about Hydro One reducing their carbon footprint or feel that it is only relevant if it makes economic sense to do so.

> *"That doesn't really play a role. I mean, is it need to do or is it just a feel-good thing?"*

> *"Unless it makes economic sense, 0 interest in doing that… I don't think you have to do the politically right thing and move to something just to say you're green."*

5. Large Distribution Customers

5.1. Respondent Profile

The participants represent organizations from a variety of sectors, including manufacturing, agriculture, automotive, and more. Participants represent a range of roles and responsibilities in their business, including energy management, billing, sustainability, and operations. For most large distribution customers, electricity usage tends to be relatively consistent, with variations driven by specific operational needs and working hours.

> *"We run a fairly complex operation of [REDACTED] production. It's a fairly complex process and it is very sensitive to any interruptions."*
>
> *"We're a tier one [REDACTED] supplier…we're a manufacturer…we're a 24 hour shift operation with working on weekends…my title is engineering division senior manager. I am Hydro One's primary contact. I look after utilities, maintenance, more maintenance, purchasing materials…I'm also in charge of our greenhouse gas reductions and environmental aspects."*
>
> *"We're a greenhouse company. We start young plants for our greenhouse grower customers. So we're an important part of the food chain in Ontario."*
>
> *"We're a [REDACTED] manufacturing plant. So we have also a warehouse on sit and we have a store on site."*
>
> *"We are a greenhouse company…we do that and we have our own marketing company as well in sales. With the help of Hydro One, we're able to grow year round 365 days a year with the lights we have purchased."*
>
> *"So I deal with all the electrical distribution for the plant and if there's any major electrical changes inside the plant I'm privy to that. If there's new business coming in, I deal with that…we'll run typically size days a week, 24 hours."*
>
> *"Ramps up from September through till June with weekend work… Maybe the odd weekend that we're running a few things, but basically, we're pretty stable."*
>
> *"52 weeks of the year, it doesn't change."*

5.2. Satisfaction with Hydro One

Overall satisfaction with Hydro One

Most customers express satisfaction with Hydro One, citing reliable service and strong communication. Customers identify appreciation having a dedicated contact or account manager who is responsive, particularly in times of outage or maintenance.

> *"They do a good job of delivering the hydro I need when I need it… They're fairly attentive… I've got a contact with Hydro One… I can contact if I have issues…I get pretty good service from Hydro One."*
>
> *"Our large account rep is really good… Communication on outages or planned work has gotten better."*

"I know our account manager really well. So, if the power flickers or goes off, I can just drop him a text, and I hear back in 30 seconds… If they're doing maintenance work, they're really good too."

"It looks like 11 out of 10… The guy I deal with, he's fantastic… I have legitimately 0 complaints. They fulfill what we need 99.9% of the time. He's prompt with responding."

"Generally, they are reacting quite good… It's much more reliable... I can't complain about the service."

Some customers indicate that they feel neutral towards Hydro One. While they recognize efforts to improve, they still experience frustration with reaching the right contacts within the organization.

"They treat us more as a customer than before that you had no choice but to deal with them… Is it still perfect? No, but at least there's a communication line open."

"The people are good, but it's frustrating. It's the same as any large corporation, we feel like we get bounced around… We keep getting pushed through without knowing the right person to talk to… I would probably end up in the middle as a kind of not satisfied."

One customer expresses dissatisfaction due to slow responses and issues with system reliability, particularly regarding infrastructure changes.

"Our experience with dealing with Hydro One for infrastructure changes has been poor… Slow response is a problem… We do struggle with the reliability of the system."

How Hydro One can better serve organizations and their energy needs

Some customers suggest improving communication, as they report slow, infrequent, or unhelpful interactions, expressing a desire for clearer and more consistent communication.

"We really don't engage a whole lot back and forth… We do have our representative, that our electrician and I reach out to once in a while... I can't tell you her name right now. That's how infrequent we talk."

"They weren't super responsive… I wasn't always getting the answers that I wanted right away."

"Maintain the open conversation… that's the important thing… Both need to gain from that synergy."

"Not the easiest communication possible. You cannot get confirmation of when things will happen… then you hear 'Ohh by the way, you didn't fill out this form.'… And we don't know all the requirements they have… Every time there was a reason it took much longer than we anticipated to get the connection."

Some customers also raise concerns about capacity, expressing worry about the system's ability to meet future energy needs. While some customers mention increasing capacity, others mention finding ways to store extra power to be utilized at times of peak demand.

"Have more capacity… What we hear from Quebec… they're saying in 2035, there's going to be not enough power with all the electric car coming in and the new plants making batteries. The concern is everywhere. Is it possible in Ontario? We're going to be in the same boat."

"Concern from my point of view is the growth in the future. Are we going to have enough capacity to grow in the future?"

"They need to improve the transmission province wide though to allow for anyone to generate power and distribute it… We'd also like to produce power, and that's not an option just because of the capacity on the system."

"Can we have an energy system where we bank that energy that we are not using?... If we're consuming 1500 in peaks, while we're using only 1000 or 700 at night, if there's a system that we can bank that energy and use during the day."

5.3. Rates

Where electricity fits within monthly expenses

While some customers acknowledge the cost is higher than they'd prefer, they view it as a necessary expense, especially when compared to fluctuating gas prices.

"Is the bill higher than I'd like it? Sure. But even if it was lower, it would probably still be a little higher than I like it. So, it is what it is."

"Electricity as far as utilities goes would be second to gas but is still a significant expenditure."

"It's quite big compared to our natural gas and it's quite a bit more stable… Gas prices in the last year have gone up substantially compared to our hydro."

Value for price

Most customers generally view the value of electricity from Hydro One as fair, with the price being considered reasonable for the service provided.

"I would have to say the value is ok. I wouldn't say it's fantastic."

"Well, there's only really 2 options, option 1) you can get hydro from Hydro One, and option 2) would be your own generation… We've tried it and it just doesn't compare. So, options 1 is always the play for us."

"Overall, I think we get good value… For us to be competitive globally, our utilities need to be competitive. So, for them to benchmark globally would be important because that's who their supplying power to in the industrial sector."

"Everybody wants to try to save money, but I would say overall, it's a fair price."

"I've no complaints when at the end of the year, I take the amount of power I used and divide it by what it cost."

5.4. Reliability

Importance of good reliability

Nearly all large distribution customers interviewed describe the consequences of poor reliability as severe. Power outages can lead to substantial financial losses, damage to equipment, or operational downtime.

"They're [outages] pretty severe… If we have an outage, we have 200 people and not making parts… We've had equipment break… We actually broke a tie bar in an injection machine last year because the hydro had flickered off and, on a few times… So that was a $10,000 hit."

"Unscheduled outages for us are measured in hundreds of thousands to millions of dollars. So, they're materially impactful to our yearly performance."

"If our system shut off in the middle of winter and we didn't have our generators then and the boilers didn't work, and we couldn't heat our facility, then we'd be in trouble. The whole place would freeze."

"Reliability is key… We have backup generators and emergency plans in place for our water system. The challenge when we lose is that we have large pumps and large equipment running and that is hard stop in a pressurized system."

Current levels of reliability

Many customers report positive experiences with the levels of reliability they experience, with some noting significant improvements in reliability with outages becoming rare and overall service stabilizing.

"I have seen a big change in reliability with Hydro One over the years. It's fantastic… Overall, I'm happy."

"Before we built the new line, it was nightmare for brownouts and power outages, and just dirty power in general. Since we built the new line, it's been excellent… Now we have reliable clean power."

"We really haven't had outages… It's been pretty stable versus what we had been experiencing prior."

"I would say that the reliability has been acceptable. Our staff aren't walking around commenting 'Oh, here we go again with another outage'."

"I can honestly say I don't have as many issues with spikes or brownouts or stuff like that with Hydro, then I do from other distributors… I have complete backup… diesel generators that can run my facility for two days."

Power Quality

When it comes to power quality, some customers report no significant issues. Some mention using uninterruptible power supplies (UPS) to regulate power and avoid any disruptions.

"I have no complaints… We have UPS that regulate power function… I get alarms when we get that kind of thing, and I have very little problems with power fluctuation."

"I don't think we've been subject to a lot of fluctuations or things that are causing any issues in our equipment on site."

On the other hand, some customers identify significant problems with what they describe as voltage fluctuations or "dirty power." For some, power quality issues have led to equipment damage.

"We have a lot of power fluctuation, so have the engineer that challenged Hydro stating that it's unbelievable that we blew a lot of drives and things like that in the plant because it was too much power fluctuation."

"If the grid isn't stable, I've seen so many motherboards fry because of unstable and dirty power… I will say we're generally set up pretty good. We do have towers in our system, so we can be down for a period of time and still comfortably provide reliable water on the ways."

"Our variable frequency drives that we have on some of our pumps, they do not like dirty power. I've blown a couple of them over my career from dirty power, and they're expensive and usually significant operational impacts… It's pretty high impact for us."

5.5. Hydro One Priorities

Areas Hydro One should focus in the next five to ten years

When asked about the areas that Hydro One should focus on in the next five to ten years, large distribution customers largely focus on addressing infrastructure, expanding the system to enable growth, and safeguarding reliability.

"I think new technologies probably where they need to focus… Probably upgrading some of the older systems would be first thing that comes to my mind. Some of the older major lines."

"You know we want to make sure that our power supply to our site is reliable and that starts with our power feeds… We would want to make sure that that transformer station is healthy."

"I probably put distribution and increasing the ability to transmit power across the province as number one. And number two, I'd say reliability."

"Investments in reliability are important… We hear from Hydro and others that the grid will be taxed as electrification happens. We would not want that to result in a decay in reliability for the site."

Maintaining or improving reliability

Many customers are willing to pay more to ensure reliability is maintained or improved, recognizing its importance to their operations.

"I'm willing to pay a bit more to have the reliability…as long as I have the reliability, I don't mind paying the extra."

"I would [pay more] since our reliability is not where we would like it to be, I would say it's likely very important that there be investments there."

"I would go with option 2 to increase reliability for our industry."

"That's 100% if they maintain [reliability], I'd be happy."

A few customers emphasize the importance of keeping rates down to remain competitive relative to other jurisdictions. They generally feel that the current reliability level is adequate and would not support additional investments that would increase costs.

"I can't say that I would value reliability over cost competitiveness because that's you can lose both ways unfortunately in business."

"Don't think we should spend a whole bunch more money to make it better… I wouldn't want rates to have to go up… I wouldn't go and spend a whole bunch more cause it's pretty reliable now."

When it comes to aspects of reliability that customers believe Hydro One should focus on, some customers focus on outage communication and reducing the duration of outages. Clearer communication about outages, such as notifications, is identified by some customers as an area for improvement.

"Their workforce… every time something is a major outage, they do have issues with getting the right people in the right places."

"Well, communication on what actually happens for the outages… it would be nice if there was some sort of system out there that would say, 'Power flicker at 11:54'… I mean just send out an email."

"Limiting the lengths of outages… It's never been bad but if it ever becomes bad, it could be a catastrophe for this area."

Closing the gap with the Ontario average

Customers are largely ambivalent when it comes to whether Hydro One should invest in closing the gap with the average local distribution company (LDC) and recognize the contribution of the rural and remote nature of Hydro One's service territory to reliability outcomes.

"I think it would be a lot of money and maybe a waste of investment to try and catch up to other companies that have a smaller area to look after… I don't think that's a good investment at all."

"For me, I don't see that gap… I don't have any concerns."

"I pay more for Hydro One than I do for one in Brampton… I don't have issues in Brampton either, but yet I pay less… If there was Brampton Power here, I'd switch probably just for savings."

Addressing growth

Many customers recognize the need for Hydro One to proactively address growth while also maintaining current reliability.

"Very important, unfortunately. The government and society have put our hydro and our hydro suppliers in a rough spot with EV, with all the EV technology and forcing it on people. They want me to put easy chargers and just that alone, the extra amount of power is gonna be a lot."

"I trust that they're looking at this, and I trust that they're making the correct moves to continue with providing the same service that they are."

"So our concern is really that hydro's going to be able to supply us with the power, the right power for the future growth…there's no more promises [from Hydro One] on power availability…it's creating more concern than before."

"They have to do some sort of planning out for sure…we want investors to want to be able to come here and think that, 'yeah, I'm gonna have access to power'. It shouldn't have to wait ten years, and who's going to invest if they have to wait ten years to get enough power?"

"I would say they definitely should plan for [growth] now. And if you can plan, they're probably going to be cheaper than if you get thrown in where you have to do something overnight. That's when you really have to pay more. So I think if they plan it now and build it into their future budgets, it would probably be more of a gradual increase in rates."

Resiliency to severe events

Most customers report that while they occasionally experience power outages due to severe weather events, the outages are generally short in duration with power tending to be restored quickly.

> *"Other than lightning storms, major thunderstorms, I've never had any major outages... We had one major thunderstorm that knocked power out. Power was only out for 20 minutes."*

> *"Once in a while with the big winds, with big storm, we have power failure, but what can you do?... It's not major… They restore us really fast."*

> *"There might have been a couple storms, but our lines are above the residential. So even sometimes the residences will be out, but we'll still be on."*

> *"There was a bad winter storm, about two years ago. Hydro was out everywhere for probably that was the longest I've experienced it, probably 15 hours… I don't think anybody got affected by it severely… Had enough generation to last 15 hours."*

Many express concerns about the increasing frequency and severity of storms, such as stronger wind, rain, and snow.

> *"The storms are getting terrible. Everything just seems to be getting worse and worse, like the wind storms are worse, the rain storms are worse. It hasn't really affected the hydro to this point, but I can see it happening."*

> *"The weather's changing every day. It's getting worse. We don't get as much snow, but when we do, it's worse… When we get a thunderstorm, we get a flood."*

> *"Right now, they're doing an awesome job, but we need to also be realistic with all the weather changing like it is right now, maybe it's going to be more and more problematic in certain region… There's cost too, because every time there is big damage, it's not free."*

> *"The weather one is probably the most important because it's inevitable and because you don't know how long or severe it can be… The ones that last the longest usually cause the most issues… 2 very severe versus 7 small ones, I would the 7 small ones."*

A number of customers agree that Hydro One should increase investments in equipment and infrastructure that can better withstand severe weather events.

> *"If they're going to spend money, that's where I would go."*

> *"Definitely… There may be 1 or 2 at most, maybe 3 [outages last year]… Potentially with whole global warming and how severe storms are getting, maybe that might go up."*

> *"Anything that is reasonable, I expect them to do for planning purposes for the storms or something like that."*

5.6. Future Expectations and Plans

Anticipated changes in electricity usage

Most customers anticipate increases in electricity usage, driven by expansions in their operations such as growing automation or facility sizes.

> *"We're gonna grow in the future. There's no choice…We need to survive and the only way to survive is to be bigger…That means we're gonna consume more electricity."*
>
> *"We're going to use more…All of our facilities are going to grow… Double or triple the size of our automation, which would mean a lot more hydro. Probably 2 or 3 times more."*
>
> *"I think it'll just keep increasing and increasing. I don't really have an answer on how much."*
>
> *"Right now, we're only using about 11 megawatts and this would be about another 3 megawatts that we'd be consuming."*

However, some customers anticipate no significant change in their electricity usage, noting that while their equipment might increase, they expect efficiency improvements, which could reduce overall consumption.

> *"I don't know if it will [increase] or not. We're looking at more [REDACTED] machines, however I've been replacing hydraulic machines with electric and there's a 60-65% decrease in usage when I do that… We'll probably see a status quo, even though our equipment is going to increase."*

Organization's investments to transition from fossil fuels to electricity

Several customers are taking various approaches to reduce their carbon footprint. Some have explicit carbon reduction targets, with efforts to minimize energy use and reduce emissions. Others are already using mostly renewable energy sources and engaging in energy-saving practices.

> *"We want to be carbon zero by 2028… We don't have a large carbon footprint as it is, but we want to be carbon 0 because we don't manufacture anything… It's a little easier to have a 0 carbon footprint in a distribution center."*
>
> *"I would say we do a pretty good job at that. We don't really use that much gas in to begin with. We use mostly hydro when it comes to everything."*
>
> *"We're doing a bunch of different things - we have these light abatement currents, energy abatement currents, everything to try to keep in the heat to use as least amount of gas as possible… I can't day we do zero because that's impossible, but we're working on it."*
>
> *"We're working on plans to 2050 to try to be as clean as we can."*

Some customers are considering or actively transitioning away from fossil fuels and towards renewable energy sources.

> *"We're decarbonizing our fleet. As we're decarbonizing, we're looking to put in EV charging stations… The next step would be to look at our grid setup so that we can put charging stations fairly robustly throughout the city to be able to move towards the greener fleet kind of thing."*

"We produce natural gas because we have anaerobic digestion here on site so we're looking at potential cogeneration impacts…There was a lot of discussion about moving the natural gas heating supply over to the electrical grid."

Some other customers do not have plans to transition from fossil fuels to electricity, citing concerns about the ability of the grid to handle the increased demand and the high costs of switching.

"I don't have any plan here to do that. I just don't see the system being able to handle it or grid. I have 60 rooftop units that run on natural gas right now. If I were to switch those all over now, it would basically triple our hydro bill."

"I've investigated heat pumps to replace natural gas, and the cost factor is just astronomical. Like right now, it's not feasible for us to do that."

Organization's investments in new technology

Several customers are considering or have already made significant investments in new technologies to improve energy efficiency or generate their own power, such as energy efficiency upgrades on equipment, solar power, or battery storage.

"We just did a LED project to save $14,000 a month on our hydro bill… That's a huge reduction in hydro bills. If we can find more things like that to do, that's what we'll do."

"We're always considering new investments, if they're profitable… We have peak saving at the site because that is a mechanism that is that is profitable for us. So, we participate in that and we participate in demand response programs."

"We've done a lot of energy efficiency upgrades, a lot of upgrades on a boiler - burner upgrades, our control upgrades on boilers that help save quite a bit as well. We've changed our heating system fully. We have a condenser on all our boilers."

"Things like solar walls where we put the power back to the grid… Looking at going from AC motors to DC motors to variable speed frequency drives… Anything we can do for energy efficiency to make ourselves more green, we will… We're an environmentally friendly company and saving money is big."

"I can't say that we have concrete plans right now to invest in, for example, solar or batteries, but we absolutely have been looking at those things as possibilities."

"Our shareholders are also thinking about clear energy; they're looking at sustainable energy. We are looking at investing in quite a large solar generator on our greenhouse."

Importance of Hydro One reducing their own carbon footprint

Customers generally support Hydro One making investments that reduce their own carbon footprint.

"I'm going to say everybody to do their best to reduce their carbon footprint… I don't know their business inside out, but I would say it's just as important as anybody else."

"I wish I knew more about their initiatives for green energy… They're a big animal and I'd like to see that they're on the same track… Like are they electrifying their vehicles?...I would like to see them go green."

"There needs to be a shift in policy towards using renewable products for power generation, like with forest biomass being a renewable product."

"I think it's important…we're all going to have to do our part, so I think they should go down the same path as all of us…"

Some customers emphasize the importance of Hydro One ensuring that investments to reduce their own carbon footprint are carefully planned and come at a minimal cost to customers.

"I think it's important for the environment, but it's gotta be done properly…you have to have a plan on how you're gonna get there…It needs to be smart investment. It needs to be investment that the customer, the environment, and the company are all going to gain from."

"If they could clearly lay out the cost…here's how much we're going to save, you know? We probably would [support Hydro One to make investments to reduce their carbon footprint]…as long as it was reasonable…obviously if it was ridiculous, then it wouldn't be that attractive."

6. Large Transmission Customers

6.1. Respondent Profile

The large transmission customers interviews include those representing generators, end users, and local distribution companies (LDCs). End users largely represent sectors such as mining, chemical processing, and other large-scale industrial manufacturing. Most participants hold senior roles in their organization in operations or engineering. Energy usage patterns are unique across the organizations that participated, but can follow a seasonal pattern, with higher demand in summer and winter. Some customers, depending on their operations, report consistent and continuous energy use.

> *"If the demand is high enough and there isn't any [or sufficient] wind and solar, then our plant gets dispatched. We are probably running about 20% of the hours in the year." (Generator)*

> *"Maybe in the winter and shoulder seasons it's a little bit less only because we get more output from our generation. So, we use a little less from the grid. But other than that, we're flat line 24/365… It never shuts down." (End-User)*

> *"Our facilities are sometimes meant to run in the cold more so they can produce more in the in winter. That said, in the summer we use a lot of cooling water which would use a lot more electricity. But other than that, it's just meant to run 24/7." (End-User)*

> *"We service [REDACTED] customers and our service territory… [is] quite geographically diverse." (LDC)*

6.2. Satisfaction with Hydro One

Overall satisfaction with Hydro One

Nearly all large transmission customers interviewed are satisfied with Hydro One and describe their relationship as positive, open, and collaborative.

> *"Our relationship [with Hydro One] is quite good. It's open. They've made for the better based on input we provided, and I would think they'd say the same with us." (Generator)*

> *"In terms of customer service, I am happy with Hydro One." (End-User)*

> *"Hydro One's been a good partner with us to make us aware of whether or not the work that they're doing on transmission is going to affect our load. [Our contact is] very attentive to our inquiries in helping us understand what they need to do us and them listening to what we need as well. So, I think that's really positive." (LDC)*

> *"Our relationship with Hydro One is good. We're satisfied with the response that we get. There's always some room for improvement, but no significant concerns with their service to us." (LDC)*

Only one participant describes their overall relationship with Hydro One negatively due to perceived competitiveness from Hydro One along with other operational challenges.

> *"Great people work there. [But] they don't treat us like a customer. They treat us like a competitor." (LDC)*

How Hydro One can better serve organizations and their energy needs

Some customers identify areas for improvement to further strengthen their relationship with Hydro One, such as streamlining processes, communication, and long-term infrastructure planning and timelines.

> *"The largest challenge is timing with them. The two companies need to get better at aligning and streamlining these [application] processes so that we can move forward on both ends." (Generator)*

> *"There are some logistical concerns. The company does struggle with fluctuating timelines and communication." (End-User)*

> *"One concern I have is just their ability to meet timelines. [They are] tied in their own internal processes, and then you might end up [with] six months of delay that didn't have to happen because it sat on approval points of process." (LDC)*

> *"If they can share the future capital plans, information like what's [their] requirement gate is expecting on the northern part of Ontario… it's good to know." (End-User)*

Some customers suggest an improvement in efforts by Hydro One to have regular, and personal interactions with their company.

> *"There's a lot of one-way nonverbal communication nowadays, and a lot of it gets overlooked because It's just an e-mail… I don't think I got that, like a personal call." (End-User)*

> *"When I brought up [requests], I haven't heard feedback. It's falling through cracks. It either wasn't delivered or was [not] considered, but nobody got back to me." (End-User)*

> *"The planning sector sends me a spreadsheet of planned outages. The one part that's missing is I usually have to reply to that e-mail to say 'hey, does this affect our load?' Because of course they can redirect power and not affect our load. That's never clear." (LDC)*

Some specifically mention automation or improvement to interfaces that would enable real-time information sharing, especially in cases of service interruptions.

> *"Having an active software that can show me outages that are coming up, and I can plan for and have real time access to … I would say that's honestly the best." (End-User)*

> *"A lot of their [Hydro One's] processes are manual. Automation [could help] a lot of these things." (Generator)*

> *"But the communication interfaces sometimes just aren't as up to date as they should be… It should probably be a web page that you can actively check and get notifications if anything is changed. So I can hear instantly rather than wait for my automated email that comes every Friday." (End-User)*

6.3. Rates

Where electricity fits within monthly expenses

Most large transmission customers consider electricity costs as a manageable part of their monthly operations.

> *"Drop in the bucket…it doesn't move the meter, figuratively speaking." (Generator)*

"[The bill] is still going to be positive for the month because we did run for the first two weeks and then producing at a good amount, enough to pay the bills and stuff like that." (Generator)

"Right now, energy is 8% of our total operational costs, that includes gas. [If] I break it down, [it would] probably be half for electricity, half gas." (End-User)

"Ever since we changed over to a direct connect, that significantly changed our overall rate that we were paying… But we were now paying like a kind of a blended rate per kWh, that definitely positively impacted the financials of the company." (End-User)

Value for price

Most say that they get good value for the price that they pay for electricity.

"We have the lowest energy price in our group, and I think we have probably the lowest energy price anywhere in North America. So, we're pretty satisfied with what we're doing right now… Overall, we're very satisfied with the price we pay." (End-User)

"We generate our own power as well, so I can compare what it costs to generate as opposed to what it costs to purchase. We're a flat base load all year. But I can see what the difference in prices from Hydro One or the grid, from generation…we're not unhappy." (End-User)

"[The value] is not bad… Our overall blended rate is a lot less than what is on the residential side, simply because we take advantage of the global adjustment side, which reduce the overall rates." (End-User)

One participant feels that electricity prices are higher in Ontario relative to other jurisdictions, which they say may lead them to grow their operations elsewhere.

"[Looking at] the overall cost for electricity, [Ontario] is our most expensive region… We just grew and are scarred from that growth experience… The Ontario market might not be the market we grow again [in the] next 10 [years] for a number of reasons, one of them being the electricity costs." (End-User)

6.4. Reliability

Importance of good reliability

Across each type of LTX customer (generators, end-users, and LDCs), customers emphasize the severe operational or financial consequences of experiencing poor reliability.

For generators, most customers highlight the importance of reliable power in their ability to generate power and feed it back into the grid.

"Even though we generate [electricity], if their system isn't available, then we can't generate. The reliability of their transmission network is vital." (Generator)

"Reliability would be at the very top... In the generation world, [we measure by] EFOR – equivalent forced outage rate. It measures how bad we do things. The smaller the number of, the better we look." (Generator)

End-users commonly cite significant financial losses and sometimes safety issues when facing interruptions or power quality issues.

"[Interruption] causes our equipment to trip. It usually shuts down very hard… Our facilities are billion-dollar assets. It's a commoditized product and they're making in a very large amount of volume. [Also], there'll be a cleaning cycle… because you have to clean out the vessels and reactors and start again." (End-User)

"Lots of money goes out the window when that [outage] happens… It's a lot of money to get them back because you can't just dump them down the drain and start over. So yeah, it's very expensive." (End-User)

For LDC participants, reliability issues have a broad impact on their customer base and in some cases, their relationship with their own customers.

"It's a big deal to us because that's going to affect 1/3 to 1/2 of our customers and it's going to take us some time to bring all the customers back online. It's a pretty devastating loss to a good portion of the town." (LDC)

"The impact [of an outage] on us is tremendous… With one issue on the Hydro One transmission line, you could be easily affecting 40%, sometimes up to 50% of our customers… like tens of thousands [of customers]." (LDC)

"When there are outages… some of the grocery stores need to get mobile generation units or mobile refrigeration units, or it's spoilage. So even though it's uncontrollable by [our company], it will still [affect our] brand reputation negatively." (LDC)

Current levels of reliability

Most customers are satisfied with the current levels of reliability, commonly citing improvements over the years.

"Reliability has continued to improve over the years. If you look back about 10 years ago, it [outages] was very frequent." (Generator)

"They [Hydro One] do a great job… I would say their reliability's got to be on par with anyone in the world." (End-User)

"Reliability is better than what it used to be. [But] it still has room to grow." (LDC)

Some customers recognize Hydro One's continuous efforts to improve reliability.

"There was historically not as good reliability, because the [REDACTED] transmission connection was a singular connection and so whenever there was maintenance done on that Hydro One substation, they would have to take the town out for a full 8 hours. Hydro One installed the switch so that we could go to a different feeder. And so, we found that that has dramatically minimized the time that we've had again the entire city out, which is really produced a lot of positive feedback from our customers. Because, they're starting to see improvements being made." (LDC)

"In the last four or five years, we have only one or two [outages]. […] Other than that, I'm pretty happy and I like they are doing some projects to further reliability on the system." (End-User)

"Hydro One is doing pretty good right now [on reliability]. I've seen them doing some projects to improve the reliability." (End-User)

6.5. Hydro One Priorities

Areas Hydro One should focus in the next five to ten years

Many customers mention proactively addressing growing demand as a key area that Hydro One should focus on in the next five to ten years. Generators are especially likely to want Hydro One to focus on preparing for growth.

> *"Ultimately the biggest challenge for [Hydro One] is the grid, the grid is going to have to grow… Over the next five years, [we need to] start to plan out with them – where is the generation going to be? How will the grid have to change to support that?" (Generator)*

> *"Infrastructure. Obviously. A lot of the sites that we are looking to develop are remote. So obviously, we're going to need to have transmission installed to go to these sites. […] We need Hydro One to work together with the suppliers to make it happen." (Generator)*

> *"Transmission expansion. The IESO, Ministry of Energy [… announced] 'we're going to put in 5,000 megawatts by 2031 or 32. The existing transmission infrastructure can't support that. So all transmission has to grow." (Generator)*

> *"The electrification is coming there. We have to be ready for it. Everyone has to be ready for it." (End-User)*

Some customers mention investments in infrastructure renewal as a key area that Hydro One should focus on in the next five to ten years.

> *"The whole power grid in Ontario is made in the 80s… We're getting up to that point at which it's exceeding that threshold significantly. So that's something that they should probably look into investing into, upgrading their infrastructure so that it can be more reliable for the future." (End-User)*

> *"Some old transmission lines are still connected. Those could be a hazard. So, there is still a lot of infrastructure they need to improve." (End-User)*

> *"Hydro One in the past had a metric that said if so and so much load is connected to only a single transmission line, according to their metric, they needed to up size it to a double transmission line. Having that metric be low enough, addressing single transmission lines and single contingency failures is an area for improvement." (LDC)*

Maintaining or improving reliability

When discussing the trade-off between cost and reliability, LTX participants are overwhelmingly willing to pay more to maintain or improve reliability, citing the costs of poor reliability to their operations.

> *"The reliability is more important than a few cents on the bill. I can understand having my own house that I don't want the rates to go up and I'm OK with power outages every once in awhile, but not here. Different here." (End-User)*

> *"...categorically investments in improving their posture for resiliency. I probably tolerate a cost increase associated with that just because the cost associated with failure is much more significant." (LDC)*

"Hydro One's system is in good, favourable reliability… and there's not so much you can do [with] winds and hailstorms. So keeping it in good condition to sort of operate at the normal level, but then pre-investing where it makes sense." (LDC)

Addressing growth

LTX customers emphasize the importance of Hydro One making investments to support increasing energy demand without compromising reliability.

"[Hydro One] have a tremendous task ahead of them as the sector grows and demand increases in Ontario and similarly so do we. The model is forecasting that Ontario's demand is expected to double by 2050. So that their infrastructure and everything has to improve just as we have to find more generation." (Generator)

"I think that's extremely important." (End-User)

"Significant, [it] is very significantly important because if they don't start the investment today, they won't be able to meet the requirements for sure." (End-User)

"[In areas] where they're already investing in assets, [they can] pre-invest that extra to prepare for a potential future of higher needs from customers." (LDC)

Resiliency to severe events

Most generators are satisfied with reliability related to severe weather events, acknowledging Hydro One's timely response to outages caused by severe weather.

"It's about the same. Even I'd say it's even been down a bit from when I first started here from outages in the summer due to lightning. This year I think we had one for lightning. So that's very good." (Generator)

"We're not so concerned about Hydro One [regarding severe weather events]. It tends to come back up fairly fast. And they're pretty good at moving from maintenance mode to all hands on deck in a hurry." (Generator)

"You should keep up time there, but we're not really affected." (Generator)

Further investments in resiliency are seen as more important to some end users and LDCs due to the significant impact on reliability.

"Without electricity our plants don't work. Those are billion-dollar assets that would be just sitting. So yeah, if there are threats to power supply like severe weather, insulating their system would be key for us." (End-User)

"The whole industry is under that microscope right now of resiliency. To me, that's almost just standard operating procedure that we need to strengthen the backbone of our systems." (LDC)

6.6. Future Expectations and Plans

Anticipated changes in electricity usage

Anticipated changes in electricity use vary across the organizations interviewed. Some customers expect their usage to stay relatively stable over the next five to ten years.

> *"It'll be the same. It'll be flat, baseload all the time." (End-User)*

> *"We have 1% growth in both population and in new business. So not a lot [of growth]. Even none of our developers are electrifying the new subdivisions. They're still putting in natural gas. They're not putting in EV connections in these new homes… On the residential side, we're not seeing residential load switching." (LDC)*

While others anticipate growing demand over the next five to ten years.

> *"I can see [us] going to increase the load gradually, like 15% to 20% maximum in maybe 7-8 years." (End-User)*

> *"There might be a slight increase. We still have a bit of room in the contract. I don't see it substantially increasing." (End-User)*

> *"We've seen a lot of inquiries on the larger data center. We're talking about 30 to even 100 or even 200 MW. That's two or three transformer stations by itself. We foresee that electrification will drive the load for the whole service area. When we did the load forecast [and] identified [that] we need to, in the next 20 years, probably increase the existing transmission capacity by 50% to 60% to meet the need." (LDC)*

> *"We're in early planning for a potential addition of up to 4,800 megawatts on site. That's part of that powering growth of Ontario [that] the province has asked us to look at that." (Generator)*

> *"The only place I can see that being a problem is if we start cording things like data centers. I think EV charging will be some of that, but I think that's going to settle down." (LDC)*

Organization's investments to transition from fossil fuels to electricity

Many customers say they have taken steps to transition their facilities and operations from fossil fuels to renewable sources of energy. These investments are often driven by corporate electrification strategies and a perception of long-term return on investment.

> *"We are in discussions with solar farms [for] different ways of producing. We're mostly renewable energy, so no coal-fired the boilers, no gas boilers, no stuff like that." (Generator)*

> *"The owner [of our company] has said that 'carbon neutral is our license to operate.' So, all the expansion, all the new products and new plants that we're going to build are all dependent on us being carbon neutral. To decarbonize, we'll need a new transformer station... We'll have to bring in an electric boiler." (End-User)*

> *"We are having electrical boilers to [replace] the existing natural gas boilers. [These are in] their five-year planning. Some fundings are already in. Some of them are currently under design." (End-User)*

But, not all customers say that they have taken steps or have plans to transition away from fossil fuels in the next five to ten years, as other strategic priorities or financial considerations have taken precedence.

> *"Nothing significant, unfortunately. That's not really on the company priority list right now. The company is looking for a more accurate way of making [products], not really changing any of the electrical infrastructure to support a more efficient plant." (End-User)*

> *"It's driven by a business case… In the future, I wouldn't discount it [if] the price of solar keeps on getting less cost prohibitive." (End-User)*

Organization's investments in new technology

For those who plan to invest in new technology, battery and solar are mentioned as common considerations. Some customers say that these new technologies can provide opportunities to enhance flexibility around peak load and lower overall costs.

> *"The only thing we are thinking [about is] maybe the battery storage... But we haven't really built anything like that yet. The main driver on that is again for the curtailment." (End-User)*

> *"Battery seems to be the flavor of the day right now." (Generator)*

> *"There are currently plans to potentially have a solar area or a battery energy storage system in the future, but nothing concrete… The primary goal for the company is money… to charge up the batteries off peak hours, and then we could effectively lower the overall electricity rate that we're paying on average." (End-User)*

> *"I know we have had meetings for various solar projects and that would be to offset our peak electricity in the summer." (End-User)*

Importance of Hydro One reducing their own carbon footprint

Many customers believe it is important for Hydro One to make investments to reduce their own carbon footprint, but priority levels and reasons for support vary.

> *"[We are] a green, renewable energy company. That's the goal of everybody to be as green as you can." (Generator)*

> *"It is important because if somebody tell us the grid is not clean, now we have to invest something else to make it clean, because otherwise how do you meet the target?" (End-User)*

> *"It is in the strategic objectives of our board to reduce our carbon footprint [and] to promote and enable that to the greatest degree possible… Anything Hydro One could do would provide a better overall footprint. I know there'd be a cost premium for that, but we would support carbon footprint reduction initiatives." (LDC)*

Other customer say that they worry making investments into reducing Hydro One's carbon footprint could come at the expense of other priorities, such as reliability or cost.

> *"If you can do it and still maintain everything else, fine. [But] it may impact reliability because I'm not sure battery powered fleets work so well in Northern Ontario when it's -40." (Generator)*

"They want to be decarbonized, which means there's going to be a lot of large investments in nuclear and hydro, which is not a bad thing. But it makes [Hydro One] uncompetitive for energy intensive industry. If there are other jurisdictions with lower energy costs, it just inherently puts Ontario into a bad position." (End-User)

"A company like Hydro One, that is so integral to the success of every person in Ontario basically… It's very important for them to be reliable, regardless of [whether] they can have more energy efficient facilities, try and decarbonize their fleets, get hybrid vehicles for local areas, initiatives that help them overall. But nothing to ever restrict the reliability of a company." (End-User)

2. Methodology

Innovative Research Group Inc. (INNOVATIVE) was engaged by Torys LLP on behalf of its client, Hydro One Inc. (Hydro One), to gain a deeper understanding of the needs and preferences of customers, specifically as it relates to Hydro One's Joint Rate Application to the Ontario Energy Board (OEB) covering the years 2028 to 2032.

As part of this engagement, INNOVATIVE conducted qualitative research to uncover specific electricity needs, outcomes and priorities from municipalities and industry associations in order to inform planners for the 2028 – 2032 draft investment planning process. All industry associations and municipalities interviewed either directly or indirectly serve Hydro One transmission or distribution customers.

This report summarizes the results of a series of in-depth interviews with municipalities and industry associations.

Approach to Stakeholder Engagement

Hydro One provided INNOVATIVE with the contact information of selected industry associations and municipalities who either directly or indirectly serve Hydro One transmission or distribution customers. INNOVATIVE invited associations and municipalities to schedule a meeting with INNOVATIVE to share their needs and preferences as they related to Hydro One's Joint Rate Application covering the years 2028-2032.

Outreach efforts included Hydro One's community and municipal relations team and external relations team pre-socializing the interview opportunity, providing a brief summary of what to expect from the interview, and that INNOVATIVE would be reaching out to them in the coming weeks.

INNOVATIVE began sending initial invitations to associations and municipalities to participate in an interview on October 7th, 2024. Those who had not yet signed up to participate in an interview received a reminder email from INNOVATIVE between October 15th and October 17th, 2024. This outreach led to interviews being conducted with 9 industry associations and 9 municipalities via videoconference or telephone.

Audience	Participants
Industry Associations	Association of Power Producers of Ontario BOMA Ontario Ontario Chamber of Commerce Canadian Renewable Energy Association Ontario Federation of Agriculture Canadian Federal of Independent Businesses Ontario Greenhouse Vegetable Growers Automotive Parts Manufacturers Association Canadian Manufacturers and Exporters
Municipalities	Durham Region City of Sault Ste. Marie County of Essex Chatham-Kent

	City of Toronto City of Greater Sudbury City of Kingston Region of Niagara City of Peterborough

Interviews were approximately 45 minutes in length and were conducted by a trained moderator following a discussion guide. In appreciation of the time provided by participants, INNOVATIVE offered a $150 cheque in either the form of a cheque or a charitable donation for each participant.

About this Report

This report summarizes the key findings based on these interviews. In general, our approach is to report representative verbatim comments and offer interpretation and/or commentary where necessary. Verbatim responses are shown in blue italics.

Please Note: Qualitative research does not hold the statistical reliability or representativeness of quantitative research. It is an exploratory research technique that should be used for directionally. In interview-based research, the value of the findings lies in the *depth* and *range* of information provided by the participants, rather than in the *number* of individuals holding each view.

3. Key Findings

Industry Associations

Most associations report having a strong relationship with Hydro One.

For those who do, they cite positive communications and collaboration on major projects and planning.

Some associations report very limited contact with Hydro One and are unsure of who they would approach if they needed to engage with someone from the utility.

Some would like Hydro One to be more proactive in their communications and share more information with them or their members on things like energy saving opportunities, better understanding bills, and information about how the system works.

Associations largely report strong reliability on behalf of their members, with some concern in more rural and remote areas.

Good reliability is of significant importance for members of many associations. Overall, the current state of reliability is viewed positively; however, there are concerns about more significant impacts in rural and remote areas.

Many associations strongly emphasize the importance of Hydro One preparing for growing demand of electricity in the province.

Some associations express concerns about capacity constraints, especially as it relates to growing demand due to electrification and the changing ways their members are using electricity. Many believe that Hydro One should prioritize preparing for the energy transition in the next five to ten years.

Several associations want Hydro One to explore new technologies and approaches to help meet growing demand and build resiliency to severe weather.

Some associations specifically mention the exploration of non-wires alternatives and enabling more local, small-scale generation to meet these emerging challenges.

Municipalities

Municipalities' relationship with Hydro One vary, with some describing a strong, collaborative relationship and others reporting little to no engagement with the utility.

For some, this limited relationship is not identified as an issue, especially since they have a closer relationship with the LDC in their own municipality. Others desire more proactive engagement, specifically mentioning more frequent meetings or touch-points.

Many highlight affordability of electricity as an important priority.

This is especially in the context of the ability to attract businesses and growing industry to their community and for more vulnerable populations, such as seniors and those on fixed incomes.

Most municipalities are satisfied with the reliability they experience today.

Municipalities largely note that outages are rare and when they do occur, they are happy with Hydro One's response. Some call for Hydro One to make investments that improve the resiliency of the system in order to better withstand extreme weather.

Several municipalities anticipate their communities will experience growing electricity demand in the next five to ten years.

This is driven by a variety of factors such as residential growth, industrial growth, electric vehicle uptake, and electrification of transit or fleets.

Many express concern over the adequacy of capacity to meet future demands for electricity.

They emphasize the importance of Hydro One looking to the future and making the necessary investments to meet this growth. Some specifically call for improved communication and sharing of information between Hydro One, municipalities, and key planning entities like the IESO.

4. Industry Associations

4.1. Relationship with Hydro One

Current relationship with Hydro One

Most associations express a strong relationships with Hydro One, frequently engaging in discussions or collaborating on large projects.

> *"We engage with Hydro One on the need for more transmission build out in this province to enable more load, but also enable more generation on the system… I think we have a good working relationship with senior leaders at Hydro One in transmission and distribution"*

> *"I have a very extensive relationship with Hydro One… We have a member service rep that helps the local customers and our members. We participate in Hydro One town halls, and whenever they're doing large projects… We have dealt with Hydro One for years."*

> *"The relationship that we have with Hydro One is pretty good and they do proactively kind of reach out to our members."*

However, a few associations report limited or no contact, not knowing who to approach at Hydro One.

> *"No interaction in my current role… interactions are primarily with Toronto Hydro."*

> *"I wouldn't really know who to contact, like who's working within the building ecosystem in Toronto from Hydro One."*

Some want Hydro One to take more initiative in communications, with one suggesting that they should be more proactive in developing relationships with associations.

> *"I reached out to them… My advice would be for them to actually reach out to associations like ours… I think it's incumbent on them to reach out… and establishing that relationship."*

Overall satisfaction with Hydro One

Most associations express general satisfaction with Hydro One, mentioning their visibility in communities or leadership in the sector.

> *"Hydro One seems to be doing pretty well with being visible in communities. Being open to dialogue and feedback from people in communities… I think their commitment to the local footprint is impressive."*

> *"I see them as a leader… Look at the level of success we were able to achieve because we've had backing from a company like Hydro One, who's done a very good job of listening to the people."*

4.2. Current and Emerging Needs

Preparing for growing demand

Some customers express concerns about capacity constraints, particularly noting anticipated increases in demand due to electrification or the changing ways electricity is being used. They emphasize the need for Hydro One to proactively prepare for growing demand.

> *"Capacity issues are definitely something that's coming up... They want to start putting electric vehicle charging, electrifying their boilers, their water heaters… Is there capacity to do that? Toronto Hydro says yes, but a lot of media says no."*

> *"There's so much capacity constraint down here and a lot of demand for energy… There isn't a lot of capacity in these smaller distribution lines."*

> *"I think there was an incentive out a couple of years ago to have electric [redacted] machine… except I couldn't install that because there isn't the capacity in my distribution network for me to suddenly for three months of the year, have that much draw on the system."*

> *"There's a lot of concern about energy supply, given how many of these electric vehicles the Ontario government wants to put on the market… So, there is a concern about energy supply on the EV side, and energy charging."*

> *"I anticipate that there's going to be significant development in Ontario. Infrastructure development, electricity… They need to be ready… ready for the large amounts of development and everything that comes along with that… Build it out now. It's cheaper now to do it than later."*

Information sharing

Some associations say they would like Hydro One to share more information with them or their members on things like how to reduce rates through energy efficiency, explaining billing and costs, or information about the system.

> *"The biggest thing is for Hydro One to make known more through our association how they can help reduce rates through energy efficiency."*

> *"Our members would like to have more detailed, more streamlined, useful interactions with Hydro One when they're looking to connect hypothetical project or a potential project that would connect to Hydro One's transmission or distribution grid."*

> *"How careful and cautious they are with sharing their maps and their system, and their connection capacity limits on each of those lines and circuits on their map…We need this information to make good development decisions… Let's have an open access information, all these other jurisdictions provide it."*

> *"Hosting public sessions for information sharing just so that people can understand… the way the bills are set up, understanding why the costs are what they are."*

Affordability

Affordability is a significant concern for most associations, as electricity is identified as a significant cost for many association members.

> *"Cost of energy is probably the main issue I would say… They want to know that there's energy available for the long term at a reasonable price."*
>
> *"Cost of doing business is always right up there… a slice of that is electricity as a major cost that they [members] have to deal with… So, it comes up as a concern since the sustainability of their business relies on access to electricity."*
>
> *"I hear the general thing. Everyone says that it costs too much for electricity. And for my customers, they don't have a lot of options that you might have… They're also a business, so it's not like we can shift to off peak times… We can't participate in a lot of things that are designed for the general customers."*
>
> *"40% of our members say that electricity costs are a major cost constraint, so keeping costs low… A lot of small businesses have yet to pay off COVID debts. They cannot afford any cost increases at this time."*
>
> *"In an ideal world, we don't raise rates. We freeze them ideally and the energy supply be reliable… If you have to raise them at some point, reach out to businesses to see what they can afford."*

Reliability

Good reliability is critical for members of many associations, recognizing the importance of stable electricity supply.

> *"In the summer…the floods. That reminded people how important electricity is… But in terms of day-to-day reliability, there hasn't been any serious concerns."*
>
> *"Those connections need to be reliable… If there are situations that occur that are a problem, they need to be remedied relatively quickly."*

Overall, most report good reliability for their members with no significant concerns. However, some challenges exist in remote and rural areas, where power outages can have additional consequences.

> *"We're not having brownouts or reliability concerns… There's not concerns about the current system."*
>
> *"The reliability for the most part is quite good. I will say this - there are certain areas, more remote areas, ends of radial lines, that kind of thing where either a [REDACTED] customer maybe doesn't have the optionality associated with taking some of their feeders out of service and doing some work and still being able to do their job."*
>
> *"Power outages in the rural system are significant… If they have to do some upgrading… what they end up doing is going in there and replacing as much as they can… they'll replace stuff that doesn't even need to be replaced yet because they know they can't come back here next week or next month or even next year and replace things… So, it's an unfortunate kind of situation in one way it wastes money. In another way, they're aware that they have to have an uninterrupted service for their customers."*
>
> *"I personally think they do a pretty good job [communicating about outages]. I think it's more education for the general public to understand that there are these pieces of information available… I don't know how much more they can do to improve that communication."*

4.3. Hydro One's Priorities

Preparing for the energy transition

Many associations believe Hydro One should prioritize preparing for the energy transition in the next five to ten years.

> *"Energy transition… So, generation's part of it but transmission is part of it as well… Hydro One is the best advocate for transmission… They need to provide information to policymakers, to the IESO…this is not just a single-issue discussion… if they have a situation where they think they can propose something that is more reasonable in terms of costs and reliability, then by all means it is up to them to do so."*

> *"We're obviously aware of the energy transition that is taking place is going to be a fundamental change in the electricity sector. I think the IESO is suppose to be coming out with a new forecast… I'm expecting they're going to say we are further behind that we though we were in terms of both capacity and energy."*

> *"I see them as an enabler for sure, and in fact even catalyst to [energy transition]. The more positive news and strides that Hydro One makes… to me, that's a win. It's a social responsibility for large companies like this. I feel to do their part, I think it's a great thing."*

Exploring new technology and local generation

Several associations want Hydro One to explore new technologies and approaches like non wires alternatives and enable more local generation to help meet growing demand and build system resiliency.

> *"I don't remember a period of time where we had as daunting a task in front of us as we do today … So, from a transmission side, Hydro One hasn't done this kind of a build out either and they haven't worked in this way where they're looking at non wires alternatives as well as wires alternatives to generation sources and being reasonable in terms of this is what it could mean."*

> *"Building in redundancy. Building in microgrids that they can tap into so if there is large scale outage, we can still operate… Adding in new non-wires alternatives, or other infrastructure, smaller infrastructure they can tap into is increasing."*

> *"Enable more generation. We have to build out more transmission, but at a local level Hydro One should look to slightly soften its ultra conservative limits on its distribution system to enable more local generation to be connected… Open up their grid a little bit more."*

> *"I would say the first thing is that we have the capacity in place to expand and sustain our business. And in addition to that, we have to have a more resilient system. So, a little bit more redundancy in place so that when there are power interruptions, they're less frequent and shorter duration… I think the cost looks after itself as more renewable generation becomes less expensive and we're avoiding carbon charges."*

4.4. Future Expectations

Anticipated changes in electricity use

Most associations expect an increase in electricity use for their members, which they expect to be primarily driven by increased demand from electric vehicles and business expansion.

> *"Yes, energy as a whole for sure… Things like demands, from the electric vehicle side as well, increasing those within our building. Parking lots as well."*

> *"We're probably going to be putting a little bit more steel on the ground because we're going to need increased facilities, the facilities we have are fine, but they're not going to deal with the kind of load increases."*

> *"We very much want and need to be able to serve the interest of growing companies… In our last report, we had just over 50% of responding members in our survey said that they anticipate growing in 2024."*

Investments to transition from fossil fuels to electricity

A number of associations report a shift from natural gas to electricity as their members pursue decarbonization and electrification to support climate goals. One association emphasizes the importance of low-carbon electricity generation.

> *"Less natural gas, more electricity on site, certainly… I suspect that more companies will be looking at electrification, decarbonization, moving away from fossil fuels."*

> *"If we are pursuing decarbonization, which is the appropriate thing to do with respect to climate change, we will be doing so at least partly with an electrification agenda… We will be growing the load to replace things that weren't necessarily powered electrically before."*

> *"There's certainly a significant concern about the greening of the grid, the maintenance of the grid, the generation of clean energy in Ontario. Very strong support in our membership for nuclear as an energy source."*

However, some associations cite concerns around transitioning away from fossil fuels, including capacity constraints and reliability of renewables like wind and solar.

> *"We still need natural gas and propane… We're very aware that the public in Toronto says you guys should be using air heat exchangers… It's just unrealistic for us to do, there isn't the capacity for us to do that… I don't have the three phase power."*

> *"I think there's the concern more than anything is the uncertainty… Concerns raised about how the government policy of the green energy has first rights on the grid, and then we're selling it for almost nothing to places like Michigan and Quebec… The lack of reliable energy from windmills, the unpredictability of solar and wind power. So, there's a strong support from our members for traditional types of power like natural gas and also nuclear power."*

5. Municipalities

5.1. Relationship with Hydro One

Relationship with Hydro One

Some municipalities describe their relationship with Hydro One positively, pointing to strong collaboration and communication and describing regular and productive interactions on major projects.

> *"Pretty good… They're collaborative. Free speech on many topics, there's no reservations. There were no hidden agendas or anything like that. Everyone seemed to be working well together."*

> *"The engagement has to do with these projects where we need to build something bigger and we need to coordinate with Hydro One to move the poles, the transformers… Most common interaction is just that back and forth for relocating utilities... When we're working together, it's very good."*

> *"Over the past couple years, we certainly have developed a pretty good relationship… Constantly we are in communication like every week… continuous discussion… not like an appointment basis… It can directly come to me, and I can go to the different stakeholders for proper communication, decision making, everything."*

On the other hand, some municipalities report limited engagement with Hydro One, citing that interactions are infrequent.

> *"Very rarely. In my 15 or so years in the region, maybe once or twice… There's hasn't been a particular problem. For better or worse, it's working well."*

> *"I don't have too much of a direct relationship with Hydro One. Among the three local distribution companies, I'd say I've got sort of the least contact with Hydro One… partly because our other LDC's are more locally based or municipally owned, so there's more of a greater accountability."*

> *"I would say it's arm's length. We primarily deal with [LDC] and the IESO… [LDC], we work with them very closely because they are the local company."*

Some municipalities with little to no engagement with Hydro One desire more proactive engagement, particularly through regular meetings, such as quarterly check-ins.

> *"Quarterly meetings with local hydro people are probably a good idea… discuss things like upcoming subdivision developments or upcoming industrial development or things like that."*

> *"Take a bit more of a proactive approach to working with municipalities in partnership… Build relationships with local municipalities."*

Overall satisfaction with Hydro One

Some municipalities express satisfaction with Hydro One, mentioning responsiveness of staff.

> *"They're really good people and they respond, and they're very helpful… The complaints I hear more often are from the local distributors, not Hydro One."*

> *"Pretty good… We are able to reach out when we need to."*

Meanwhile, other municipalities highlight challenges in obtaining timely and consistent responses, with Hydro One being harder to contact compared to other local distributors.

> *"In terms of timely responses, I would say that they're definitely harder to get in contact with in a timely manner than our local provider."*

> *"I find it quite challenging to obtain clear information from Hydro One. So when we have initiatives, projects that come up… different hydro needs will get an answer in terms of capacity, and then we get a different answer 2 weeks later. So, it is unclear."*

5.2. Current and Emerging Needs

Preparing for growing demand

A few municipalities say Hydro One is already doing the right things to address their needs in response to the increasing demand for electricity.

> *"I think they've already heard the call for electricity, and they're already on it. So, from what I've seen anyway, they're focused on the right thing."*

> *[When asked if their community's electricity needs are being met] "Yes, at a high level, I would say so, with the additional comment that I think people are starting to wonder or looking perhaps for more certainly that will be the case in the longer term as more electrical vehicles hit the street."*

Many municipalities express concern about the adequacy of current energy capacity to meet future demands, especially regarding the adoption of electric vehicles.

> *"It's important we continue to plan forward… The idea for their electrification of everything in the EV space… It's going to eat up a lot of capacity and not have much left for any other sort of growth in the community… We need to start planning for that."*

> *"There's some parts of [REDACTED] region… there's not enough short circuit capacity for people to install level 2 solar chargers… And Hydro One's not planning to upgrade that anytime soon… To what extent can Hydro One as a transmission utility help to prioritize areas that are currently constraining adoption of the tech that we need."*

> *"I worry about Ontario's long-term plan because our two major nuclear plants are well past their expiration date and are being kept operational because of the absolute necessity. But I worry that if those have to go offline, what happens to our provincial grid?... I don't believe that has been considered enough for this huge potential growth that we are already showing, let alone will be coming."*

> *"We are on the verge of having exhausted the capacity based on what we understand… Current residents have power, but if I have someone coming in with a subdivision tomorrow or large businesses that are going to consume a lot of electricity in that area of the city, probably would have to be declines based on the fact that there is not sufficient electrical capacity."*

> *"Given the way things are going, the types of developments that we're seeing in the electric mobility space around EV. Those are all going to require significant capacity that I think normally we haven't seen in the past… There's definitely not enough available as it stands."*

Communication and information sharing

Some municipalities call for more effective communication and information sharing between Hydro One, municipalities, and other entities like the IESO.

> *"Within the IESO, there's like 20-year load forecast that gets updated every 5 years… Hydro One didn't reach out to us… There's still very much a lot of gaps in information between municipalities and the LDC to create a load forecast that's informed by and aligned with broader decarbonization agenda."*

> *"You got IESO driving their current regional plans and looking at forecasted needs, and then you get Hydro One kind of doing this exercise. Maybe there's an opportunity for collaborative discussion around that."*

> *"We are constantly trying to guess whether or not there is capacity in the system… The information sharing is not on our side… We need to be able to openly share information and have faith and trust in the information that we're receiving that it won't change literally weeks later."*

Affordability

For a minority of municipalities, the cost of electricity is not a significant issue and affordability of electricity isn't a pressing concern compared to other factors like grocery or gas prices.

> *"You can get complaints about a lot of things – grocery prices, gas prices, service delays, and things like that. I don't think I've ever heard anyone complain about hydro prices."*

However, several other municipalities highlight affordability of electricity as a concern, especially in the context of economic development and vulnerable populations, such as seniors and others on fixed incomes.

> *"It's a very significant concern. From an economic development side and new business is coming… Generally, companies have not landed in [REDACTED] because of price of electricity."*

> *"Like the whole affordability question, can we tailor incentives and programs for the lowest income, for seniors struggling with fixed incomes, and in particular the seniors that are most at risk during extreme heat events of dying… So how can we help people on the fixed income make these moves?"*

> *"Keep costs low but more targeted towards people who actually need it a little bit more."*

> *"We would be looking at how to balance affordability within the system… We still have to advocate for the residents in terms of impacts that are just environmental but also related to kind of overall cost."*

Importance of good reliability

Many municipalities emphasize the importance of reliable electricity, particularly in the context of changing weather as extreme events become more frequent.

> *"I worry more about resiliency when it comes to the future, from impacts of changing climate, whether that is significant rainstorms, whether that is prolonged heat events that stress the system."*

> *"My worry is that we are not going to prepare for the existing system, make the investments for the weather events that will lead to impacts on residents… people without cooling… not able to access elevators, etc.… These events will become more frequent and more extreme in terms of the levels based on our analysis and our projections."*

"If there is a storm that takes out a tower, then the whole region is kind of screwed… because they're being fed by one line."

Current levels of reliability

Most municipalities highlight positive reliability experiences, noting that outages are rare and when they do occur due, they are happy with Hydro One's response.

"We have a smart grid here… It stores power when it's not being utilized, but when it's required, it'll draw that power… So, we don't have a lot of power outage other than old trees falling on lines, or animals."

"When there's been big storm events and there's been disruptions, they've been dealt with relatively expediently, I would say."

"I believe in the [REDACTED] area, yeah, it's good."

"Quite good… I've not experienced any real outages with the exception of winter storms."

"My own impression is that it's good. When there have been storm related outages, I think Ontario Hydro does a very good job of keeping its website up to date. You can check and get updates in terms of when things are coming back online."

However, one municipality reported ongoing concerns with reliability, particularly in smaller or rural communities where frequent outages and power surges are common.

"I just got a note this morning from somebody in one of the smaller communities about still having concerns about their power supply in the community of [REDACTED]… They still get constant outages and a lot of power surges. So, I know there's some other rural areas where there's power outages longer than what you might experience in most of the urban centers."

5.3. Hydro One's Priorities

Preparing for the energy transition

Several municipalities emphasize the importance of preparing for the energy transition and supporting future growth. There is a strong desire for Hydro One to focus on understanding and preparing for the rising demand of electricity related to things like increased electric vehicle adoption and new residential developments.

"Focus on understanding where the growth is going to be and just making sure that they've got the right plans in place to be able to accommodate that growth as it happens."

"Better understand how Hydro One is potentially planning for the electrification of the grid… Some more insights into Hydro One's planning to know how to respond to businesses that are coming or how to respond to anticipated growth."

"Hydro One, along with all the other kind of main players in the electricity system, have a key role in terms of enabling electrification. And that's not just electrification for climate… but it is also for growth, that can be regular population growth or economic growth."

"Making sure that our grid is ready for the electrification of vehicles and the 3000 to 5000 new residential units that we anticipate coming online before 2030."

"We're all sort of collectively concerned… With increasing electrification and higher demand and how that will be."

"Need collectively to start to chart out the plan for the future, and not just at the really high level of demand and general supply. But start to talk about what are the infrastructure investments and when they need to happen over time. Start to pick a path… We're spending a lot of time talking about all the different paths as opposed to saying, here a path that looks like it's a good place to go."

"Enabling overall electrification… If I'm Hydro One… I see this huge opportunity around that energy transition away from natural gas… make money by building infrastructure, supply, electricity… Success for them would be seeing that opportunity and be looking how they can monetize that being part of a transition away from fossil fuels, because they're in the supply chain of electrons as opposed to the supply chain of fossil fuel molecules."

"An integrated approach to how energy is moved into the city… how the bulk system interacts with the local system. And how we find the right balance, right investment of activity that supports electrification, supports growth."

Building system resiliency

A few municipalities emphasize the need to invest in the resiliency of the existing system, not just growth for the future. Some are concerned about the grid's ability to withstand extreme weather events.

"My worry is that we are not going to prepare for the existing system - make the investments for the weather events that will lead to impacts on residents… I don't think we're necessarily investing in the resiliency of the system. We often focus on growing the system for the future as opposed to how do we ensure the existing system doesn't fall apart? And that's in every type of infrastructure we have."

"Will the grid be reliable in the context of extreme weather? That's what we're going to be dealing with, longer heat waves, more intense heat waves. They are going to drive up cool air conditioning demand... So, that's a concern."

5.4. Future Expectations

Anticipated changes in electricity use

Several municipalities anticipate an increase in electricity usage, driven by a variety of factors such as residential growth, industrial growth, electric vehicle uptake, and electrification of transit.

"We're projecting to grow continually over the next number of years, mainly from newcomers and expansion, more affordable housing… We're seeing growth comes from all over the world. We have a local immigration partnership here… So that's been very successful as well to drive people here."

"Significant residential and industrial growth as well… There is a significant more amount of electric cars on our street… Absolutely, it's going to be a significant larger draw on residential power."

"We do have recent growth projection show that in the next 20 to 25 years, the region could increase by almost 100,000 people."

"More of it going forward as we electrify our fleets. So power requirements are going to be substantial, especially with transit… We can order one charger and charge one bus right now, but we don't have the power to do multiple units right now. So, we're working a bit with our local utility provider."

We've been experiencing a population growth that has been much higher than anything we've seen in the past, at a rate of 7%. We expect this growth to continue… Demand is coming from additional housing development… I also want to stress our employment growth… far greater than anything we've seen… A lot of the EV sector businesses… they come in and have massive power requirements."

Hydro One's role in helping meet changing energy needs

When asked about Hydro One's role in helping them meet their changing energy needs, some municipalities highlight the importance of Hydro One making investments in infrastructure that will enable growing demand.

"They need to build the infrastructure, like in one example - for transit, to be able to supply our buses, they can't deliver, in the current fashion, to that site without doing some infrastructure investment... If we're reducing fossil fuels and we're getting away from gasoline, there's going to have to be better infrastructure."

"New transmission lines probably going to solve a lot of issues with driving power here."

"Our fleet electrification is really important, so the redundancy and backup at those facilities."

"Potentially updating policies… in order to accommodate the future capacity that's going to be required if we're actually going to meet provincial and federal government targets… Everybody needs to be on the same page, not only from a government perspective, but from a utility perspective because they're going to require those utilities to make those investments. Without the utilities, we have nothing. The infrastructure needs to be there."

Investments to transition from fossil fuels to electricity

Many municipalities report taking steps to shift from natural gas to electricity, through activities such as electrifying transit, fleets, and facilities.

"It's part of our corporate strategy plan. We have green initiatives built within it. We're trying to get to net zero, think it was by 2050."

"There's a strong shift in moving away from carbon intensive to something that's more carbon neutral. And then that comes at the expense of needing huge amount of electrification to run some of those building operating systems… Plan to electrify transit… plan to electrify fleet… plan to electrify facilities."

"On the climate side, we don't have an anti-nuclear bend, but we are looking for less natural gas in the system, and more other sources, recognizing we're got to deal with the peaks, and you have to provide reliable, affordable system."

However, some municipalities note challenges associated with transitioning away from fossil fuels, such as skepticism around the reliability of renewable energy sources and lack of understanding about alternatives like heat pumps.

"There's just an information gap and a knowledge gap. A sense that heat pumps aren't suitable for climate, which is false, or that the electricity isn't as reliable as natural gas. There are some information gaps for sure that Hydro One could maybe help with."

"I think there's skepticism on renewables in terms of their ability to deal with peaks at various points in time… It was like pulling teeth to get people who, long time folks in the electric system, to even kind of buy into renewable energy as an opportunity… We need to ensure that bias isn't kind of setting the direction before the analysis has been done."

Investments in new technology

Several municipalities have already made investments in technologies like solar panels, heat pumps, HVAC replacements, LED lighting, and energy-efficient retrofits or are considering doing so.

"We support our residents with energy efficiency retrofits, and installing heat pumps for example… There's significant cost savings from moving from a propane or electric baseboard to a heat pump."

"We got our roof redone at transit, and we're putting solar panels on that to try to drive our own power and then give it back to the grid… We're doing HVAC replacement… LED lighting conversion, heat pump conversions, those types of things."

"Looking for help to do heat pumps or energy retrofit… People are looking for options for more affordable energy… Interested in understanding what options are and if they can be convinced that it's lower cost and sustainable."

"We're proceeding as a municipality on the basis on taking climate action, and looking at best ways to mitigate greenhouse gases… And so, in that vein, we anticipate an increasing electrification demand, particularly for like home heating as you get more switching and conversion to heat pumps, and supplementing with that type of thing."

One municipality mentioned not planning to invest in these technologies, citing that their current cost of electricity is too low to justify the upfront costs of solar panels.

"My nephew sells solar panels… He looked at my electricity bills and he said, 'Wow there's no way I would be able to sell you your solar panels. It's way too cheap for you to buy electricity.'"

2. Methodology

Innovative Research Group Inc. (INNOVATIVE) was engaged by Torys LLP on behalf of its client, Hydro One Inc. (Hydro One), to gain a deeper understanding of the needs and preferences of First Nations communities directly from members of the community in a leadership position, specifically as it relates to Hydro One's Joint Rate Application to the Ontario Energy Board (OEB) covering the years 2028 to 2032.

Approach to First Nations Engagement

Hydro One provided INNOVATIVE with the contact information of leaders in all 89 of the First Nations it serves. INNOVATIVE invited each of the First Nations to schedule a meeting with INNOVATIVE to share their perceptions of their communities' needs and preferences as they relate to Hydro One's Joint Rate Application covering the years 2028 to 2032.

Outreach efforts included Hydro One's Indigenous Relations team pre-socializing the interview opportunity with all First Nations, providing a brief summary of what to expect from the interview, and that INNOVATIVE would be reaching out to them in the coming weeks.

INNOVATIVE sent the initial invitation to all 89 First Nations to participate in an interview on August 26th, 2024. For First Nations that had not yet signed up to participate in an interview, subsequent reminder emails were sent on September 9th, 2024 and September 23rd, 2024. First Nations leaders had the opportunity to book an interview between August 26th and October 10th, 2024. This outreach led to 18 First Nations leadership interviews being completed via videoconference or telephone.

The invitation included a pre-read document that provided background information to participants including a brief summary of what will be asked in the interview, who will be conducting the interview, the next steps in Hydro One's customer engagement, Hydro One's role in Ontario's electricity system, and the amount of the typical On-Reserve First Nations residential customer electricity bill that goes to Hydro One.

Interviews were approximately 45 minutes in length and were conducted by a trained moderator following a discussion guide. In appreciation of the time provided by First Nations leadership, INNOVATIVE provided a $250 cheque for each participating community.

About this Report

This report summarizes the key findings based on these interviews. In general, our approach is to report representative verbatim comments and offer interpretation and/or commentary where necessary. Verbatim responses are shown in blue italics.

Please Note: Qualitative research does not hold the statistical reliability or representativeness of quantitative research. It is an exploratory research technique that should be used directionally. In interview-based research, the value of the findings lies in the *depth* and *range* of information provided by the participants, rather than in the *number* of individuals holding each view.

3. Key Findings

Several First Nations leaders express overall satisfaction with the services they receive from Hydro One and their relationship to the utility.

Some leaders emphasize their satisfaction with outage response times, local line workers, and other direct relationships with internal contacts at Hydro One, pointing to strong collaboration and communication.

Many First Nations leaders report frequent or prolonged outages, especially in rural and remote reserves.

Several leaders say that outages are common in their community, often due to weather-related events. Leaders identify many aspects of reliability that they feel Hydro One could focus on, including aging infrastructure, resiliency to severe weather, outage response times, and improved communication.

Poor reliability has significant consequences for First Nations – especially related to prolonged outages that impact access to heat, medical equipment for elders, or contribute to food spoilage.

When discussing the impacts of poor reliability, many First Nations leaders identify food storage and security, especially as it relates to traditional hunting practices. Many First Nations also rely primarily on electricity for heat, meaning that prolonged outages can have a significant impact on the health and safety of communities, and especially elders or those with medical needs.

Affordability is a top concern for First Nations leaders.

While some leaders acknowledge the benefit of the First Nations Delivery Credit, the majority still describe electricity costs as a significant burden, especially for low-income households and those on fixed incomes. Many call for greater support or financial relief for customers living on-reserve.

Leaders desire more collaboration with Hydro One and a greater presence in their community.

Many leaders call for an improved relationship with Hydro One, especially related to communication between the Nation and the utility and seek more in-person opportunities to collaborate. Several leaders want Hydro One to provide education around energy use and energy efficiency to leaders and community members.

Most leaders expect significant community, business, and facility growth in their communities in the next five to ten years, resulting in greater demand for electricity.

Some leaders are concerned about the capacity of existing infrastructure to meet this growing demand and delays in service connections for new residences or projects are often cited as a significant barrier.

There is significant interest among First Nations leaders in renewable energy projects, with many already making significant investments.

Communities are actively exploring and implementing solar, biomass, and other renewable energy projects. Many desire Hydro One's guidance and support in this process.

4. Profile & Energy Needs

4.1. Respondent Profile

Communities engaged

Interviews were conducted with leaders representing a diverse range of First Nations, varying from small, remote populations of fewer than 200 on-reserve to larger communities with on-reserve populations up to 1,000 or more, often with more developed infrastructure, including access to more reliable electricity and facilities for larger projects like arenas.

> *"We're a remote community so usage for internet, usage for satellite television, usage for communications, has a huge part on our society. And because of the amount of people living in houses, there's a lot of people sleeping in different shifts, and lots of people staying up at night. So, you end up with, pretty much round-the-clock electricity use in our community."*
>
> *"We have one of the smallest communities in Canada, we only have about 190 people here."*
>
> *"We're on a small island… So, we're considered a remote or semi remote. We have a population of about 200 people on the island. And when it comes to electric electricity, we are probably almost 100% electricity for heating. We do still run wood stoves, but not as much as we used to."*
>
> *"We're a largely urbanized population… living in different urban centers… On reserve, energy requirements are minimal. We don't have any industrial or commercial operations on the reserve."*
>
> *"We have a thriving community here. There's approximately 1000 people in our First Nation territory. We have 2400 acres… We have [REDACTED]… employs about 1100 people."*
>
> *"We're largely urbanized population. We've been flooded off our reserve for the last 100 years here. We're slowly repatriating that that reserve, and physically rebuilding that reserve along with the rest of the First Nations governance and political abilities… So, we actually have very few people living on reserve, less than 10."*
>
> *"The energy demand that we require has been basically addresses, so we converted out single phase power to three phase power in our community. So, we'll be able to accommodate new larger projects like the construction of arenas and so on. Bigger facilities can be built. Our communities in a good position, we're fortunate to be able to get that type of power into our community, which I know that 90% of First Nations across Canada haven't been able to do."*

5. Satisfaction and Relationship with Hydro One

5.1. Overall satisfaction with Hydro One

Satisfaction with Hydro One

Some appreciate Hydro One's responsiveness and the professionalism of their local workers. A few note the limited interaction they have with Hydro One makes it difficult to provide a full assessment, however their sentiment is still favourable.

> *"9 out of 10 I think. I think I talked about it a lot already. You know, I spoke about the geographical and the environmental issues that we would have because of where we are located. That's not their fault, though. Uh, so 9 out of 10."*
>
> *"For the most part, I would say yes. We just went through a contract with Hydro One that employed three to four of our community members and clearing brush, which went good."*
>
> *"Hydro One... the local people that work in the lines... they're very accommodating. Like when power goes off, you know, they're usually here at a very decent time... But it takes a while before power comes on."*
>
> *"I don't think I've had enough interaction with them. Like it's been very limited with just these like almost crisis situations. So, it's hard to say. I don't really deal with hydro that often. Like, it goes off once in a while, but we just wait for it to come back on and there's no issues."*

Dissatisfaction with Hydro One

Meanwhile, others express overall dissatisfaction with the services provided by Hydro One.

> *"I'm not satisfied. We are one of the [isolated] communities that Hydro One doesn't really pay attention to. Many cottages have been added to the system over the years, [but] there's no upgrades on their equipment… They don't respond [to our concerns]. They don't do anything… So if we're gone be serviced as we currently are in 10 years, we got big problems coming up."*
>
> *"People just getting disconnected. No questions asked… [They] don't really tell us right until the last minute."*
>
> *"There's a planning challenge here for me with Hydro One… I don't think we're speaking the same language. It's hard for me to understand what they need and I don't know that I have the technical answers that that I think they want."*
>
> *"We waited for one full year for one building to be connected and it was rental. By the time that they got to connecting, we had to disconnect it because we were done with the rental. So it just doesn't make sense sometimes. Their service response time is not great."*

5.2. How Hydro One can better serve the community

Guidance and education

Most leaders express a strong desire for more active engagement between their communities and Hydro One, particularly in terms of providing guidance and education to members on ways to reduce energy usage.

> *"We need what I would consider kind of like a navigator, someone who can advocate and lead… If there was someone who could kind of nurture or encourage participation and update people, that sort of thing."*

> *"From a First Nation perspective, it's like step up to the plate and share with us what you know, and how we can better manage our power requirements and be able to be in a position to share with you what we're planning. And what kind of advice you may have regarding our plans for development in the future."*

> *"So, I think if they worked with [community energy champion] to provide some info on energy savings initiatives… Maybe also to work with our emergency working group because we're trying to work on a community safety plan, but we haven't really considered the hydro aspect of it."*

> *"Any advice, any ideas, or advising maybe would benefit us in what we use within the buildings to cut on hydro costs… As a bigger agency, or a bigger perspective on the hydro business. That would definitely be beneficial if they worked with everyone, I guess in municipalities, First Nations to advice how they could cut on costs or what route to take to potentially go in that way."*

> *"I think the building of the relationship, the in-person ability to speak to someone who may provide us with a little insight on how the big machine works."*

Vegetation management

Some have concerns regarding vegetation management practices, including the need for timely trimming and the avoidance of chemical sprays, particularly due to perceived environmental and health impacts. There is also a focus on the need for transparency in forestry activities related to new power lines, especially regarding the types of trees removed and the environmental consequences.

> *"With the vegetation a few years ago, I did get them to come after numerous requests to trim the vegetation back, which they did. They did not do it in its entirety and it's time again overdue to trim this vegetation back from the wires."*

> *"It depends if they are going to chemical spray. Absolutely not. We are trying to move to 0 chemicals on our entirety of our traditional land. It's been a real sore point for us for the tree maintenance they do."*

> *"There's a history of sickness in our community and a lot of people have historically blamed that right of way. They said that right up until the 1980s that Hydro One was spraying all types of different pesticides and whatever else he would use to kill the vegetation and without much regard for human life, because we really weren't considered humans till about 60 years ago. I think there's some high rates of cancer even to today."*

> *"When they [Hydro One] go in and they're cutting new lines somewhere, there's issues related to forestry. What kind of trees are they taking down?... But what happens to that? What happens to that*

wood? Where does it go? Who gets it? Is there a process to access it? Those are the kinds of issues. Just from an environmental perspective as well, we need to know, because if it's happening in our harvesting territories, hunting and fishing, we need to understand that the environmental concerns and our issues are being looked after."

5.3. Relationship with Hydro One

Current relationship with Hydro One

Some First Nation communities feel that their relationship with Hydro One is a positive one, with strong communication and support, responsive service, and reliable collaboration that helps resolve their issues efficiently.

"Our current relationship with Hydro One is good. They're responsive to our needs in terms of energy. They work with us. They've been quite helpful in advance in several of the energy demands required for the infrastructure we're doing in our community. So, we haven't had any issues, and I think the way they've approached things up until now have been working."

"We have a really strong relationship, I would say… We have very strong internal contacts with HONI. So that if we did have an issue, if we wanted to, we could go to the highest levels of HONI to get an issue solved. We don't do that because we have good connections in their middle management as well to help rectify issues should they come up or to help fast track something if needed."

"Hydro One… And I'm talking about the construction portion of it, they're very accommodating. Like when the power goes off, they're usually here at a very decent time… they communicate with us really well. Updating us on what they're finding or when they suspect the power is going to come back on. It's not necessarily correct all the time…I think we have a pretty good relationship."

"We do have collaboration and communication with Indigenous relations with Hydro One, and my experience with those individuals are good. And they do work towards trying to resolve issues that we do have and to supply information at request when needed. And it's a good collaboration and communication to this point."

On the other hand, some report frustration with their relationship with Hydro One, citing issues ranging from poor communication, unfulfilled agreements, and uncertainty about who to contact for assistance, resulting in a sense of disconnection and limited progress in their interactions.

"No we don't really have much of a relationship with Hydro One… I mean, we've attempted to do some things with them and whatnot, but we haven't gotten very far… Called partnerships and whatnot, and you know, different work that they're doing outside the community, but because of political things with our neighbor here for [REDACTED], we sort of get pushed out of the way… Well, they get to the table before us, and leave us the crumbs. So yeah, sometimes crumbs are good to pick up, but you're not in the main pool. What are you really there for?"

"At one point we had an agreement in place if they were coming over to [territory], they are to report in here to the office. So, we knew that they were on the [territory] and we wanted to know what they were doing so we could track what is being accomplished. And that went by the wayside. It went on maybe for

a year and then they just dropped that and haven't done that for at least five years…I never know what they're doing over here."

"We have a hard time reaching out… And because we've never met them, they've never reached out or anything."

"The relationship we're having from our community to Hydro One, that's involving [redacted]… And she relays our message to Hydro One, and that's where - and that's not on her part, she represents the community 100% - it's getting back to her and back to us. It's a little weak link there, so that's what we feel. And I went in a different direction, and by going that direction, the message did get to where it's supposed to go. But coming back to us, it was not there. A very weak link there. So, Hydro One's part, it can be improved with the First Nations."

Some leaders express a positive outlook on the development of their relationship with Hydro One, mentioning the progress that has been made and recognition that Hydro One is making efforts to improve the relationship with their community.

"I know the doors are wide open. There's a feeling of camaraderie with Hydro One. There's a feeling of renewed partnership."

"We're just starting to develop some relationships…they do a pretty good job of trying to ensure that they're having patience…we're a First Nations that's in a state of emergency [due to deaths in the community]…They've been patient because every time there's a phone call, a negotiation session, there's another funeral…we're going through so many funerals and it's hard to get the technical expertise and they took a risk on us and [provided us with] a grant…Some really good things that Hydro One has done recently, so I've got to again give them credit where credit's due and that is a positive for us. But we need more of it."

"It's a rebuilding phase. I like how they've come to the table. They have offered us a great…well…grand offer, we still have to work out the details of that… I think they're really trying. So, we're going to try to work together and see what we can come up with."

Desired relationship with Hydro One

Many First Nations leaders express a desire for improved communications from Hydro One and a greater presence in their community.

"I think if Hydro One could be a little bit more present, you know, come to visit us, the leadership... People talk about power; it's usually related to some kind of crisis that they're experiencing. It could be the rates, the cost, or potential cut-offs until a bill is paid."

"I guess a better relationship where they come and speak to us. You know, you have different companies out there, Enbridge and whatnot, that assist you with different things – funding wise and partnerships on this and that. I don't believe we've ever been given that opportunity from Hydro One."

"I think the main thing would just to have, whoever sits on the Indigenous seat there to be in more contact."

"Just better communications I guess and then coming to the nation to sit down and talk with us and tell us what they have to offer that may work for us."

"They could have come to our table a few times, and [asked] 'What can we help you with?' But I've never seen that. We get the odd letter from them on different things. But you know what? Sending me a letter or whatever means nothing to me. You want to talk to me? Come and talk to me."

"Improving communications…helping to partner on the youth crisis center that we're building…we would gladly call it the Hydro One Youth Crisis Center…they're able to sponsor major hocket teams, so we'd love for them to be able to sponsor some of these local community events if possible."

Some leaders focus specifically on Hydro One's role in reconciliation, both culturally and economically.

Cultural Reconciliation: A number of leaders highlight the need for more inclusive partnerships with Hydro One to address the historical impacts on their traditional lands, urging Hydro One to take a deeper, more thoughtful approach to reconciliation.

"Well, for me, I think it'd be being a little more creative and in partnership with First Nations voices and to move the needle on reconciliation... There are impacts not only to the natural environment but to the lands management of the community and our people are very connected to the natural world... If Hydro One was able to understand and build a better perspective on using or considering empowering Indigenous perspective on spirit of the land and those impacts... That would mean a lot."

"There should be more conversation on the accommodation side of things… Accommodation to me is redressing the issue around treaty, the impacts to lands and territories. It's understanding the cumulative effects that not just this industry, but all industries have had on our on our territories and ultimately our peoples. So, like in a perfect world, I think that would be amazing to have that avenue and that support to have those meaningful conversations that have actionable outcomes… I mean you have to have conversation somewhere and keep it moving forward."

"With the legacy issues, there have been improvements. We all know that there is public information that Hydro One is working on new transmission lines that exceed over $100 million. That's part of the policy to have indigenous participation. I mean, that's a start but it still doesn't address the legacy issues. There are definitely cumulative effects that I don't think are taking the right time to appreciate the perspective that indigenous people have, especially in respect to treaty and what that relationship means… Hydro has shifted a policy for their reconciliation action plan, which is positive, but there's still a lot of work to do in terms of fostering a mutually beneficial relationship… It's all growing pains at this point."

Economic Reconciliation: Some leaders specifically point to economic aspects of reconciliation related to the use of traditional lands or resources for electricity infrastructure.

"Lowering the rates. We have that agreement with Ontario that our rates are a little lower than others. But you know, take the rate right off. Let's get rid of the rate. I've heard that from my members. Why do we pay for hydro? It's our resources. And it's hard to argue with them because it's just the way it is."

"Well, I know Hydro One is making millions and billions of dollars every year. They make a lot of money. And the infrastructure they have - they've been able to establish that infrastructure on traditional territory without compensating communities at all. There's no money for lease agreements… Hydro One needs to really look at that and compensate communities accordingly."

"To provide a competitive edge for First Nations or, some would say, to restore historical imbalance as well of their history of, you know, frankly taking advantage of First Nations… There's are ways of providing investments into reconciliation…and we're going to need that as well you know."

"One thing that we don't talk about is like the absolute supply chain in the whole industry… We would like to carve our space in that sort of area of supply chain - in the electrification industry. That to us, is what economic reconciliation looks like. It's about creating quality of life for our people that have been impacted so negatively from industries, government, you name it."

6. Price & Affordability

Electricity costs

Some say that the price of electricity is fair, and that they have benefitted from the First Nations Delivery Credit.

> *"So, like in terms of the on-reserve infrastructure, we have a very unique energy system in that our community buildings are run off renewables and the grid system acts as a backup to those renewables. So, we actually don't pay that much for electricity… Looking in town, from my own perspective, everything is going up in terms of price. Everyone wishes things could be cheaper. But in terms of value for what we're paying for, I think it's at the very least it's fair."*

> *"Now that the delivery charge has been removed, it's certainly been a lot better and easier for our community members to afford to properly heat their houses."*

> *"Something I like for one thing, with the delivery charges and all that, they have been removed, and I think really benefiting our communities."*

However, for many, affordability is still a significant issue, with many First Nation communities struggling with high electricity costs, especially for low-income households.

> *"It's a big impact. Hydro is the same thing... everyone's thinking, all these projects that they put up was supposed to increase the power and to help with the accessibility and affordability of power rates? None of that has happened yet... where are the savings?"*

> *"We have a pretty significant population that is on fixed income... for some of the folks on the lower income levels, if they can save 50 bucks, 100 bucks, it makes a difference in their lives. It certainly does."*

> *"…people deciding whether to pay X amount on hydro this week and get groceries and pay some other bills and... clothes for their kids and feed their kids."*

> *"Once you get out of our community and it goes to Hydro One, the rates are definitely much higher... those fees are probably hurting our community."*

> *"Hydro are a significant cost to the membership and to the band as a whole."*

> *"We have serious levels of poverty here, a lot of it tied into drug problems."*

> *"Affordability is a huge issue, especially with markets, inflation, all of that sort of thing. Things are definitely impacting the folks."*

A few leaders mention that they are exploring various options to help with affordability, such as helping community members apply for the Ontario Electricity Support Program, and looking into alternative energy sources, including local generation.

> *"To lower the electric bills a little bit, I have sent in application for them through the Ontario Electricity Support Program so that takes off a little bit… It depends on your income also with that one. For example, if you make $20,000 or less, and if you have five people, it takes $90 off your hydro bill."*

"We're working on a district biomass unit right now to lower heating costs from the electrical baseboard heating that the member currently have. So that's an ongoing project that's gonna assist with affordability and obviously environmental and everything else."

Impact of electricity bills

Many leaders report that their communities are facing significant financial strain due to high electricity bills, with some even struggling to meet basic needs like food.

"What it impacts are the people that can't afford to turn the light on. The low-income families, the people that are on fixed incomes… Hydro One is continuously contributing to the undermining of the quality of life and standard living in nations by having ridiculous rates for hydro when they are getting lands for free for nothing, for forever. They don't pay for anything."

"Seniors have to run different things and whatnot - just some of the medical needs that they have. So, you know, that sort of thing there, just a lot of cost of hydro."

"There's not too much opportunity here… Community members get impacted in a not so pleasant way when it comes to paying for utilities. I'm not too sure on the numbers but a lot of folks here are on social assistance. So, that's stretched pretty thin when your dollars are very limited. The impacts of your utility bills are essential thing."

"The same impact as food. Things have skyrocketed to the roof…you hear all the time about CEOs getting bonuses of millions and millions and for what? For the expense of us guys starving and suffering and pillaging for scraps. It's a big issue."

"We have a greenhouse…the big challenge that's making the project not viable …they're running four boxes [meters], so that means they're on every bill paying about 50% of that bill is for delivery charges, and it's killing…really hampering the ability of that greenhouse to cover its cost…the goal of our community towards food sovereignty and all these things get people healthy. We have a lot of people here who have diabetes, all kinds of health problems. We need healthy food in the community that's at a decent price. The IESO is trying to help us, but I feel like Hydro isn't really. In fact, I get a lot of complaints from the membership of Hydro giving them a hard time on the bills."

"Very high hydro rates in the community…it's tough when you've got a family of 12-15 living in a house with three bedrooms. How do you teach people about conservation? It's life or death in our communities at times."

Desire for financial support

There is a strong desire for Hydro One to offer more financial support, such as rebates or assistance for low-income individuals and for better access to investment opportunities that could benefit First Nations.

"Anything financial that can help the burden of poverty in First Nations. Reducing rates."

"I think the billing has to be looked at. We have a handful of different bills from Hydro One for the band and I don't understand why it has to be like that. It'd be nice if we could amalgamate all of our band owned properties into consolidated bills, but I don't know how…it's just a headache to try to understand and to keep up with."

"So, with regard to pricing for Hydro, I would love to see some sort of rebate or kick back to the low-income people in the community. That would certainly help."

"So certainly, the investment opportunities with HONI should change... They need to change also not from just a respect to the nations and reconciliation aspect, historical aspect… their competitors from other industries are doing things in terms of economic development that HONI is not doing… selling existing profit, generating assets to First Nations… Additionally, there's other developers that are looking at developing infrastructure projects, energy related or not, that are offering larger investment opportunities for specific project that HONI's offering."

7. Reliability

7.1. Importance of good reliability

Impact on traditional food storage and food security

When asked about the importance of good reliability for their community, many leaders specifically mention negative impacts on food storage and security, with some focusing on traditional hunting practices.

> *"It could be potentially catastrophic for some people here. The difference I think is there's a moose hunt in the fall and a lot of fishing in the summer and in the winter too, through the ice. People are keeping freezers full of food and a lot of people are not buying meat at the grocery store…moose and fish are staples here…if the power goes out for a day or two, you're in big trouble. You start talking about basic food security problems."*

> *"It's a threat to food sources. I mean, refrigerators, freezers, people could lose, you know, groceries. And we all know groceries are super expensive these days. And there's a lot of poverty in communities."*

> *"And you have to worry about your food going bad in your fridge and freezers…that's costly."*

> *"If your freezer's out and your food's spoiling, then you've got to drive another hour to town to go get some more supplies."*

> *"In the summer [when outages happen], you risk losing your food, and your fridge, and your freezer."*

> *"We've lost a lot of meat from freezers not coming back on."*

Heating challenges

Some leaders also report frequent power outages, especially during the wintertime, posing serious heating challenges for homes relying on electric heat.

> *"Big thing is also the power outages. Sometimes it could take 8 hours to get reconnected. A majority of homes in [First Nation] have no secondary heating systems...most homes have electric heat."*

> *"It looks to be anywhere from $7,000 to $8,000 per household for these generators...and to me, keeping people safe, keeping them warm in the winter...that may be the route to go...we'd be spending our own money on that."*

> *"We have a lot of power outages here in the community… The only other business around our area is tourism, camps and summertime fishing. So, there's ongoing power outages during the summertime and wintertime. So, a lot of times over the last 10-15 years, we ended up evacuating people in the wintertime."*

> *"We had an outage last winter and this outage was supposed to last four or five hours and it ended up being eight or ten hours. Now, for people that are in homes that are heated by electricity, that's a big concern. So, we had people cold, we had people scrambling…past six hours in the winter, that's not acceptable."*

Health risks and impact on vulnerable community members

Many are concerned about the outages endangering the health of vulnerable community members, such as the elderly or those with medical needs.

> *"At one time we did have people on oxygen and no power and were running around trying to find emergency power sources, generators or move them to other places...That was bad when they're not well."*

> *"Like you have the younger group that aren't used to being without power… So that's where the panic starts, it's with the younger groups because they don't know how to survive without electricity or anything else."*

> *"We make the best of what we got, and if we have to open up the community center we will, especially if it's cold. The first people we go after is the seniors because they're at the most vulnerable."*

> *"There were a couple times we've been without power for a week. So, we ended up having to transfer a lot of our people, especially our elderly and young kids out into municipalities... The other thing we were trying to do to alleviate, and to assist our people when they encountered long power outages, is we ended up putting in high end propane generators into most of the units in the community. And we focused on our elderly first because we didn't want them without power when temperatures are hitting 30s, it'd be without no air conditioning."*

> *"We have looked into actual generators at certain homes, at senior homes, just to keep the heat going and whatnot."*

7.2. Current state of reliability

Prolonged outages

Several leaders mention that power outages in their communities are common, often due to weather-related events or fallen trees. Some specifically mention "brown outs" or power quality issues in their community.

> *"Three or four times a year. Sometimes a whole day, sometimes more… We have a lot of power outages."*

> *"During the wintertime, about 4 to 5 times every winter. Something like a severe weather knocks out the power."*

> *"There are more numerous during the summer months, could be either a fallen tree or could be other effects that disrupt that service."*

> *"Last weekend it fluctuated a few times. It's something nobody's ever ready for. I am concerned about the short power interruptions where the generators just kick on and then right off again because I believe that that's hard on our generators…I am concerned that it's going to damage the generators"*

> *"Well, they [brownouts] happen. It's been an ongoing thing since I've been there now a little over four years, I guess. Our last one would have been, I think it was June, where we had to post-phone a few meetings and activities that we had a storm."*

"My only grievance is, I can understand the line being down from time to time. Periodically, I'll say, you know, is fair…but at the same time the length of time the line is down is a very big issue."

"There has been an issue quite recently and, in the past, as well. We get hit with a little bit more frequent violent storms… But the issue was the first response, or I mean, the reconnection in our community seemed to be last in the pecking order."

Outage response

Some note that while power outages can be frequent and sometimes lengthy, they still emphasize their satisfaction with Hydro One's response time and online tools.

"They're pretty frequent and they seem to happen more on our side of the boundary than the local community…they typically are resolved within a few hours."

"Where we are, I think everyone accepts that, especially in the winter, there's going to be some service interruptions and generally speaking I think Hydro has been pretty responsive."

"I think reliability in general is at an acceptable level when it comes to number of outages a year. I think there's there may be longer than they should be, but again, that's geography. The crew… got to get on a boat sometimes and we will have outages for 12 hours to 14 hours. Sometimes some things like that. There hasn't been one in the winter since I've been here yet… Maybe in the spring we might have had one. We get wind outages from trees fairly frequently."

"It's been pretty good. If something occurs, power goes down in the middle of January from a blizzard or whatever, I like how you can go online and determine, when the power should be back on."

7.3. Aspects of reliability Hydro One should focus investments on

Reliability areas of focus

Leaders identify many aspects of reliability that Hydro One should focus on, including aging infrastructure, resiliency to severe weather, outage response times, and improved communication.

"It's important to note that being in a First Nation community, infrastructure is not up to the standards… It's very subpar. Our electrical infrastructure feeds into our wastewater program, which is essential service for everybody else, but it seems like for us that we're kind of always just band-aid solutioning things."

"Maybe they could put in a backup power of some kind here. If power goes out, then they'll be here."

"We've had some pretty nasty storms throughout the last couple years here… I think what it boils down to is just manpower in our area, and when things like that happen, there isn't enough… the magnitude of some of the storms that we are getting now, it seems to be worsening throughout the last few years."

"We've been struggling with power at times… We get a little lightening storm and not even some time, we lose power. So, it takes us to restore, sometimes up to two to three days to restore."

"Communication portion, they communicate with us really well, updating us on what they're finding or when they suspect the power is gonna come back on, but the accuracy of it sometimes isn't."

"It's a weak line that goes down several time a year. There are blackouts. There are brownouts, not just for us, but for our neighboring First Nations… And if affects all the business and homes in the heat of the summer, and the cold of the winter."

8. Hydro One Priorities & Future Expectations

8.1. Anticipated changes in electricity use

Community growth

Many leaders expect significant community growth in the upcoming years, resulting in greater demand for electricity. There are some who are concerned about the capacity of existing infrastructure to meet greater demand.

> *"There is a boom in our population, boom in our community. And we were building more homes. We're putting in more infrastructure for housing lots and water lines and everything. And we're still working on it. Just a year and a half ago or something, we just finally got our state-of-the-art water treatment plant going."*

> *"We're trying to do quite a bit of upgrades... but we're just trying to be mindful about, you know, the capacity."*

> *"I'm getting more and more concerned that we're going to have trouble down the line, like, in the near future with is there going to be enough capacity in the line? And we can't afford to pay those kind of contracts like the mining companies…when there's a shortage, those mines are paying the big bucks to have the guaranteed power."*

> *"We have a housing plan. It's very ambitious. They're calling it the 100-unit housing plan. So right now, we're very limited in lots that we can build on… If we have to expand, it would be places that don't have hydro right now. So that would be something that we would have to work with hydro… We're just using our community energy champion to do some of our technical work, but I don't think he's done an energy plan."*

> *"We likely will [be using more electricity in the next 10 years], just like any other community across Canada. We paid for that infrastructure ourselves, Hydro One had no role in financing any of the infrastructure that's required for our growth."*

Business and facility growth

Aside from residential and community growth, many leaders also expect greater demand for electricity related to business and facility growth.

> *"And more and more, especially since the pandemic we've tripled the number of applications that we normally would receive in a quarter for member-owned businesses. And we're seeing new types of businesses come up…[our] economy is growing and diversifying. It's also meaning that there are more and more needs for electricity, and we're already running into some challenges with the amount of power that's available."*

> *"We're expanding all the time right now. We are currently building a big resource center consisting of a public school and the daycare into one facility is currently being built now."*

"There's going to be an increase in demand for sure. We have some projects on the horizon. There's a lot of power that's going to be needed for new homes and new buildings and new facilities and a number of different things."

"We're about to build a multiplex centre…I think it's close to a 12/13 million dollar building it's going to have some substantial hydro needs and we are budgeting of course for the cost of operations and maintenance, but that's going to be something as well that we would love for Hydro One to consider."

"We have a trust which is going to be aimed specifically at growth, infrastructure, for both economic development but also for community needs. So we do see the need for increased demands on hydro…I don't know what upgrading those electrical grids will require."

"We're in the process of building a training and cultural learning center. It's going to be around 15,000 square feet, and that's where part of my concerns are going to be. Like, our community is growing. It's a growing community, and a lot of times we run into energy sources and power outages in our community."

8.2. Investments in alternative sources of energy

Current use of alternative energy sources

Many mention already investing in alternative sources of energy, particularly solar power, to address their energy needs.

"We as a community, we've done solar. We have solar, so we get little rebates and stuff like that."

"Oh yeah. Yeah, we're in a partnership with all the same windmill power anyway. We have been selling energy to the [redacted]. So, yeah, we're doing that anyway. I guess that would be more of a commercial and non-residential application but... so we do have some private, like recreational landowners that have solar energy.. I think it's something that you'll see expand to our homes like people who have travel trailers. I already see panels up in their travel trailers here."

"The solar is totally passive income. It's like the best thing ever. We have a bunch of installations here and we own installations in the South that are just like every month the check comes in. It's the best thing ever."

"Some homes have alternative sources for generated power, but we don't have the number of units to look after everyone's needs."

"So, we were not a grid connected community. We received funding through the small communities' fund to do a solar micro grid and battery system. It's about 93-kilowatt system which actually runs the infrastructure on reserve because we don't have a lot of it either. There are a couple of major facilities that are enough to run on."

"We're always looking at ways to help our members. We do own a solar farm that is roughly 30 miles away from the First Nation. And we have explored doing one that is a little but smaller capacity closer to the First Nation in hopes that we could obviously make a deal again with Hydro."

Meanwhile, others share that they are exploring alternative energy sources, such as solar, wind, and biomass to reduce reliance on external power sources and provide their communities with more affordable and sustainable energy.

> *"We're exploring other ideas…biomass heating distribution system. We're looking at things like that in our new subdivisions that are coming up…of course, there's a cost to everything…but I think for the most part the biomass stuff sounds really good to me for the future. We're also working on solar rooftop projects for all homes to help reduce actual electricity lines coming through."*

> *"We've looked at water source power, we've looked at wind - we're not in a very windy area from what I gather. Solar panels, we're just starting to look at that through these other initiatives that are out there for funding. So, we have proposals for that one. We are always searching for a better way of generating power in the community."*

> *"I'd like to get more solar projects in the community to lower the hydro for everybody. I'm hoping for us to get solar panels done for every house to lower energy costs for every member."*

> *"I'm sure Hydro could help us. Our goal is to embrace energy transition…I think in terms of that relationship, walking together, this is going to be important…I hear about the vehicle transition and all this need for new generation…we're ready to do this stuff, we've got chargers in the community here."*

> *"I'm becoming more and more interested in things like battery storage...we're already into renewables here. We have a company that generates renewable energy here and down South... now there's an old wind project that I'm trying to revive that got squashed right at the last minute when Ford came in."*

Hydro One's role in helping communities meet changing energy needs

Some leaders desire education and assistance programs from Hydro One, particularly around reducing energy usag, energy efficiency, and career opportunities in the energy sector, especially for youth.

> *"It's all about education, understanding systems, understanding what our usage is and what our future projections are for that stuff, and then trying to make something fit that'll work for everyone…I'm sure we have some very interested people that want to participation and check [education from Hydro One] out."*

> *"Thing that Hydro could help us with is understand, as a community and an administration, what do those jobs [with Hydro] look like in the future… getting the youth to understand what the opportunities would look like at Hydro."*

> *"Something that would certainly help that Hydro could do, if there was some sort of assistance program for the youth to enter the trades… I've seen things with Hydro Quebec, where they have impacted the communities with dams, where they've sponsored people to got to school for trades that they need at the dams, and they guarantee the people a job when they're done. That sort of thing would help our community."*

> *"I think if they could like advise us if we're having enough power, because right now, we have one person who knows a little but about electrical work, and they're not certified or anything. So, it would be nice to get some expert advice. We're trying to do quite a bit of upgrades out there, but we're just trying to be mindful about the capacity."*

“If anybody knows power, if it's not Hydro, I don't know who it is. [Would like education on] looking at the different options, looking at how we could reduce our consumption, but still have the use of the power to run our households…Hydro One can play a big role in the whole educational component.”

Some leaders also seek alternative or backup power sources or support with renewable energy projects.

"An alternate source of power, whether it be a big community generator or something, would definitely give us some added comfort. Because we are isolated."

“They can provide us with a backup power source. We’d be happy with that… We can’t afford it.”

“We have an issue with trying to get our solar projects going. We had a project plan for solar panels to go on a school or in community elsewhere… Holding it up is there’s not enough capacity for us to put up solar panels.”

Many claim delays in service connections and project timelines are a significant concern.

"There's more onus on the customer to supply detailed information... And that has certain conditions that you need information to be inputted in order to move on to the next step... It's more of a delay and the timelines are extended within the project to get that set up."

"For project specific, it... carries on and delays... indirect with other contractors and scheduling to complete the project. For example, we have a project that's ongoing right now, but we still do not have a connection."

"Facilitate a new hook up... our poles are in place and it's just running a line to a house... shouldn’t take a couple months to do... Sometimes on new hookups to some of the new homes it’s taken, you know, two to three months when... we should have already been in motion."

“It’s really causing a huge stumbling block to the development of this property…Hydro One is very firm about, there has to be an easement with the town of [community]…it’s really huge in delay in our project and it’s going to get worse.”

“That is one of our biggest complaints is that we do build probably about six or seven houses a year. We’ve been lucky enough to be able to do that, but you’ve got to call [Hydro One] 3-4 months in advance…I think we waited for one full year for one building to be connected….they could really improve the response time pretty substantially.”

“We were trying to get hookups to our new 15 lot subdivision. There were some hiccups and getting the homes moved into right away…it just seemed as though we were jumping through hoops even with our Indigenous liaison…it’s still seemed very slow...it seems like we have to go through a lot of red tape to get the power delivered to these homes.”

9. Appendix 1: Pre-read Document

1

Thank you for taking the time to participate in Hydro One's customer engagement interview.

Hydro One is in the early stages of developing its draft plans covering the years 2028 through 2032.

The purpose of this one-on-one conversation is to begin a dialogue on what you expect from Hydro One as they start developing their Distribution and Transmission system plans for 2028-2032. This includes both the priorities and needs of your community, as well as what you feel Hydro One should be focusing on in the future.

These exploratory conversations are just the first step in an ongoing dialogue. Once Hydro One has developed its draft plans in 2025, you will again be asked to provide feedback.

What will be asked in this interview?

While you may have multiple relationships with Hydro One beyond being a customer (e.g., being a partner in current or future projects), this interview will focus solely on your community's relationship with Hydro One as a **customer**. For instance, in this interview, you will be asked questions about your community's energy needs, what Hydro One can do to better serve your community, what "good" reliability means for your community, and which areas you feel Hydro One should focus more on in the next five to ten years.

The Ontario Energy Board (OEB) expects Hydro One to have an investment plan that responds to customer needs and preferences.

In appreciation for your time, upon completion of this interview, we will provide your community with a $250 donation.

Who will be conducting the interview?

Hydro One has hired an independent research company, Innovative Research Group, to both facilitate and document these conversations. All conversations will be led by a trained researcher who is independent of Hydro One.

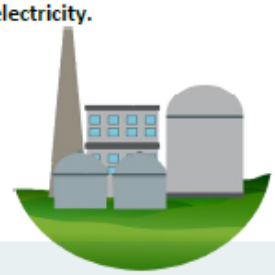
Unless you choose otherwise, all your feedback throughout this process will remain completely anonymous to Hydro One.

What are the next steps in Hydro One's customer engagement?

Hydro One plans to gather customer needs and preferences in stages:

- First, identify customer needs and preferences through in-depth conversations with leadership and surveys among on-reserve First Nations customers (**where we are today**)
- Throughout 2025, Hydro One will use this feedback to guide the development of its draft plans.
- Then, later in 2025, Hydro One will return to customers to ensure that their draft plans have found the right balance between investment and outcomes that matter most to customers.
- Finally, again, based on the feedback from customers, Hydro One will revise its plans and submit it to the OEB for final approvals.

Hydro One 2028 – 2032 Rate Application Customer Engagement (Strictly Confidential)



Hydro One's role in Ontario's electricity system

Ontario's electricity system is operated by public, private, and municipal companies across the province. It is made up of three components: generation, transmission and distribution. **Hydro One is Ontario's largest electricity transmission and distribution service provider; it does not generate electricity.**

Generation

Where electricity comes from

Ontario gets its electricity from a mix of energy sources owned by other companies. About half comes from nuclear power. The rest comes from a mix of hydroelectric and natural gas and, to a lesser extent, wind and solar.

Transmission

Hydro One transports electricity across Ontario.

Once electricity is generated, it must be transported to urban, rural, and Indigenous communities across the province. This is done by high voltage transmission lines that serve as highways for electricity. Often these lines are suspended on large steel towers. Hydro One owns and operates almost all of the more than 30,000 km of these lines in Ontario and provides transmission services to most electricity customers in Ontario.

Local Distribution

Hydro One delivers power to homes and businesses in your community.

In your community, Hydro One is also responsible for the last step of the journey: delivering electricity to customers through its local distribution system.

This system includes transformer stations that decrease the voltage of the electricity so it can be used safely in your home or business.

While there are many distributors in different areas of Ontario, Hydro One builds, operates and maintains the local distribution system that serves you. Hydro One reads meters, calculates and collects bills for all parts of the electricity system and answers customer calls.

How much of the typical electricity bill goes to Hydro One?

- Every item and charge on your bill is mandated by the Ontario government or regulated by the OEB.
- Although Hydro One is responsible for collecting payment for the entire electricity bill, for a typical On-Reserve First Nations residential customer about **44% or $116.41*** is related to the services Hydro One provides per month.
- The portion that is related to Hydro One services consists of: **35% (or $92.14)** for distribution delivery, and **9% (or $24.27)** for transmission delivery. First Nations customers living on-reserve do not pay delivery charges or HST, as they are offset by the **First Nations Delivery Credit**.
- The rest of the bill goes to power generation companies and regulatory agencies.

2. Methodology

Innovative Research Group Inc. (INNOVATIVE) was engaged by Torys LLP on behalf of its client, Hydro One Networks Inc. (Hydro One), to gain a deeper understanding of the needs and preferences of Métis Nation of Ontario (MNO) citizens directly from citizens in a leadership position, specifically as it relates to Hydro One's Joint Rate Application to the Ontario Energy Board (OEB) covering the years 2028 to 2032.

Approach to MNO Engagement

Hydro One provided INNOVATIVE with the contact information of leaders of all 9 Regional Councils as well as 30 local Community Councils. INNOVATIVE invited each of the Council leaders to schedule a meeting with INNOVATIVE to share their perceptions of their citizens' needs and preferences as they relate to Hydro One's Joint Rate Application covering the years 2028 to 2032.

Outreach efforts included Hydro One's Indigenous Relations team pre-socializing the interview opportunity with MNO leadership and providing a brief summary of what to expect from the interview and that INNOVATIVE would be reaching out to them in the coming weeks.

INNOVATIVE sent the initial invitation to Métis leadership to participate in an interview on September 23rd, 2024. For leaders that had not yet signed up to participate in an interview, a subsequent reminder email was sent on October 7th, 2024. Métis leaders had the opportunity to book an interview between September 23rd and October 10th, 2024. This outreach led to 8 interviews being completed via videoconference or telephone.

The invitation included a pre-read document that provided background information to participants including a brief summary of what will be asked in the interview, who will be conducting the interview, the next steps in Hydro One's customer engagement, Hydro One's role in Ontario's electricity system, and the amount of the typical residential customer electricity bill that goes to Hydro One.

Interviews were approximately 45 minutes in length and were conducted by a trained moderator following a discussion guide. In appreciation of the time provided by MNO leadership, INNOVATIVE provided a $250 cheque.

About this Report

This report summarizes the key findings based on these interviews. In general, our approach is to report representative verbatim comments and offer interpretation and/or commentary where necessary. Verbatim responses are shown in blue italics.

Please Note: Qualitative research does not hold the statistical reliability or representativeness of quantitative research. It is an exploratory research technique that should be used directionally. In interview-based research, the value of the findings lies in the *depth* and *range* of information provided by the participants, rather than in the *number* of individuals holding each view.

3. Key Findings

Leaders are generally satisfied with the reliability that citizens experience, though more rural areas are more likely to be impacted by frequent or extended outages.

Most leaders express general satisfaction with reliability, especially in more urban areas. Some leaders with citizens in rural and remote areas identify issues with more frequent or prolonged outages, which have significant impacts on food spoilage, medical equipment, and heating.

Most Métis leaders report a very limited relationship with Hydro One and desire more collaboration and direct communication between Hydro One and Métis leaders and citizens.

For most leaders, there is a desire for more consistent and direct communication with Hydro One. Many identified a need for a more collaborative relationship through community events, open houses, or educational initiatives.

Affordability is a significant concern, especially for seniors and citizens in low-income households.

Many leaders raise affordability concerns, emphasizing the impacts of electricity bills on citizens. Several leaders call for greater financial support for Métis citizens when it comes to electricity bills, focusing on citizens most impacted by the costs of their bill.

Some Métis leaders have concerns around vegetation management, specifically regarding chemical spraying.

Leaders emphasize the impact of spraying on traditional harvesting practices and express a preference for mechanical clearing and improved communication around the timing of tree and vegetation trimming.

Many Métis leaders expect growing energy demand in their communities.

This growing energy demand is expected as a result of residential growth, industrial growth, and the changing ways citizens are using electricity.

4. Profile & Energy Needs

4.1. Respondent Profile

Communities Engaged

Interviews were conducted with leaders representing Métis regions across Ontario, with populations ranging from approximately 220 to up to 7,000 citizens. These communities span both urban and rural areas, with varying levels of distribution service from Hydro One. When discussing their membership, some leaders emphasize growing affordability issues.

> *"I would say probably more than half of our citizens [are served by Hydro One]."*
>
> *"We've got a fair mix of people who live in town and their heat sources, usually propane or electric, and then the people who live out of town. I think most of us are wood stoves."*
>
> *"Well, for people, we have in between roughly say 500 and 700…in there somewhere…I would say over 90% [are served by Hydro One]."*
>
> *"The average household or average couple has 1.2 kids. Indigenous families have 2.6 to 2.8 almost three kids per household. So is that difference in demographic will impact a household—more kids, more laundry, right? More laundry, more hydro."*
>
> *"We do have a section of our citizenship that is marginalized, working for minimum wage, having issues going month to month as cost of living is up tremendously over the last couple of years. One income family with children can barely getting by."*
>
> *"It's huge [the territory]. I have 1,500 citizens in my catchment…I think we all pay to Hydro One."*
>
> *"We have about 220 citizens here. We had to revamp and eliminate a lot of citizens that were unverified…I think Hydro One is the only [distributor]."*

5. Satisfaction and Relationship with Hydro One

5.1. Overall satisfaction with Hydro One

Satisfaction related to reliability

Métis leaders largely attribute satisfaction with services to their reliability experience. Some Métis leaders note improvement in reliability over time and recognize the importance of the services Hydro One provides.

> *"Over the past 10 years, I would say things have improved dramatically... We still get some blackouts out of the mine, but it wasn't near as much as it was."*
>
> *"When you turn the lights on, the lights work. That's invaluable. You don't really realize how much you need hydro until the hydro goes out and then you would probably pay whatever you need to get it back. So, I think you know it's kind of just like a monopoly we need it. So you're going to pay what you have to pay to get it."*
>
> *"It was pretty good as far as that's concerned. I've got nothing bad to say about Hydro One."*
>
> *"Is it satisfactory to me? Yes, because I'm getting hydro on a regular basis. I'm paying what I can afford."*

Areas of Dissatisfaction

Some other Métis leaders express dissatisfaction with Hydro One for a variety of reasons, including issues with communication, a lack of clarity on where customers should go for support, and vegetation management issues.

> *"[When] they were fixing hydro poles at the end of the road and they just come snap your power out for the entire day. Maybe some sort of e-mail to a customer saying, 'hey, we're going to be doing work down this road. [You] might experience power outages.' But instead, I barely woke up, turn the TV on. 10 minutes later, it was out. And it was out the entire day, and I didn't know why until I actually went down the road to ask the workers... Maybe just some sort of communication to keep you in the loop so you feel like you're valued instead of just 'Oh, well, you get the power when you get the power. You don't when you don't.'"*
>
> *"I don't know if those customers are aware of what [contacts] Hydro [One] has. It's not like they've got a fridge magnet [that] says, 'for all things Hydro, call this number,' right?... How do I tell them who to call?"*
>
> *"They complain about [spraying] because it affects their way of life, for harvesting... If you're used to trapping in your area, why should you go another couple 100 miles just to trap, it's not worth it, right?"*

5.2. How Hydro One can better serve the community

Vegetation management

Some leaders express concern over vegetation management practices, specifically related to chemical spraying. They emphasize the impact of spraying on Métis traditional harvesting practices and express a preference for mechanical clearing.

> *"Being Indigenous means we collect medicines and foods off of those lines sometimes. It's nice to know if they're marked that they're chemically clean. It'd be nice to know the schedule when they tend to go and do mechanical clearing, because if there are plants that are at that seasonal time of the year when they're ready to be harvested, we would have that ability to go in ahead of them and harvest them."*

> *"We don't like that pesticide or herbicide, because it was killing everything. The trappers were getting angry because there were no more animals around there. There wasn't even a flyer. Nothing. And other provinces have gotten rid of that. They don't use it anymore. So anyway, so they said, 'OK, we're not going to use it because of your concerns.' And then they use something else. But it still had Garlon pour in it. They just renamed it."*

> *"There's nothing controversial about what they're doing, except for that spraying. And that's about the only thing that we have a problem with. Until that's resolved, it's always going to be a problem with citizens."*

Community engagement

Many leaders have a desire for a stronger relationship with Hydro One, including regular, direct communication through community events, open houses, or educational initiatives.

> *"Say an annual fish fry, for instance... and last year was our biggest one, which I think was roughly 175 people plus other local businesses like say, Bruce Nuclear. Like all the surrounding businesses are starting to come up. And [they] put tables at our events so that it gets the word out as well. So it's not just like a faceless company, right? There's more interactions and stuff like that. So maybe if they started to partake in some of our events. And then they would actually get to hear from our people directly."*

> *"Being more involved with us, even if it's just to have like a meet and greet or an information session. If there's information that they would like to get out just to invite our people [to] have a little sit down. They can explain some things or what they plan on doing. They kind of just do what they want when they want and you figure out after."*

> *"I can put the QR code for them to scan and to do that survey for Hydro One. They just got to ask. And I think that [it] would be a lot better to hear individually from all those people."*

> *"Maybe there's a newsletter they can stick in there and give some trivia pieces about hydro and how it relates to everything."*

> *"Having some open houses [so] that where people could come in and ask most people about Hydro One, they wouldn't be able to tell you very much. Huge company. They know this much about it, right? The education about a big company might help people to not be so frustrated and mad at their bill."*

"To get my citizens to events, I have all kinds of big draws. I have monthly draws. We give away all kinds of $1000 attendance prizes. We have... $500 gas cards. Nothing, right? All you have to do is click register if you're in an account holder with them and they pull five names every month."

Greater financial support

Many leaders express issues around affordability of electricity for citizens and some specifically mention the role of Hydro One in providing greater financial support to those most impacted by the cost of their electricity bills.

"They can give them, you know, a $50 credit every month to help towards that bill. Maybe there has to be something like that, or someone whose income's $20,000 a year, having to decide am I eating or am I going to be cold."

"It'd be nice to have a program for Indigenous people through Hydro One that helps subsidize some of the lower income families... I have a role in in putting our citizens in contact with the proper staff to be able to get their assistance. Whatever program that MNO are running or mainstream programming."

"It's hard. It's extremely hard, especially for seniors. I have a job. It's great. I'll pay my bill. But when you're [a] senior, you're already cutting... They don't really think [about] seniors and people that are on very low income. They shouldn't be paying the same as what we're paying."

"The big one that is a concern for many people is if you're struggling to pay your hydro bill. [If] you are First Nations and you live on reserve, you can access a pot of funding from Hydro One. But if you're Métis, you can't."

"You don't get people who want to even sign up for their citizenship because it doesn't get him a break on hydro. It doesn't get him a break on their taxes. They still have to pay all of their taxes. Not like if they lived on a reserve."

"When I lived in Alberta, I could access a utilities bank if I needed to, like you could go there like a food bank, but if you need help paying your utility. They have that out there. We don't [have] that here. So if you're not making your payments, you're getting cut off."

"The only thing that I have heard from constituents was the price of hydro. If there was a way that they could work something out... that there would be some sort of like discount or back pay at the end of the year kind of thing. Basically all, it's just prices."

5.3. Relationship with Hydro One

Current relationship with Hydro One

When asked about their current relationship with Hydro One, most leaders say that they do not have a strong relationship or communicate regularly with the utility in their role within the Métis Nation of Ontario.

"Well, personally I don't have much of a relationship with Hydro One."

"It's amicable. We have not met as often as I think we need to, and that is mostly due to COVID. We used to have a multi-disciplinary meeting about once a year…and those haven't happened probably since 2019, maybe 2018? I don't know if we're going to get back on track with that…they're usually good gatherings and good information."

"We did a deal with them, but our relationship with Hydro One was very, very contentious for quite a while…we kicked them out of a room at one point."

"I'm not overly happy with the fact that I was told at one point previously that Hydro One already has its agreements with First Nations [while we are in ongoing negotiations]."

"To be honest, I am new to this role…so I personally have never had any interactions with Hydro One at all with my council."

"I don't really have communication with them…just when there's an outage, I get a notice that there is going to be an outage."

Desired relationship with Hydro One

Many leaders call for greater engagement with Hydro One and project involvement on par with First Nations. Some note challenges in addressing the dispersed Métis population, as well as perceived inequities in economic opportunities and project involvement compared to other Indigenous groups.

"If you have a duty to consult and measure impacts and benefits, you have to do that with all Indigenous groups, whether it's Inuit, First Nations or Métis. Hydro One said, 'Oh, it's real easy to do reserves, because that's a postal code. Basically, we can just slam it all down at once and get it done.' It's a little more difficult [for us]. We're scattered over large geography. You'd have to basically register with them that you are Indigenous and then they would have to settle. But they're not talking to us about that. So there's an unfairness from Hydro One and other distributors."

"Hydro [One] said there is going to be no economic development for any group. Didn't matter what group you were, there was going to be no economic development. 3 weeks later they are announcing cross Ontario that they're giving the First Nations 51% of this project. Three weeks. Three weeks after we were told nothing. Zero. Nada. Nobody's getting anything."

"They didn't say, 'hey, we want to change the name of this project, and here's what your options are.' We were just told this is the name of the line. I mean, I know First Nation groups that weren't happy with it... We are one of the three Indigenous groups in Canada, and we have to be treated very similarly... If we had a treaty, we would have our impact to rights be on par with the First Nations. But until we have a treaty with Canada, they keep thinking that they can just keep pushing us off to the side."

"We need to be treated fairly, equitably and fairly as our as our brothers and sisters are."

Many leaders are open and willing to work with Hydro One to build and maintain a proactive and supportive relationship.

"If there's a way possible for us to move forward together, I think that would be great cause. Again, it shows that they're trying to get more involved with the community and we'd be more than happy to work with them on any process, like even getting information out. If they want to do like the fixing... 'your hydro will be down while,' we can put that to our people in the area... We'd be willing to."

"Electricity grid and service providers might want to at some point time get together and do the same thing and say, 'hey, let's give one number out to our customers if they have to call, they will be redirected by somebody on who answers that call and tell you who to get a hold of, right?"

6. Price & Affordability

Affordability

Many raise significant concerns around the affordability of electricity bills, emphasizing the financial burden it places on citizens, especially for those living in rural areas, seniors, and low-income households.

> *"[Affordability] is a huge issue... I think we spend a disproportionate amount of it on our hydro and if you're like me, I live out in the middle of nowhere. I don't have any other utilities."*
>
> *"[Hydro One can] slash their bills by 90%."*
>
> *"Over the last year, we've had several citizens that have come to us asking for help paying their bills. Specifically, their hydro bill because, it's too unaffordable."*
>
> *"The colder the winter, the more you heat, the more you pay. You have to take it from someplace else to be able to pay that bill. So that's generally the food on your table, right?... [So] you're not going to eat healthy because you can't afford a healthy meal."*
>
> *"With the prices today, I keep the furnace off, I keep air conditioning off. I keep my lights off. We do so much in the dark because it's not affordable otherwise... We shouldn't have to be that cheap with the use of hydro to exist. There are people that are less fortunate in wages that keep their hydro off even more than that because they can't afford those bills. People, people have already cut down."*
>
> *"If there was some affordability, why should I have to keep my house at 58°? Because I can't afford a hydro bill. If it's at 70°, where I'd be comfortable or 68°, that would be comfortable. [But] I'm keeping it down, pushing it down to 60°. Well, that's not reasonable."*
>
> *"Reducing cost... I know that it's repetitious, but it's cost. Cost is what affects my community members the most right now."*

Billing

Some share that billing clarity could be improved. Some also note that seniors find bills difficult to understand.

> *"But you have lots of seniors. So people who are not understanding the words or the way that they're explaining and the bill is just downright terrible."*
>
> *"We're at the whim of whatever they want to charge…if you look at when your bill comes, they're changing you for delivery here and delivery there. And I'm like, 'the stuff's in the pipe'. Whether you use this much or this little, they charge you the same no matter what you do…I would like an explanation of why we have to pay 3 delivery charges, you know, to come from that pipe... So I think a little bit more detailed explanation that's user friendly."*
>
> *"They say square cubic foot…you know, and all that. Like what does that mean to a senior that you've used this much…where are they getting this from?...I feel sorry for especially the seniors because they really don't know."*
>
> *"The bill is really only 20% of what we are actually using…everything else, you know, just started being astronomical. I honestly believe we're being gouged…and it's taking advantage of people."*

"People think when they hear in the news that hydro is only going up 3%, they don't understand that's the production of the electricity. The delivery can also go up 3% and since they're both 50% of your bill, your bill is really going up 5%. I think the corporations need to be clear on what the total impact of your bill will be. Not trying to pull the wool over people's eyes."

7. Reliability

7.1. Importance of good reliability

Impacts of poor reliability

Leaders identify a range of impacts related to poor reliability and especially extended outages, highlighting issues related to food spoilage, medical equipment, and heat.

> *"After that big snowstorm... there was a lot of people that were coming to me going. 'I need a generator because I lost all the food in my fridge. I lost everything. I didn't have heat.'"*

> *"But if it's not mostly the older people who we'd be worried about because they wouldn't be able to feed themselves, take their medication, or even like the ones who would have sleep apnea, couldn't use their machines, right?"*

> *"I know that the longer power outages are about 12 hours. And that's a pretty long time, especially if you're one of my citizens who's on an oxygen machine and you're relying on that power and you don't have that backup... And so there are some people that have come to rely on me providing my personal backup generator during power outages because they've got either older freezers that don't do well when they're turning off and on, and they don't want to lose their meat or they have the oxygen machines or other medical equipment that they need to have plugged in."*

> *"Hydro, for the most part, you get a three, 4–5-hour outage. Nothing to worry about. If it looks like it's going to be more than five hours, you have to start thinking about the meats in your fridges and freezers and whatever else."*

7.2. Current state of reliability

General satisfaction in reliability

Leaders are generally satisfied with the reliability of Hydro One's service to their citizens, expressing that they do not often experience reliability issues.

> *"[Citizens] don't ever say it's not reliable. They just say it's too expensive."*

> *"When I look at reliability, it's there. I don't think there's an issue with that. It comes down to cost and how affordable is it for our citizens."*

> *"The reliability's pretty consistent. There are some interruptions, but [that is] what happens with anything right?"*

> *"Other than the old homes with the old wiring, I would say that I really don't have flickering unless the light bulb's about to bust."*

> *"Overall, is it reliable? Yes. Do I think that they could do better informing a proper outage that they know in advance? Yes."*

Urban and rural differences

For some, reliability is considered less dependable in rural areas compared to urban centers, with rural and remote citizens more likely to report frequent or prolonged outages.

> *"[Reliability] just depends on what grid you're in for. For me, any sort of storm, it'll go out right away because of where I am. But the ones who are in the bigger cities never really seem to have a problem because they're on a whole different power grid."*

> *"Most of them, they know the area where they live. They know when there's an outage, it could be significant being six or eight hours or more versus, you know, living in town. You might have a two-to-four-hour window of concern. So, most of them have been prepared. They have that survival mentality already that power could go out. So, they've got the equipment to get through it."*

> *"Work quicker to restore power because when they're taking away resources from [redacted] to send them down to [redacted] during an outage for both communities. Because there is a more urban area, they're more prioritized over the rural areas. And I don't think that that's fair."*

> *"We had a really bad snowstorm three years ago, where we had 4 1/2 feet of snow dumped on us and my road. For three days, every single one of my neighbors down my road lost their power. Large amount of them were citizens. I was the only one who had no issues because I wasn't on the grid. But for some people they were without power for a week or so."*

8. Hydro One Priorities & Future Expectations

8.1. Anticipated changes in electricity use

Community growth

Many leaders anticipate growing use of electricity in their communities due to population growth, particularly in more rural areas.

> *"Immigration [is] stronger than it's ever been. We're seeing more diverse cultures settling in our area. Housing construction is way up... The next census should see a significant growth in our town."*

> *"Where I live now, they're starting to take the farmland outside of the that's roughly around the city and they're about to turn those into apartment buildings... Growth is booming, that's for sure."*

> *"I see lots of people, city people, moving to the small rural areas… people are selling their homes in the city, in Toronto, and all over and moving to these tiny towns."*

Business and industry growth

In line with expected community growth, many leaders also expect expanding housing construction, urban development, and growing economic activity as a result of expanded business and industry activity.

> *"With the mining industry in this area, because that's the one of the main employers, there are a number of new properties coming into existence... The demand for workers is going to be there. So the growth is going to be there."*

> *"[Redacted] itself is growing, but a lot of this area is dependent on the mines at [redacted]. In [redacted] was a very small community. People work logging in forestry. [Redacted] is mostly the hospital, government or education."*

> *"With the amount of mines that we're hoping to open and stuff like that in the area, they're going to chew up a really big part of whatever power that they can do. I think Hydro [One] needs to up their game, make things more efficient in... how they're producing power. I think they could. I think they can squeeze way more out of what they're doing and become that much more efficient."*

General increasing energy demand

In addition to population and industry growth, some leaders share that rising consumption habits and increasing demand for electric vehicle charging infrastructure are contributing to higher energy usage. Some mention that climate change and fluctuating weather patterns, including prolonged extreme heat, are further driving rising demand.

> *"The rationale for why it's going up is going to be electric vehicles. Everything else is getting more energy efficient. So the promotion of electric vehicles and charging stations. You see them popping up in every community. Now they are a dime a dozen…so those types of things are part of the growth factor."*

"[With] the climate change,... last summer we had several days where it was over 40 for a week, and that was a lot on the grid when you're trying to power all those air conditioners. So that's also another thing is with the fluctuating weather."

"In terms of power consumption, [it] is mainly going to be that everybody needs that bigger TV. Everybody wants to plug absolutely everything in all the time."

"Even though I do follow time of [use], I do everything I can to reduce my power output, input and stuff like that. I know that I'm going to increase how much power I use. It's inevitable."

"I think with the amount of power that everybody is going to be using, I think that they I think that hydro really needs to keep [up with] their maintenance."

8.2. Investments in alternative sources of energy

Renewable uptake and energy-conscious behaviours

Some leaders note uptake of renewable energy options like solar and identify growing trends in energy-conscious behaviours to reduce usage.

"I think they're trying to go, 'greener,' right? They're trying to do the solar panels and that stuff. I don't know how much of it would [change] because the more you look into [it], you realize more [that] it's not really worth it. The trade off the wind, propellers, turbines, etc. and the animals that kills really isn't worth what people are getting. Because they don't work half the time, right?"

"People who live in the more rural areas where they do have a fair amount of sunshine, they set their solar panels up where they built their house…[One of my friends] did that. All his solar panels and everything are all set up... He's getting the batteries the whole 9 yards.."

"The usage stays the same. I think people are being a little more cautious keeping the lights down, even though with the LED bulbs today you're using very little electricity. You know those that heat by electricity? Keep that heat down one or two degrees. You put a sweater on instead of putting the heat up and so on."

Hydro One's role in helping communities meet changing energy needs

Leaders look to Hydro One to take a leadership role in addressing the rising climate change concerns by continuously modernizing infrastructure and investing in renewable energy sources.

"People's concerns are absolutely right about climate change, something that needs to be taken very seriously. And I think that the more modern techniques and the more modern your infrastructure is, the better chance of its survival."

"I think that we need the introduction of not just hydro dams, but the increase of power has to come from renewables... I think in the far north where all these communities are on diesel, we need to remove them from diesel because of climate change. They need to get on the small nuclear reactors. I honestly don't think there's enough sunlight in the day, and winds are not as consistent."

"Nuclear produced electricity is the most expensive out there right now... But over the 60-year period that cost [would] drop because the return is greater over time.?"

9. Appendix 1: Pre-read Document

Thank you for taking the time to participate in Hydro One's customer engagement interview.

Hydro One is in the early stages of developing its draft plans covering the years 2028 through 2032.

The purpose of this one-on-one conversation is to begin a dialogue on what you expect from Hydro One as they start developing their Distribution and Transmission system plans for 2028-2032. This includes both the priorities and needs of your members, as well as what you feel Hydro One should be focusing on in the future.

These exploratory conversations are just the first step in an ongoing dialogue. Once Hydro One has developed its draft plans in 2025, you will again be asked to provide feedback.

What will be asked in this interview?

While you may have multiple relationships with Hydro One beyond being a customer (e.g., being a partner in current or future projects), this interview will focus solely on your and your members' relationship with Hydro One as a **customer**. For instance, in this interview, you will be asked questions about your members' energy needs, what Hydro One can do to better serve your members, what "good" reliability means for your members and which areas you feel Hydro One should focus more on in the next five to ten years.

The Ontario Energy Board (OEB) expects Hydro One to have an investment plan that responds to customer needs and preferences.

In appreciation for your time, upon completion of this interview, you will be provided with a $250 donation to support one of the Métis Nation of Ontario's programs.

Who will be conducting the interview?

Hydro One has hired an independent research company, Innovative Research Group, to both facilitate and document these conversations. All conversations will be led by a trained researcher who is independent of Hydro One.

Unless you choose otherwise, all your feedback throughout this process will remain completely anonymous to Hydro One.

What are the next steps in Hydro One's customer engagement?

Hydro One plans to gather customer needs and preferences in stages:

- First, identify customer needs and preferences through in-depth conversations with leadership and surveys among Hydro One customers (**where we are today**)
- Throughout 2025, Hydro One will use this feedback to guide the development of its draft plans.
- Then, later in 2025, Hydro One will return to customers to ensure that their draft plans have found the right balance between investment and outcomes that matter most to customers.
- Finally, again, based on the feedback from customers, Hydro One will revise its plans and submit it to the OEB for final approvals.

Hydro One's role in Ontario's electricity system

Ontario's electricity system is operated by public, private, and municipal companies across the province. It is made up of three components: generation, transmission and distribution. **Hydro One is Ontario's largest electricity transmission and distribution service provider; it does not generate electricity.**

Generation

Where electricity comes from

Ontario gets its electricity from a mix of energy sources owned by other companies. About half comes from nuclear power. The rest comes from a mix of hydroelectric and natural gas and, to a lesser extent, wind and solar.

Transmission

Hydro One transports electricity across Ontario.

Once electricity is generated, it must be transported to urban, rural, and Indigenous communities across the province. This is done by high voltage transmission lines that serve as highways for electricity. Often these lines are suspended on large steel towers. Hydro One owns and operates almost all of the more than 30,000 km of these lines in Ontario and provides transmission services to most electricity customers in Ontario.

Local Distribution

Hydro One delivers power to homes and businesses in many communities.

In many communities across each of the 9 Métis Nation of Ontario regions, Hydro One is also responsible for the last step of the journey: delivering electricity to customers through its local distribution system.

This system includes transformer stations that decrease the voltage of the electricity so it can be used safely in homes and businesses.

There are many distributors in different areas of Ontario serving Métis membership, and Hydro One builds, operates and maintains the local distribution system in many communities. Hydro One reads meters, calculates and collects bills for all parts of the electricity system and answers customer calls.

How much of the typical electricity bill goes to Hydro One?

- Every item and charge on your bill is mandated by the Ontario government or regulated by the OEB.
- Although Hydro One is responsible for collecting payment for the entire electricity bill from its distribution customers, for a typical residential customer about **34% or $57.72*** goes to Hydro One per month.
- The portion that goes to Hydro One consists of: **24% (or $41.18^)** for distribution services, and **10% (or $16.54)** for transmission services.
- The rest of the bill goes to power generation companies, taxes and regulatory agencies.

*Before Ontario Electricity Rebate of 19.3%.

^Distribution portion of the delivery charges include Distribution Rate Protection savings.

2028-2032 Joint Rate Application
Phase I: Planning Placemat

Hydro One Phase I Customer Engagement

Planning Placemat (Identifying Customer Needs and Preferences)

Between August and December 2024, INNOVATIVE engaged with customers, community leaders, and stakeholder groups to identify general customer needs and preferences, and to gather feedback on a series of high-level investment trade-offs covering both the distribution and transmission systems.
This planning placemat summarizes the quantitative feedback received from customers through an online survey. The online survey was customized for different customer types and rate classes with estimated bill impacts provided. Where appropriate, results are weighted by region and consumption to ensure they are representative of Hydro One's broader customer base.

Customer Type Unweighted n (weighted in brackets)	Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers	
	Residential n=6,053 (5,000)	First Nations On-Reserve n=426 (400)	Small Business n=477 (450)	Commercial & Industrial n=311 (300)	Large Dx Accounts n=61	Other LDC* Residential n=1,019 (1,000)	Large Tx Accounts n=72
What are customer needs? **Most customers do not identify any specific needs. Among those who do, the top responses include decreased outages, lower rates, address/proactive tree trimming, communications during outages, and improving customer service.**							
Customer Needs (%) indicates share of customers within the customer group providing the response. Results are based on an open-ended question asking customers what they would like Hydro One to do to improve its services. Top-3 most common responses are shown.	Decrease outages (9%)	Lower rates (7%)	Lower rates (10%)	Decrease outages (9%)	Decrease outages (15%)		Improve customer service (19%)
	Lower rates (9%)	Decrease outages (6%)	Decrease outages (5%)	Improve customer service (4%)	Communication during outages (10%)		Decrease outages (13%)
	Address/proactive tree trimming (7%)	Improve outage response times (3%)	Address/proactive tree trimming (4%)	Upgrade/better maintain infrastructure (3%)	Building capacity/ addressing growth (7%)		Improve information sharing (7%)
What outcomes do customers prioritize? **Reasonable rates and reliable electricity are top priorities for all customer types. Meeting growing demand for electricity is a top priority for C&I, Large Dx, and Other LDC Residential customers.**							
General Priorities (%) indicates total share of customers within the customer group that select the priority in their top-3 outcomes. Only the 3 most frequently selected priorities are shown.	Reasonable rates (80%)	Reasonable rates (76%)	Reasonable rates (82%)	Reasonable rates (83%)	Reasonable rates (75%)	Reasonable rates (76%)	Reliable electricity (81%)
	Reliable electricity (69%)	Reliable electricity (49%)	Reliable electricity (52%)	Reliable electricity (67%)	Reliable electricity (69%)	Meeting growing demand (59%)	Reasonable rates (61%)
	Ensuring safety (40%)	Ensuring safety (38%)	Enhancing the grid for new tech (37%)	Meeting growing demand (39%)	Meeting growing demand (43%)	Reliable electricity (57%)	Ensuring safety (53%)
What reliability outcomes do customers prioritize? **Both the length and number of outages are important priorities across all customer types. For all customer types, the length of outages <u>not</u> caused by severe weather is within their top-3 priorities.**							
Reliability Priorities (%) indicates total share of customers within the customer group that select the priority in their top-3 outcomes. Only the 3 most frequently selected priorities are shown.	Length of outages caused by severe weather (63%)	Length of outages caused by severe weather (59%)	Length of outages caused by severe weather (60%)	Number of outages <u>not</u> caused by severe weather (61%)	Number of outages <u>not</u> caused by severe weather (57%)	Length of outages caused by severe weather (65%)	Number of outages <u>not</u> caused by severe weather (65%)
	Length of outages <u>not</u> caused by severe weather (57%)	Communications during outages/ETOR (54%)	Number of outages <u>not</u> caused by severe weather (57%)	Length of outages <u>not</u> caused by severe weather (60%)	Momentary interruptions in power (57%)	Number of outages <u>not</u> caused by severe weather (59%)	Length of outages <u>not</u> caused by severe weather (58%)
	Number of outages <u>not</u> caused by severe weather (52%)	Length of outages <u>not</u> caused by severe weather (52%)	Length of outages <u>not</u> caused by severe weather (54%)	Length of outages caused by severe weather (49%)	Length of outages <u>not</u> caused by severe weather (46%)	Length of outages <u>not</u> caused by severe weather (59%)	Number of outages caused by severe weather (50%)

Hydro One 2028-2032 Joint Rate Application Customer Engagement (Phase I)

Innovative Research Group Inc. (INNOVATIVE) was engaged by Torys LLP on behalf of its client, Hydro One Networks Inc. (Hydro One), to assist in meeting its customer engagement commitments under the Renewed Regulatory Framework for Electricity Distributors and Chapter 5 Filing Requirements. The information contained within this report is the result of a series of online surveys conducted as part of Phase I of this customer engagement for the 2028-2032 joint rate application.

Report Overview

In Phase I, Hydro One and INNOVATIVE set out to develop an understanding of current customer needs and preferences, as well as gain some preliminary insights on more specific investment areas that could be further explored in Phase II. Investment trade-off questions were asked relating to both the distribution and transmission systems.

A key principle of this phase uses random-sampling research methods to ensure a representative sample of customers were engaged, ensuring the generalizability of the findings.

The online survey was customized for different customer types, and this report contains separate sections for each: **Residential & Seasonal**, **First Nations On-Reserve**, **Small Business (GS<50)**, **Commercial & Industrial**, **Large Distribution Accounts**, **Large Transmission Accounts**, and **Other LDC Residential**.

Introduction
Segmenting Customers

Customer Segmentation

In addition to segmenting customers based on where they reside or operate in Hydro One's service territory, it is important to be able to identify factors that may influence customer preferences and distinguish between what is within, and what is outside of Hydro One's influence or control.

Segmentation, where possible, is used throughout this report to look beyond the topline numbers and to analyze the results for key segments:

1. **Region:** Using customer data provided by Hydro One, we split customers into five regions for analysis; West, Central, Central East, East, and North based on Hydro One's service zones.

2. **Consumption Quartiles**: For residential, First Nations On-Reserve, small business (GS<50), and commercial & industrial customers, results are also shown by consumption quartiles. For low-volume customers, this is based on how much electricity the customer consumes in an average month (in kWh). For commercial & industrial customers, this is based on customer demand in an average month (in kW). This is used to ensure that no one customer consumption/demand profile is over or underrepresented in the survey results.

3. **Bill Impact on Finances**: Segmentation that INNOVATIVE refers to as "Bill Impact on Finances" is provided. This segment is determined based on the extent to which customers agree with the following statement(s):

    a) Residential/First Nations On-Reserve: *The cost of my electricity bill has a major impact on my finances and requires I do without some other important priorities.*

    b) Small Business/Commercial & Industrial*: The cost of my organization's electricity bill has a major impact on the bottom line of my organization and results in some important spending priorities and investments being put off.*

4. **Vulnerable Consumers**: For residential and First Nations On-Reserve customers, using a combination of household size and combined household income, the report identifies customers who would be eligible for financial assistance programs. The methodology used to calculate this segmentation is based on the OEB's *Ontario Electricity Support Program (OESP)* criteria.

Understanding Segmentation

Segmentation is an effective way to look past the topline numbers and dig deeper into the needs and preferences of the customer segments outlined above. Segmentation allows readers of this report to quickly look past the topline numbers and understand how various segments of customers feel based on perceptions that may be outside of the utility's influence or control.

Overview and Methodology

Section 1

Overview and Methodology

Research Objectives

Research Objectives

As part of its Phase I Customer Engagement, Torys LLP, on behalf of its client Hydro One, commissioned INNOVATIVE to conduct parallel telephone and online surveys among low-volume customer types.

Running parallel telephone and online surveys serves two primary purposes

Online surveys are conducted to gather feedback and insights on preferences and needs from customers. It is important to establish a baseline level of knowledge of the electricity system among customers in order to gather informed feedback on customer needs and preferences. The most effective way to present this information is through an online survey. Feedback from these surveys will help Hydro One's planners inform the design of the utility's draft investment plan, which will be share with customers in Phase II of the customer engagement.

Parallel telephone "reference surveys" are conducted to ensure that customers reached by email are representative of the broader population of Hydro One customers reached via telephone. Not all customers have provided their email address to Hydro One, but all have phone numbers. Understanding the differences between customers with a known email address (email sample) and the broader customer base (reached via telephone) is a critical step for understanding how representative the email sample is of the broader customer base. This approach allows for weighting adjustments to be made to the online survey results when significant differences are found between the two samples that meaningfully impact the overall results.

Benefits of Utilizing an Online Methodology

Online surveys allow us to provide the context and information needed for customers to give meaningful input into their needs, preferences, and evaluation of Hydro One's draft investment plan that will be presented in Phase II of the customer engagement. Benefits of utilizing an online methodology include:

- Better presentation of information through the use of visuals (e.g. diagrams and pictures)
- Ability to ask more questions, as respondents are more likely to spend a longer time participating in an online survey than on the phone
- Flexibility for customers to complete the survey at their own pace

Overview and Methodology

Overview of Approach

INNOVATIVE undertook a rigorous "sample validation" process to understand whether and where differences existed between customers who have provided their email to Hydro One and the full population of customers. Telephone reference surveys were conducted for all low-volume customer types, namely residential (both primary and seasonal), First Nations On-Reserve, and small business (GS>50kW).

Since email addresses were available for all Large Distribution Accounts (LDA) and nearly all Commercial and Industrial (C&I) and Large Transmission Accounts (LTX), telephone reference surveys were not conducted among those customer groups.

Overview of Approach

The sample validation portion of this report takes several steps to validate the sample across customer types, both when a telephone reference survey was conducted and when it was not.

1. **Use complete customer lists to compare known sample variables between those with an email address and the full population of customers.** This allows us to identify systematic differences between those with an email on file and the full population of customers regarding known characteristics (rate class, region, and consumption) that may impact outcomes. All samples except Large Distribution Accounts (LDA) and Large Transmission Accounts (LTX) are weighted by region and consumption quartile to ensure representativeness.
2. **For customer types where parallel telephone and online surveys were conducted, we compare responses on core demographics, firmographics, and controls that may impact outcomes.** This allows us to identify differences between online and telephone respondents on self-reported demographics, firmographics, and controls.
3. **Based on the above exercise, we identify any sample differences that may be corrected for with weighting.** We focus on differences that meaningfully impact the overall results of the online surveys.

Overview and Methodology

Survey Methodologies

The sample validation portion of this report documents the results of several telephone reference surveys and online surveys conducted by INNOVATIVE among selected customer groups. Below, an overview of survey methodology is provided. All surveys listed below follow a random sampling methodology where customers are randomly selected to be invited to participate.

Telephone Reference Surveys

The **residential telephone survey** was fielded from November 13th, 2024, to November 24th, 2024, among a random sample of n=1,011 primary residential and seasonal customers. The sample is weighted proportionately to n=1,000 by region, consumption quartile, and customer type.

The **First Nations On-Reserve telephone survey** was fielded from November 14th, 2024, to November 19th, 2024, among a random sample of n=204 First Nations On-Reserve residential customers. The sample is weighted proportionately to n=200 by region and consumption quartile.

The **small business (GS<50) telephone survey** was fielded from November 13th, 2024, to November 21st, 2024, among a random sample of n=401 small business customers. The sample is weighted proportionately to n=400 by region and consumption quartile.

Online Surveys

The **residential online survey** was fielded from November 12th, 2024, to December 4th, 2024, among a random sample of n=6,053 primary residential and seasonal customers. The sample is weighted proportionately to n=5,000 by region, consumption quartile, and customer type.

The **First Nations On-Reserve online survey** was fielded from November 14th, 2024, to December 5th, 2024, among a random sample of n=426 First Nations On-Reserve residential customers. The sample is weighted proportionately to n=400 by region and consumption quartile.

The **small business (GS<50) online survey** was fielded from November 12th, 2024, to December 3rd, 2024, among a random sample of n=477 small business customers. The sample is weighted proportionately to n=450 by region and consumption quartile.

Note: *Graphs and tables may not always total 100% due to rounding. Values greater than any error in data. Sums are added before rounding numbers.*

Sample Validation

Comparing Known Sample Variables

Comparing Known Sample Variables

Overall Customer Email Coverage

Overall Customer Email Coverage

The table below summarizes the email coverage of each of Hydro One's customer types.

Rate Class	Total Records (Meters)	Unique customers*	Customers with an email	Email coverage (out of unique customers)
Residential	1,193,492	1,078,621	766,702	**71.1%**
Seasonal	136,763	102,349	68,663	**67.1%**
First Nations On-Reserve	20,801	17,276	11,552	**66.9%**
Small Business	113,709	63,122	45,571	**72.2%**
Commercial & Industrial	7,453	5,154	4,827	**93.7%**
Large Distribution	289	276	276	**100.0%**
Large Transmission	249	197	195	**99.0%**

*Unique *customers* from the complete list of Hydro One's records (individual meters) are identified by cross-referencing available contact information to identify customers with multiple meters. Customers are assigned to their highest-order rate class in the following order (Large Transmission Account, Large Distribution Account, Commercial & Industrial, Small Business (GS<50kW), First Nations On-Reserve, Residential, Seasonal). For customers with multiple records within the same rate class, the record with the highest average monthly consumption is used for the purpose of assigning sample variables.

Comparing Known Sample Variables

Regional Distribution by Customer Type (Con't)

Comparing Known Sample Variables

The information below compares the sample of each customer type with email addresses to the total customer accounts of that customer type across regions.

Legend: Difference
More than -10%
-10% to -4%
-4% to +4%
+4% to +10%
More than +10%

(1) Regional Distribution by Customer Type

Using service zones, areas are grouped into five distinct regions within Hydro One's service territory.

Distributions of region are similar (+/- 4%) across residential, seasonal, and First Nations On-Reserve customer types. Any differences are accounted for by making weighting adjustments based on region.

Customer Type	Region	Share of full population	Share of email sample	Difference
Residential	Central	26%	26%	**0%**
	Central East	31%	31%	**0%**
	East	16%	17%	**+1%**
	North	11%	10%	**-1%**
	West	16%	15%	**-1%**
Seasonal	Central	39%	40%	**+1%**
	Central East	32%	32%	**0%**
	East	6%	6%	**0%**
	North	16%	15%	**0%**
	West	7%	6%	**0%**
First Nations On-Reserve	Central	26%	24%	**-1%**
	Central East	14%	15%	**0%**
	East	1%	1%	**0%**
	North	48%	50%	**+2%**
	West	11%	10%	**-2%**

Comparing Known Sample Variables

Regional Distribution by Customer Type

(1) Regional Distribution by Customer Type

Using service zones, areas are grouped into five distinct regions within Hydro One's service territory.

Distributions of region are similar (+-/ 4%) small business (GS<50) and commercial & industrial customer types. Any differences are accounted for by making weighting adjustments based on region.

Legend: Difference
More than -10%
-10% to -4%
-4% to +4%
+4% to +10%
More than +10%

Customer Type*	Region	Share of full population	Share of email sample	Difference
Small Business (GS<50)	Central	24%	25%	**+1%**
	Central East	27%	27%	**0%**
	East	14%	15%	**+1%**
	North	15%	14%	**0%**
	West	21%	20%	**-1%**
Commercial & Industrial	Central	25%	25%	**0%**
	Central East	22%	22%	**0%**
	East	12%	12%	**0%**
	North	11%	12%	**0%**
	West	28%	29%	**0%**

Note: LDA and LTX customers are not shown as all, or nearly all customers have an email on file.

Comparing Known Sample Variables

Distribution of Consumption Quartile by Customer Type

Comparing Known Sample Variables

The information below compares the sample of each customer type with email addresses to the total customer accounts across average monthly consumption (low-volume) or demand (commercial & industrial).

Legend: Difference
More than -10%
-10% to -4%
-4% to +4%
+4% to +10%
More than +10%

(2) Distribution of Consumption Quartile by Customer Type

Within each customer type, customers are grouped into four equal quartiles based on average monthly consumption (measured in kWh) for low-volume customers and average monthly demand (measured in kW) for commercial & industrial customers.

Distributions of consumption quartile are similar (+/- 4%) for residential and First Nations On-Reserve customers. Seasonal customers with an email on file skew towards higher consumption. Any differences are accounted for by making weighting adjustments based on consumption quartile.

Customer Type	Region	Share of full population	Share of email sample	Difference
Residential	First	25%	23%	**-1%**
	Second	25%	24%	**0%**
	Third	25%	25%	**0%**
	Fourth	25%	26%	**+1%**

Sample Validation

Reference Surveys: Comparing Telephone and Online

Reference Surveys
Comparing Telephone and Online

Comparing Telephone and Online

For residential (including seasonal), First Nations On-Reserve, and small business (GS<50) customers, parallel telephone and online surveys were conducted to identify differences between online and telephone respondents on self-reported demographics, firmographics, and controls. The following tables outline similarities and differences across each of the customer groups where parallel telephone and online surveys were conducted.

Summary of Residential Sample Validation

Comparing the results of the telephone reference survey and the online survey across basic demographics, familiarity and satisfaction, outage experience, and environmental controls reveals minor differences between the two samples with some notable differences on age and highest level of education.

On education, telephone respondents are more likely to have their highest level of education at the high school or less level and online respondents are more likely to have their highest level of education at the college/trades level. Additionally, online respondents skew slightly younger than telephone respondents.

The online results are not weighted by education or age as doing so does not meaningfully impact the overall results.

Comparing Telephone and Online

Summary of First Nations On-Reserve Sample Validation

Comparing results of the telephone reference survey and the online survey across basic demographics, familiarity and satisfaction, outage experience, and environmental controls reveals minor differences between the two samples with some notable differences on age and highest level of education.

As is the case with the Residential & Seasonal results, telephone respondents are more likely to have their highest level of education at the high school or less level and online respondents are more likely to have their highest level of education at the college/trades level. Additionally, First Nations On-Reserve online respondents skew slightly younger than telephone respondents.

The online results are not weighted by education or age as doing so does not meaningfully impact the overall results.

Summary of Small Business (GS<50) Sample Validation

Comparing the results of the telephone reference survey and the online survey across basic firmographics, familiarity and satisfaction, outage experience, and environmental controls reveals minor differences between the two samples.

While telephone respondents are less likely to say they are familiar with the share of their bill that goes to Hydro One than online respondents, the online results are not weighted by familiarity with the share of their bill that goes to Hydro One as doing so does not meaningfully impact the overall results.

INNOVATIVE RESEARCH GROUP

Residential & Seasonal Customers

Online Survey Results

Section 2

Online Survey
Survey Design & Methodology

Field Dates

The **Residential and Seasonal Online Surveys** were sent to a random selection of Hydro One residential and seasonal customers who provided the utility with an email address. Customers had an opportunity to complete the survey between **November 12th and December 4th, 2024**.

Each customer received a unique URL that could be linked back to their average monthly consumption, region and rate class.

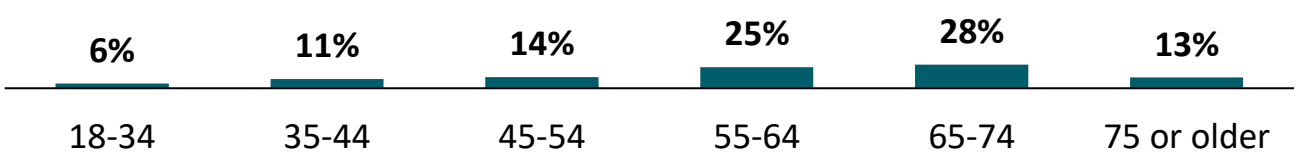
In total, the residential survey was sent to **44,567** customers and the seasonal survey was sent to **4,004** customers from *customerexperience@hydroone.com*. Reminder emails were sent on November 18th, November 27th, and December 2nd, 2024 to those who had not yet completed the survey.

Residential & Seasonal Online Survey Completes

A total of **6,053** (unweighted) Hydro One residential and seasonal customers completed the online survey.

Sample Weighting

The residential and seasonal online survey sample was weighted down to n=5,000 proportionately by consumption quartile, region, and customer type (primary residential vs. seasonal) in order to be representative of the broader Hydro One customer base.



The table below summarizes the unweighted and weighted (in brackets) sample breakdown by consumption quartile and region. Totals may not correspond with cell values as some customers are missing region or consumption quartile information. Weights are calculated based off of all available information for a given customer.

Region	Consumption Quartiles				Total
	First	Second	Third	Fourth	
West	186 (175)	205 (183)	187 (191)	195 (183)	786 (743)
Central	376 (340)	411 (331)	419 (332)	442 (355)	1,674 (1,378)
Central East	432 (381)	479 (387)	481 (382)	473 (371)	1,890 (1,541)
East	240 (181)	250 (189)	271 (195)	254 (190)	1,029 (767)
North	145 (155)	188 (143)	159 (134)	175 (134)	673 (571)
Total	1,380 (1,233)	1,533 (1,233)	1,517 (1,233)	1,539 (1,233)	6,053 (5,000)

Note: *Graphs and tables may not always total 100% due to rounding values other than any error in data. Sums are added before rounding numbers. Caution interpreting results with small n-sizes.*

Residential & Seasonal Customers

Familiarity & Experience

Preamble:

Before we begin, this survey has **three key objectives**.

First, **Hydro One** wants to better understand your experiences as a customer.

Second, **Hydro One** wants your input on some of the investment areas they could focus on in the future.

Third, **Hydro One** wants to learn a little bit more about their customers. This will help them ensure that they are receiving feedback that represents a wide range of customers.

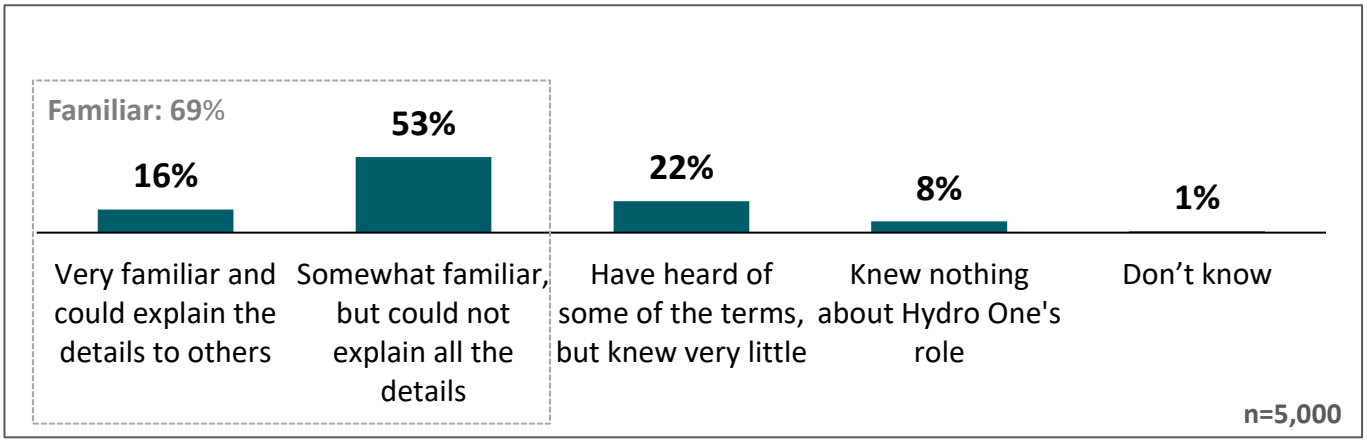
First, let's talk about your experience.

While you might have multiple accounts with **Hydro One**, for this survey, we want you to think about your overall experience as a [residential/seasonal] customer.

Familiarity & Experience

Familiarity with Hydro One's Role in the System

Residential & Seasonal



Ontario's electricity system has three key components: **generation**, **transmission** and **distribution**.

Hydro One's transmission system takes electricity from generation stations and transports it via high voltage transmission lines to local communities across the province.

In many communities, including your own, **Hydro One** is also responsible for the local distribution system, which takes electricity from transmission lines and brings it to your [home/seasonal property] through a network of wires, poles and other equipment.

Hydro One does not generate electricity or set electricity prices.

Q Before this survey, how familiar were you with Hydro One's role in Ontario's electricity system?

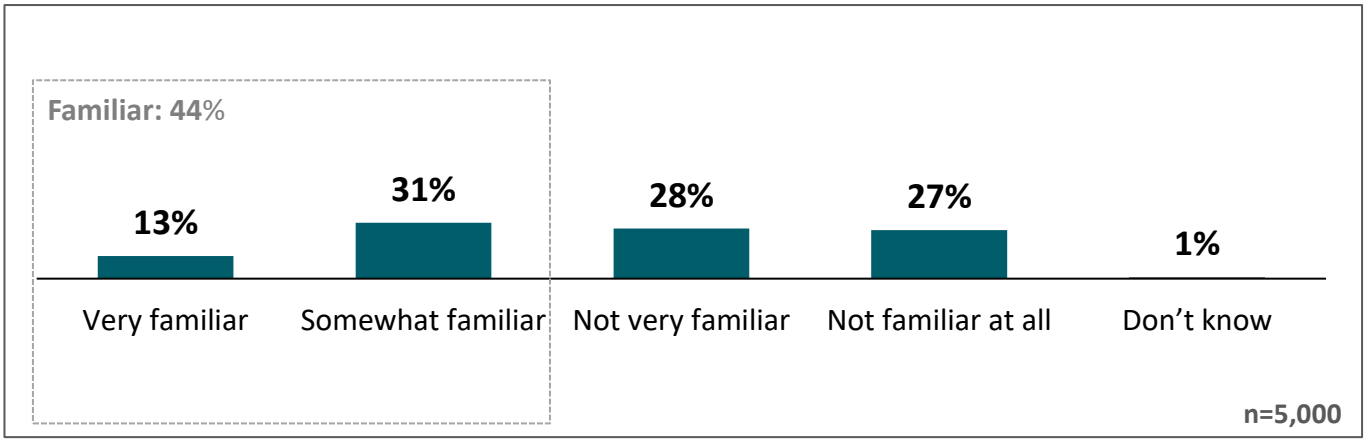
None/Don’t know	57.0%

Note: Only responses >0.1% shown

Familiarity & Experience

Bill Familiarity

Every item and charge on your bill is mandated by the provincial government or regulated by the Ontario Energy Board, the provincial energy regulator.



Although **Hydro One** is responsible for collecting payment from you for your entire electricity bill, only a portion goes to **Hydro One**. As of October 1st, 2024, for a typical **[residential/seasonal]** customer, about **[bill percentage]** or **[bill amount]** goes to **Hydro One** per month. This amount is split into **[distribution amount]** for distribution and **[transmission amount]** for transmission.

The rest of your bill payment goes to power generation companies, taxes, and regulatory agencies.

Bill Legend

Customer Group	[bill percentage]	[bill amount]	[distribution amount]	[transmission amount]
Residential	32%	$46	$33	$13
Seasonal	45%	$61	$55	$6

Q Before this survey, how familiar were you with the amount of your electricity bill that went to **Hydro One**?

Residential & Seasonal

Hydro One is funded by the rates paid by its customers.

Roughly every five years, **Hydro One** is required to file an application with the Ontario Energy Board (OEB), the energy regulator in Ontario, to set rates. **Hydro One's** next rate application will cover the years 2028-2032.

In this process, **Hydro One's** rate application will be examined in detail and **Hydro One** must demonstrate that customer needs and priorities were factored into its investment planning process.

If approved by the OEB, the investments areas that are discussed throughout the remainder of this survey would be directly funded by customers.

Q Before this survey, were you aware that **Hydro One** must file a rate application with the OEB every 5 years?

	Customer Type		Region

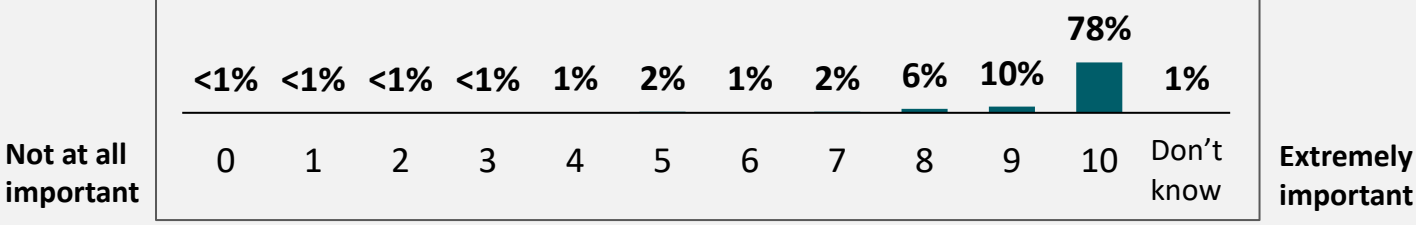
Response Labels Legend

Residential & Seasonal

Now, let's talk about the priorities that matter most to you.

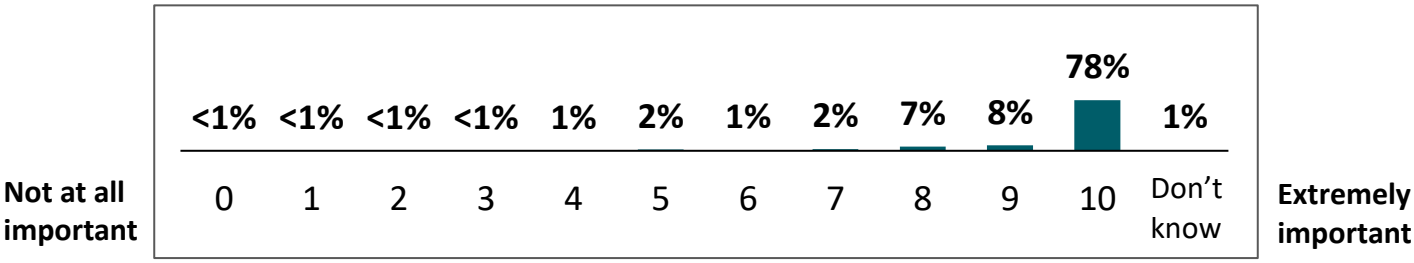
Hydro One is considering investments that can help address a range of issues. The list below is not exhaustive of all **Hydro One** priorities but includes 8 different themes that may be important to customers like you.

Shortened Customer Priorities Response Labels	Full Customer Priorities Response Labels
Delivering electricity at reasonable rates	Delivering electricity at reasonable rates
Providing reliable electricity	Providing reliable electricity to my [home/seasonal property]
Enhancing Hydro One's customer service	Enhancing Hydro One's customer service
Offering programs to help manage usage	Offering programs that can help customers better manage their electricity usage
Meeting the growing electricity need	Meeting the growing need for electricity in my community
Ensuring the safety of electricity infrastructure	Ensuring the safety of electricity infrastructure for Hydro One employees and the public
Enhancing the grid for new technologies	Enhancing the grid so that customers can connect new technologies like rooftop solar panels, heat pumps, and electric vehicle chargers
Reducing the environmental impact	Reducing the environmental impact of Hydro One's operations



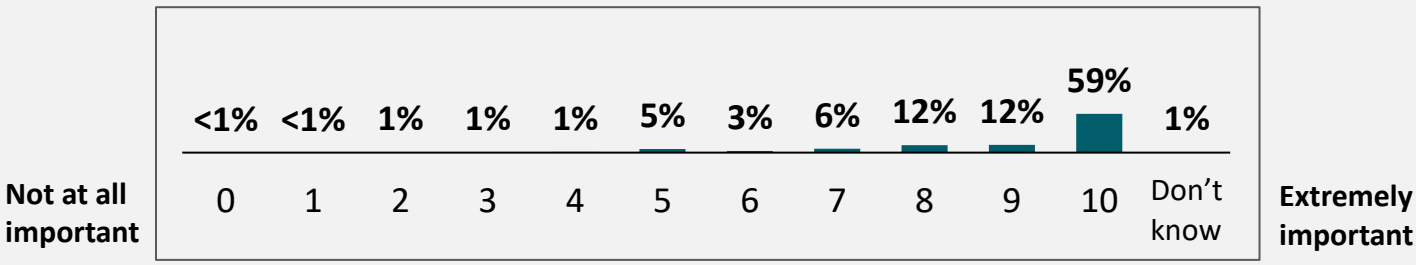
Customer Priorities

Importance of Customer Priorities

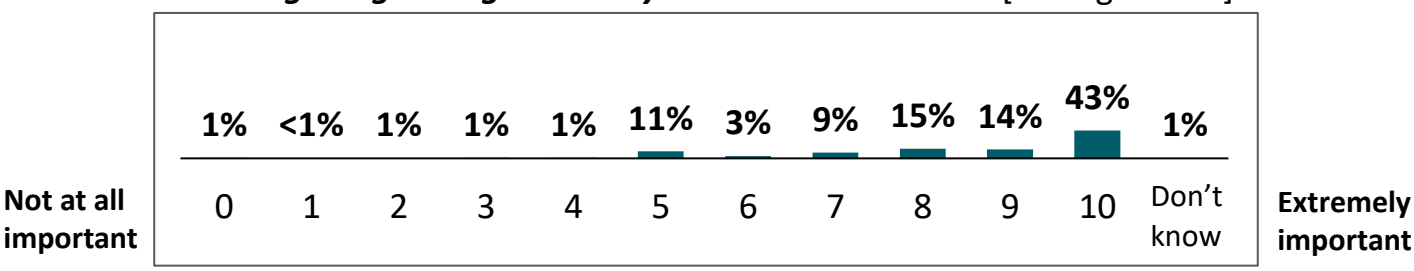


Residential & Seasonal

Q Using a scale from 0 to 10, where *0 means not important at all* and *10 means extremely important*, how important are each of the following priorities to you as a customer?



Providing reliable electricity [average = **9.5**]



Delivering electricity at reasonable rates [average = **9.5**]

Ensuring the safety of electricity infrastructure [average = **8.9**]

Meeting the growing electricity need [average = **8.2**]

Note: Priority labels have been shortened for brevity. See slide 50 for full label text.
"Don't know" not included in calculation of means.

Reliability Experience

Importance of Reliability Priorities

When it comes to reliability, there are several areas that **Hydro One** can focus their investments on.

Some of these areas are **related to severe weather**, such as ice storms, windstorms and thunderstorms.

Others are **not related to severe weather** and include issues such as aging or defective equipment, animal interference, and vehicle collisions.

Shortened Reliability Priorities Response Labels	Full Reliability Priorities Response Labels
Reducing number of non-weather outages	Reducing the number of outages not caused by severe weather
Reducing length of non-weather outages	Reducing the length of outages not caused by severe weather
Reducing number of weather-caused outages	Reducing the number of outages caused by severe weather
Reducing length of weather-caused outages	Reducing the length of outages caused by severe weather
Reducing momentary interruptions in power	Reducing momentary interruptions (less than one minute) in power that can result in the flickering or dimming of lights
Improving communications during outages	Improving communications during outages, including estimated restoration times

Reducing momentary interruptions in power	24%	21%	23%	25%	26%

Note: Priority labels have been shortened for brevity. See slide 66 for full label text. "Don't know" not shown.

INNOVATIVE RESEARCH GROUP

Residential & Seasonal Customers

Investment Priorities

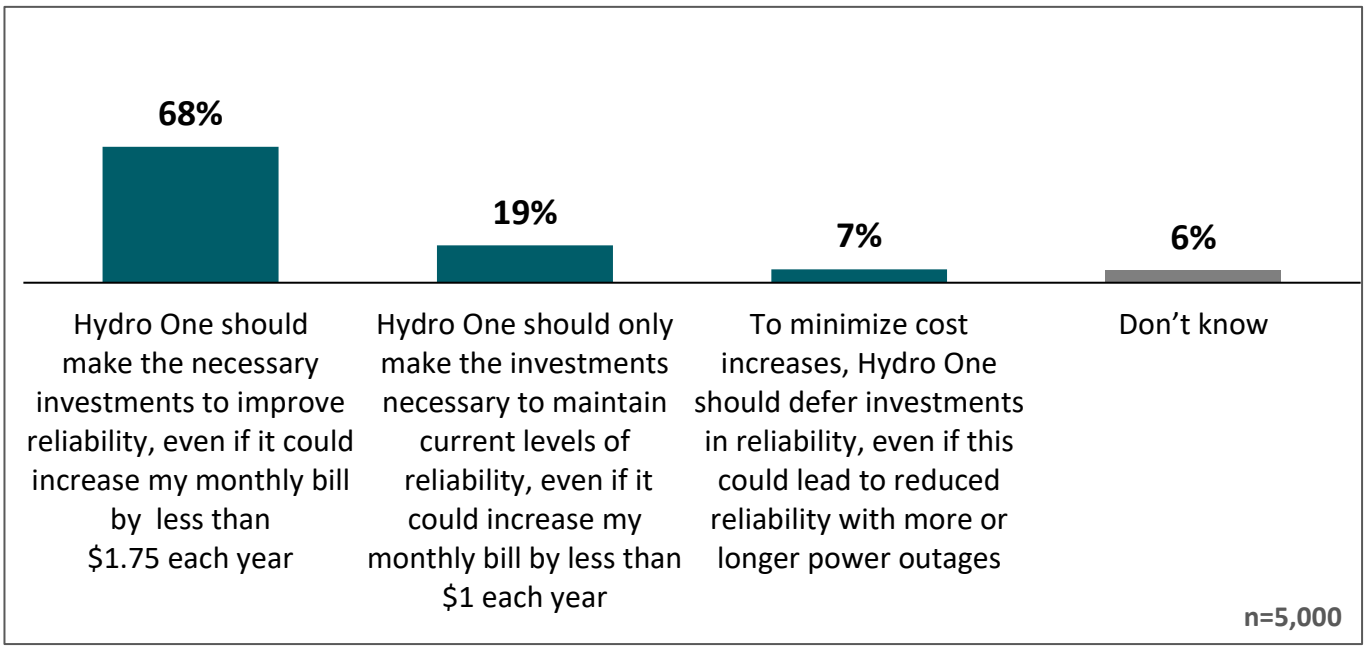
Investment Priorities

High-Level Reliability

Now let's turn to the next topic – investment trade-offs. There are **6** investment areas that **Hydro One** would like your input on.

You do not need to be a system planner or engineer to answer these questions. The trade-offs will focus on what outcomes matter most to you as a customer – balancing investment outcomes and cost to you.

First, we would like to talk about the local distribution system, which takes electricity from transmission lines and brings it to your [home/seasonal property] through a network of wires, poles and other equipment.



The first category is related to the reliability you experience.

On average, between 2019 and 2023, the typical **Hydro One** customer has experienced about 3.8 outages per year, resulting in a total of 16.6 hours without power.

It's important to keep in mind that these are system averages, and that your actual experience may be different.

Hydro One has historically identified investments in maintaining or improving reliability by taking into consideration the overall age, health, and likelihood of failure of equipment.

Q Based on your own reliability experience, which of the following is closest to your point of view?

Investment Priorities
High-Level Reliability

Residential & Seasonal

Q Based on your own reliability experience, which of the following is closest to your point of view?

		Customer Type		Region				
	Overall	Residential	Seasonal	West	Central	Central East	East	North
Necessary investments to improve reliability	68%	68%	73%	69%	69%	68%	68%	67%
Necessary investments to maintain reliability	19%	19%	17%	17%	19%	19%	20%	18%
Defer investments	7%	7%	5%	8%	6%	7%	6%	8%
Don't know	6%	6%	5%	6%	6%	6%	7%	7%

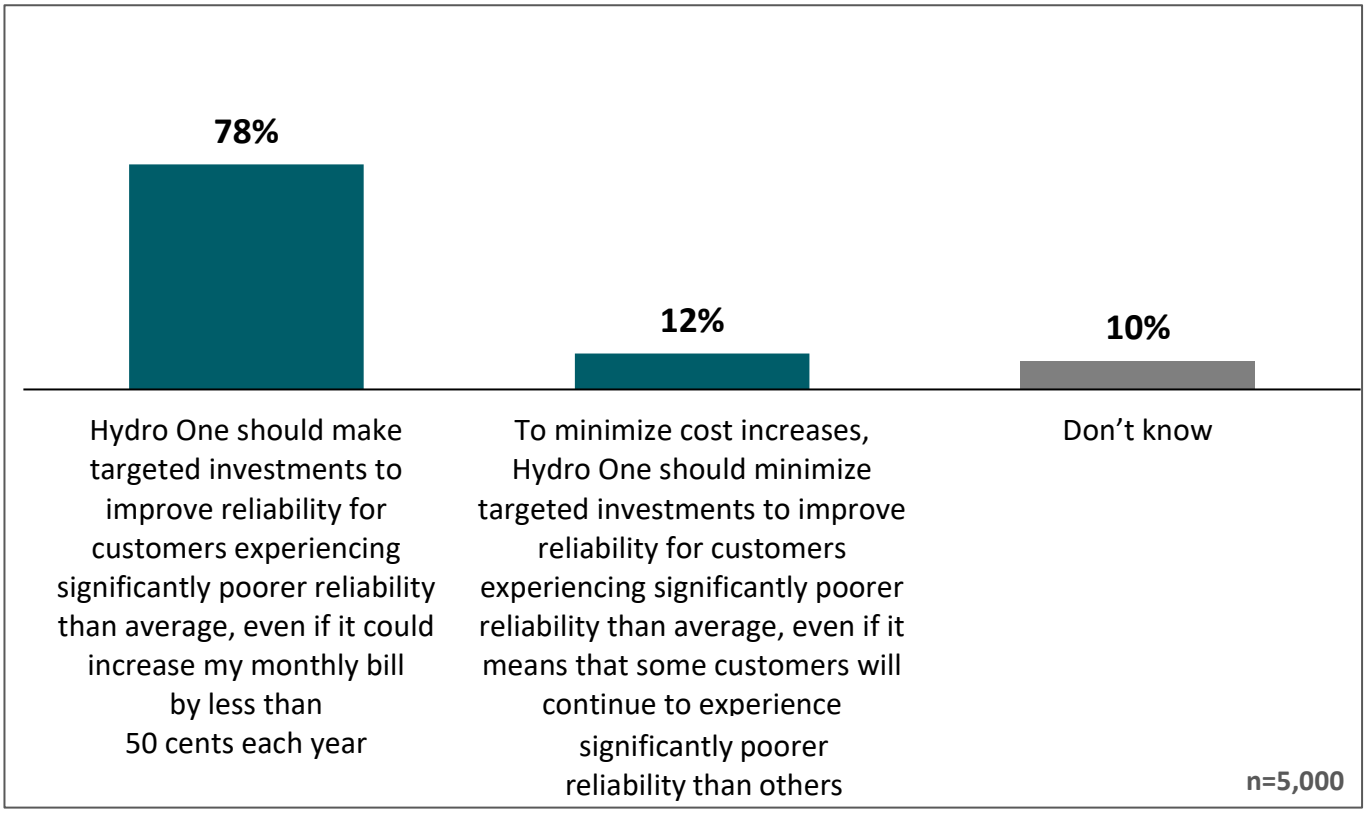
Don't know	6%	7%	6%	7%	5%

Note: Response labels have been shortened for brevity. See slide 76 for full label text.

Investment Priorities



Targeted Reliability

The second category is related to more targeted improvements to reliability.

Hydro One customers experience different levels of reliability, depending on where they live, the design of the system and the condition of the equipment supplying them.

While some **Hydro One** customers didn't experience any outages in 2022 or 2023, others were without power more than 10 times per year. Similarly, the total length of time that customers were without power ranges from less than one hour to more than 50 hours per year.

Q When it comes to more targeted investments to improve reliability for those customers that experience significantly poorer reliability than average, which of the following is closest to your point of view?

Investment Priorities
Targeted Reliability

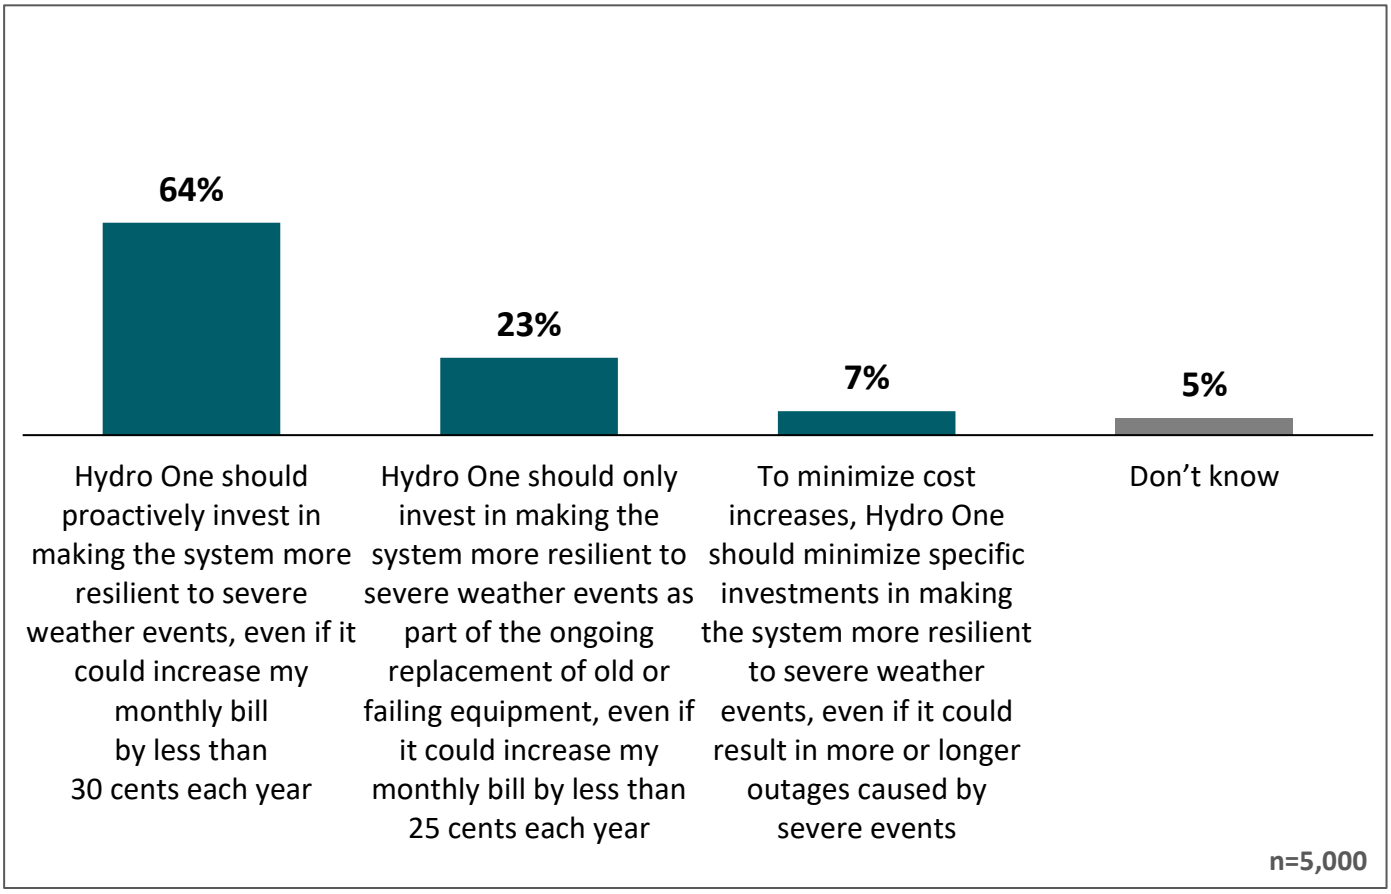
Note: Response labels have been shortened for brevity. See slide 79 for full label text.



Investment Priorities

Responding to Severe Weather

On average, between 2019 and 2023, **severe weather events**, such as ice storms, windstorms or thunderstorms, have contributed to 51% of all hours that the typical customer has been without power per year.

While some of these outages may be inevitable, **Hydro One** could make additional investments to make the system more resilient to these types of events. These investments could help either reduce the number of outages caused by severe weather events or improve restoration times when these outages do occur.

Q Based on this, which of the following is closest to your point of view?

Investment Priorities
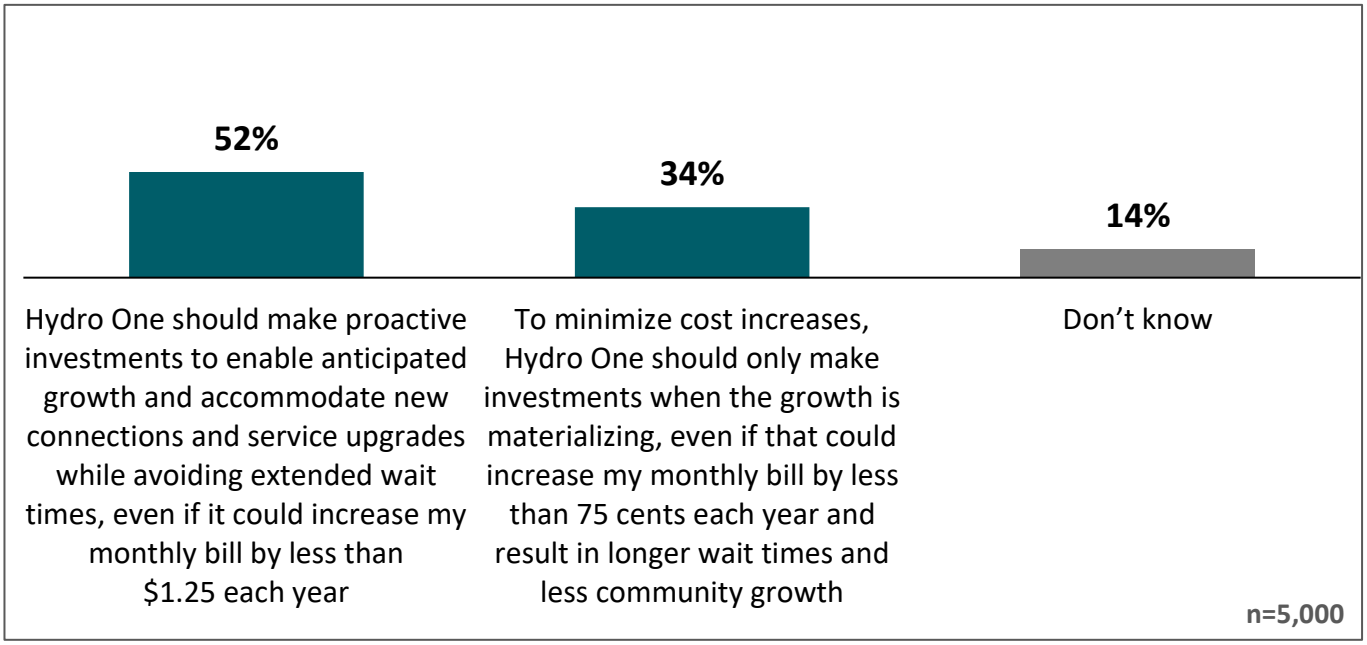
Growth



Electricity demand is on the rise across Ontario. This increasing demand, resulting from industrial and residential growth, as well as the changing ways we use electricity, will require electricity companies like **Hydro One** to make significant investments in the grid.

Increased growth can result in longer wait times to connect new homes or businesses to the system or facilitate upgrades for existing customers if insufficient capacity is available.

For instance, as increasing growth occurs, some new businesses may be asked to wait up to 2 years or longer for their facility to be connected to the **Hydro One** grid.

However, **Hydro One** could make proactive investments to enable anticipated growth and allow new homes or businesses to connect to the system in a timely manner, and to not delay service upgrades for existing customers.

Q Based on this, which is closest to your point of view?

Investment Priorities

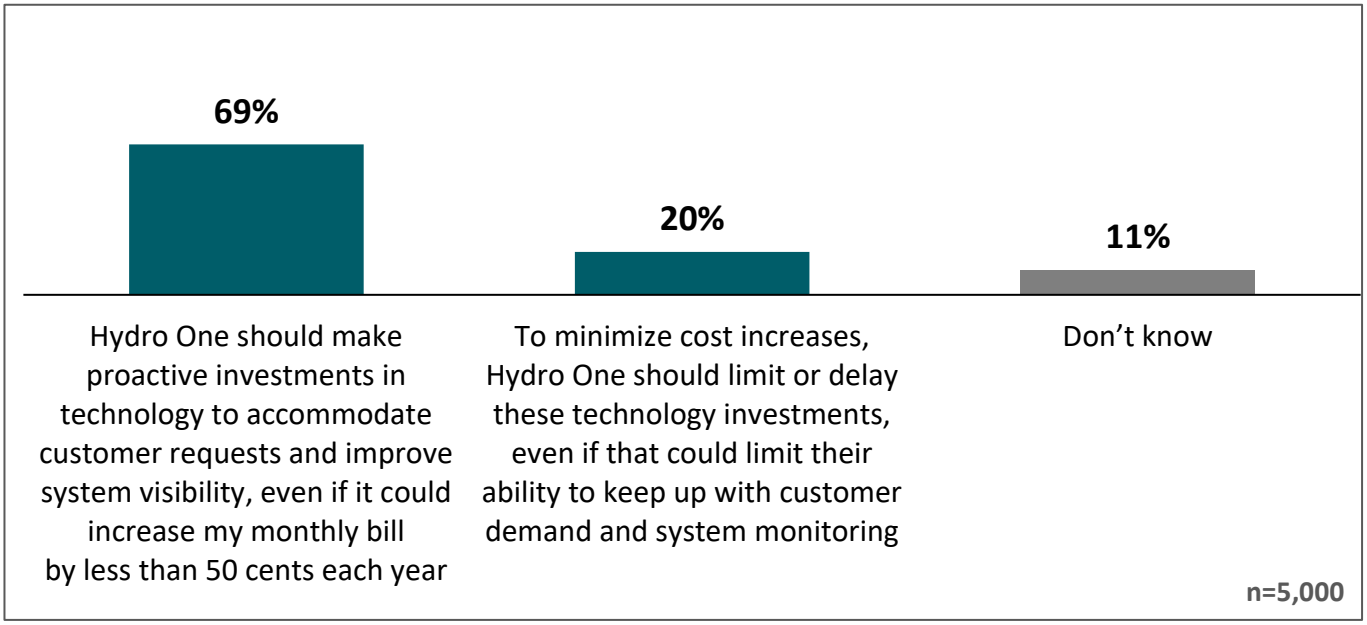
Evolving Customer Requests & System Visibility

Residential & Seasonal

Beyond residential and industrial growth, customers are increasingly requesting information and upgrades related to new technologies like rooftop solar panels, heat pumps, and electric vehicle chargers.

Whether or not you are actively considering these types of technologies for yourself, **Hydro One** needs to be prepared to accommodate these types of customer requests, not just today, but over the next 5 to 10 years.



While **Hydro One** has an obligation to make certain investments to accommodate customer requests, planners have identified incremental investments that can help:

- Ensure that **Hydro One's** grid is ready to accommodate if and when customers request to connect new technologies.

- Give the **Hydro One** control room more "visibility" into exactly where and how much electricity is being used in real-time, helping make more informed decisions on managing electricity demand and equipment maintenance or upgrades.

As the pace of change and customer needs are rapidly evolving, delaying or limiting these investments means that **Hydro One** could struggle to keep up with customer demand for connecting new technology and lack the precision to monitor the grid as new technology adoption increases.

Q With regards to these investments, which of the following is closest to your point of view?

Investment Priorities

Transmission Renewal

Now, we would like to talk about the provincial transmission system. That is the part of the system that uses high voltage transmission lines that serve as highways for electricity, bringing power from generation stations to your community.

Hydro One's transmission system serves most electricity customers in Ontario, including local distribution companies across the province. In fact, many large industrial customers like mines and auto manufacturers, as well as electricity generators like nuclear plants and hydro dams are directly connected to the transmission grid.

When an outage occurs on **Hydro One's** transmission system, the impacts are significant, both to communities and Ontario's economy. As such, the transmission system is designed to minimize both the frequency and duration of outages. For example, most of Ontario's population centres are served by multiple transmission lines, so that if one fails, there is always a backup to keep power flowing.

Portions of **Hydro One's** transmission system were built in the 1930s, 40s, and 50s. Even at historical levels of investment, portions of the transmission system continue to age and degrade, increasing the risk of failure. To minimize the risk of potential outages and support the growing electricity demands of communities, industries, and businesses across the province, **Hydro One** will need to continue to make significant investments to renew and upgrade older and degrading equipment.

First Nations On-Reserve Customers

Online Survey Results

Section 3

Field Dates

The **First Nations On-Reserve Customer Online Surveys** was sent to a random selection of Hydro One on-reserve customers who provided the utility with an email address. Customers had an opportunity to complete the survey between **November 14th and December 5th, 2024**.

Each customer received a unique URL that could be linked back to their average monthly consumption, region and rate class.

In total, the survey was sent to **6,293** customers from *customerexperience@hydroone.com*. Reminder emails were sent on November 21st, November 28th, and December 4th, 2024 to those who had not yet completed the survey.

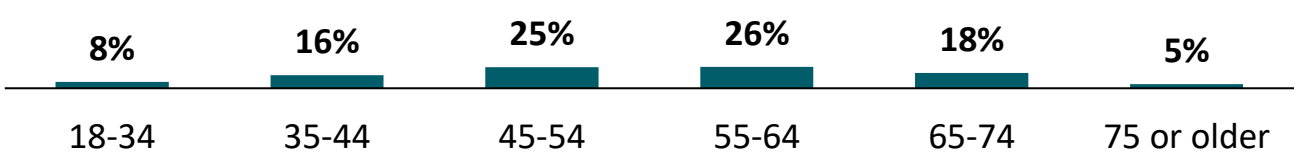
First Nations On-Reserve Customer Online Survey Completes

A total of **426** (unweighted) Hydro One on-reserve customers completed the online survey.

Sample Weighting

The First Nations On-Reserve Customer online survey sample was weighted down to n=400 proportionately by consumption quartiles and region in order to be representative of the broader Hydro One customer base.

The table below summarizes the unweighted and weighted (in brackets) sample breakdown by consumption quartile and region. Totals may not correspond with cell values as some customers are missing region or consumption quartile information. Weights are calculated based off of all available information for a given customer.



Region	Consumption Quartiles				Total
	First	Second	Third	Fourth	
West	7 (10)	9 (12)	11 (13)	9 (9)	37 (45)
Central	43 (36)	26 (29)	24 (22)	14 (17)	107 (104)
East/Central East	30 (17)	32 (17)	16 (15)	10 (11)	91 (60)
North	34 (35)	48 (42)	53 (49)	51 (62)	191 (191)
Total	114 (99)	115 (99)	104 (99)	84 (99)	426 (400)

Note: *Graphs and tables may not always total 100% due to rounding values rather than any error in data. Sums are added before rounding numbers. Caution interpreting results with small n-sizes.*

Familiarity & Experience

Preamble:

Before we begin, this survey has **three key objectives**.

First, **Hydro One** wants to better understand your experiences as a customer.

Second, **Hydro One** wants your input on some of the investment areas they could focus on in the future.

Third, **Hydro One** wants to learn a little bit more about their customers. This will help them ensure that they are receiving feedback that represents a wide range of customers.

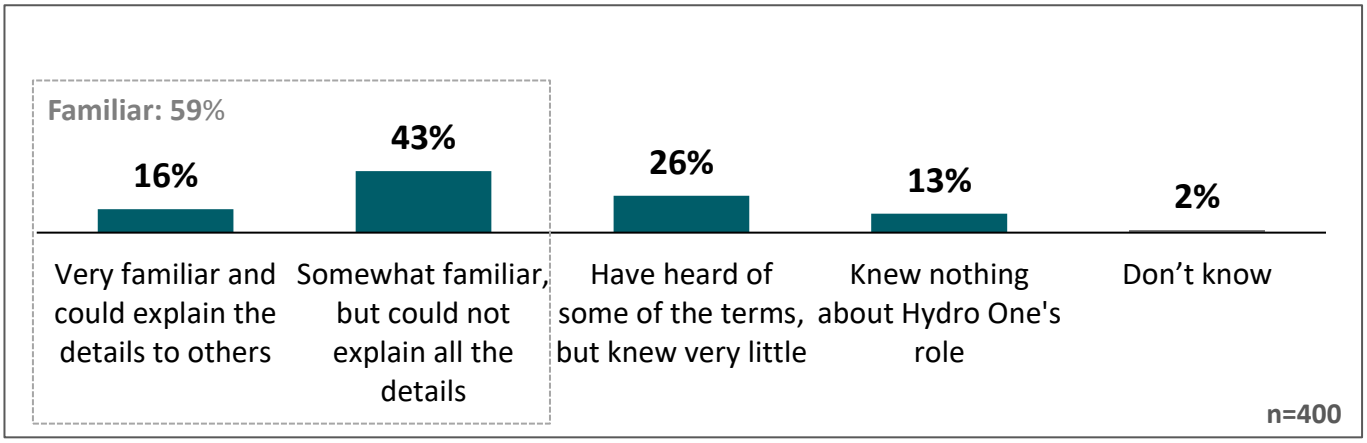
First, let's talk about your experience.

While you might have multiple accounts with **Hydro One**, for this survey, we want you to think about your overall experience as a residential customer.

Familiarity & Experience

Familiarity with Hydro One's Role in the System

First Nations On-Reserve



Ontario's electricity system has three key components: **generation**, **transmission** and **distribution**.

Hydro One's transmission system takes electricity from generation stations and transports it via high voltage transmission lines to local communities across the province.

In many communities, including your own, **Hydro One** is also responsible for the local distribution system, which takes electricity from transmission lines and brings it to your home through a network of wires, poles and other equipment.

Hydro One does not generate electricity or set electricity prices.

Q Before this survey, how familiar were you with Hydro One's role in Ontario's electricity system?

Familiarity & Experience

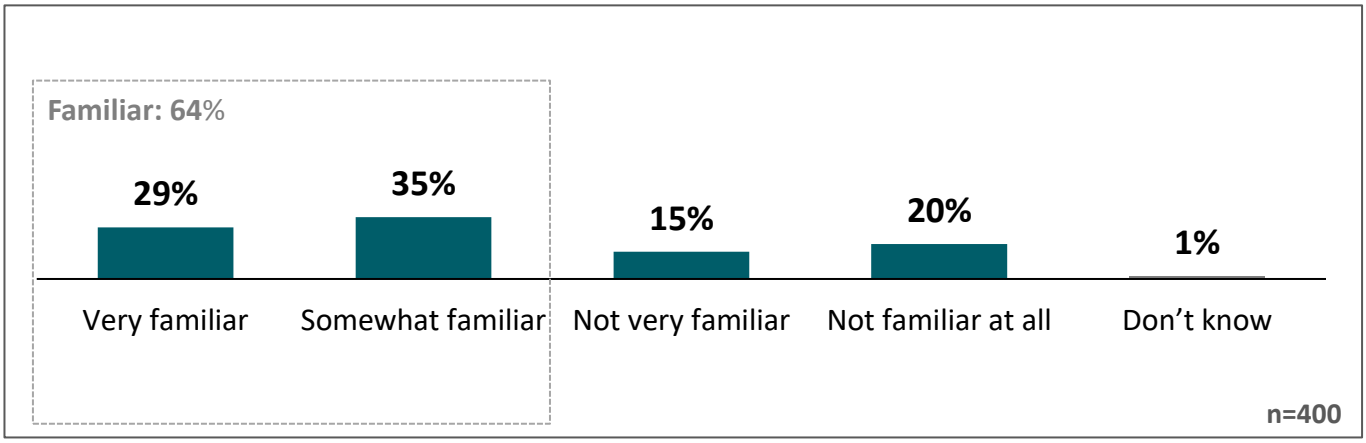
Bill Familiarity



Every item and charge on your bill is mandated by the provincial government or regulated by the Ontario Energy Board, the provincial energy regulator.

Although **Hydro One** is responsible for collecting payment from you for your entire electricity bill, the portion of your bill that goes to **Hydro One**, covering distribution and transmission delivery services, is offset by the **First Nations Delivery Credit**.

As of October 1st, 2024, for a typical On-Reserve First Nations residential customer, the bill credit offsets approximately **26%** of the total bill, or **$53** per month, related to the services **Hydro One** provides. This amount is split into **$33** for distribution delivery and **$20** for transmission delivery.

The rest of your bill payment goes to power generation companies and regulatory agencies.

Q Before this survey, how familiar were you with the **First Nations Delivery Credit**, which offsets the amount of your electricity bill that covers **Hydro One's** services?

Familiarity & Experience

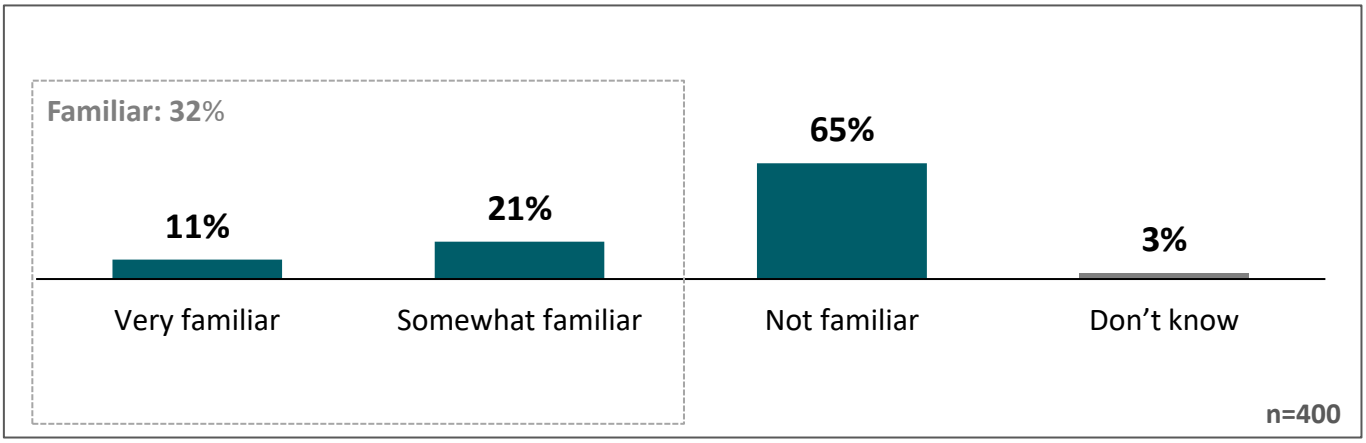
Familiarity with Rate Applications

First Nations On-Reserve



Hydro One is funded by the rates paid by its customers.

Roughly every five years, **Hydro One** is required to file an application with the Ontario Energy Board (OEB), the energy regulator in Ontario, to set rates. **Hydro One's** next rate application will cover the years 2028-2032.

In this process, **Hydro One's** rate application will be examined in detail and **Hydro One** must demonstrate that customer needs and priorities were factored into its investment planning process.

If approved by the OEB, the investments areas that are discussed throughout the remainder of this survey would be directly funded by customers.

Q Before this survey, were you aware that **Hydro One** must file a rate application with the OEB every 5 years?

Region

Customer Priorities

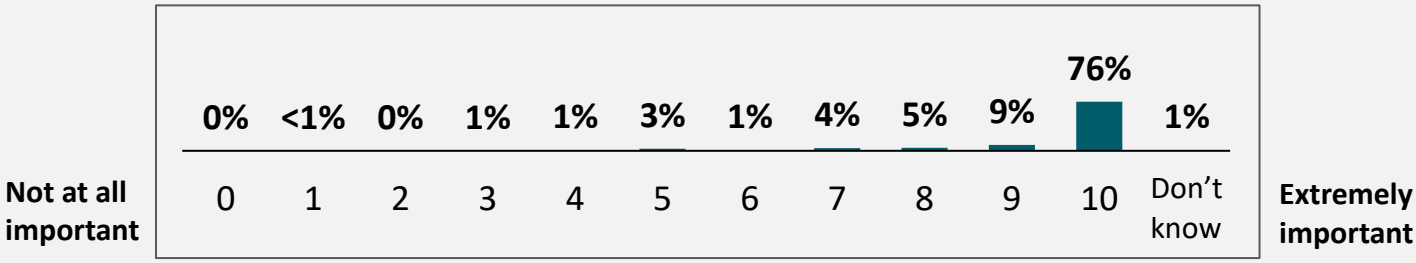
Customer Priorities

Response Labels Legend

Now, let's talk about the priorities that matter most to you.

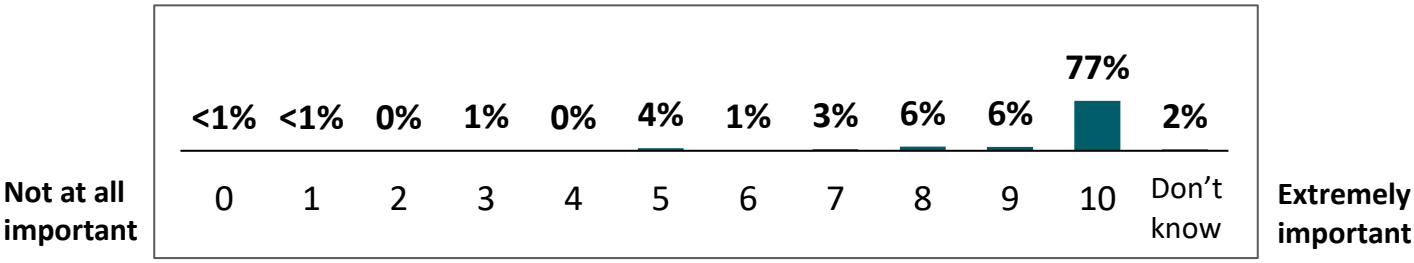
Hydro One is considering investments that can help address a range of issues. The list below is not exhaustive of all **Hydro One** priorities but includes 8 different themes that may be important to customers like you.

Shortened Customer Priorities Response Labels	Full Customer Priorities Response Labels
Delivering electricity at reasonable rates	Delivering electricity at reasonable rates
Providing reliable electricity	Providing reliable electricity to my home
Enhancing Hydro One's customer service	Enhancing Hydro One's customer service
Offering programs to help manage usage	Offering programs that can help customers better manage their electricity usage
Meeting the growing electricity need	Meeting the growing need for electricity in my community
Ensuring the safety of electricity infrastructure	Ensuring the safety of electricity infrastructure for Hydro One employees and the public
Enhancing the grid for new technologies	Enhancing the grid so that customers can connect new technologies like rooftop solar panels, heat pumps, and electric vehicle chargers
Reducing the environmental impact	Reducing the environmental impact of Hydro One's operations



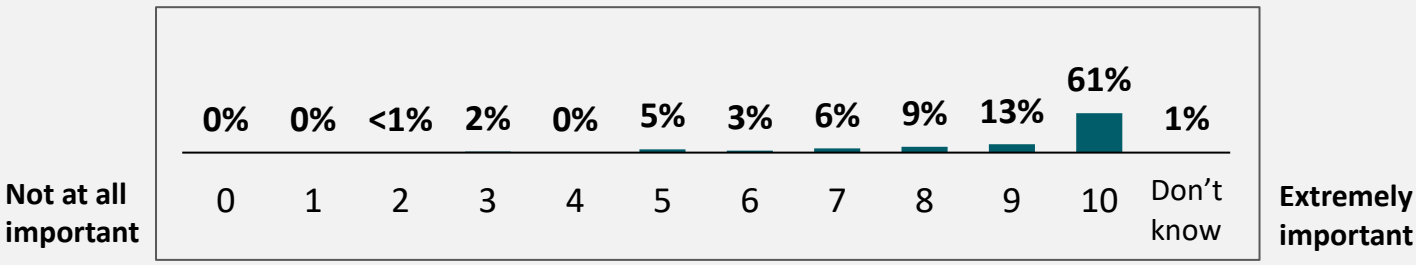
Customer Priorities

Importance of Customer Priorities

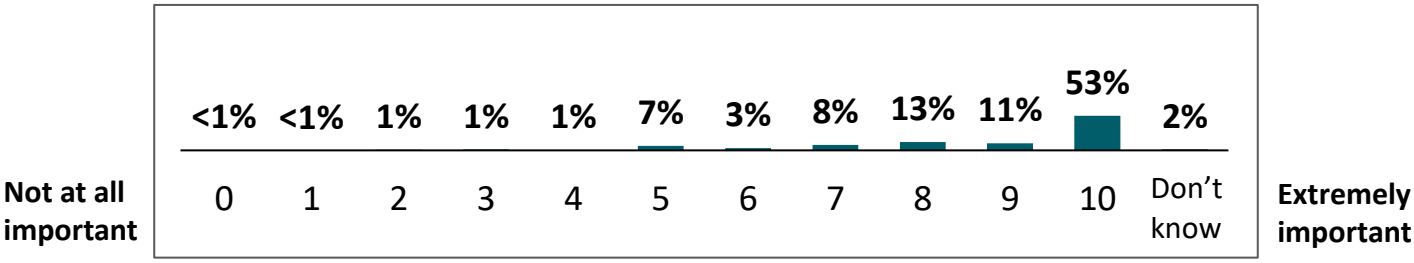


First Nations On-Reserve

Q Using a scale from 0 to 10, where *0 means not important at all* and *10 means extremely important*, how important are each of the following priorities to you as a customer?



Providing reliable electricity [average = **9.4**]

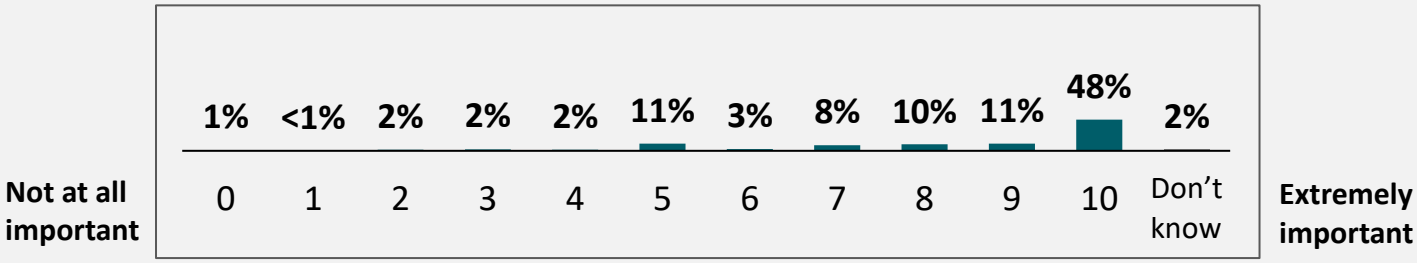


Delivering electricity at reasonable rates [average = **9.4**]

Ensuring the safety of electricity infrastructure [average = **9.0**]

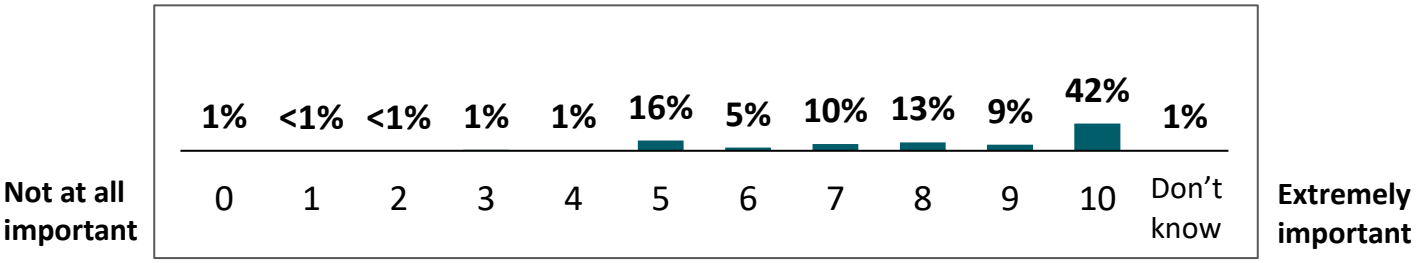
Meeting the growing electricity need [average = **8.7**]

Note: Priority labels have been shortened for brevity. See slide 107 for full label text.
"Don't know" not included in calculation of means.



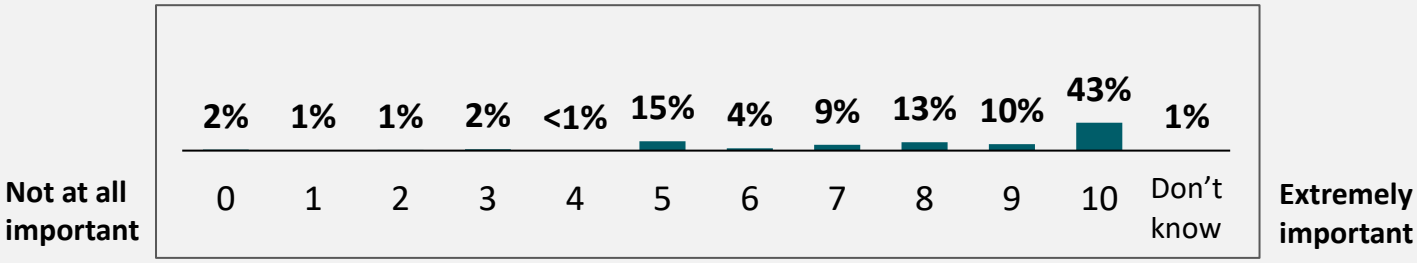
Customer Priorities

Importance of Customer Priorities (Cont'd)

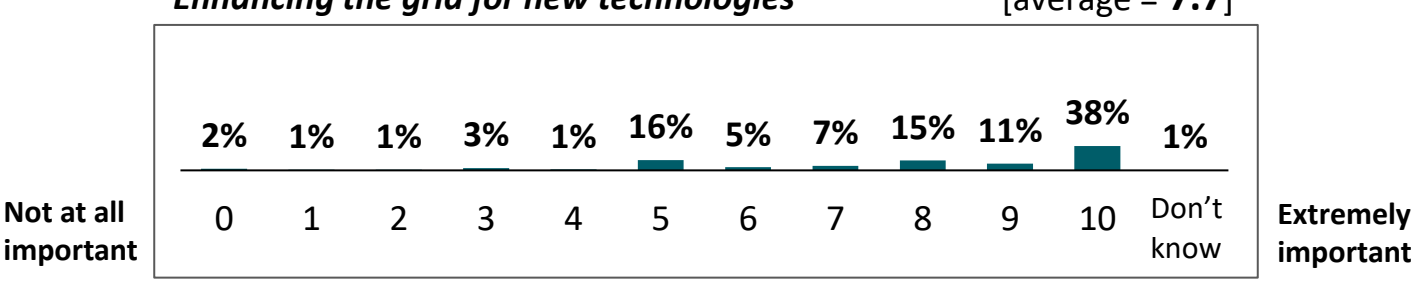


First Nations On-Reserve

Q Using a scale from 0 to 10, where *0 means not important at all* and *10 means extremely important*, how important are each of the following priorities to you as a customer?



Reducing the environmental impact [average = **8.2**]



Enhancing Hydro One's customer service [average = **8.0**]

Offering programs to help manage usage [average = **8.0**]

Enhancing the grid for new technologies [average = **7.7**]

Note: Priority labels have been shortened for brevity. See slide 107 for full label text.
"Don't know" not included in calculation of means.

Reliability Experience

Importance of Reliability Priorities

When it comes to reliability, there are several areas that **Hydro One** can focus their investments on.

Some of these areas are **related to severe weather**, such as ice storms, windstorms and thunderstorms.

Others are **not related to severe weather** and include issues such as aging or defective equipment, animal interference, and vehicle collisions.

Shortened Reliability Priorities Response Labels	Full Reliability Priorities Response Labels
Reducing number of non-weather outages	Reducing the number of outages not caused by severe weather
Reducing length of non-weather outages	Reducing the length of outages not caused by severe weather
Reducing number of weather-caused outages	Reducing the number of outages caused by severe weather
Reducing length of weather-caused outages	Reducing the length of outages caused by severe weather
Reducing momentary interruptions in power	Reducing momentary interruptions (less than one minute) in power that can result in the flickering or dimming of lights
Improving communications during outages	Improving communications during outages, including estimated restoration times

And which would you say is the second most important **reliability** priority you think **Hydro One** should focus on? And which would you say is the third most important **reliability** priority you think **Hydro One** should focus on?

		Consumption Quartiles			
% who select as top 3 priority	**Overall**	**Low**	**Medium-Low**	**Medium-High**	**High**
Reducing length of weather-caused outages	59%	59%	70%	54%	55%
Improving communications during outages	54%	54%	49%	57%	55%
Reducing length of non-weather outages	52%	56%	56%	47%	50%
Reducing number of non-weather outages	43%	45%	51%	43%	31%
Reducing number of weather-caused outages	42%	36%	43%	42%	49%
Reducing momentary interruptions in power	27%	29%	20%	33%	28%

Note: Priority labels have been shortened for brevity. See slide 123 for full label text. "Don't know" not shown.

First Nations On-Reserve Customers

Investment Priorities

Investment Priorities

High-Level Reliability

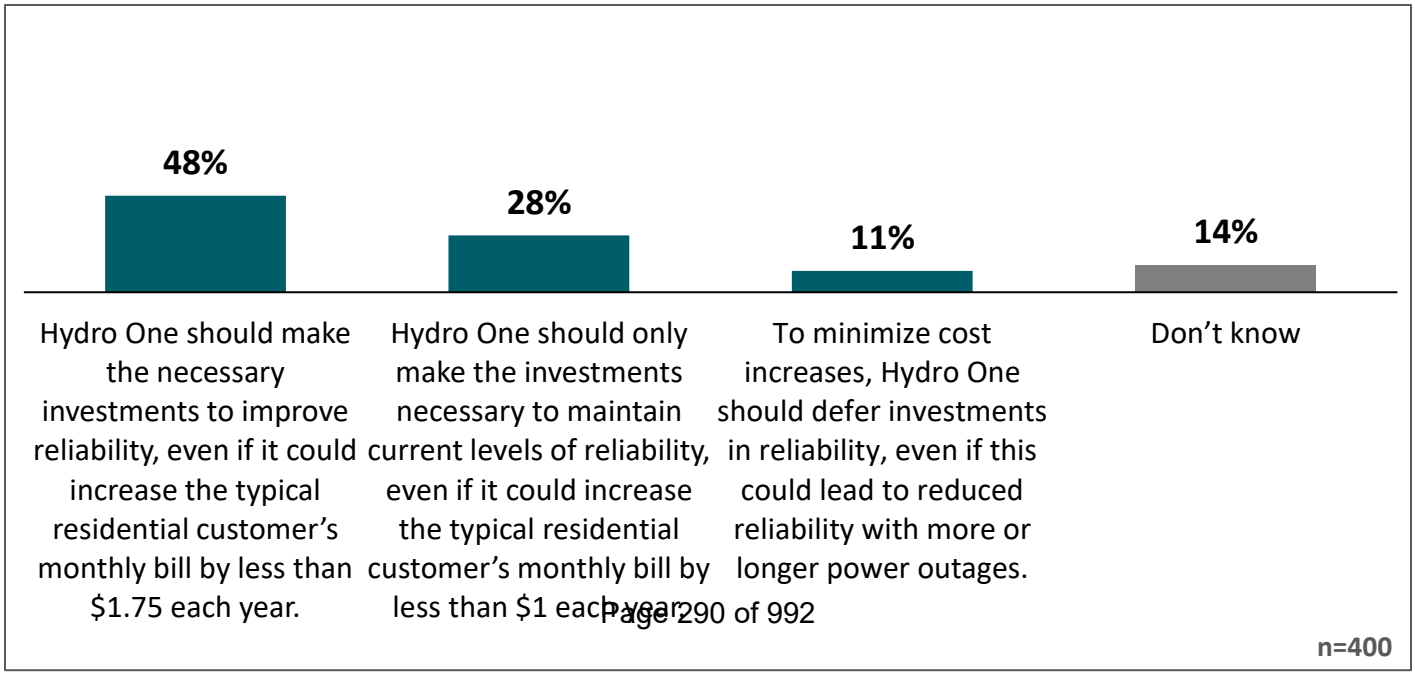
First Nations On-Reserve

Now let's turn to the next topic – investment trade-offs. There are **6** investment areas that **Hydro One** would like your input on.

You do not need to be a system planner or engineer to answer these questions. The trade-offs will focus on what outcomes matter most to you as a customer – balancing investment outcomes and cost to you.

The costs outlined in the following questions are for illustrative purposes only. Because the portion of your bill that goes to **Hydro One** is offset by the First Nations Delivery Credit, these costs would not be reflected on your bill, but still represent the true cost of the choices.

First, we would like to talk about the local distribution system, which takes electricity from transmission lines and brings it to your home through a network of wires, poles and other equipment.



The first category is related to the reliability you experience.

On average, between 2019 and 2023, the typical **Hydro One** customer has experienced about 3.8 outages per year, resulting in a total of 16.6 hours without power.

It's important to keep in mind that these are system averages, and that your actual experience may be different.

Hydro One has historically identified investments in maintaining or improving reliability by taking into consideration the overall age, health, and likelihood of failure of equipment.

Q Based on your own reliability experience, which of the following is closest to your point of view?

Investment Priorities
High-Level Reliability

Q Based on your own reliability experience, which of the following is closest to your point of view?

		Region

Investment Priorities

Targeted Reliability

The second category is related to more targeted improvements to reliability.

Hydro One customers experience different levels of reliability, depending on where they live, the design of the system and the condition of the equipment supplying them.

While some **Hydro One** customers didn't experience any outages in 2022 or 2023, others were without power more than 10 times per year. Similarly, the total length of time that customers were without power ranges from less than one hour to more than 50 hours per year.

Q When it comes to more targeted investments to improve reliability for those customers that experience significantly poorer reliability than average, which of the following is closest to your point of view?

Investment Priorities

Investment Priorities

Responding to Severe Weather

On average, between 2019 and 2023, **severe weather events**, such as ice storms, windstorms or thunderstorms, have contributed to 51% of all hours that the typical customer has been without power per year.

While some of these outages may be inevitable, **Hydro One** could make additional investments to make the system more resilient to these types of events. These investments could help either reduce the number of outages caused by severe weather events or improve restoration times when these outages do occur.

Q Based on this, which of the following is closest to your point of view?

Investment Priorities
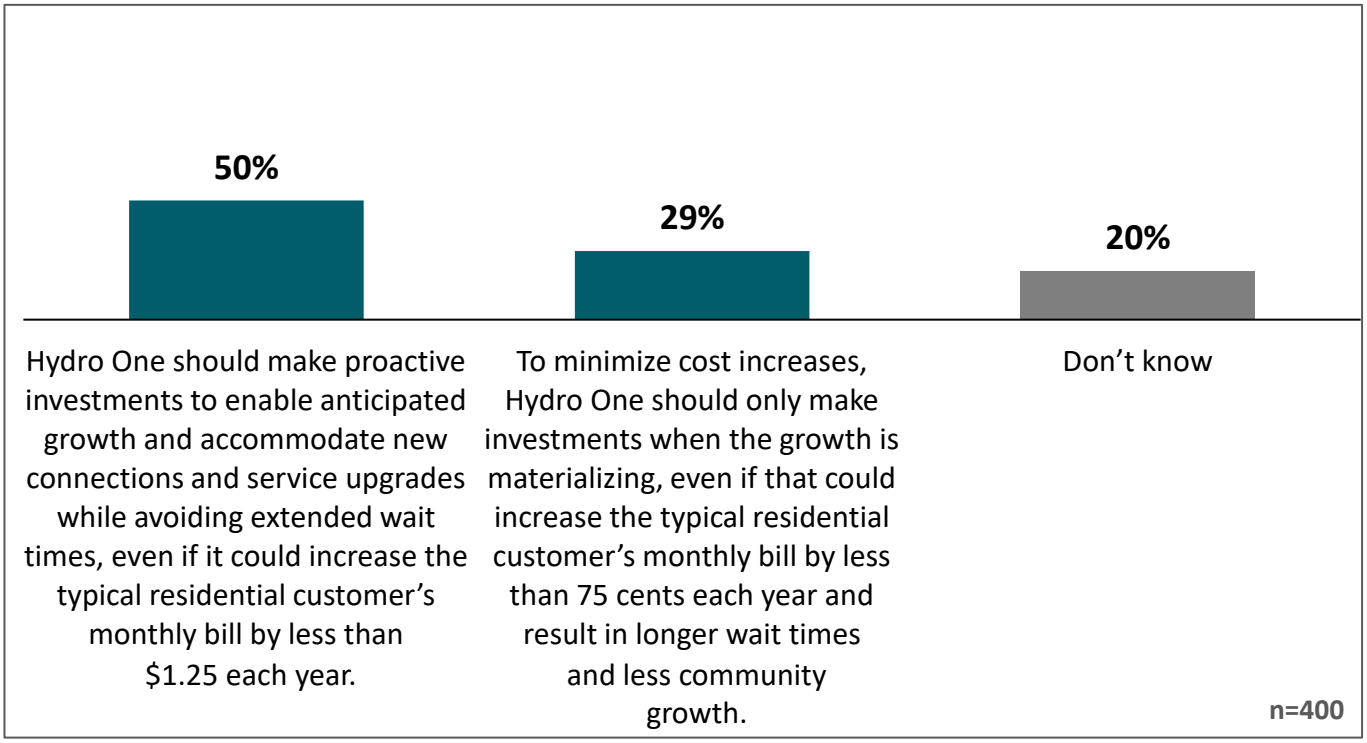
Growth



Electricity demand is on the rise across Ontario. This increasing demand, resulting from industrial and residential growth, as well as the changing ways we use electricity, will require electricity companies like **Hydro One** to make significant investments in the grid.

Increased growth can result in longer wait times to connect new homes or businesses to the system or facilitate upgrades for existing customers if insufficient capacity is available.

For instance, as increasing growth occurs, some new businesses may be asked to wait up to 2 years or longer for their facility to be connected to the **Hydro One** grid.

However, **Hydro One** could make proactive investments to enable anticipated growth and allow new homes or businesses to connect to the system in a timely manner, and to not delay service upgrades for existing customers.

Investment Priorities

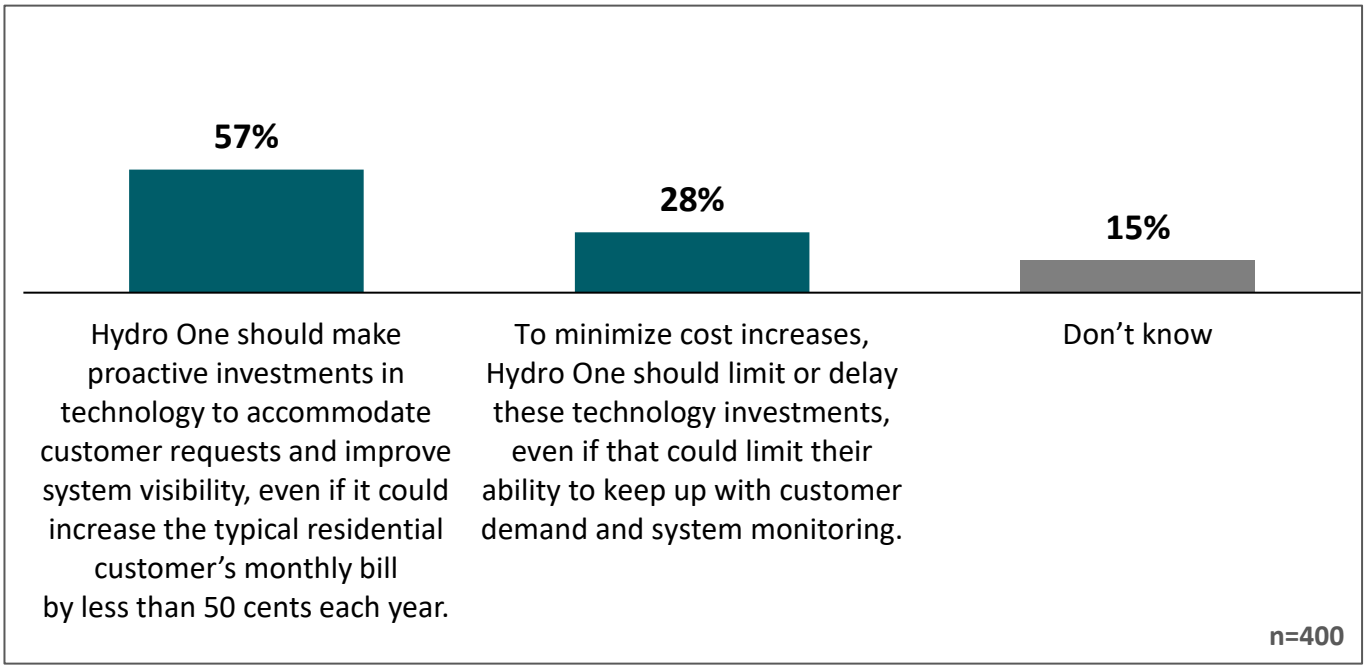
Evolving Customer Requests & System Visibility

First Nations On-Reserve

Beyond residential and industrial growth, customers are increasingly requesting information and upgrades related to new technologies like rooftop solar panels, heat pumps, and electric vehicle chargers.

Whether or not you are actively considering these types of technologies for yourself, **Hydro One** needs to be prepared to accommodate these types of customer requests, not just today, but over the next 5 to 10 years.



While **Hydro One** has an obligation to make certain investments to accommodate customer requests, planners have identified incremental investments that can help:

- Ensure that **Hydro One's** grid is ready to accommodate if and when customers request to connect new technologies.

- Give the **Hydro One** control room more "visibility" into exactly where and how much electricity is being used in real-time, helping make more informed decisions on managing electricity demand and equipment maintenance or upgrades.

As the pace of change and customer needs are rapidly evolving, delaying or limiting these investments means that **Hydro One** could struggle to keep up with customer demand for connecting new technology and lack the precision to monitor the grid as new technology adoption increases.

Q With regards to these investments, which of the following is closest to your point of view?

Investment Priorities

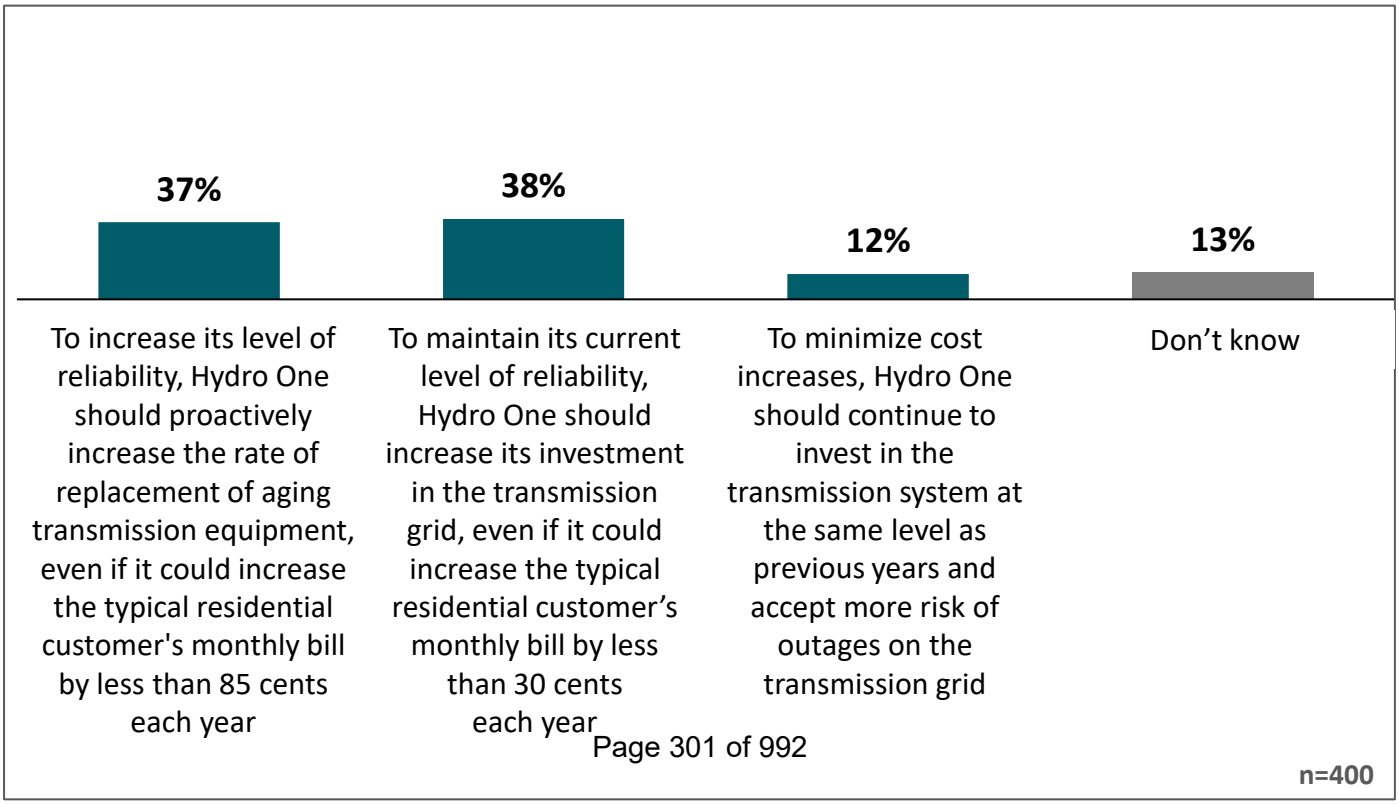
Transmission Renewal

First Nations On-Reserve



Now, we would like to talk about the provincial transmission system. That is the part of the system that uses high voltage transmission lines that serve as highways for electricity, bringing power from generation stations to your community.

Hydro One's transmission system serves most electricity customers in Ontario, including local distribution companies across the province. In fact, many large industrial customers like mines and auto manufacturers, as well as electricity generators like nuclear plants and hydro dams are directly connected to the transmission grid.

When an outage occurs on **Hydro One's** transmission system, the impacts are significant, both to communities and Ontario's economy. As such, the transmission system is designed to minimize both the frequency and duration of outages. For example, most of Ontario's population centres are served by multiple transmission lines, so that if one fails, there is always a backup to keep power flowing.

Portions of **Hydro One's** transmission system were built in the 1930s, 40s, and 50s. Even at historical levels of investment, portions of the transmission system continue to age and degrade, increasing the risk of failure. To minimize the risk of potential outages and support the growing electricity demands of communities, industries, and businesses across the province, **Hydro One** will need to continue to make significant investments to renew and upgrade older and degrading equipment.

Small Business Customers

Online Survey Results

Section 4

Field Dates

The **Small Business (GS<50) Online Survey** was sent to a random selection of Hydro One small business customers who provided the utility with an email address. Customers had an opportunity to complete the survey between **November 12th and December 3rd, 2024**.

Each customer received a unique URL that could be linked back to their average monthly consumption, region and rate class.

In total, the small business survey was sent to **7,875** customers from *customerexperience@hydroone.com*. Reminder emails were sent on November 18th, November 27th and December 2nd, 2024 to those who had not yet completed the survey.

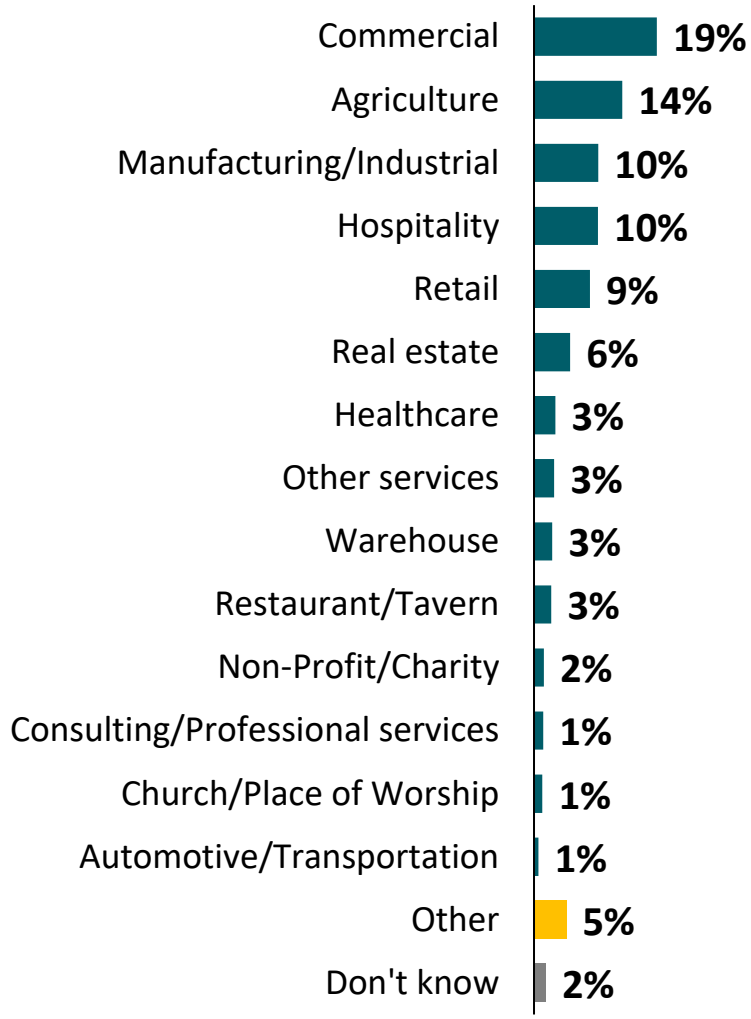
Small Business Online Survey Completes

A total of **477** (unweighted) Hydro One small business customers completed the online survey.

Sample Weighting

The small business online survey sample was weighted down to n=450 proportionately by consumption quartile and region in order to be representative of the broader Hydro One customer base.

The table below summarizes the unweighted and weighted (in brackets) sample breakdown by consumption quartile and region. Totals may not correspond with cell values as some customers are missing region or consumption quartile information. Weights are calculated based off of all available information for a given customer.



Region	Consumption Quartiles				Total
	First	Second	Third	Fourth	
West	31 (25)	27 (23)	17 (23)	32 (24)	107 (94)
Central	25 (27)	26 (27)	27 (27)	20 (27)	98 (108)
Central East	39 (29)	41 (30)	25 (31)	27 (29)	133 (119)
East	24 (16)	17 (17)	16 (16)	18 (15)	75 (64)
North	22 (16)	10 (15)	18 (16)	14 (18)	64 (66)
Total	141 (112)	121 (112)	103 (112)	111 (112)	477 (450)

Note: *Graphs and tables may not always total 100% due to rounding values rather than any error in data. Sums are added before rounding numbers. Caution interpreting results with small n-sizes.*

INNOVATIVE RESEARCH GROUP

Small Business Customers

Familiarity & Experience

Preamble:

Before we begin, this survey has **three key objectives**.

First, **Hydro One** wants to better understand your experiences as a customer.

Second, **Hydro One** wants your input on some of the investment areas they could focus on in the future.

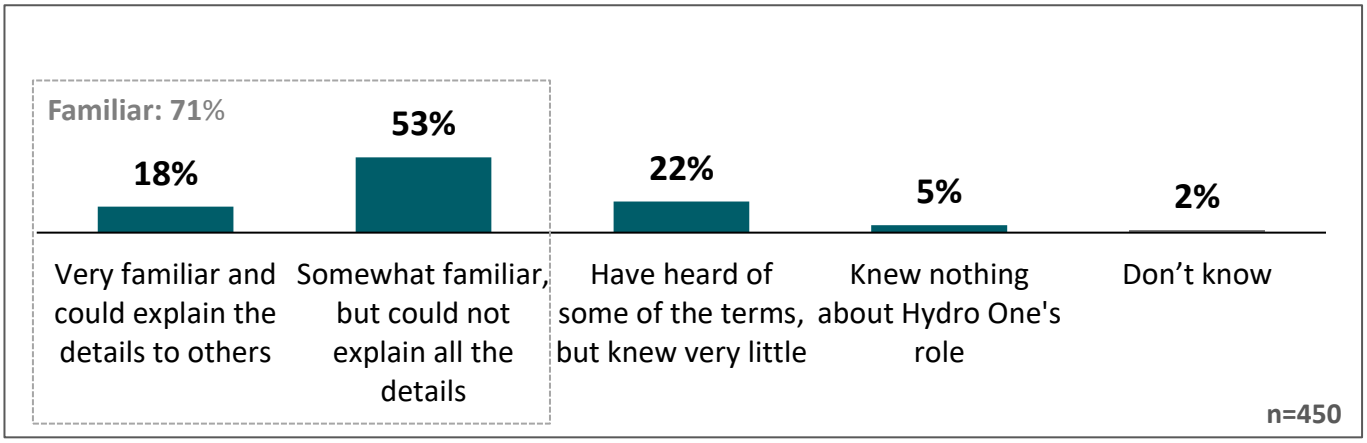
Third, **Hydro One** wants to learn a little bit more about their customers. This will help them ensure that they are receiving feedback that represents a wide range of customers.

First, let's talk about your experience.

While you might have multiple accounts with **Hydro One**, for this survey, we want you to think about your overall experience as a small business customer.

Familiarity & Experience

Familiarity with Hydro One's Role in the System



Ontario's electricity system has three key components: **generation**, **transmission** and **distribution**.

Hydro One's transmission system takes electricity from generation stations and transports it via high voltage transmission lines to local communities across the province.

In many communities, including your own, **Hydro One** is also responsible for the local distribution system, which takes electricity from transmission lines and brings it to your organization through a network of wires, poles and other equipment.

Hydro One does not generate electricity or set electricity prices.

Q Before this survey, how familiar were you with Hydro One's role in Ontario's electricity system?

Region

Familiarity & Experience

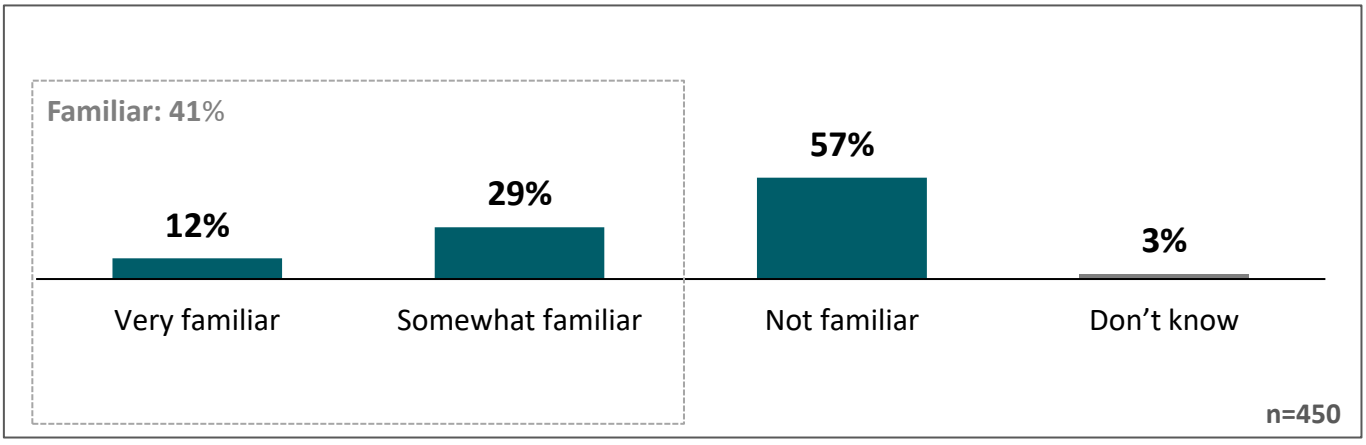
Familiarity with Rate Applications



Hydro One is funded by the rates paid by its customers.

Roughly every five years, **Hydro One** is required to file an application with the Ontario Energy Board (OEB), the energy regulator in Ontario, to set rates. **Hydro One's** next rate application will cover the years 2028-2032.

In this process, **Hydro One's** rate application will be examined in detail and **Hydro One** must demonstrate that customer needs and priorities were factored into its investment planning process.

If approved by the OEB, the investments areas that are discussed throughout the remainder of this survey would be directly funded by customers.

Q Before this survey, were you aware that **Hydro One** must file a rate application with the OEB every 5 years?

Region

	West	Central	Central East	East	North

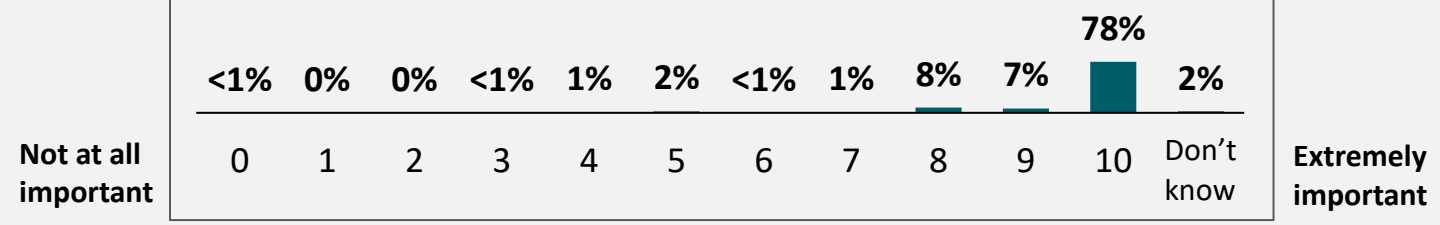
Small Business

Now, let's talk about the priorities that matter most to you.

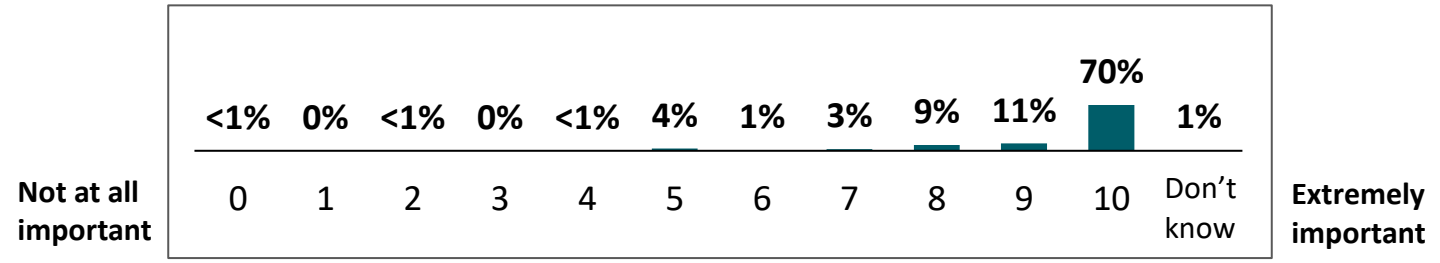
Hydro One is considering investments that can help address a range of issues. The list below is not exhaustive of all **Hydro One** priorities but includes 8 different themes that may be important to customers like you.

Shortened Customer Priorities Response Labels	Full Customer Priorities Response Labels
Delivering electricity at reasonable rates	Delivering electricity at reasonable rates
Providing reliable electricity	Providing reliable electricity to my organization
Enhancing Hydro One's customer service	Enhancing Hydro One's customer service
Offering programs to help manage usage	Offering programs that can help customers better manage their electricity usage
Meeting the growing electricity need	Meeting the growing need for electricity in my community
Ensuring the safety of electricity infrastructure	Ensuring the safety of electricity infrastructure for Hydro One employees and the public
Enhancing the grid for new technologies	Enhancing the grid so that customers can connect new technologies like rooftop solar panels, heat pumps, and electric vehicle chargers
Reducing the environmental impact	Reducing the environmental impact of Hydro One's operations



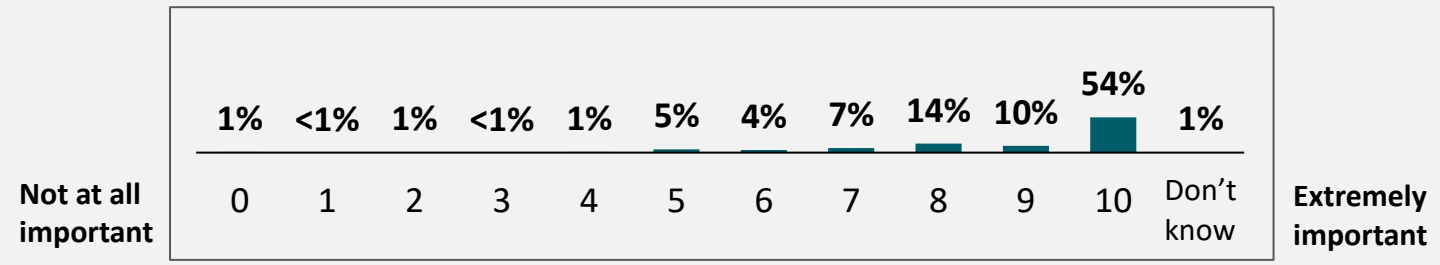
Customer Priorities

Importance of Customer Priorities

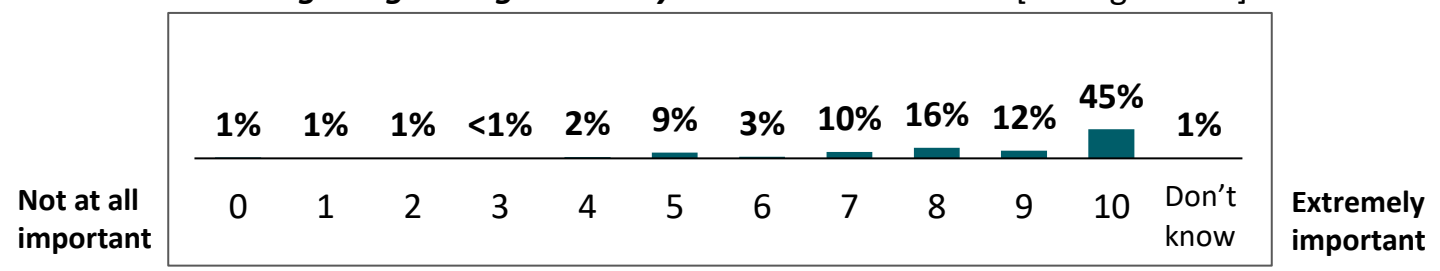


Small Business

Q Using a scale from 0 to 10, where *0 means not important at all* and *10 means extremely important*, how important are each of the following priorities to you as a customer?



Delivering electricity at reasonable rates [average = **9.5**]



Providing reliable electricity [average = **9.3**]

Ensuring the safety of electricity infrastructure [average = **8.7**]

Meeting the growing electricity need [average = **8.3**]

Note: Priority labels have been shortened for brevity. See slide 162 for full label text.
"Don't know" not included in calculation of means.

Reliability Experience

Importance of Reliability Priorities

When it comes to reliability, there are several areas that **Hydro One** can focus their investments on.

Some of these areas are **related to severe weather**, such as ice storms, windstorms and thunderstorms.

Others are **not related to severe weather** and include issues such as aging or defective equipment, animal interference, and vehicle collisions.

Shortened Reliability Priorities Response Labels	Full Reliability Priorities Response Labels
Reducing number of non-weather outages	Reducing the number of outages not caused by severe weather
Reducing length of non-weather outages	Reducing the length of outages not caused by severe weather
Reducing number of weather-caused outages	Reducing the number of outages caused by severe weather
Reducing length of weather-caused outages	Reducing the length of outages caused by severe weather
Reducing momentary interruptions in power	Reducing momentary interruptions (less than one minute) in power that can result in the flickering or dimming of lights
Improving communications during outages	Improving communications during outages, including estimated restoration times

INNOVATIVE RESEARCH GROUP

Small Business Customers

Investment Priorities

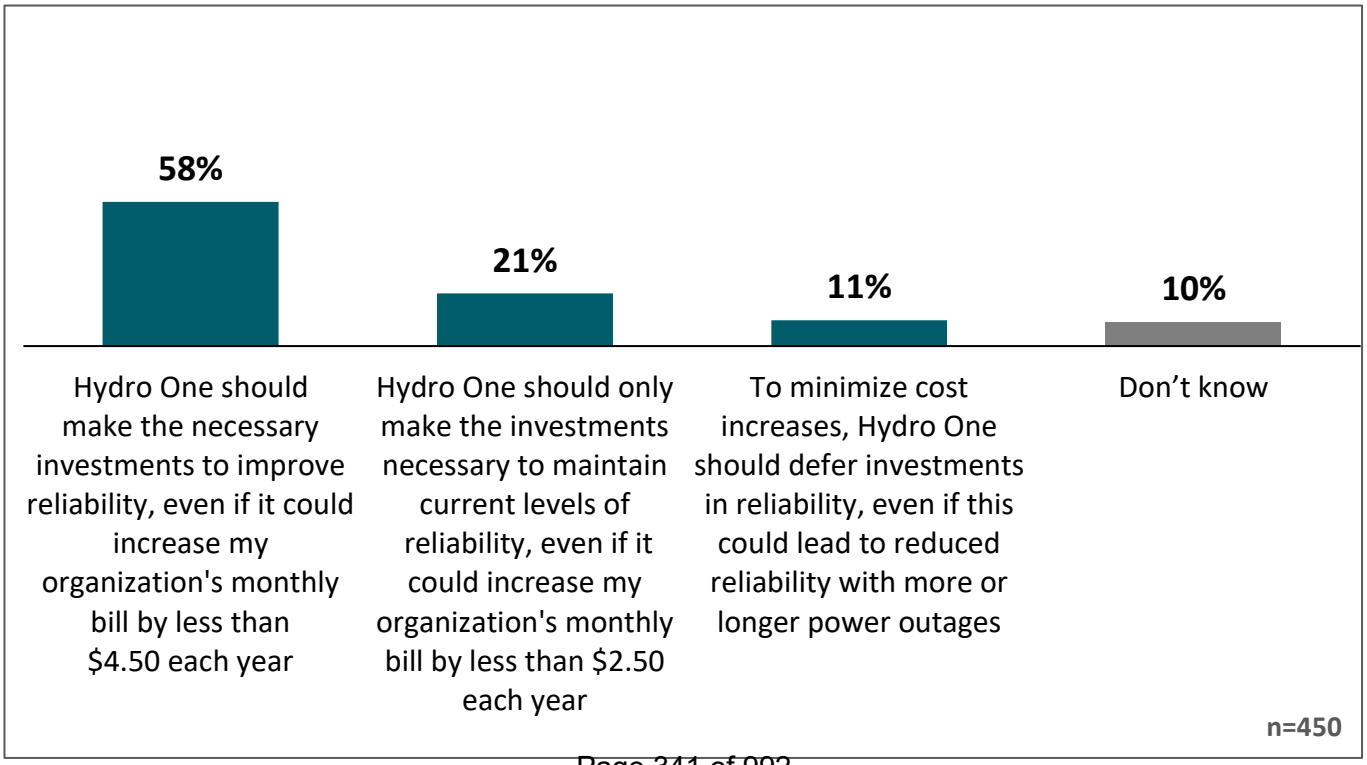
Investment Priorities

High-Level Reliability

Now let's turn to the next topic – investment trade-offs. There are **6** investment areas that **Hydro One** would like your input on.

You do not need to be a system planner or engineer to answer these questions. The trade-offs will focus on what outcomes matter most to you as a customer – balancing investment outcomes and cost to you.

First, we would like to talk about the local distribution system, which takes electricity from transmission lines and brings it to your organization through a network of wires, poles and other equipment.



The first category is related to the reliability you experience.

On average, between 2019 and 2023, the typical **Hydro One** customer has experienced about 3.8 outages per year, resulting in a total of 16.6 hours without power.

It's important to keep in mind that these are system averages, and that your actual experience may be different.

Hydro One has historically identified investments in maintaining or improving reliability by taking into consideration the overall age, health, and likelihood of failure of equipment.

Q Based on your own reliability experience, which of the following is closest to your point of view?

Investment Priorities

High-Level Reliability

Small Business

Q Based on your own reliability experience, which of the following is closest to your point of view?

		Region				
	Overall	West	Central	Central East	East	North
Necessary investments to improve reliability	58%	61%	59%	63%	59%	46%
Necessary investments to maintain reliability	21%	20%	24%	20%	22%	22%

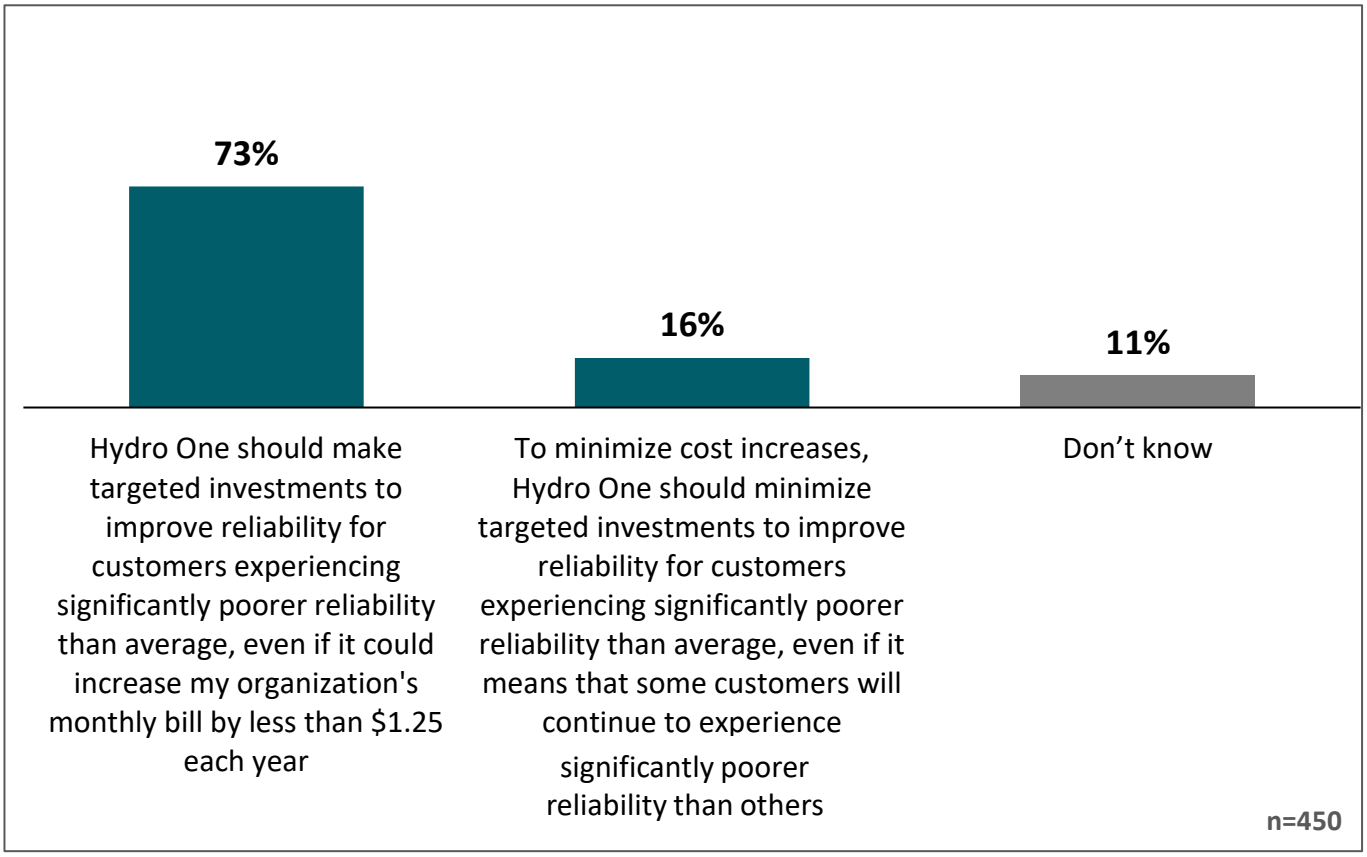
Don't know	9%	9%	11%	10%	11%	8%

Note: Response labels have been shortened for brevity. See slide 184 for full label text.

Investment Priorities



Targeted Reliability

The second category is related to more targeted improvements to reliability.

Hydro One customers experience different levels of reliability, depending on where they live, the design of the system and the condition of the equipment supplying them.

While some **Hydro One** customers didn't experience any outages in 2022 or 2023, others were without power more than 10 times per year. Similarly, the total length of time that customers were without power ranges from less than one hour to more than 50 hours per year.

Q When it comes to more targeted investments to improve reliability for those customers that experience significantly poorer reliability than average, which of the following is closest to your point of view?

Investment Priorities

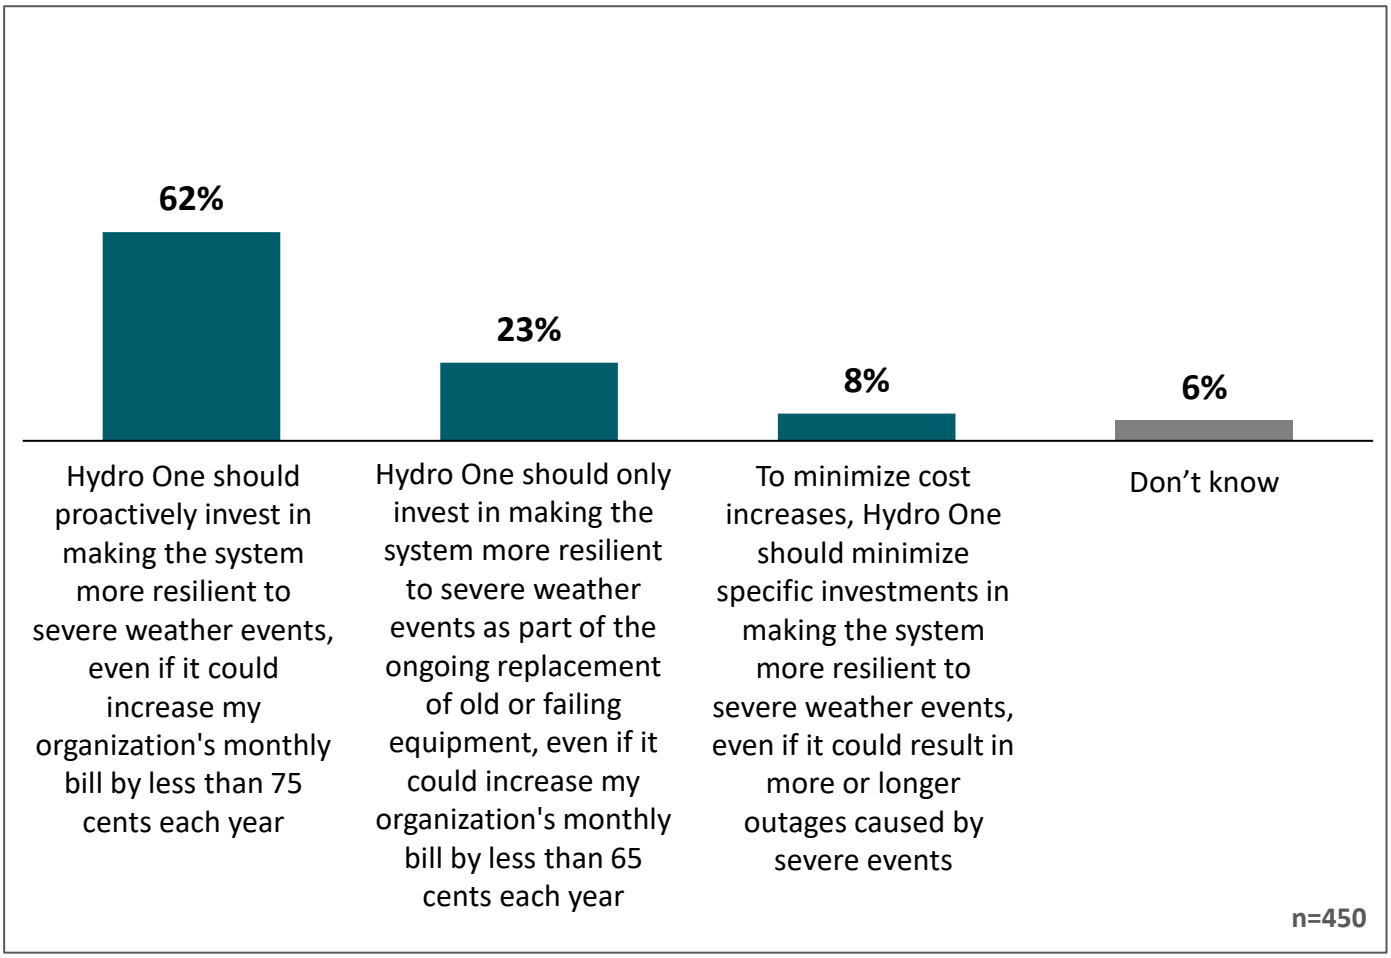
Don't know	10%	11%	12%	9%	12%	8%

Note: Response labels have been shortened for brevity. See slide 186 for full label text.



Investment Priorities

Responding to Severe Weather

On average, between 2019 and 2023, **severe weather events**, such as ice storms, windstorms or thunderstorms, have contributed to 51% of all hours that the typical customer has been without power per year.

While some of these outages may be inevitable, **Hydro One** could make additional investments to make the system more resilient to these types of events. These investments could help either reduce the number of outages caused by severe weather events or improve restoration times when these outages do occur.

Q Based on this, which of the following is closest to your point of view?

Investment Priorities

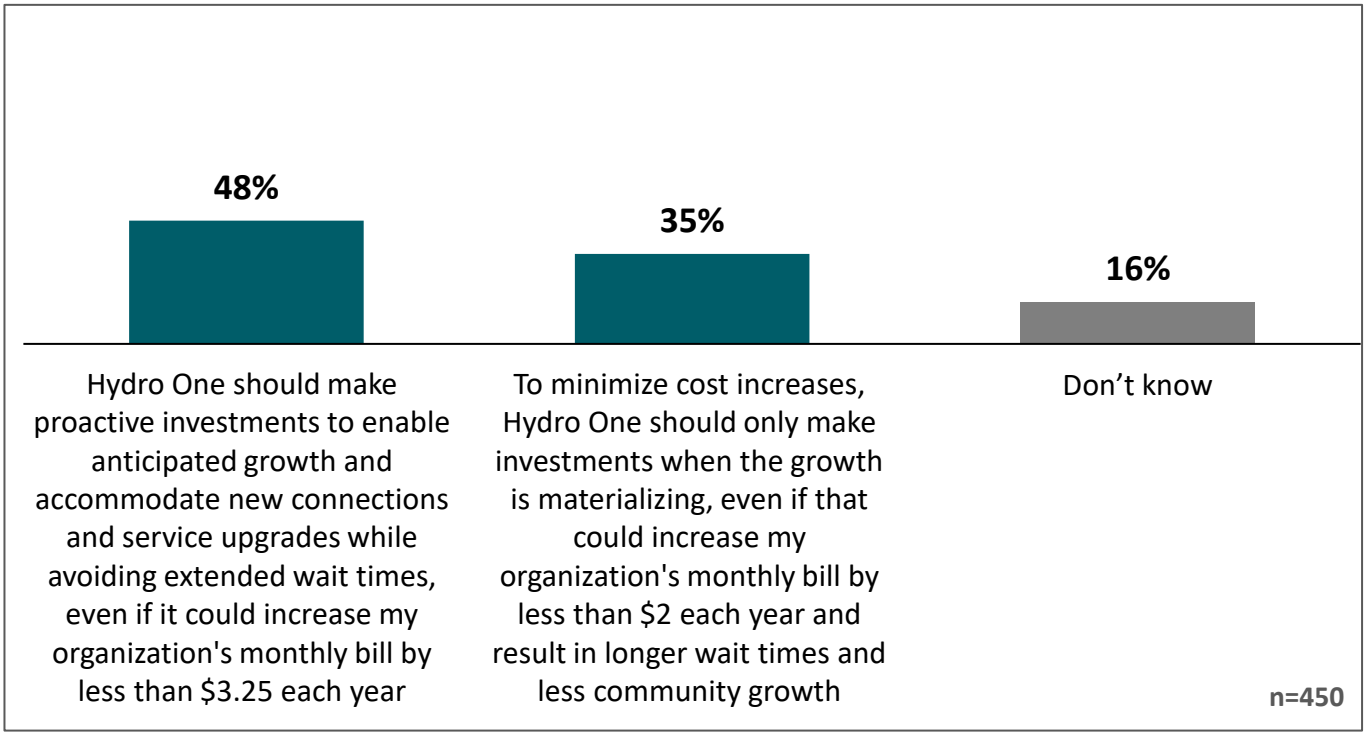
Note: Response labels have been shortened for brevity. See slide 186 for full label text.

Investment Priorities

Growth



Electricity demand is on the rise across Ontario. This increasing demand, resulting from industrial and residential growth, as well as the changing ways we use electricity, will require electricity companies like **Hydro One** to make significant investments in the grid.

Increased growth can result in longer wait times to connect new homes or businesses to the system or facilitate upgrades for existing customers if insufficient capacity is available.

For instance, as increasing growth occurs, some new businesses may be asked to wait up to 2 years or longer for their facility to be connected to the **Hydro One** grid.

However, **Hydro One** could make proactive investments to enable anticipated growth and allow new homes or businesses to connect to the system in a timely manner, and to not delay service upgrades for existing customers.

Q Based on this, which is closest to your point of view?

Investment Priorities

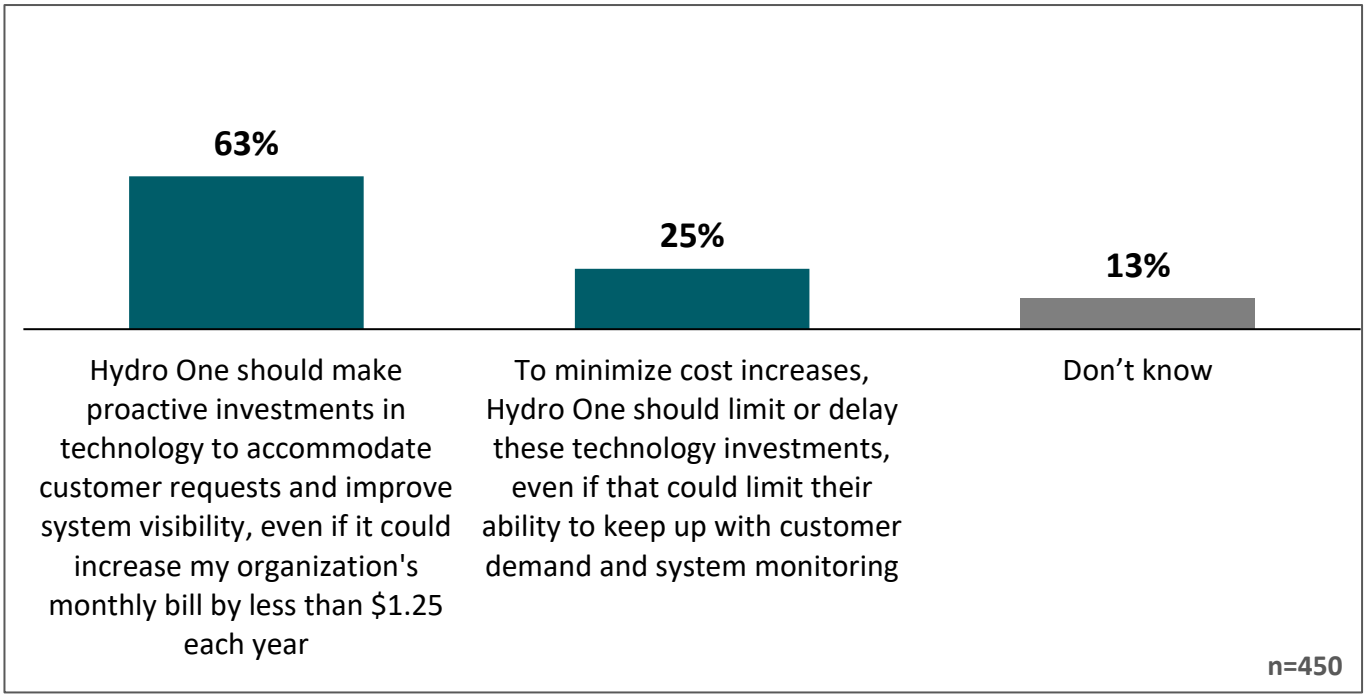
Investment Priorities

Evolving Customer Requests & System Visibility

Small Business

Beyond residential and industrial growth, customers are increasingly requesting information and upgrades related to new technologies like rooftop solar panels, heat pumps, and electric vehicle chargers.

Whether or not you are actively considering these types of technologies for yourself, **Hydro One** needs to be prepared to accommodate these types of customer requests, not just today, but over the next 5 to 10 years.



While **Hydro One** has an obligation to make certain investments to accommodate customer requests, planners have identified incremental investments that can help:

- Ensure that **Hydro One's** grid is ready to accommodate if and when customers request to connect new technologies.

- Give the **Hydro One** control room more "visibility" into exactly where and how much electricity is being used in real-time, helping make more informed decisions on managing electricity demand and equipment maintenance or upgrades.

As the pace of change and customer needs are rapidly evolving, delaying or limiting these investments means that **Hydro One** could struggle to keep up with customer demand for connecting new technology and lack the precision to monitor the grid as new technology adoption increases.

Q With regards to these investments, which of the following is closest to your point of view?

Investment Priorities

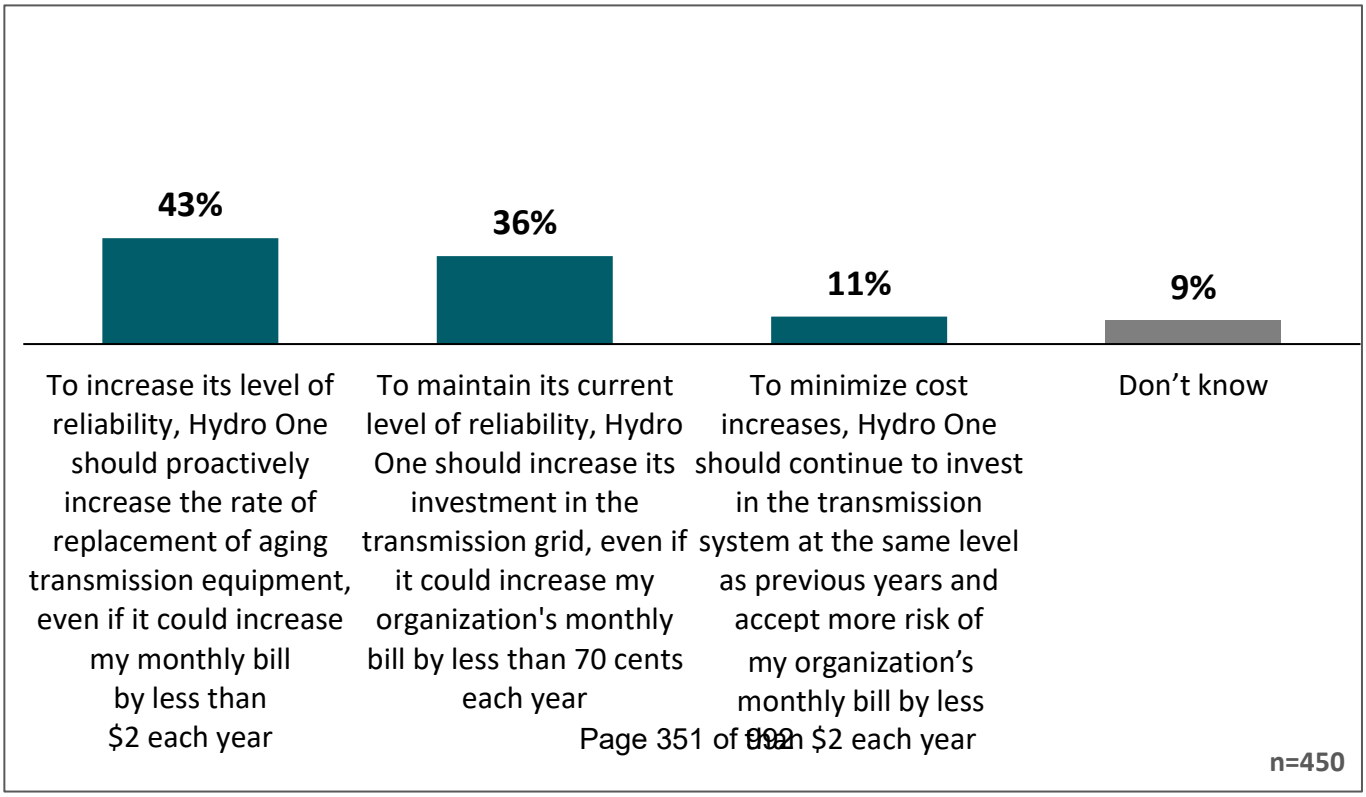
Transmission Renewal

Small Business



Now, we would like to talk about the provincial transmission system. That is the part of the system that uses high voltage transmission lines that serve as highways for electricity, bringing power from generation stations to your community.

Hydro One's transmission system serves most electricity customers in Ontario, including local distribution companies across the province. In fact, many large industrial customers like mines and auto manufacturers, as well as electricity generators like nuclear plants and hydro dams are directly connected to the transmission grid.

When an outage occurs on **Hydro One's** transmission system, the impacts are significant, both to communities and Ontario's economy. As such, the transmission system is designed to minimize both the frequency and duration of outages. For example, most of Ontario's population centres are served by multiple transmission lines, so that if one fails, there is always a backup to keep power flowing.

Portions of **Hydro One's** transmission system were built in the 1930s, 40s, and 50s. Even at historical levels of investment, portions of the transmission system continue to age and degrade, increasing the risk of failure. To minimize the risk of potential outages and support the growing electricity demands of communities, industries, and businesses across the province, **Hydro One** will need to continue to make significant investments to renew and upgrade older and degrading equipment.

Q With this in mind, what is closest to your point of view?

Commercial & Industrial Customers

Online Survey Results

Section 5

Field Dates

The **Commercial & Industrial Online Survey** was sent to all Hydro One commercial & industrial customers who provided the utility with an email address. Customers had an opportunity to complete the survey between **November 13th and December 13th, 2024**.

Each customer received a unique URL that could be linked back to their average monthly demand, region and rate class. Customers were sent a survey that reflects their rate class (Sub Transmission low, medium, high, or General Service Demand).

In total, the commercial & industrial survey was sent to **4,827** customers from *customerexperience@hydroone.com*. Reminder emails were sent on November 20th, November 27th, December 4th and December 10th, 2024, to those who had not yet completed the survey.

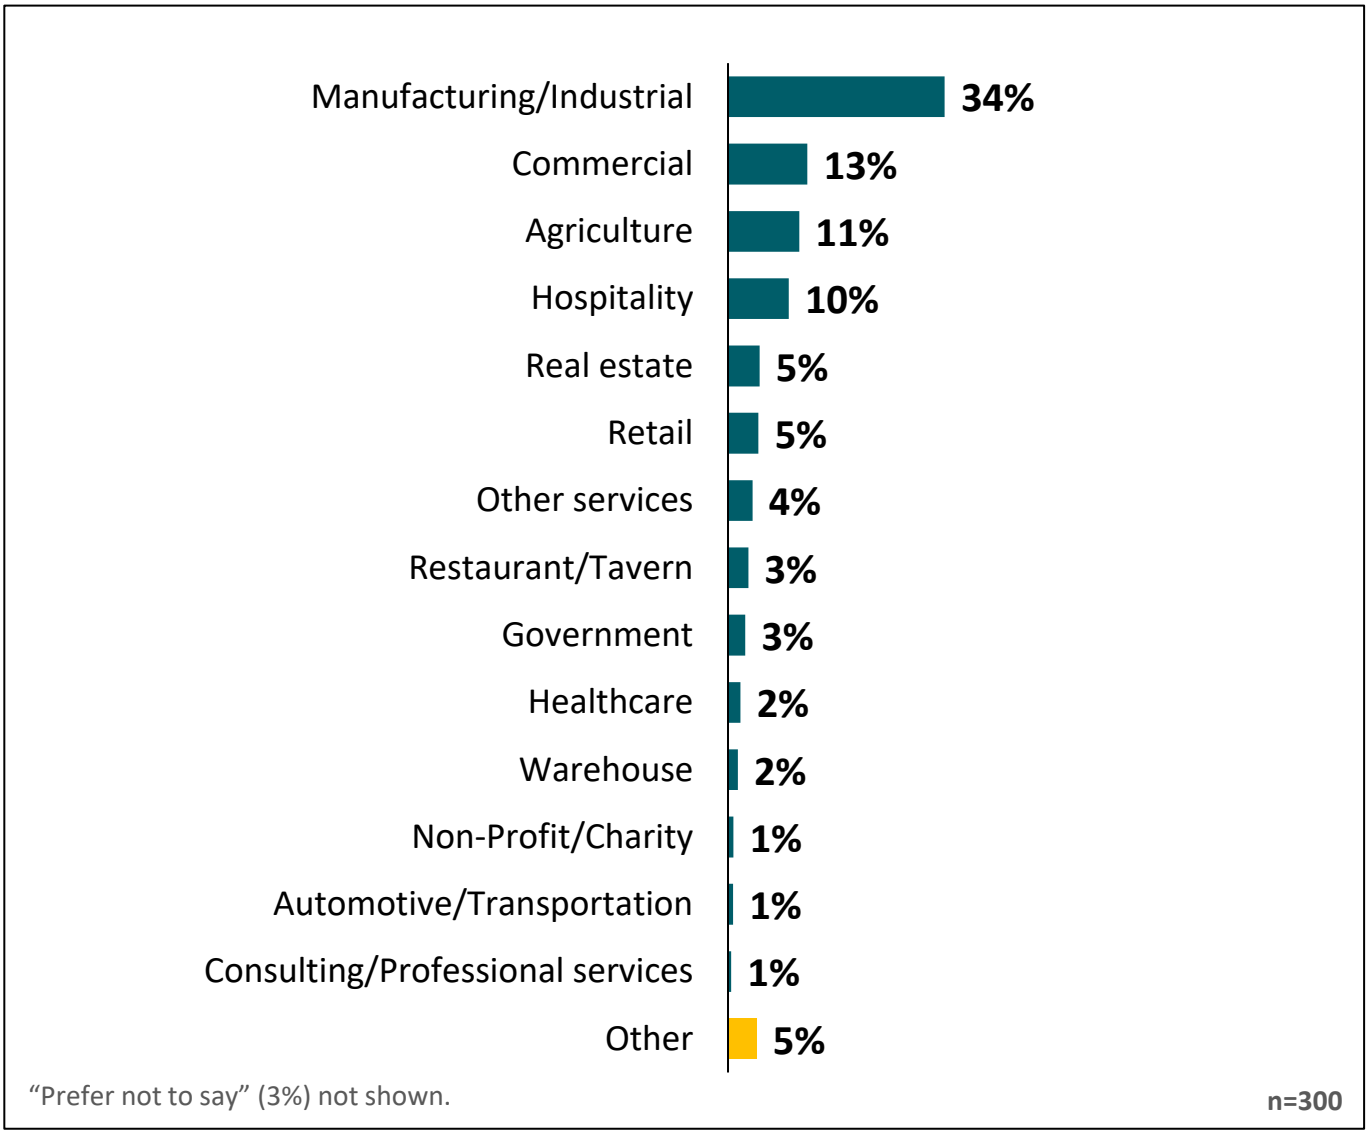
Commercial & Industrial Online Survey Completes

A total of **311** (unweighted) Hydro One commercial & industrial customers completed the online survey.

Sample Weighting

The commercial & industrial online survey sample was weighted down to n=300 proportionately by consumption quartiles and region in order to be representative of the broader Hydro One customer base.

The table below summarizes the unweighted and weighted (in brackets) sample breakdown by consumption quartile and region. Totals may not correspond with cell values as some customers are missing region or consumption quartile information. Weights are calculated based off of all available information for a given customer.



Region	Consumption Quartiles				Total
	First	Second	Third	Fourth	
West	19 (18)	35 (26)	28 (20)	24 (21)	106 (86)
Central	17 (22)	22 (24)	21 (21)	13 (15)	73 (82)
Central East	15 (18)	12 (11)	19 (17)	18 (19)	64 (66)
East	6 (7)	7 (7)	8 (7)	7 (7)	28 (28)
North	9 (8)	7 (5)	9 (9)	10 (12)	35 (34)
Total	67 (75)	85 (75)	86 (75)	73 (75)	311 (300)

Note: *Graphs and tables may not always total 100% due to rounding values rather than any error in data. Sums are added before rounding numbers. Caution interpreting results with small n-sizes.*

Commercial & Industrial Customers

Familiarity & Experience

Familiarity & Experience
Preamble

Before we begin, this survey has **three key objectives**.

First, **Hydro One** wants to better understand your experiences as a customer.

Second, **Hydro One** wants your input on some of the investment areas they could focus on in the future.

Third, **Hydro One** wants to learn a little bit more about their customers. This will help them ensure that they are receiving feedback that represents a wide range of customers.

First, let's talk about your experience.

While you might have multiple accounts with **Hydro One**, for this survey, we want you to think about your overall experience as a commercial & industrial customer.

***Note**: The estimates throughout this survey are for illustrative purposes only and may not reflect the actual size of your organization's monthly electricity bill.*

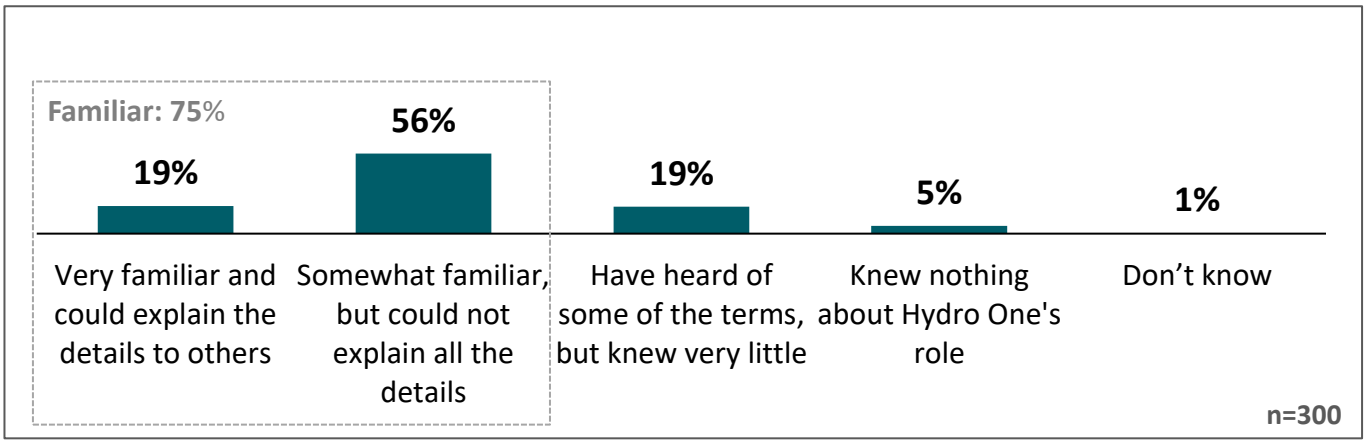
For the purpose of this exercise, the estimates are based on a customer with an average monthly demand of [demand] and average monthly consumption of [usage].

Estimate Legend

Customer Group	[demand]	[usage]
GSd	110 kW	34,334 kWh
ST-Low	500 kW	88,780 kWh
ST-Med	2,808 kW	1,373,443 kWh
ST-High	13,730 kW	2,641,420 kWh

Familiarity & Experience

Familiarity with Hydro One's Role in the System



Ontario's electricity system has three key components: **generation**, **transmission** and **distribution**.

Hydro One's transmission system takes electricity from generation stations and transports it via high voltage transmission lines to local communities across the province.

In many communities, including your own, **Hydro One** is also responsible for the local distribution system, which takes electricity from transmission lines and brings it to your organization through a network of wires, poles and other equipment.

Hydro One does not generate electricity or set electricity prices.

Q Before this survey, how familiar were you with Hydro One's role in Ontario's electricity system?

Region

	West	Central	Central East	East*	North

How can Hydro One improve services?

Q Is there anything in particular you would like **Hydro One** to do to improve its services to your organization?

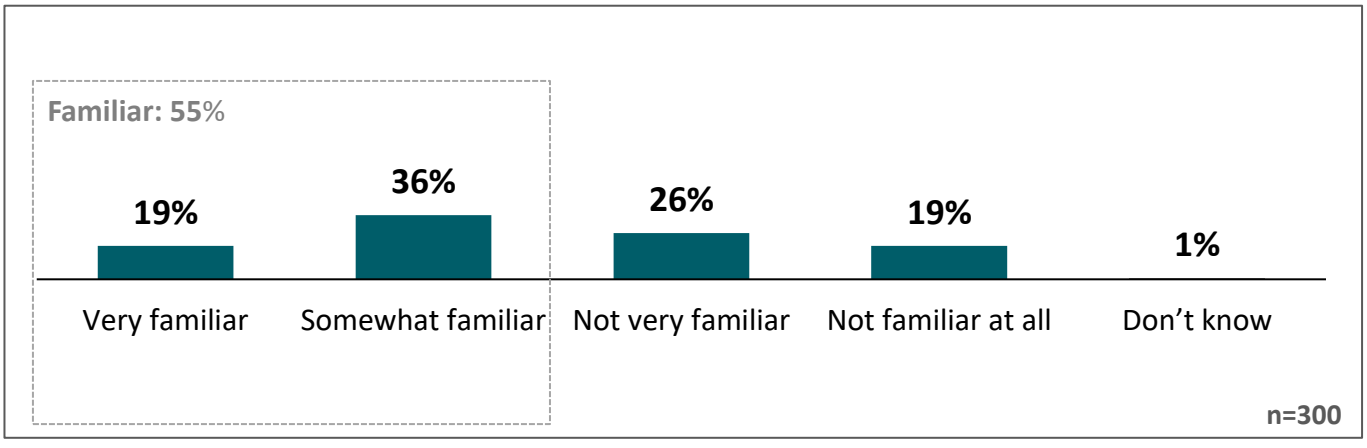
Response	%
Decrease outages/interruptions	9.1%
Improve customer service	4.0%
Satisfied with services/no issues	3.8%
Upgrade/better maintain infrastructure	3.2%
Lower rates/decrease bills	3.2%
Improve communication during outages	2.8%
Bury power lines/better line maintenance	2.8%
Improve general communication	2.0%
Billing improvements - timing/payments/bill format	1.9%
More information/visibility into usage	1.3%
Improve response time for outages	1.1%
More transparency around costs	0.9%
Find efficiencies/costs savings	0.8%
Provide incentives/rebates	0.7%
Improve website/app	0.6%
Address/proactive tree trimming	0.6%
Building capacity/addressing growth	0.4%
Other	2.2%
None/Don’t know	58.5%

Note: Only responses >0.1% shown

Familiarity & Experience

Bill Familiarity

Every item and charge on your bill is mandated by the provincial government or regulated by the Ontario Energy Board, the provincial energy regulator.



Although **Hydro One** is responsible for collecting payment from you for your entire electricity bill, only a portion goes to **Hydro One**. As of October 1st, 2024, for a typical commercial & industrial customer, about **[bill percentage]** or **[bill amount]** goes to **Hydro One** per month. This amount is split into **[distribution amount]** for distribution and **[transmission amount]** for transmission.

The rest of your bill payment goes to power generation companies, taxes, and regulatory agencies.

Bill Legend

Customer Group	[bill percentage]	[bill amount]	[distribution amount]	[transmission amount]
GSd	38%	$2,945	$2,355	$590
ST-Low	36%	$6,640	$2,055	$4,585
ST-Med	16%	$31,550	$5,800	$25,750
ST-High	30%	$149,425	$23,525	$125,900

Q Before this survey, how familiar were you with the amount of your organization's electricity bill that went to **Hydro One**?

Familiarity & Experience

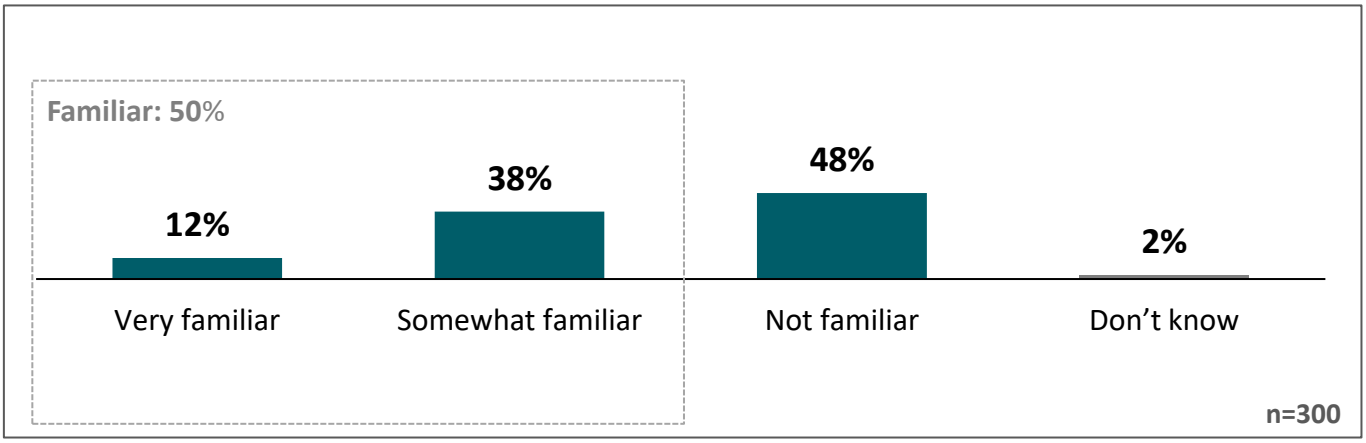
Familiarity with Rate Applications



Hydro One is funded by the rates paid by its customers.

Roughly every five years, **Hydro One** is required to file an application with the Ontario Energy Board (OEB), the energy regulator in Ontario, to set rates. **Hydro One's** next rate application will cover the years 2028-2032.

In this process, **Hydro One's** rate application will be examined in detail and **Hydro One** must demonstrate that customer needs and priorities were factored into its investment planning process.

If approved by the OEB, the investments areas that are discussed throughout the remainder of this survey would be directly funded by customers.

Q Before this survey, were you aware that **Hydro One** must file a rate application with the OEB every 5 years?

Region

	West	Central	Central East	East*	North

INNOVATIVE RESEARCH GROUP

Reliability Experience

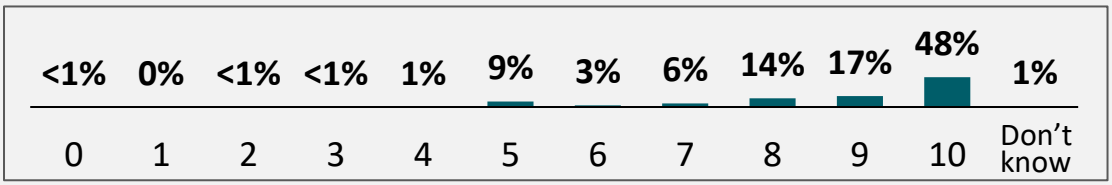
Importance of Reliability Priorities

When it comes to reliability, there are several areas that **Hydro One** can focus their investments on.

Some of these areas are **related to severe weather**, such as ice storms, windstorms and thunderstorms.

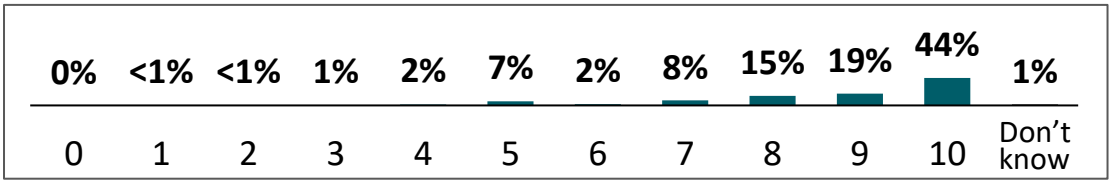
Others are **not related to severe weather** and include issues such as aging or defective equipment, animal interference, and vehicle collisions.

Shortened Reliability Priorities Response Labels	Full Reliability Priorities Response Labels
Reducing number of non-weather outages	Reducing the number of outages not caused by severe weather
Reducing length of non-weather outages	Reducing the length of outages not caused by severe weather
Reducing number of weather-caused outages	Reducing the number of outages caused by severe weather
Reducing length of weather-caused outages	Reducing the length of outages caused by severe weather
Reducing momentary interruptions in power	Reducing momentary interruptions (less than one minute) in power that can result in the flickering or dimming of lights
Improving communications during outages	Improving communications during outages, including estimated restoration times



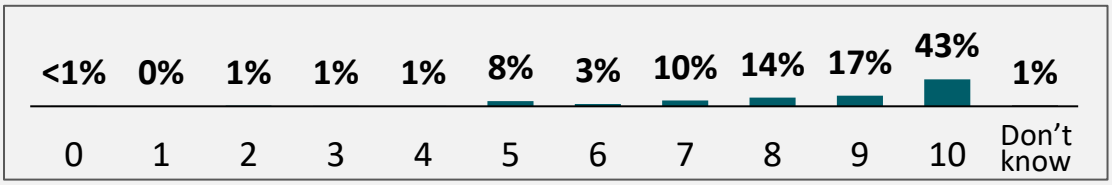
Reliability Experience

Importance of Reliability Priorities

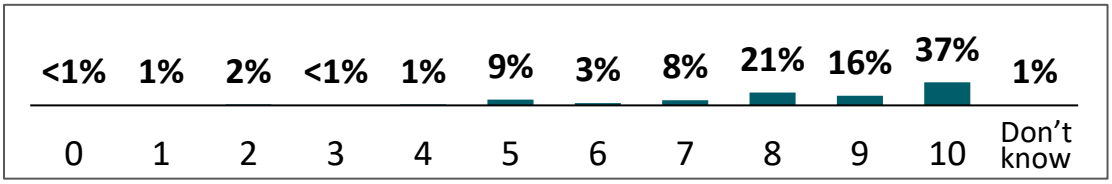


Commercial & Industrial

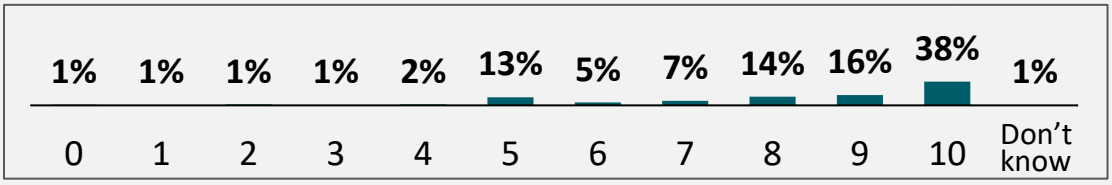
Q Using a scale from 0 to 10, where *0 means not important at all* and *10 means extremely important*, how important are each of the following **reliability** priorities to you as a customer?



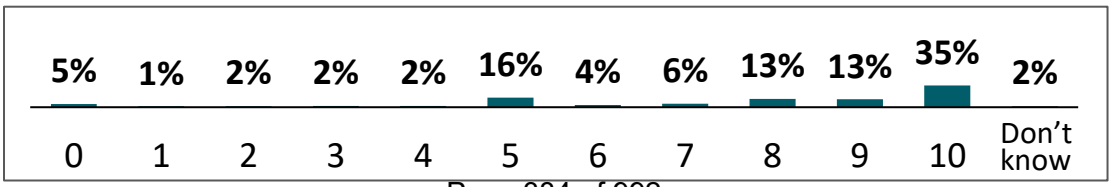
Reducing length of non-weather outages [average = **8.7**]



Reducing number of non-weather outages [average = **8.6**]



Reducing length of weather-caused outages [average = **8.5**]



Reducing number of weather-caused outages [average = **8.2**]

Improving communications during outages [average = **8.1**]

Reducing momentary interruptions in power [average = **7.4**]

Note: Priority labels have been shortened for brevity. See slide 226 for full label text.
"Don't know" not included in calculation of means.

Investment Priorities

Investment Priorities

High-Level Reliability

Now let's turn to next topic – investment trade-offs. There are **6** investment areas that **Hydro One** would like your input on.

You do not need to be a system planner or engineer to answer these questions. The trade-offs will focus on what outcomes matter most to you as a customer – balancing investment outcomes and cost to you.

First, we would like to talk about the local distribution system, which takes electricity from transmission lines and brings it to your organization through a network of wires, poles and other equipment.

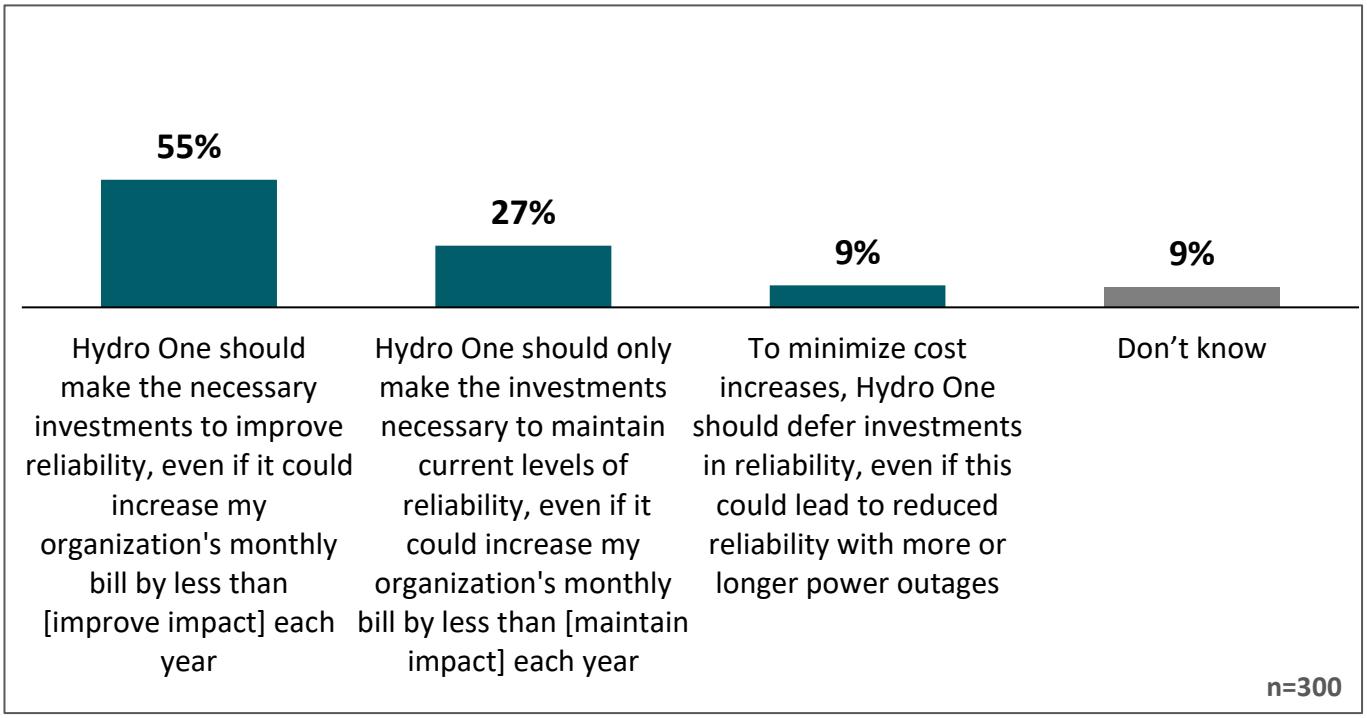
The first category is related to the reliability you experience.

On average, between 2019 and 2023, the typical **Hydro One** customer has experienced about 3.8 outages per year, resulting in a total of 16.6 hours without power.

It's important to keep in mind that these are system averages, and that your actual experience may be different.

Hydro One has historically identified investments in maintaining or improving reliability by taking into consideration the overall age, health, and likelihood of failure of equipment.

Investment Priorities



High-Level Reliability

Commercial & Industrial

Q Based on your own reliability experience, which of the following is closest to your point of view?

High-Level Reliability Legend

Customer Group	[improve impact]	[maintain impact]
GSd	$75	$40
ST-Low	$35	$20
ST-Med	$185	$105
ST-High	$920	$520

Investment Priorities
High-Level Reliability

Commercial & Industrial

Q Based on your own reliability experience, which of the following is closest to your point of view?

	Overall	Region: West	Region: Central	Region: Central East	Region: East*	Region: North
Necessary investments to improve reliability	55%	60%	51%	54%	54%	56%

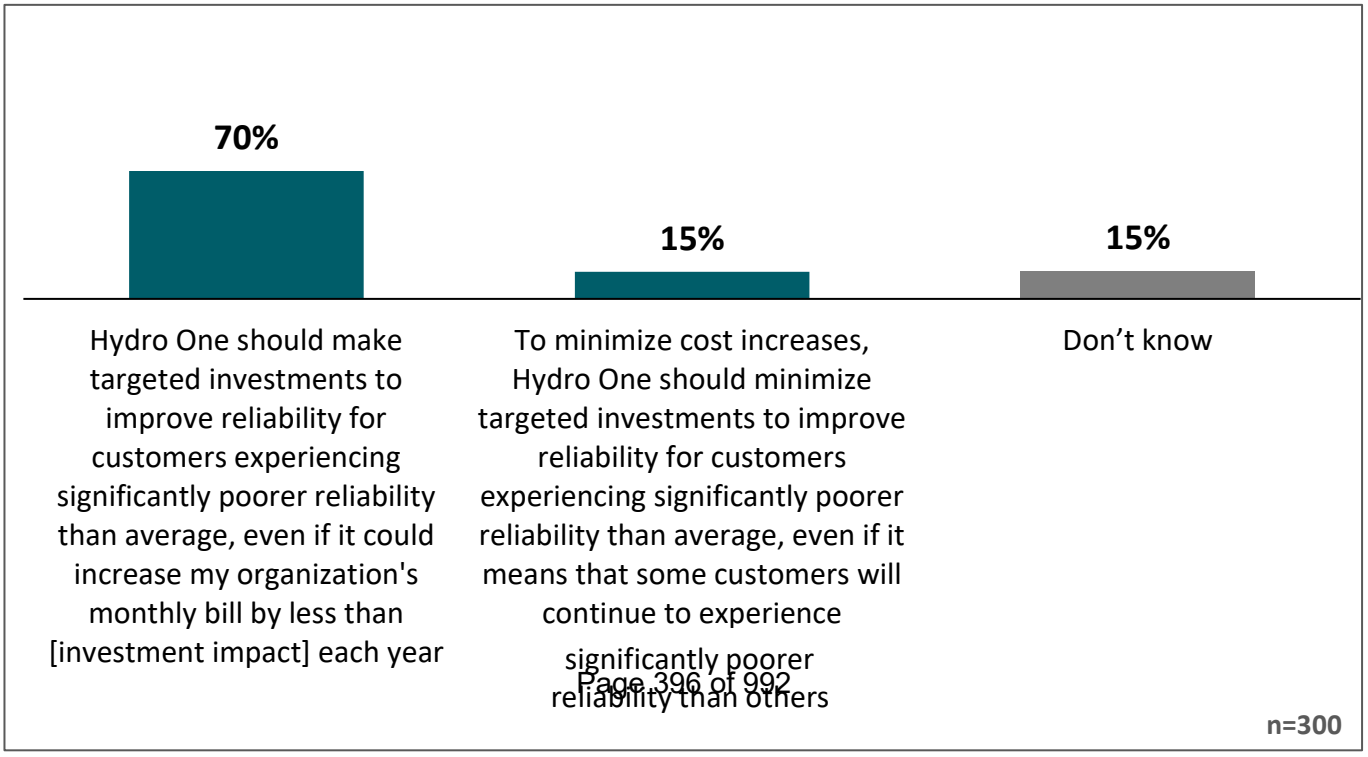
***Note: Small sample size (n=28); interpret results with caution**

Response labels have been shortened for brevity. See slide 237 for full label text.

Investment Priorities

Targeted Reliability

The second category is related to more targeted improvements to reliability.



Hydro One customers experience different levels of reliability, depending on where they live, the design of the system and the condition of the equipment supplying them.

While some **Hydro One** customers didn't experience any outages in 2022 or 2023, others were without power more than 10 times per year. Similarly, the total length of time that customers were without power ranges from less than one hour to more than 50 hours per year.

Q When it comes to more targeted investments to improve reliability for those customers that experience significantly poorer reliability than average, which of the following is closest to your point of view?

Targeted Reliability Legend

Customer Group	[investment impact]
GSd	$20
ST-Low	$10
ST-Med	$55
ST-High	$260

Investment Priorities

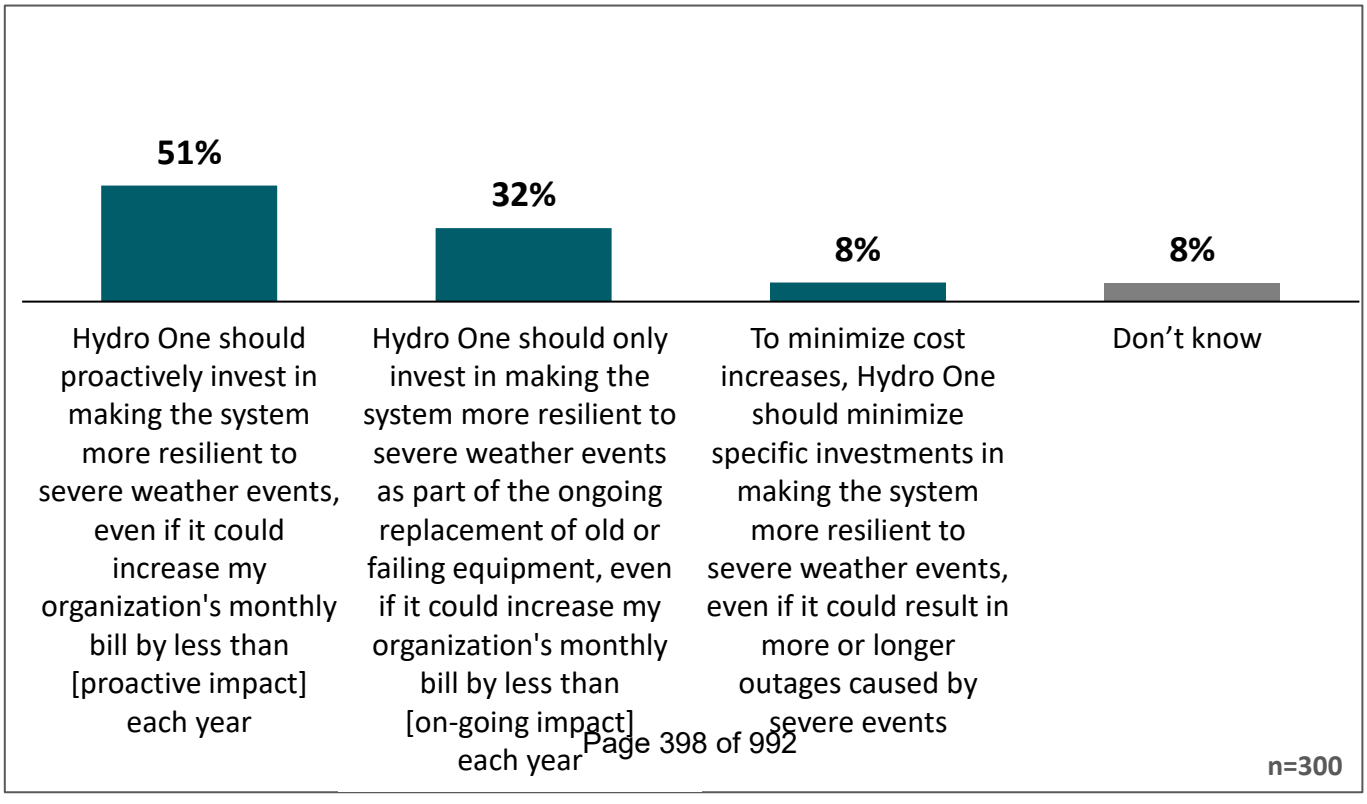
Responding to Severe Weather

Commercial & Industrial



On average, between 2019 and 2023, **severe weather events**, such as ice storms, windstorms or thunderstorms, have contributed to 51% of all hours that the typical customer has been without power per year.

While some of these outages may be inevitable, **Hydro One** could make additional investments to make the system more resilient to these types of events. These investments could help either reduce the number of outages caused by severe weather events or improve restoration times when these outages do occur.

Q Based on this, which of the following is closest to your point of view?

Responding to Severe Weather Legend

Customer Group	[proactive impact]	[on-going impact]
GSd	$13	$10
ST-Low	$6	$5
ST-Med	$30	$25
ST-High	$155	$130

Investment Priorities

***Note: Small sample size (n=28); interpret results with caution**

Response labels have been shortened for brevity. See slide 241 for full label text.

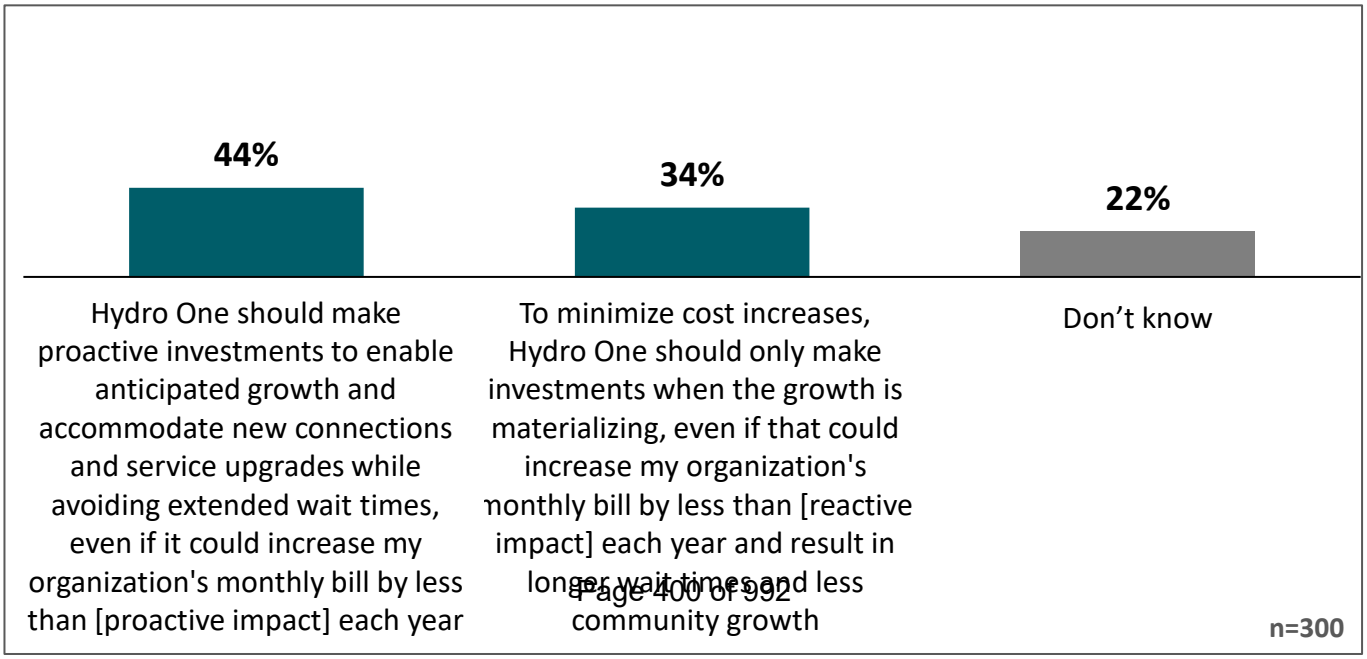
Investment Priorities

Growth

Commercial & Industrial

Electricity demand is on the rise across Ontario. This increasing demand, resulting from industrial and residential growth, as well as the changing ways we use electricity, will require electricity companies like **Hydro One** to make significant investments in the grid.

Increased growth can result in longer wait times to connect new homes or businesses to the system or facilitate upgrades for existing customers if insufficient capacity is available.



For instance, as increasing growth occurs, some new businesses may be asked to wait up to 2 years or longer for their facility to be connected to the **Hydro One** grid.

However, **Hydro One** could make proactive investments to enable anticipated growth and allow new homes or businesses to connect to the system in a timely manner, and to not delay service upgrades for existing customers.

Q Based on this, which is closest to your point of view?

Growth Legend

Customer Group	[proactive impact]	[reactive impact]
GSd	$50	$30
ST-Low	$25	$15
ST-Med	$135	$80
ST-High	$650	$390

***Note: Small sample size (n=28); interpret results with caution**
Response labels have been shortened for brevity. See slide 243 for full label text.

Investment Priorities

Evolving Customer Requests & System Visibility

Beyond residential and industrial growth, customers are increasingly requesting information and upgrades related to new technologies like rooftop solar panels, heat pumps, and electric vehicle chargers.

Whether or not you are actively considering these types of technologies for yourself, **Hydro One** needs to be prepared to accommodate these types of customer requests, not just today, but over the next 5 to 10 years.

While **Hydro One** has an obligation to make certain investments to accommodate customer requests, planners have identified incremental investments that can help:

- Ensure that **Hydro One's** grid is ready to accommodate if and when customers request to connect new technologies.

- Give the **Hydro One** control room more "visibility" into exactly where and how much electricity is being used in real-time, helping make more informed decisions on managing electricity demand and equipment maintenance or upgrades.

As the pace of change and customer needs are rapidly evolving, delaying or limiting these investments means that **Hydro One** could struggle to keep up with customer demand for connecting new technology and lack the precision to monitor the grid as new technology adoption increases.

Investment Priorities

Transmission Renewal

Now, we would like to talk about the provincial transmission system. That is the part of the system that uses high voltage transmission lines that serve as highways for electricity, bringing power from generation stations to your community.

Hydro One's transmission system serves most electricity customers in Ontario, including local distribution companies across the province. In fact, many large industrial customers like mines and auto manufacturers, as well as electricity generators like nuclear plants and hydro dams are directly connected to the transmission grid.

When an outage occurs on **Hydro One's** transmission system, the impacts are significant, both to communities and Ontario's economy. As such, the transmission system is designed to minimize both the frequency and duration of outages. For example, most of Ontario's population centres are served by multiple transmission lines, so that if one fails, there is always a backup to keep power flowing.

Portions of **Hydro One's** transmission system were built in the 1930s, 40s, and 50s. Even at historical levels of investment, portions of the transmission system continue to age and degrade, increasing the risk of failure. To minimize the risk of potential outages and support the growing electricity demands of communities, industries, and businesses across the province, **Hydro One** will need to continue to make significant investments to renew and upgrade older and degrading equipment.

Large Distribution Account Customers

Online Survey Results

Section 6

Field Dates

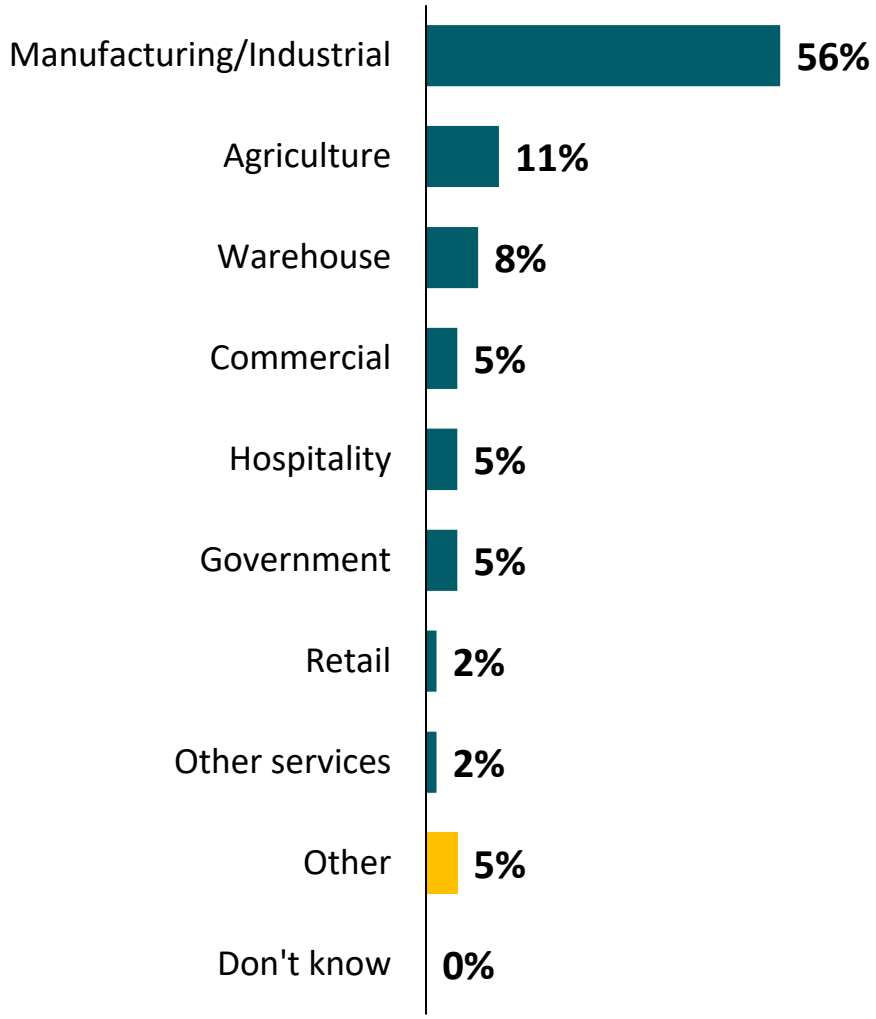
The **Large Distribution Account Customers Online Survey** was sent to all Hydro One large distribution account customers who provided the utility with an email address. Customers had an opportunity to complete the survey between **November 13th and December 12th, 2024**.

Each customer received a unique URL that could be linked back to their average monthly demand, region and rate class. Customers were sent a survey that reflects their rate class (Sub Transmission low, medium, high, or General Service Demand).

In total, the large distribution account customers survey was sent to **276** customers from *customerexperience@hydroone.com*. Reminder emails were sent on November 20th, November 27th, December 4th, and December 10th 2024 to those who had not yet completed the survey.

Large Distribution Accounts Online Survey Completes

A total of **61** (unweighted) Hydro One large distribution account customers completed the online survey.



Sample Weighting

The large distribution account online survey sample was not weighted due to the small number of completes.

Familiarity & Experience

Familiarity & Experience
Preamble

Before we begin, this survey has **three key objectives**.

First, **Hydro One** wants to better understand your experiences as a customer.

Second, **Hydro One** wants your input on some of the investment areas they could focus on in the future.

Third, **Hydro One** wants to learn a little bit more about their customers. This will help them ensure that they are receiving feedback that represents a wide range of customers.

First, let's talk about your experience.

While you might have multiple accounts with **Hydro One**, for this survey, we want you to think about your overall experience as a large distribution customer.

***Note**: The estimates throughout this survey are for illustrative purposes only and may not reflect the actual size of your organization's monthly electricity bill.*

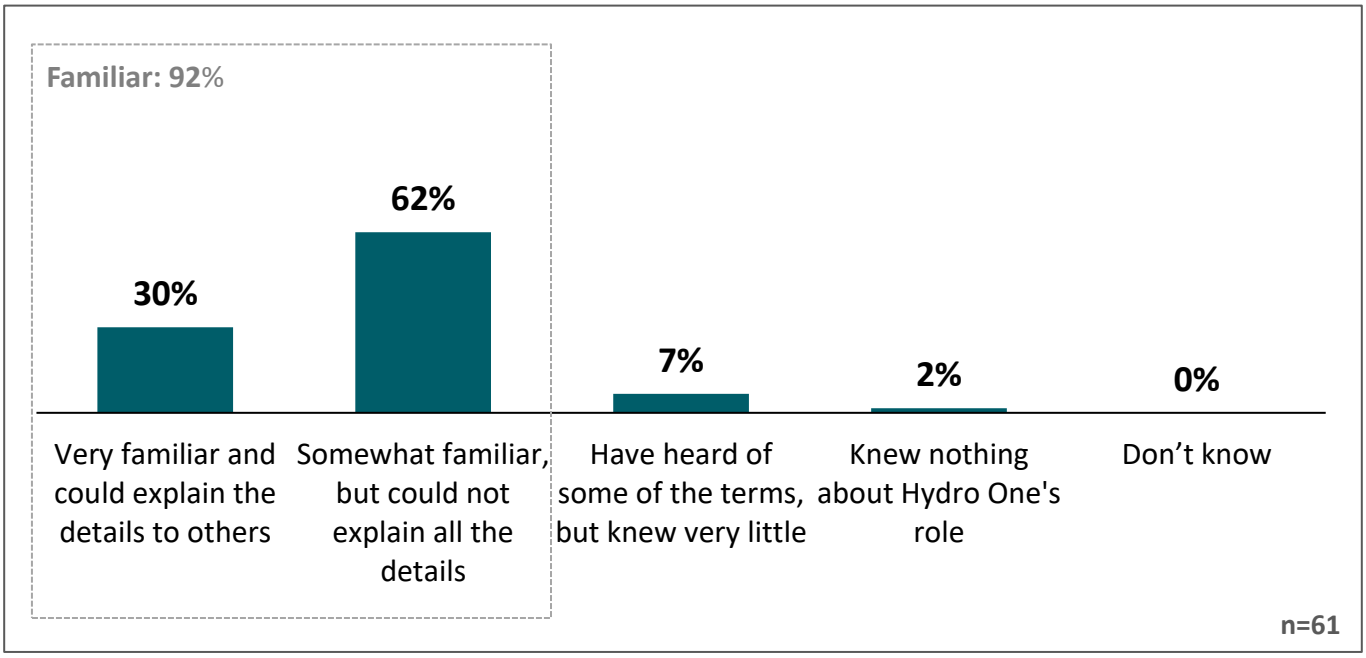
For the purpose of this exercise, the estimates are based on a customer with an average monthly demand of [demand assumption] and average monthly consumption of [usage assumption].

Estimate Assumptions Legend

Customer Group	[demand]	[usage]
GSd	110 kW	34,334 kWh
ST-Low	500 kW	88,780 kWh
ST-Med	2,808 kW	1,373,443 kWh
ST-High	13,730 kW	2,641,420 kWh

Familiarity & Experience

Familiarity with Hydro One's Role in the System



Ontario's electricity system has three key components: **generation**, **transmission** and **distribution**.

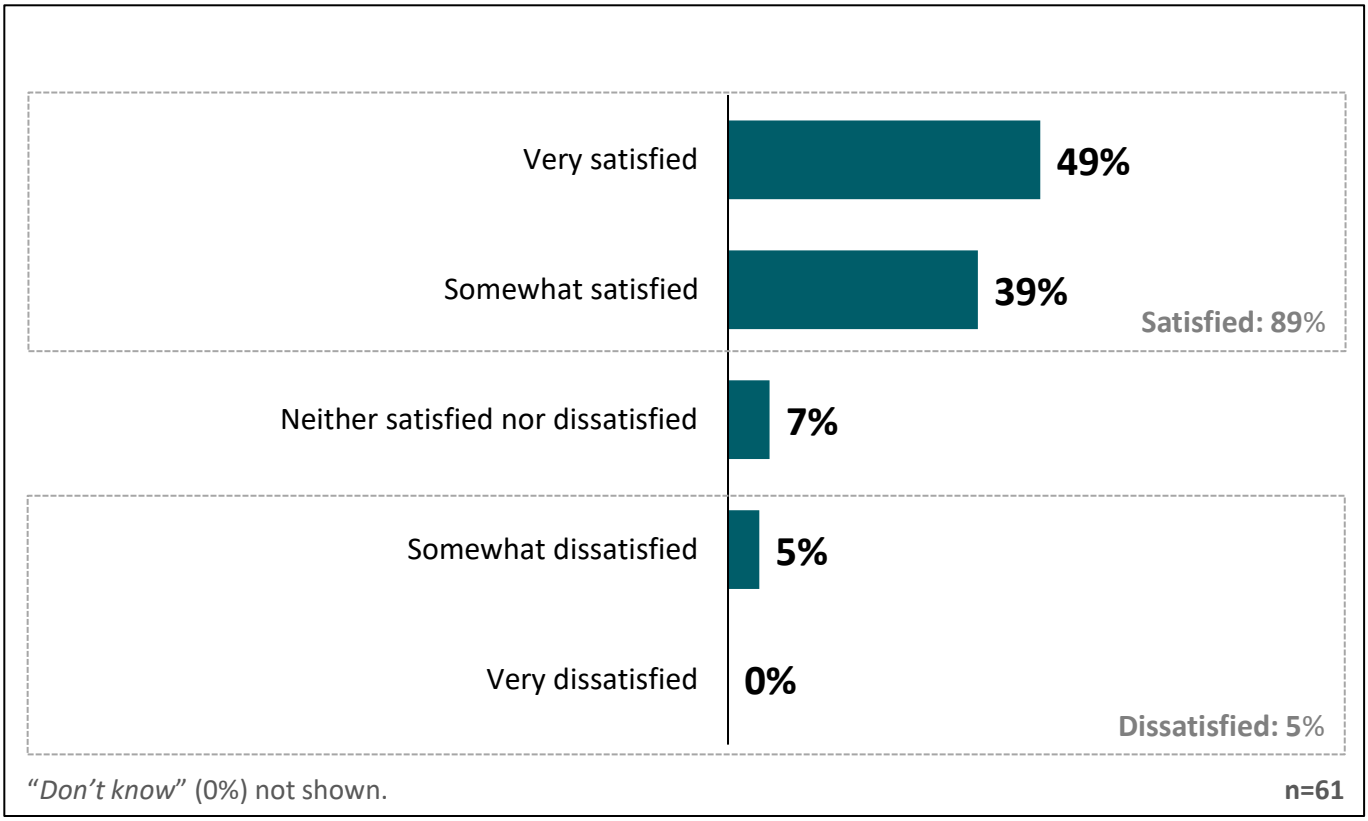
Hydro One's transmission system takes electricity from generation stations and transports it via high voltage transmission lines to local communities across the province.

In many communities, including your own, **Hydro One** is also responsible for the local distribution system, which takes electricity from transmission lines and brings it to your organization through a network of wires, poles and other equipment.

Hydro One does not generate electricity or set electricity prices.

Q Before this survey, how familiar were you with Hydro One's role in Ontario's electricity system?

INNOVATIVE RESEARCH GROUP



Familiarity & Experience

Overall Satisfaction with Hydro One

Large Distribution

Hydro One builds and maintains power lines, towers and poles, delivers electricity, reads meters, answers customer calls, responds during outages, and clears trees and brush from power lines.

Q Overall, how satisfied or dissatisfied are you with the service your organization receives from **Hydro One**?

"*Don't know*" (0%) not shown.

n=61

INNOVATIVE RESEARCH GROUP

Familiarity & Experience

How can Hydro One improve services?

Large Distribution

Q Is there anything in particular you would like **Hydro One** to do to improve its services to your organization?

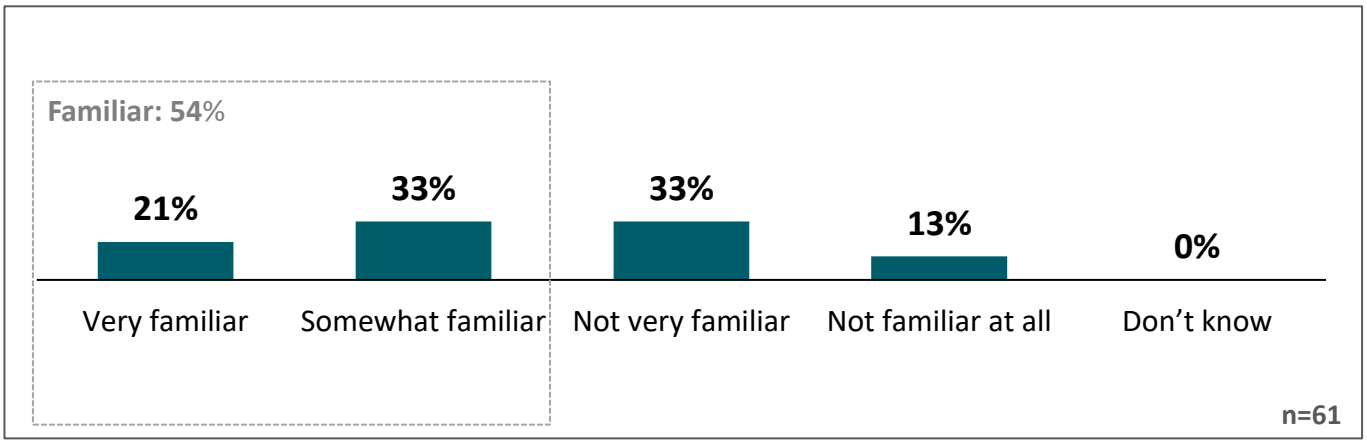
Response	%
Decrease outages/interruptions	14.8%
Improve communication during outages	9.8%
Satisfied with services/no issues	8.2%
Building capacity/addressing growth	6.6%
Improve customer service	3.3%
Upgrade/better maintain infrastructure	1.6%
Billing improvements - timing/payments/bill format	1.6%
Other	1.6%
None/Don't know	52.5%

Note: Only responses >0.1% shown

Familiarity & Experience

Bill Familiarity

Every item and charge on your bill is mandated by the provincial government or regulated by the Ontario Energy Board, the provincial energy regulator.



Although **Hydro One** is responsible for collecting payment from you for your entire electricity bill, only a portion goes to **Hydro One**. As of October 1st, 2024, for a typical large distribution customer, about **[bill percentage]** or **[bill amount]** goes to **Hydro One** per month. This amount is split into **[distribution amount]** for distribution and **[transmission amount]** for transmission.

The rest of your bill payment goes to power generation companies, taxes, and regulatory agencies.

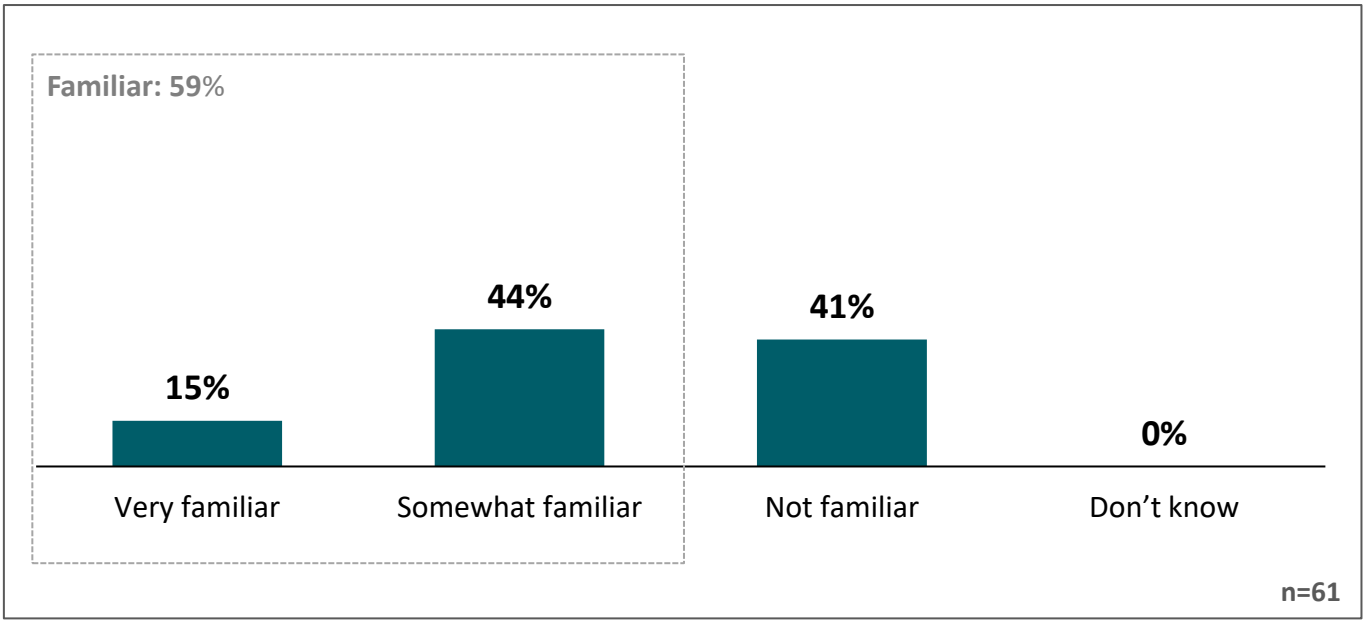
Bill Legend

Customer Group	[bill percentage]	[bill amount]	[distribution amount]	[transmission amount]
GSd	38%	$2,945	$2,355	$590
ST-Low	36%	$6,640	$2,055	$4,585
ST-Med	16%	$31,550	$5,800	$25,750
ST-High	30%	$149,425	$23,525	$125,900

Q Before this survey, how familiar were you with the amount of your organization's electricity bill that went to **Hydro One**?

Familiarity & Experience

Familiarity with Rate Applications



Hydro One is funded by the rates paid by its customers.

Roughly every five years, **Hydro One** is required to file an application with the Ontario Energy Board (OEB), the energy regulator in Ontario, to set rates. **Hydro One's** next rate application will cover the years 2028-2032.

In this process, **Hydro One's** rate application will be examined in detail and **Hydro One** must demonstrate that customer needs and priorities were factored into its investment planning process.

If approved by the OEB, the investments areas that are discussed throughout the remainder of this survey would be directly funded by customers.

Q Before this survey, were you aware that **Hydro One** must file a rate application with the OEB every 5 years?

INNOVATIVE RESEARCH GROUP

Reliability Experience
Planned Power Outages

Large Distribution

Q In the past year, has your organization experienced any **planned power outages** (or loss of supply) with **Hydro One**?

Q Generally, how satisfied or dissatisfied were you with the way your organization's **planned power outages** were managed by **Hydro One**? *[Asked of those who have experienced a planned outage in the past year]*

INNOVATIVE RESEARCH GROUP

INNOVATIVE RESEARCH GROUP

Large Distribution Account Customers

Investment Priorities

Investment Priorities

High-Level Reliability

Now let's turn to next topic – investment trade-offs. There are **6** investment areas that **Hydro One** would like your input on.

You do not need to be a system planner or engineer to answer these questions. The trade-offs will focus on what outcomes matter most to you as a customer – balancing investment outcomes and cost to you.

First, we would like to talk about the local distribution system, which takes electricity from transmission lines and brings it to your organization through a network of wires, poles and other equipment.

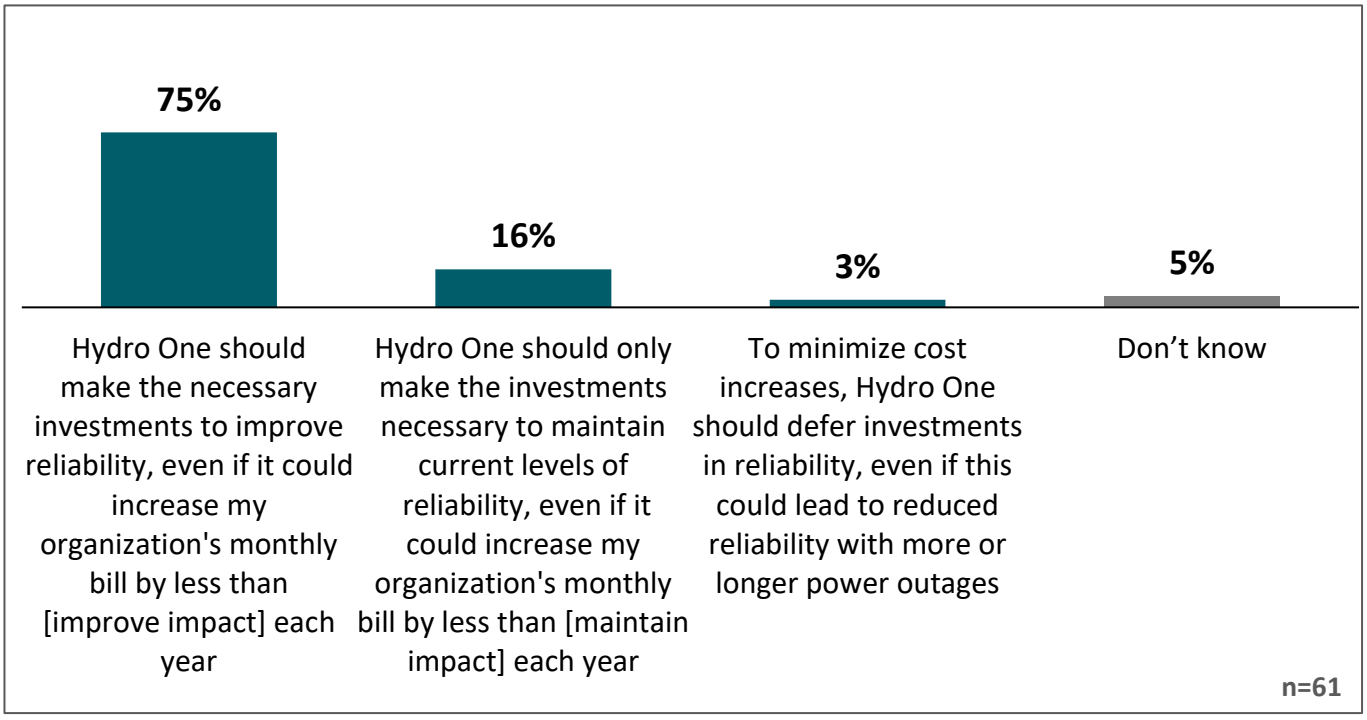
The first category is related to the reliability you experience.

On average, between 2019 and 2023, the typical **Hydro One** customer has experienced about 3.8 outages per year, resulting in a total of 16.6 hours without power.

It's important to keep in mind that these are system averages, and that your actual experience may be different.

Hydro One has historically identified investments in maintaining or improving reliability by taking into consideration the overall age, health, and likelihood of failure of equipment.

Investment Priorities



High-Level Reliability

Large Distribution

Q Based on your own reliability experience, which of the following is closest to your point of view?

High-Level Reliability Legend

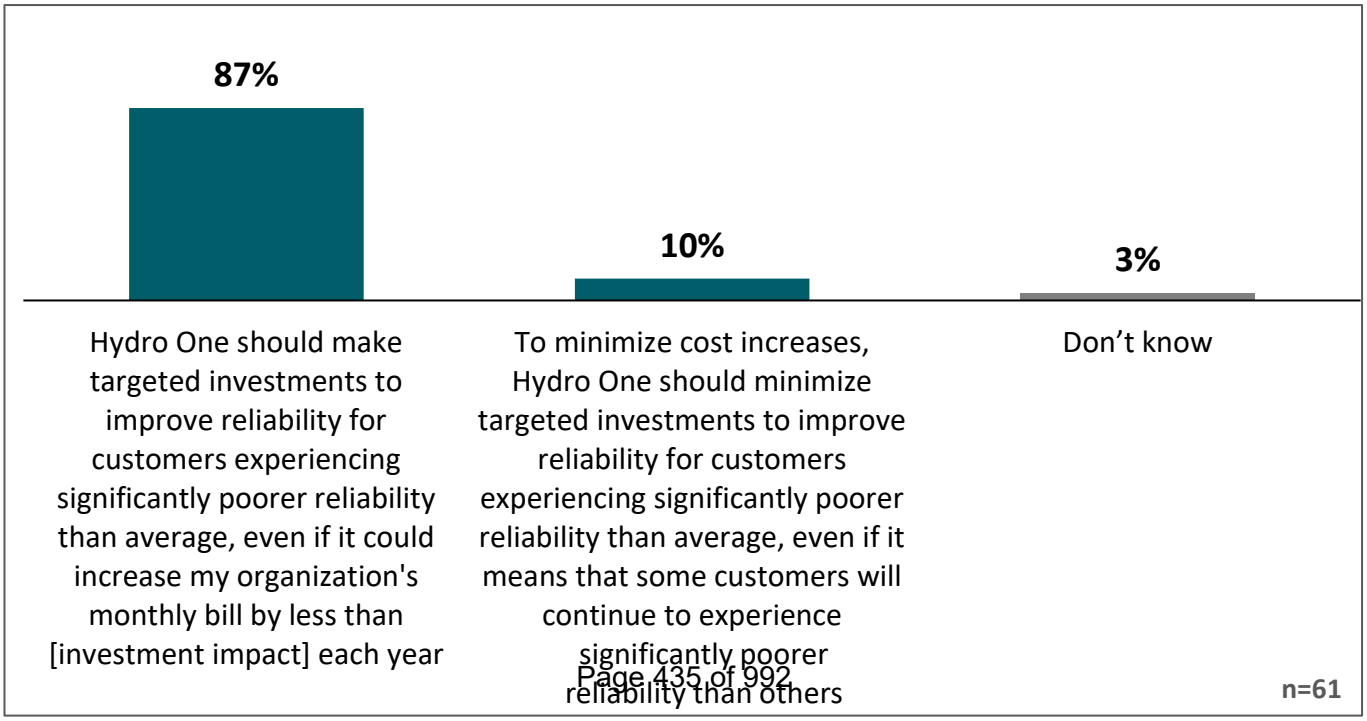
Customer Group	[improve impact]	[maintain impact]
GSd	$75	$40
ST-Low	$35	$20
ST-Med	$185	$105
ST-High	$920	$520

INNOVATIVE RESEARCH GROUP

Investment Priorities

Targeted Reliability

The second category is related to more targeted improvements to reliability.



Hydro One customers experience different levels of reliability, depending on where they live, the design of the system and the condition of the equipment supplying them.

While some **Hydro One** customers didn't experience any outages in 2022 or 2023, others were without power more than 10 times per year. Similarly, the total length of time that customers were without power ranges from less than one hour to more than 50 hours per year.

Q When it comes to more targeted investments to improve reliability for those customers that experience significantly poorer reliability than average, which of the following is closest to your point of view?

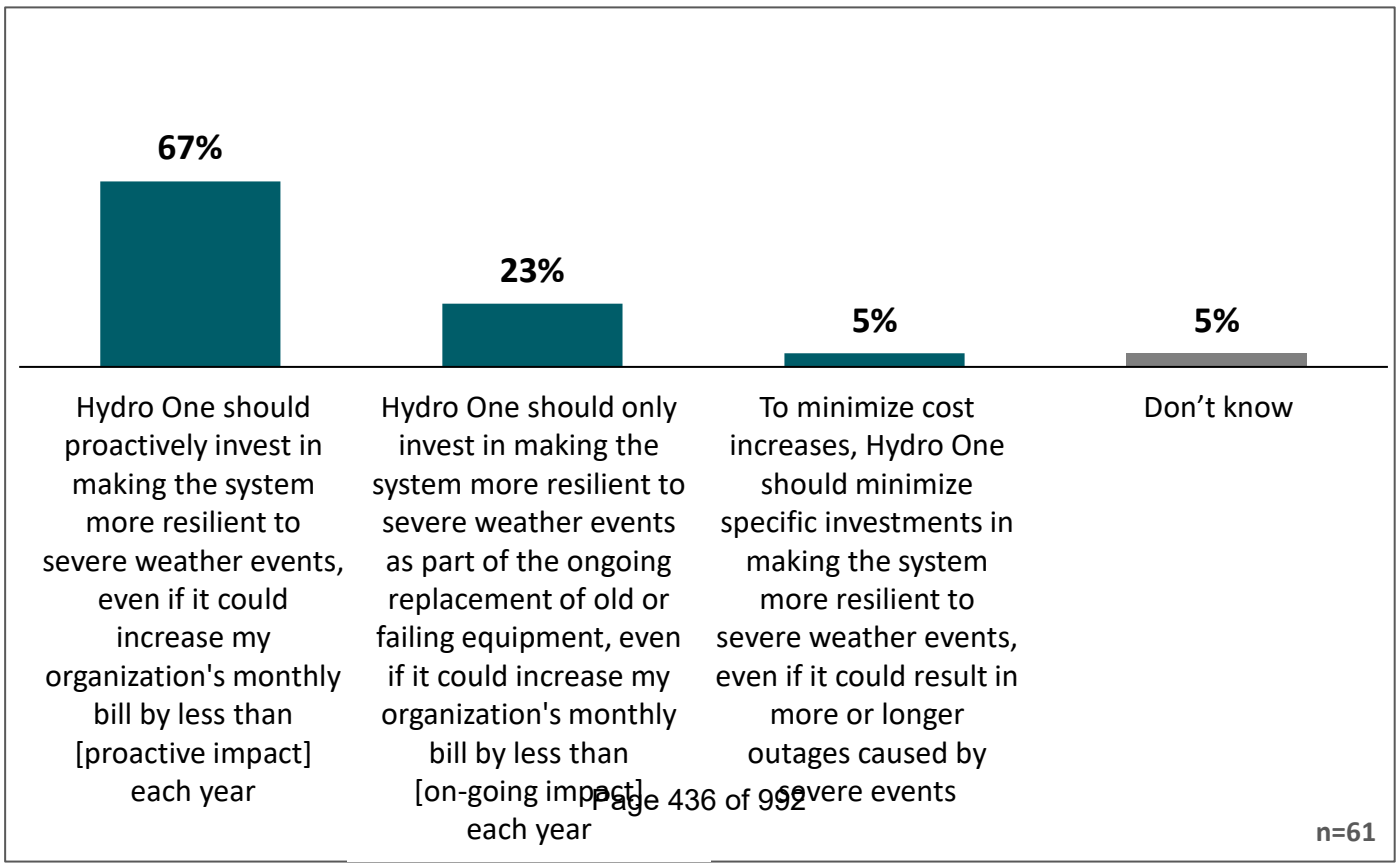
Targeted Reliability Legend

Customer Group	[investment impact]
GSd	$20
ST-Low	$10
ST-Med	$55
ST-High	$260

Investment Priorities

Responding to Severe Weather

Large Distribution



On average, between 2019 and 2023, **severe weather events**, such as ice storms, windstorms or thunderstorms, have contributed to 51% of all hours that the typical customer has been without power per year.

While some of these outages may be inevitable, **Hydro One** could make additional investments to make the system more resilient to these types of events. These investments could help either reduce the number of outages caused by severe weather events or improve restoration times when these outages do occur.

Q Based on this, which of the following is closest to your point of view?

Responding to Severe Weather Legend

Customer Group	[proactive impact]	[on-going impact]
GSd	$13	$10
ST-Low	$6	$5
ST-Med	$30	$25
ST-High	$155	$130

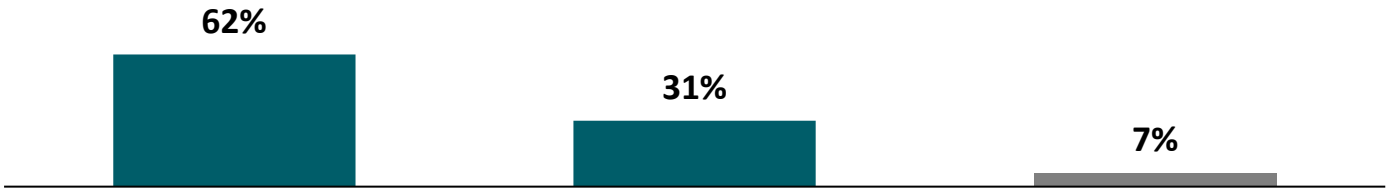
Investment Priorities

Growth

Large Distribution

Electricity demand is on the rise across Ontario. This increasing demand, resulting from industrial and residential growth, as well as the changing ways we use electricity, will require electricity companies like **Hydro One** to make significant investments in the grid.

Increased growth can result in longer wait times to connect new homes or businesses to the system or facilitate upgrades for existing customers if insufficient capacity is available.



For instance, as increasing growth occurs, some new businesses may be asked to wait up to 2 years or longer for their facility to be connected to the **Hydro One** grid.

However, **Hydro One** could make proactive investments to enable anticipated growth and allow new homes or businesses to connect to the system in a timely manner, and to not delay service upgrades for existing customers.

Q Based on this, which is closest to your point of view?

Growth Legend

Customer Group	[proactive impact]	[reactive impact]
GSd	$50	$30
ST-Low	$25	$15
ST-Med	$135	$80
ST-High	$650	$390

Hydro One should make proactive investments to enable anticipated growth and accommodate new connections and service upgrades while avoiding extended wait times, even if it could increase my organization's monthly bill by less than [proactive impact] each year

To minimize cost increases, Hydro One should only make investments when the growth is materializing, even if that could increase my organization's monthly bill by less than [reactive impact] each year and result in longer wait times and less community growth

Don't know

n=61

Investment Priorities

Evolving Customer Requests & System Visibility

Beyond residential and industrial growth, customers are increasingly requesting information and upgrades related to new technologies like rooftop solar panels, heat pumps, and electric vehicle chargers.

Whether or not you are actively considering these types of technologies for yourself, **Hydro One** needs to be prepared to accommodate these types of customer requests, not just today, but over the next 5 to 10 years.

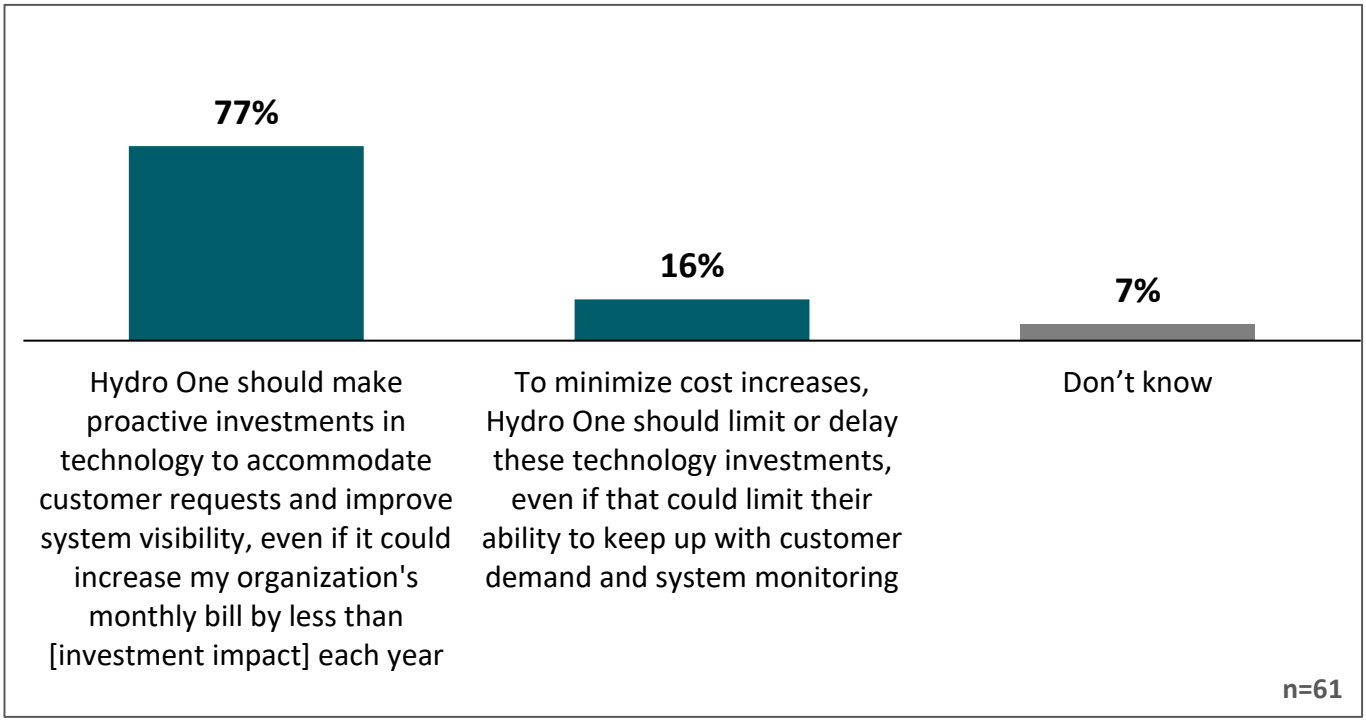
While **Hydro One** has an obligation to make certain investments to accommodate customer requests, planners have identified incremental investments that can help:

- Ensure that **Hydro One's** grid is ready to accommodate if and when customers request to connect new technologies.

- Give the **Hydro One** control room more "visibility" into exactly where and how much electricity is being used in real-time, helping make more informed decisions on managing electricity demand and equipment maintenance or upgrades.

As the pace of change and customer needs are rapidly evolving, delaying or limiting these investments means that **Hydro One** could struggle to keep up with customer demand for connecting new technology and lack the precision to monitor the grid as new technology adoption increases.

Investment Priorities



Evolving Customer Requests & System Visibility

Large Distribution

Q With regards to these investments, which of the following is closest to your point of view?

Evolving Customer Requests & System Visibility Legend

Customer Group	[investment impact]
GSd	$20
ST-Low	$10
ST-Med	$55
ST-High	$260

INNOVATIVE RESEARCH GROUP

Investment Priorities

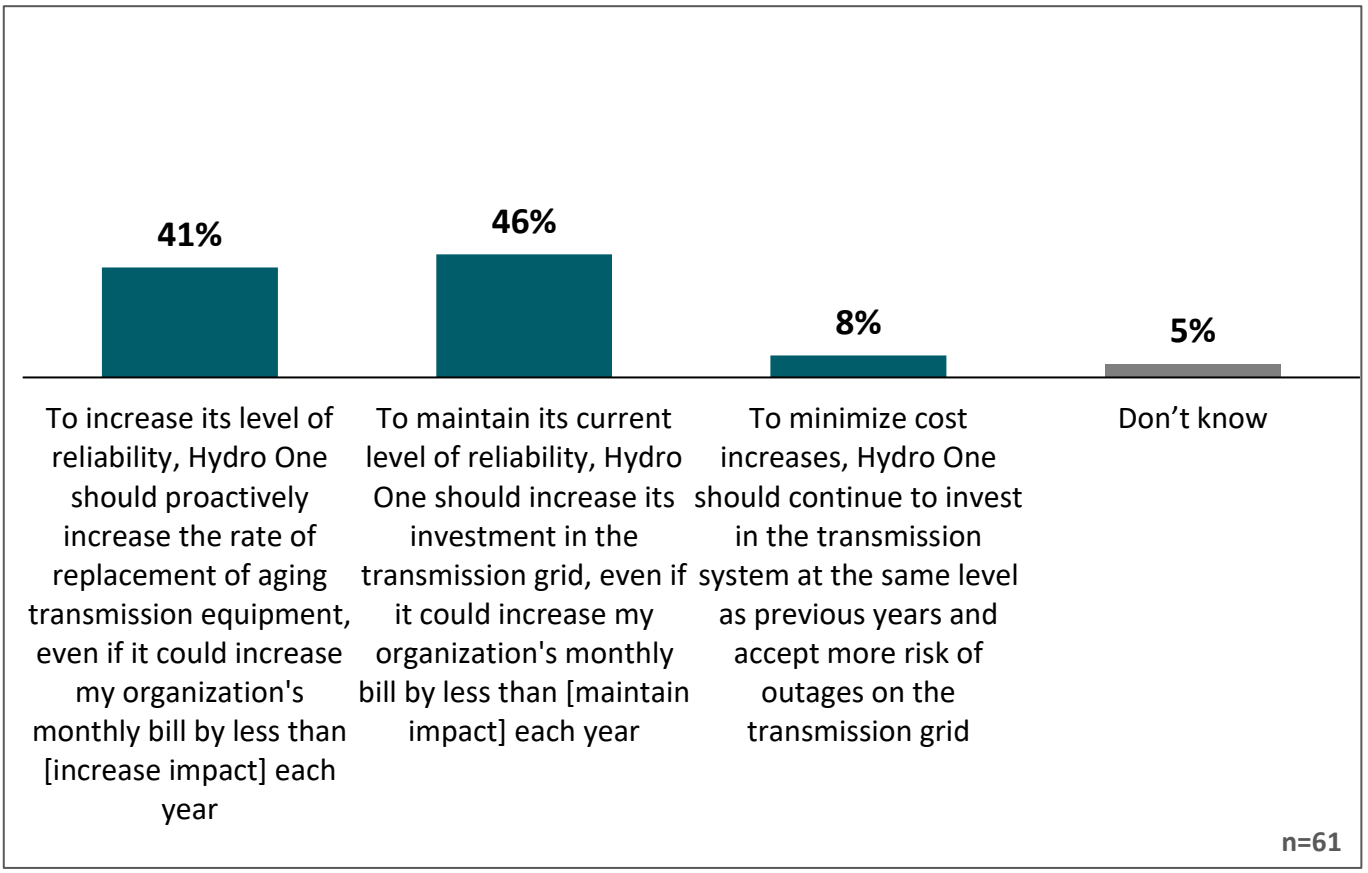
Transmission Renewal

Now, we would like to talk about the provincial transmission system. That is the part of the system that uses high voltage transmission lines that serve as highways for electricity, bringing power from generation stations to your community.

Hydro One's transmission system serves most electricity customers in Ontario, including local distribution companies across the province. In fact, many large industrial customers like mines and auto manufacturers, as well as electricity generators like nuclear plants and hydro dams are directly connected to the transmission grid.

When an outage occurs on **Hydro One's** transmission system, the impacts are significant, both to communities and Ontario's economy. As such, the transmission system is designed to minimize both the frequency and duration of outages. For example, most of Ontario's population centres are served by multiple transmission lines, so that if one fails, there is always a backup to keep power flowing.

Portions of **Hydro One's** transmission system were built in the 1930s, 40s, and 50s. Even at historical levels of investment, portions of the transmission system continue to age and degrade, increasing the risk of failure. To minimize the risk of potential outages and support the growing electricity demands of communities, industries, and businesses across the province, **Hydro One** will need to continue to make significant investments to renew and upgrade older and degrading equipment.



Investment Priorities

Transmission Renewal

Q With this in mind, what is closest to your point of view?

Transmission Renewal Legend

Customer Group	[increase impact]	[maintain impact]
GSd	$40	$15
ST-Low	$300	$105
ST-Med	$1,670	$590
ST-High	$8,180	$2,890

Online Survey Results

Section 7

Online Survey
Survey Design & Methodology

Field Dates

To obtain feedback from **Other LDC Residential customers**, a random sample of online panelists were invited to complete the survey from a set of partner panels based on the Lucid exchange platform.

In order to qualify to complete the survey, respondents must be Ontarians 18+ who at least share responsibility for paying the electricity bill in their household, excluding Hydro One distribution customers.

Survey responses were collected between **December 2nd and December 4th, 2024**.

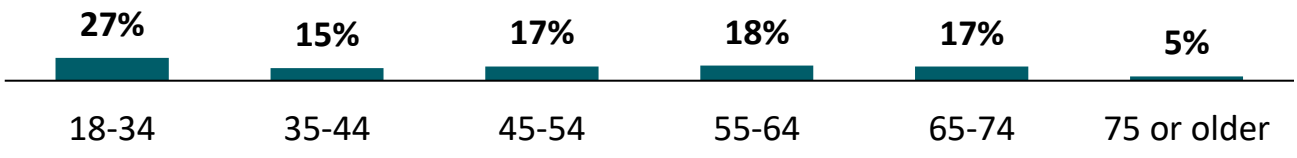
Other LDC Residential Online Survey Completes

A total of **1,019** (unweighted) Ontarians completed the online survey.

Sample Weighting

The Other LDC Residential online survey sample was weighted down to n=1,000 proportionately by age, gender, region and education in order to be representative of the broader Ontario population based on Census data.

The table below summarizes the unweighted and weighted (in brackets) sample breakdown by consumption quartile and region.



The table below summarizes the unweighted and weighted (in brackets) sample breakdown by age, gender, and region. Totals may not correspond with cell values as some respondents prefer to self-describe their gender. Weights are calculated based off of all available information for a given respondent.

Region	Age-Gender						Total
	Men 18-34	Men 35-54	Men 55+	Women 18-34	Women 35-54	Women 55+	
Toronto	32 (33)	40 (31)	34 (33)	34 (33)	42 (35)	46 (40)	229 (205)

Familiarity & Experience

Preamble:

This survey is part of **Hydro One's** on-going customer engagement.

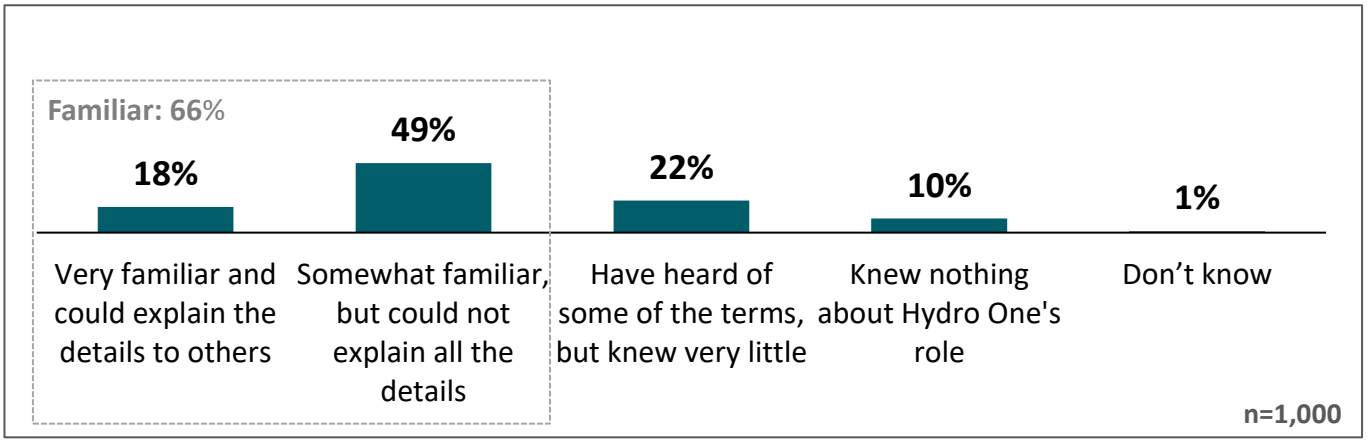
Hydro One, Ontario's largest electricity transmission and distribution service provider, is looking for input into choices that will affect the rates Ontarians pay for electricity.

This engagement is about the choices **Hydro One** can make for its transmission system, which serves most electricity customers in Ontario.

The goal is to understand your point of view as a residential ratepayer.

Familiarity & Experience

Familiarity with Hydro One's Role in the System



Ontario's electricity system has three key components: **generation**, **transmission** and **distribution**.

Hydro One's transmission system takes electricity from generation stations and transports it via high voltage transmission lines to local communities across the province.

In many communities, your local distribution company is responsible for the local distribution system, which takes electricity from transmission lines and brings it to your home through a network of wires, poles and other equipment.

Hydro One does not generate electricity or set electricity prices.

Q Before this survey, how familiar were you with Hydro One's role in Ontario's electricity system?

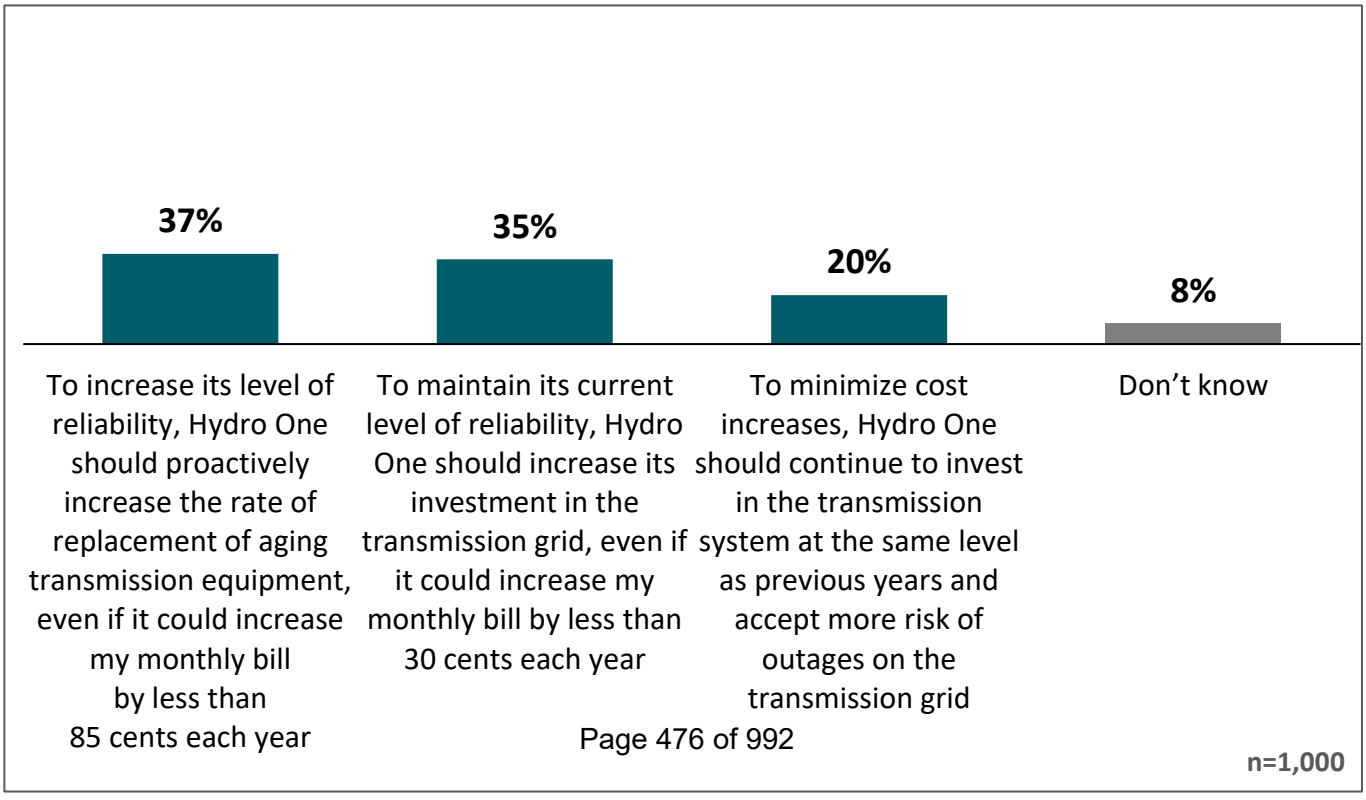
Investment Priorities

Transmission Renewal

Other LDC Residential



Now, we would like to talk about the provincial transmission system. That is the part of the system that uses high voltage transmission lines that serve as highways for electricity, bringing power from generation stations to your community.

Hydro One's transmission system serves most electricity customers in Ontario, including local distribution companies across the province. In fact, many large industrial customers like mines and auto manufacturers, as well as electricity generators like nuclear plants and hydro dams are directly connected to the transmission grid.

When an outage occurs on **Hydro One's** transmission system, the impacts are significant, both to communities and Ontario's economy. As such, the transmission system is designed to minimize both the frequency and duration of outages. For example, most of Ontario's population centres are served by multiple transmission lines, so that if one fails, there is always a backup to keep power flowing.

Portions of **Hydro One's** transmission system were built in the 1930s, 40s, and 50s. Even at historical levels of investment, portions of the transmission system continue to age and degrade, increasing the risk of failure. To minimize the risk of potential outages and support the growing electricity demands of communities, industries, and businesses across the province, **Hydro One** will need to continue to make significant investments to renew and upgrade older and degrading equipment.

Q With this in mind, what is closest to your point of view?

Large Transmission Account Customers

Online Survey Results

Section 8

Field Dates

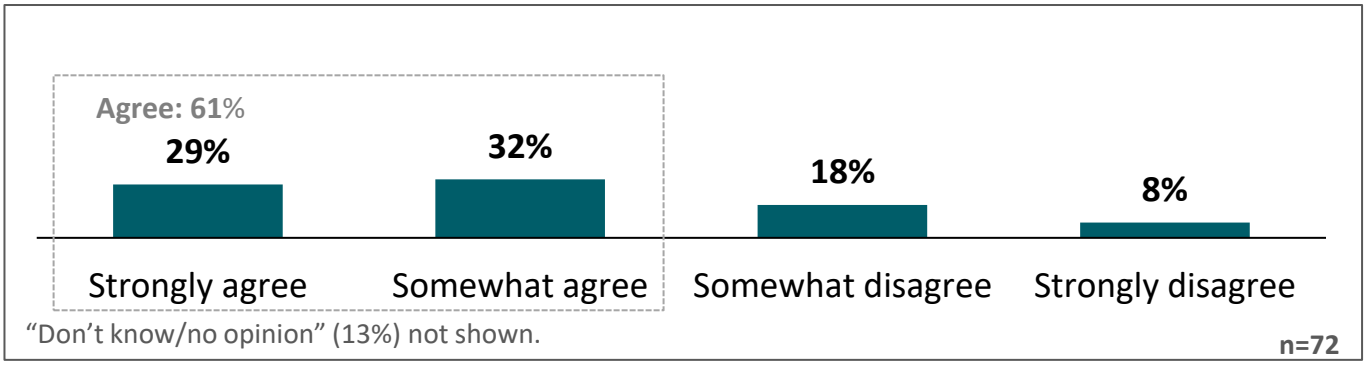
The **Large Transmission Customers Online Survey** was sent to all Hydro One large transmission account customers who provided the utility with an email address. Customers had an opportunity to complete the survey between **November 13th and December 12th, 2024**.

Each customer received a unique URL that could be linked back to their region and customer type (End-User, Generator, or LDC).

In total, the large transmission customers survey was sent to **195** customers from *customerexperience@hydroone.com*. Reminder emails were sent on November 20th, November 27th, December 4th, and December 10th, 2024, to those who had not yet completed the survey.

Large Transmission Accounts Online Survey Completes

A total of **72** (unweighted) Hydro One large transmission account customers completed the online survey.

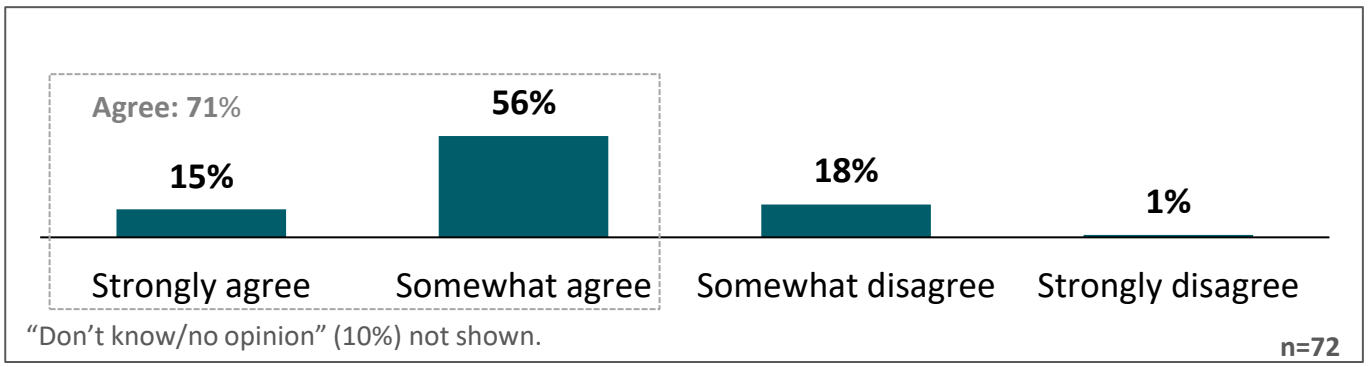


Sample Weighting

The large transmission account online survey sample was not weighted due to the small number of completes.

Environmental Controls

To what extent do you agree or disagree with the following statements?



Q The cost of my organization's electricity bill has a major impact on the bottom line of my organization and results in some important spending priorities and investments being put off.

"Don't know/no opinion" (13%) not shown.

n=72

Q Consumers are well-protected with respect to prices and the reliability and quality of electricity service in Ontario.

"Don't know/no opinion" (10%) not shown.

n=72

Large Transmission Account Customers

Familiarity & Experience

Preamble:

Before we begin, this survey has **two key objectives**.

First, **Hydro One** wants to better understand your experiences as a customer.

Second, **Hydro One** wants your input on some of the investment areas they could focus on in the future.

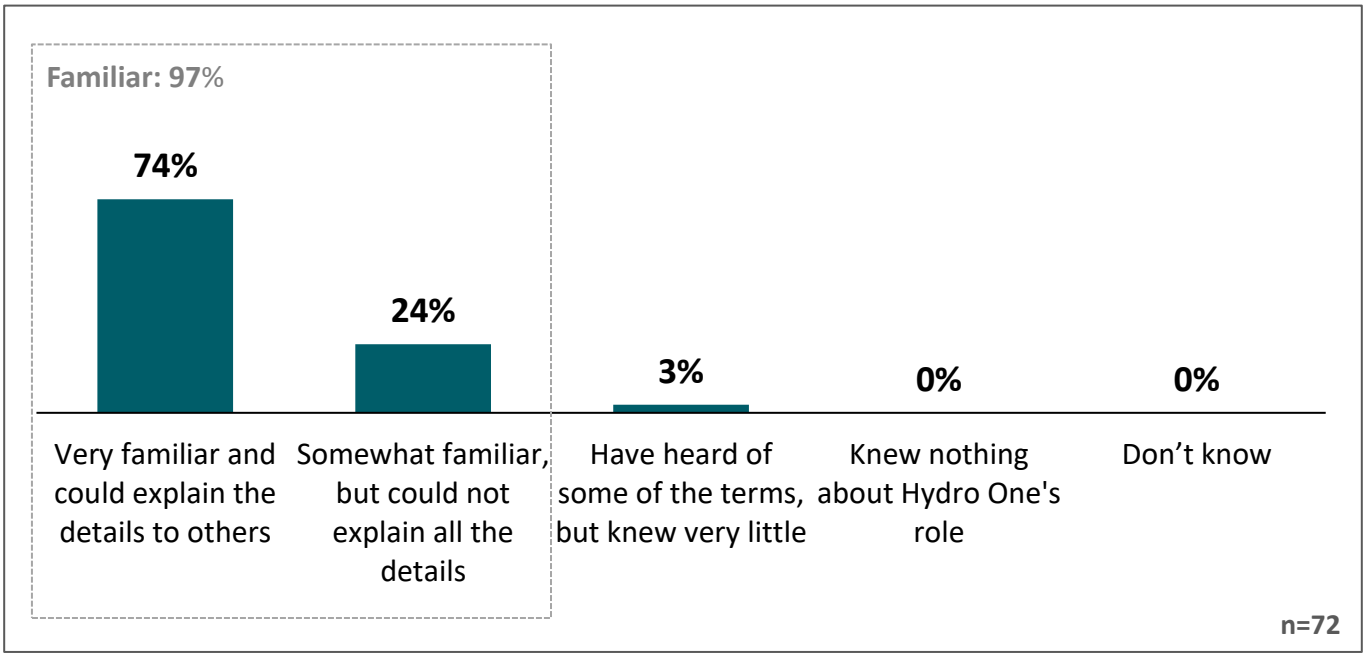
First, let's talk about your experience.

While you might have multiple accounts with **Hydro One**, for this survey, we want you to think about your overall experience as a transmission-connected customer.

***Note**: The estimates throughout this survey are for illustrative purposes only and may not reflect the actual size of your organization's monthly electricity bill.*

Familiarity & Experience

Familiarity with Hydro One's Role in the System



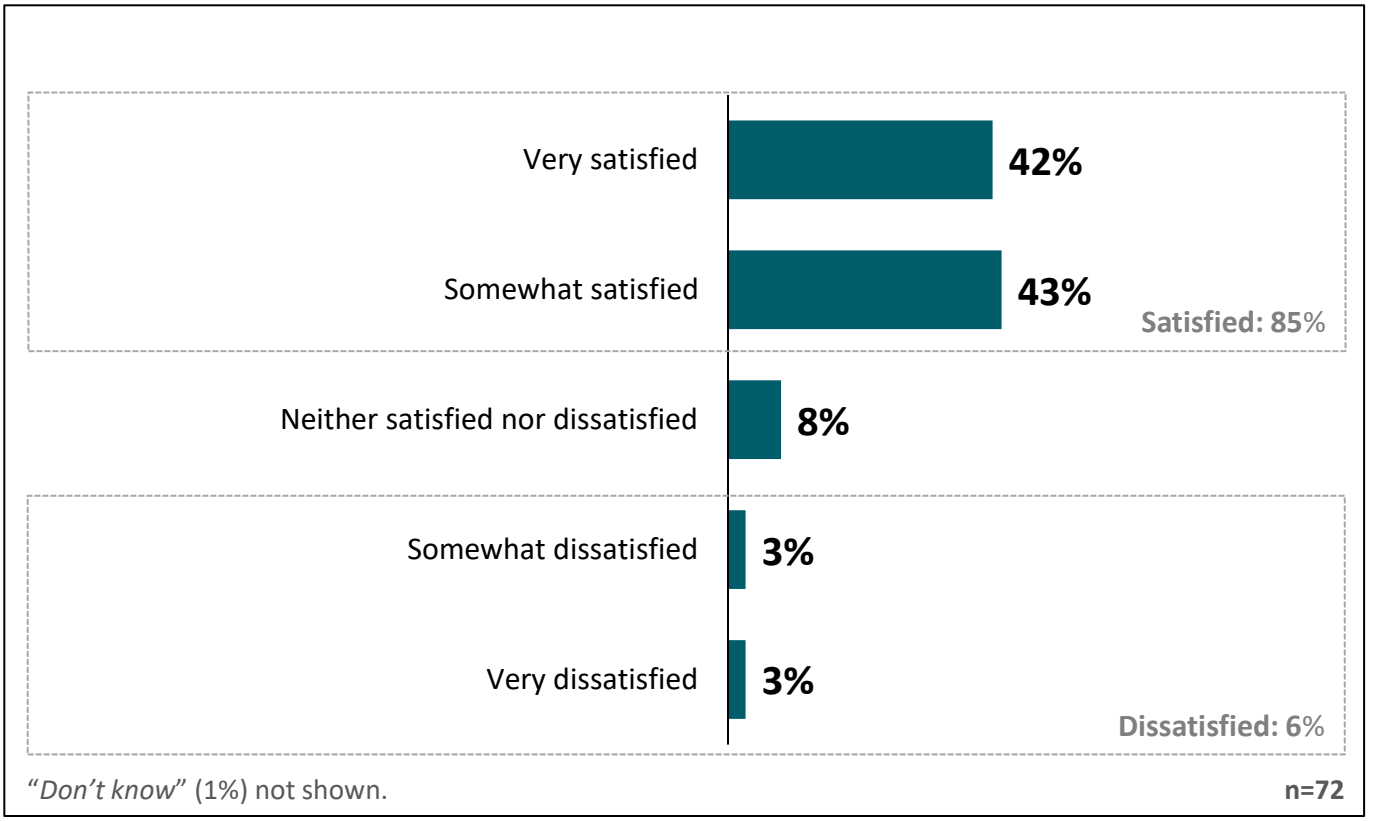
Ontario's electricity system has three key components: **generation**, **transmission** and **distribution**.

Hydro One's transmission system takes electricity from generation stations and transports it via high voltage transmission lines to local communities across the province.

In many communities, including your own, **Hydro One** is also responsible for the local distribution system, which takes electricity from transmission lines and brings it to your organization through a network of wires, poles and other equipment.

Hydro One does not generate electricity or set electricity prices.

Q Before this survey, how familiar were you with Hydro One's role in Ontario's electricity system?



Familiarity & Experience

Overall Satisfaction with Hydro One

Hydro One builds and maintains power lines, towers and poles, delivers electricity, reads meters, answers customer calls, responds during outages, and clears trees and brush from power lines.

Q Overall, how satisfied or dissatisfied are you with the service your organization receives from **Hydro One**?

"*Don't know*" (1%) not shown.

n=72

Familiarity & Experience

How can Hydro One improve services?

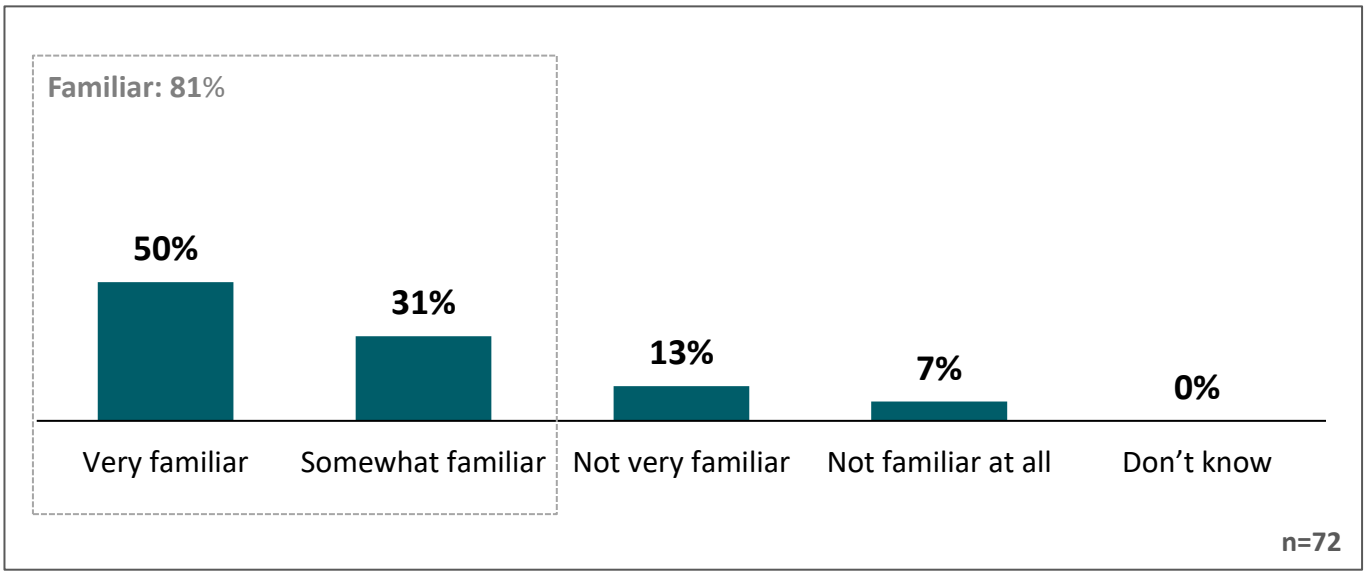
Large Transmission

Q Is there anything in particular you would like **Hydro One** to do to improve its services to your organization?

Response	%
Improve customer service	19.4%
Decrease outages/interruptions	12.5%
Improve information sharing	6.9%
Improve communication during outages	5.6%
Building capacity/addressing growth	5.6%
Lower rates/decrease bills	2.8%
Upgrade/better maintain infrastructure	2.8%
Satisfied with services/no issues	2.8%
Improve response time for outages	1.4%
Other	5.6%
None/Don't know	34.7%

Note: Only responses >0.1% shown

Familiarity & Experience



Bill Familiarity

Every item and charge on your bill is mandated by the provincial government or regulated by the Ontario Energy Board, the provincial energy regulator.

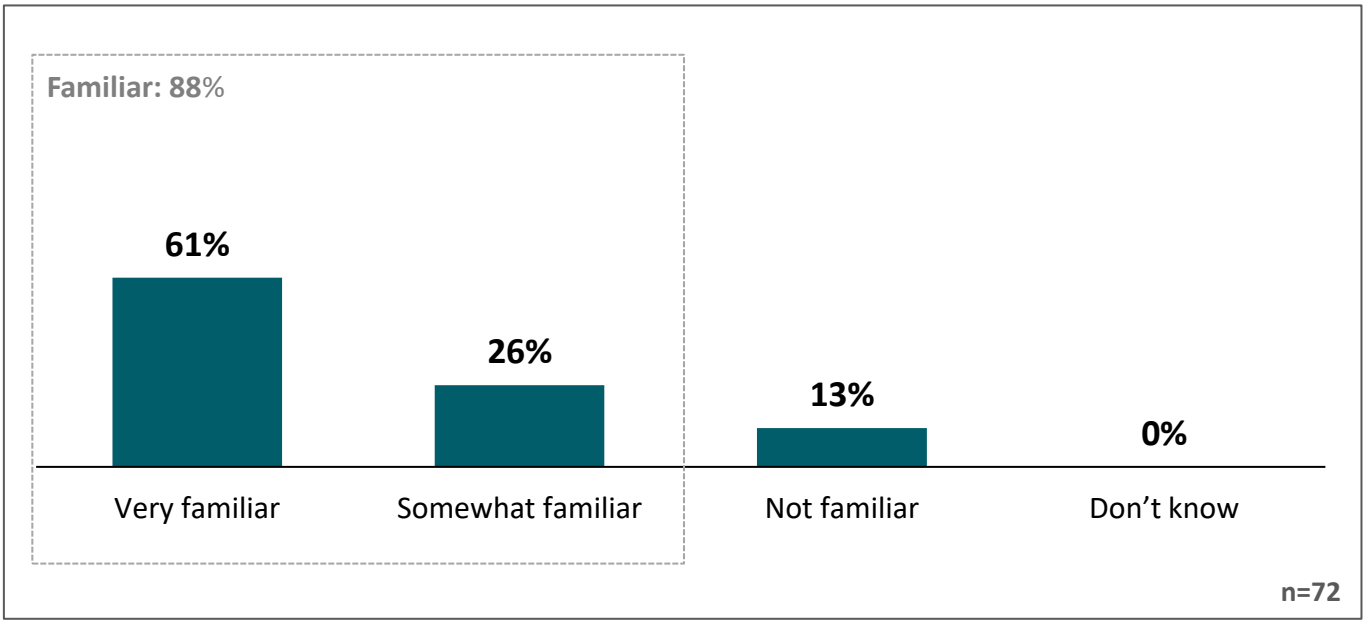
Hydro One is responsible for most of the transmission charges on your organization's monthly bill. For the average transmission-connected customer, transmission charges represent about 12% of the total bill. This share may vary for your organization, depending on your organization's load profile.

The rest of your bill payment goes to power generation companies, taxes, and regulatory agencies.

Q Before this survey, how familiar were you with the amount of your organization's electricity bill that went to **Hydro One**?

Familiarity & Experience

Familiarity with Rate Applications



Hydro One is funded by the rates paid by its customers.

Roughly every five years, **Hydro One** is required to file an application with the Ontario Energy Board (OEB), the energy regulator in Ontario, to set rates. **Hydro One's** next rate application will cover the years 2028-2032.

In this process, **Hydro One's** rate application will be examined in detail and **Hydro One** must demonstrate that customer needs and priorities were factored into its investment planning process.

If approved by the OEB, the investments areas that are discussed throughout the remainder of this survey would be directly funded by customers.

Q Before this survey, were you aware that **Hydro One** must file a rate application with the OEB every 5 years?

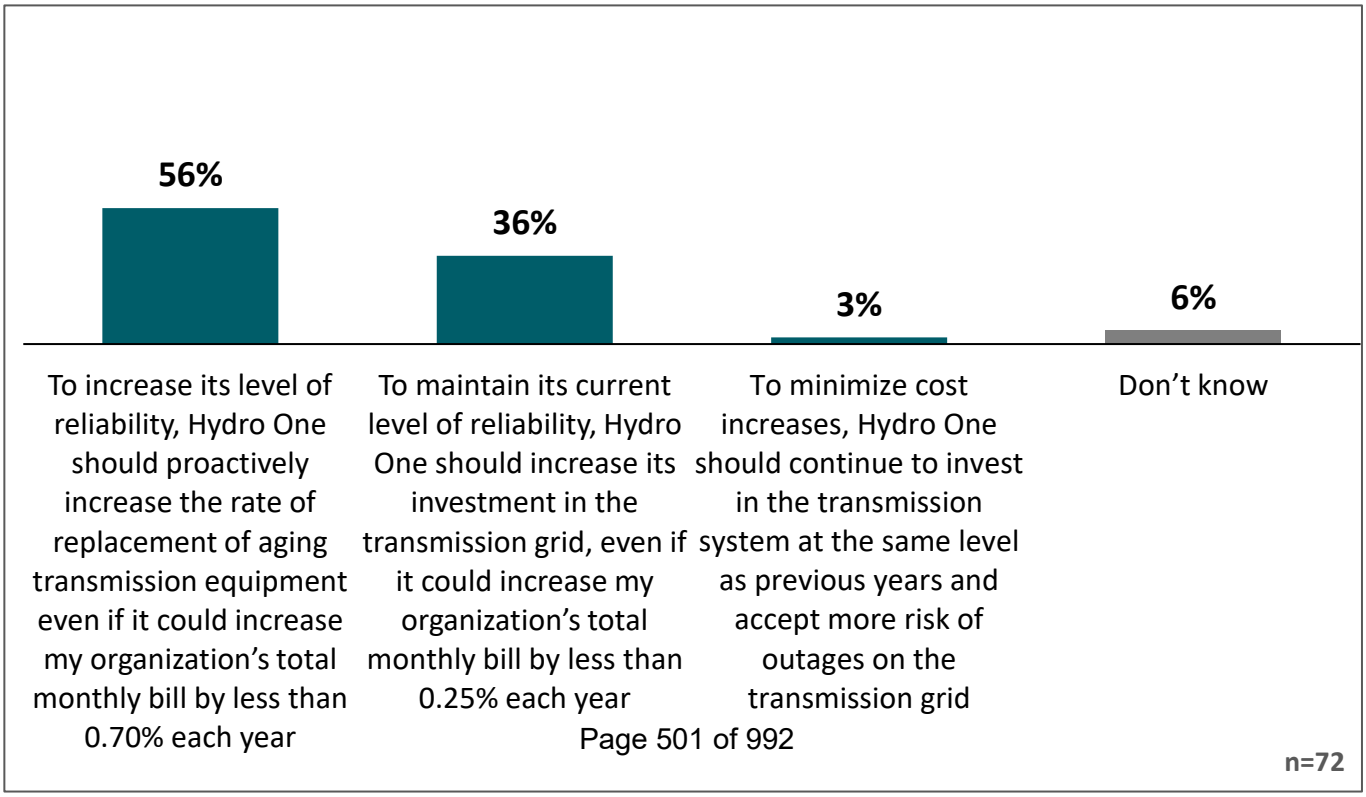
Transmission Renewal

Large Transmission



Now, we would like to talk about the provincial transmission system. That is the part of the system that uses high voltage transmission lines that serve as highways for electricity, bringing power from generation stations to your community.

Hydro One's transmission system serves most electricity customers in Ontario, including local distribution companies across the province. In fact, many large industrial customers like mines and auto manufacturers, as well as electricity generators like nuclear plants and hydro dams are directly connected to the transmission grid.

When an outage occurs on **Hydro One's** transmission system, the impacts are significant, both to communities and Ontario's economy. As such, the transmission system is designed to minimize both the frequency and duration of outages. For example, most of Ontario's population centres are served by multiple transmission lines, so that if one fails, there is always a backup to keep power flowing.

Portions of **Hydro One's** transmission system were built in the 1930s, 40s, and 50s. Even at historical levels of investment, portions of the transmission system continue to age and degrade, increasing the risk of failure. To minimize the risk of potential outages and support the growing electricity demands of communities, industries, and businesses across the province, **Hydro One** will need to continue to make significant investments to renew and upgrade older and degrading equipment.

Q With this in mind, what is closest to your point of view?

Building Understanding.

2028-2032 Joint Rate Application
Phase II: Planning Placemat

hydro one

Hydro One Phase II Customer Engagement Planning Placemat

Between November and December 2025, INNOVATIVE engaged with over 100,000 customers to gather feedback on Hydro One's draft 2028-2032 investment plans, including key investment decisions. These investment choices covered both the distribution and transmission systems, as well as shared services. This placemat summarizes feedback collected through a series of online surveys. The online survey was customized for different customer types and rate classes with estimated bill impacts provided.

Customer Type Unweighted n (weighted in brackets)	Hydro One Distribution & Transmission Customers					Hydro One Transmission-Only Customers		
	Residential n=94,611 (90,000)	First Nations On-Reserve Residential n=793 (775)	Small Business n=2,791 (2,790)	Commercial & Industrial n=368 (350)	Large Dx Accounts n=53	Other LDC* Residential n=2,071 (2,000)	Other LDC* Small Business n=305 (300)	Large Tx Accounts n=73
Distribution Investment Trade-Offs

Survey Methodology

Residential, First Nations On-Reserve Residential, Small Business, and Commercial & Industrial results are weighted by Hydro One region and consumption or demand quartile to ensure the results are representative of Hydro One's broader customer base. Other LDC Residential results are weighted by age, gender, region, and education to ensure that the overall sample's composition reflects that of the actual population according to Census data. Other LDC Small Business results are weighted by region, employee count, and sector, again, according to Census data. Large Dx Accounts and Large Tx Account results are not weighted due to sample size.

Hydro One 2028-2032 Joint Rate Application Customer Engagement (Phase 2)

Innovative Research Group Inc. (INNOVATIVE) was engaged by Torys LLP on behalf of its client, Hydro One Networks Inc. (Hydro One), to assist in meeting its customer engagement commitments under the Renewed Regulatory Framework for Electricity Distributors and Chapter 5 Filing Requirements. The information contained within this report is the result of a series of online surveys conducted as part of Phase 2 of this customer engagement for the 2028-2032 joint rate application.

Both distribution and transmission connected customers were invited to participate. Hydro One distribution customers – those who receive an electricity bill from Hydro One – had the opportunity to comment on both distribution and transmission related questions. Those who do not receive an electricity bill from Hydro One were only presented with transmission related questions.

Report Overview

Between November and December 2025, INNOVATIVE engaged with over 100,000 customers to gather feedback on Hydro One's draft 2028-2032 investment plans, including key investment decisions. These investment choices covered both the distribution and transmission systems, as well as shared services.

The online workbook was customized for different customer types, and this report contains separate sections for each: **Residential & Seasonal**, **First Nations On-Reserve Residential**, **Small Business (GS<50)**, **Commercial & Industrial**, **Large Distribution Accounts**, **Large Transmission Accounts**, **Other LDC Residential,** and **Other LDC Small Business**.

Ways Distribution and Transmission-Only Customers Could Participate

Hydro One Distribution Customers

All Hydro One distribution customers with an available email address on file were invited to participate in the customer engagement via direct email outreach.

For those without an email address on file, an open-access survey link was made available. Customers who accessed the survey through the open link could verify themselves as customers by entering their account number and the first three characters of a postal code associated with one of their accounts. Verified customers were routed into the "representative" stream, where their account information such as customer type, consumption level, and region were appended to their survey results for segmentation and weighting purposes.

Customers who chose not to verify their account information or were unable to do so could still participate by self-selecting the appropriate survey version (residential including seasonal, First Nations On-Reserve residential, or small business) and were included in the "voluntary", unverified stream. Feedback provided through the voluntary stream is shown separately in this report.

Transmission-Only Customers

Transmission-only representative results were collected through a separate sampling approach. A representative sample of residential and small business customers from other local distribution companies (LDCs) were recruited through online research panels.

Other-LDC customers could also participate through the open-access survey link. Those entering through this route self-selected the residential or small business survey version and were included in the voluntary stream rather than the representative sample. Feedback provided through the voluntary stream is shown separately in this report.

Promotion of the Open-Access Survey

The open-access survey was promoted by Hydro One through multiple communication channels, including social media, bill inserts, and the Hydro One website in an effort to encourage participation across both representative and voluntary streams.

Introduction
Segmenting Customers

Customer Segmentation

In addition to segmenting customers based on where they reside or operate in Hydro One's service territory, it is important to be able to identify factors that may influence customer preferences and distinguish between what is within, and what is outside of Hydro One's influence or control.

Segmentation, where possible, is used throughout this report to look beyond the topline numbers and to analyze the results for key segments:

1. **Region:** Using customer data provided by Hydro One, we split customers into regions for analysis based on Hydro One's service zones.

2. **Consumption Quartiles**: For residential, First Nations On-Reserve, small business (GS<50), and commercial & industrial customers, results are also shown by consumption quartiles. For low-volume customers, this is based on how much electricity the customer consumes in an average month (in kWh). For commercial & industrial customers, this is based on customer demand in an average month (in kW). This is used to ensure that no one customer consumption/demand profile is over or underrepresented in the survey results.

3. **Bill Impact on Finances**: Segmentation that INNOVATIVE refers to as "Bill Impact on Finances" is provided. This segment is determined based on the extent to which customers agree with the following statement(s):

    a) Residential/First Nations On-Reserve: *The cost of my electricity bill has a major impact on my finances and requires I do without some other important priorities.*

    b) Small Business/Commercial & Industrial*: The cost of my organization's electricity bill has a major impact on the bottom line of my organization and results in some important spending priorities and investments being put off.*

4. **Vulnerable Consumers**: For residential and First Nations On-Reserve customers, using a combination of household size and combined household income, the report identifies customers who would be eligible for financial assistance programs. The methodology used to calculate this segmentation is based on the OEB's *Ontario Electricity Support Program (OESP)* criteria.

Understanding Segmentation

Segmentation is an effective way to look past the topline numbers and dig deeper into the needs and preferences of the customer segments outlined above. Segmentation allows readers of this report to quickly look past the topline numbers and understand how various segments of customers feel based on perceptions that may be outside of the utility's influence or control.

INNOVATIVE RESEARCH GROUP

Sample Validation

Overview and Methodology

Section 1

Overview of Approach

In Phase 1, INNOVATIVE undertook a rigorous "sample validation" process to understand whether and where differences existed between customers who have provided their email to Hydro One and the full population of customers. Telephone reference surveys were conducted for all low-volume customer types, namely residential (both primary and seasonal), First Nations On-Reserve, and small business (GS>50kW).

Since email addresses were available for all Large Distribution Accounts (LDA) and nearly all Commercial and Industrial (C&I) and Large Transmission Accounts (LTX), telephone reference surveys were not conducted among those customer groups.

In Phase 2, we focus on **using complete customer lists to compare known sample variables between those with an email address and the full population of customers**.

This allows us to identify systematic differences between those with an email on file and the full population of customers regarding known characteristics (rate class, region, and consumption). All samples except Large Distribution Accounts (LDA) and Large Transmission Accounts (LTX) are weighted by region and consumption quartile to ensure representativeness.

After collecting survey responses, sample differences based on known sample variables (region, consumption quartile) are corrected for with weighting.

Comparing Known Sample Variables

Overall Customer Email Coverage

Overall Customer Email Coverage

The table below summarizes the email coverage of each of Hydro One's customer types.

Rate Class	Total Records (Meters)	Unique customers*	Customers with an email	Email coverage (out of unique customers)
Residential	1,209,388	1,090,008	831,248	**76.3%**
Seasonal	137,981	102,107	73,261	**71.7%**
First Nations On-Reserve	21,671	17,916	12,747	**71.1%**
Small Business	114,721	63,193	50,003	**79.1%**
Commercial & Industrial	7,554	5,371	5,105	**95.0%**
Large Distribution	357	313	313	**100%**
Large Transmission	249	197	197	**100%**

*Unique *customers* from the complete list of Hydro One's records (individual meters) are identified by cross-referencing available contact information to identify customers with multiple meters. Customers are assigned to their highest-order rate class in the following order: Large Transmission Account, Large Distribution Account, Commercial & Industrial, Small Business (GS<50kW), First Nations On-Reserve, Residential, Seasonal. For customers with multiple records within the same rate class, the record with the highest average monthly consumption or demand is used for the purpose of assigning sample variables.

Comparing Known Sample Variables

Overall Customer Email Coverage (Con't)

Comparing Known Sample Variables

The information below compares the sample of each customer type with email addresses to the total customer accounts of that customer type across regions.

Legend: Difference
More than -10%
-10% to -4%
-4% to +4%
+4% to +10%
More than +10%

(1) Regional Distribution by Customer Type

Using service zones, areas are grouped into five distinct regions within Hydro One's service territory.

Distributions of region are similar (+/- 4%) across residential, seasonal, and First Nations On-Reserve customer types. Any differences are accounted for by making weighting adjustments based on region.

Customer Type	Region	Share of full population	Share of email sample	Difference
Residential	Central	26%	26%	**0%**
	Central East	31%	31%	**0%**
	East	16%	17%	**+1%**
	North	11%	10%	**-1%**
	West	16%	15%	**-1%**
Seasonal	Central	39%	40%	**+1%**
	Central East	32%	32%	**0%**
	East	6%	6%	**0%**
	North	16%	15%	**0%**
	West	7%	6%	**0%**
First Nations On-Reserve	Central	26%	24%	**-1%**
	Central East	15%	15%	**+1%**
	East	1%	1%	**0%**
	North	48%	50%	**+2%**
	West	11%	10%	**-2%**

Comparing Known Sample Variables

Regional Distribution by Customer Type

(1) Regional Distribution by Customer Type

Using service zones, areas are grouped into five distinct regions within Hydro One's service territory.

Distributions of region are similar (+-/ 4%) for small business (GS<50) customers. Any differences are accounted for by making weighting adjustments based on region.

Legend: Difference
More than -10%
-10% to -4%
-4% to +4%
+4% to +10%
More than +10%

Customer Type*	Region	Share of full population	Share of email sample	Difference
Small Business (GS<50)	Central	24%	25%	**+1%**
	Central East	26%	27%	**0%**
	East	14%	15%	**0%**
	North	14%	14%	**0%**
	West	21%	20%	**-1%**

Note: LTX, LDA, and C&I customers are not shown as all, or nearly all customers have an email on file.

Comparing Known Sample Variables

Distribution of Consumption Quartile by Customer Type

Comparing Known Sample Variables

Legend: Difference
More than -10%
-10% to -4%
-4% to +4%
+4% to +10%
More than +10%

The information below compares the sample of each customer type with email addresses to the total customer accounts across average monthly consumption (low-volume) or demand (commercial & industrial).

(2) Distribution of Consumption Quartile by Customer Type

Within each customer type, customers are grouped into four equal quartiles based on average monthly consumption (measured in kWh).

Distributions of consumption quartile are similar (+/- 4%) for residential and First Nations On-Reserve customers. Seasonal customers with an email on file skew towards higher consumption. Any differences are accounted for by making weighting adjustments based on consumption quartile.

Customer Type	Region	Share of full population	Share of email sample	Difference
Residential	First	25%	23%	**-2%**
	Second	25%	24%	**0%**
	Third	25%	25%	**0%**
	Fourth	25%	26%	**+1%**
	Average Monthly Consumption (kWh)	987.8	1,011.3	**+2%**
Seasonal	First	25%	21%	**-4%**
	Second	25%	24%	**-1%**
	Third	25%	26%	**+1%**
	Fourth	25%	28%	**+3%**
	Average Monthly Consumption (kWh)	465.4	517.6	**+11%**
First Nations On-Reserve	First	25%	23%	**-2%**
	Second	25%	24%	**0%**
	Third	25%	25%	**0%**
	Fourth	25%	26%	**+2%**
	Average Monthly Consumption (kWh)	1,271.4	1,312.5	**+3%**

Comparing Known Sample Variables

Distribution of Consumption Quartile by Customer Type

(2) Distribution of Consumption Quartile by Customer Type

Within each customer type, customers are grouped into four equal quartiles based on average monthly consumption (measured in kWh).

Small business (GS<50) customers with an email on file skew towards higher consumption. Any differences are accounted for by making weighting adjustments based on consumption quartile.

Legend: Difference
More than -10%
-10% to -4%
-4% to +4%
+4% to +10%
More than +10%

Customer Type	Region	Share of full population	Share of email sample	Difference
Small Business (GS<50)	First	25%	22%	**-3%**
	Second	25%	24%	**-1%**
	Third	25%	25%	**0%**
	Fourth	25%	27%	**+3%**
	Average Monthly Consumption (kWh)	2,522.1	2,777.5	**+10%**

Note: LTX, LDA, and C&I customers are not shown as all, or nearly all customers have an email on file.

Residential and Seasonal Customers

Online Survey Results

Section 2

Field Dates

The **Residential and Seasonal Online Survey** was sent to all Hydro One residential and seasonal customers with an available email address. Customers had an opportunity to complete the survey between **November 12th and December 22nd, 2025**.

Each customer received a unique URL that could be linked back to their average monthly consumption, region and rate class. Survey pages that differed by customer type are identified as residential or seasonal versions throughout this report.

In total, the residential survey was sent to **831,248** customers and the seasonal survey was sent to **73,261** customers from *customerexperience@hydroone.com*. A total of three reminder emails were sent on a rolling basis over the survey field window to those who had not yet completed the survey.

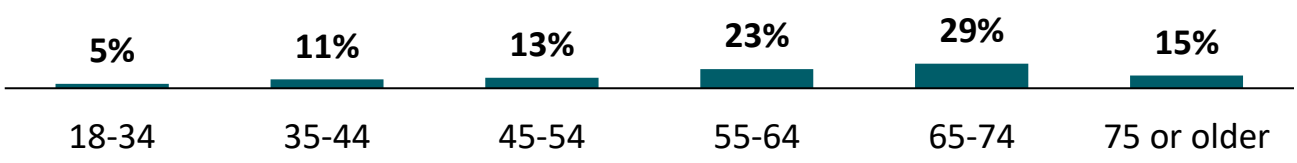
Residential & Seasonal Online Survey Completes

A total of **94,611** (unweighted) Hydro One residential and seasonal customers completed the online survey.

Sample Weighting

The residential and seasonal online survey sample was weighted to n=90,000 proportionately by consumption quartile, region, and customer type (primary residential vs. seasonal) in order to be representative of the broader Hydro One customer base.

The table below summarizes the unweighted and weighted (in brackets) sample breakdown by consumption quartile and region. Totals may not correspond with cell values as some customers are missing region or consumption quartile information. Weights are calculated based off of all available information for a given customer.



Region	Consumption Quartiles				Total
	First	Second	Third	Fourth	
West	3,039 (3,138)	3,331 (3,329)	3,445 (3,494)	3,010 (3,335)	12,980 (13,445)
Central	5,980 (6,061)	6,232 (5,957)	6,406 (6,011)	6,319 (6,359)	25,236 (24,670)
Central East	6,787 (6,773)	7,446 (6,591)	7,477 (6,868)	7,094 (6,685)	29,165 (27,621)
East	3,757 (3,387)	4,138 (3,482)	4,130 (3,511)	3,972 (3,444)	16,231 (14,048)
North	2,821 (2,853)	2,721 (2,495)	2,668 (2,329)	2,629 (2,389)	10,998 (10,215)
Total	22,384 (22,213)	23,868 (22,213)	24,126 (22,213)	23,024 (22,213)	94,611 (90,000)

Note: *Graphs and tables may not always total 100% due to rounding values rather than any error in data. Sums are added before rounding numbers. Caution interpreting results with small n-sizes.*

Hydro One Customer Engagement Survey

Welcome to Hydro One's customer engagement survey!

As Hydro One plans for the future, they need your input on choices that will impact the services you receive and the rates you pay.

- **Hydro One is looking for your feedback on their draft investment plans** for the years 2028 to 2032 to ensure they make spending decisions that matter to you, the customer.
- **You don't need to be an electricity expert to complete this survey.** It focuses on basic choices and provides the background information you need to answer the questions.
- The survey will take approximately 20-30 minutes to complete. If you need to pause and return later to finish the survey, your progress will be saved. If you are reading this on a mobile device, you may want to consider switching to a tablet or laptop so that it is easier for you to read.

Those who complete the survey will be invited to enter a draw to win one (1) of five (5) $500 cash prizes.

All individual responses will be kept confidential.
Innovative Research Group (www.innovativeresearch.ca), an independent research company, has been hired by Hydro One to gather your feedback while protecting your confidentiality. Your individual answers will not be shared with Hydro One in any identifiable way.

INNOVATIVE RESEARCH GROUP

SURVEY PAGE

Hydro One Customer Engagement Survey
What is this survey about?

Hydro One is funded by the rates paid by their customers. Every five years, Hydro One is required to file an application with the Ontario Energy Board (OEB), the energy regulator in Ontario, to set rates. Hydro One's next rate application will cover the years 2028-2032.

In this process, Hydro One's rate application will be examined in detail and Hydro One must demonstrate that customer needs and priorities were factored into their investment planning process.

Today, Hydro One wants your feedback on their draft investment plans, including specific investment choices where they need customer input. This feedback, along with other input, will be used to help Hydro One's planners refine and finalize the draft investment plans.

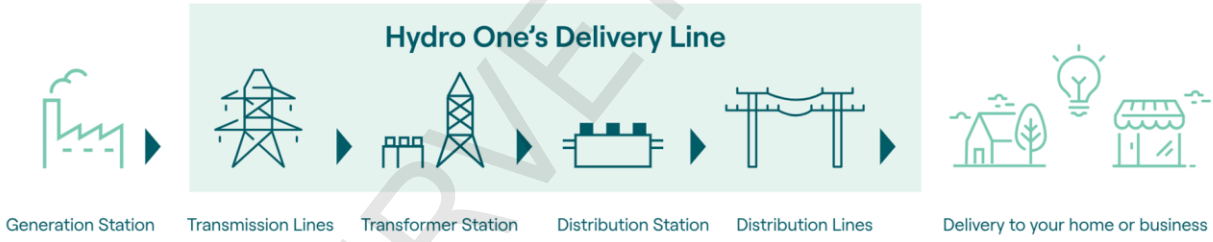
Next year, Hydro One will present their proposed plans and input provided by customers to the OEB.

SURVEY PAGE

Familiarity & Experience

Hydro One's role in Ontario's electricity system

Residential & Seasonal



Hydro One Customer Engagement Survey

What is Hydro One's role in Ontario's electricity system?

Ontario's electricity system has three key components: **generation**, **transmission** and **distribution**.

Hydro One's transmission system takes electricity from generation stations and transports it via high-voltage transmission lines to local communities across the province.

In many communities, including your own, **Hydro One** is also responsible for the local distribution system, which delivers electricity to your home, seasonal property, or organization through a network of wires, poles and other equipment.

Hydro One does not generate electricity or set electricity prices.

Hydro One builds and maintains power lines, towers and poles, delivers electricity, reads meters, answers customer calls, responds during outages, and clears trees and brush from power lines.

Familiarity & Experience

Portion of the electricity bill that goes to Hydro One

Residential & Seasonal

Residential Version

SURVEY PAGE

Hydro One Customer Engagement Survey

How much of my electricity bill goes to Hydro One?

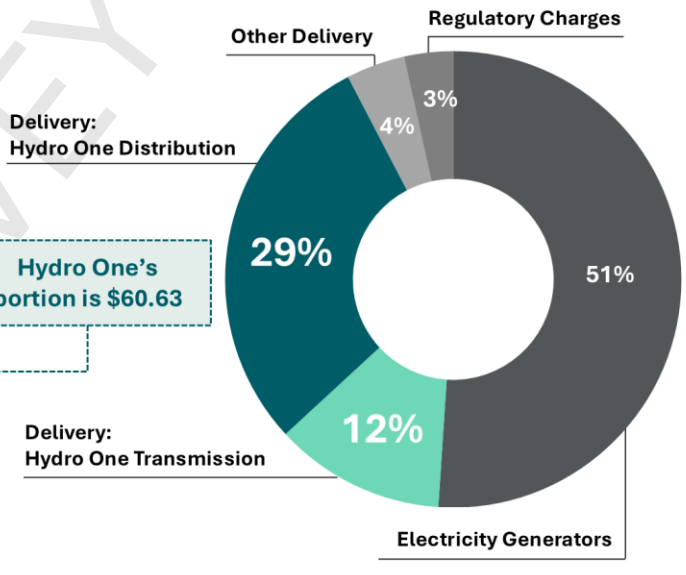
Every item and charge on your bill is mandated by the provincial government or regulated by the OEB, the provincial energy regulator.

Although **Hydro One** is responsible for collecting payment from you for your entire electricity bill, only a portion goes to Hydro One. As of **July 1, 2025**, for a typical residential customer, about 41% of the bill, or $60.63, goes to Hydro One per month. This amount is split into $42.88 for distribution and $17.75 for transmission.

Approximately 60% of Hydro One's residential customers are classified as rural and receive **distribution rate protection**, a government program designed to bring rural customer bills more in line with what urban customers pay. For these customers, distribution charges are currently capped at $42.88.

The rest of your bill payment goes to power generation companies, taxes, and regulatory agencies.

Sample Residential Monthly Bill
(based on consumption of 750 kWh as of July 1, 2025)



Account Number:
0000000000

Meter Number:
00000000

Your Electricity Charges

Electricity	
On-Peak (highest price) @ 18.2 c/kWh	22.52
Mid-Peak (mid price) @ 12.2 c/kWh	16.47
Off-Peak (lowest price) @ 8.7 c/kWh	35.91
Delivery	66.74
Regulatory Charges	5.09
Total Electricity Charges	$146.73
HST	19.07
Ontario Electricity Rebate	(-$19.22)
Total Amount	$146.58

Hydro One's portion is $60.63

The pie chart above is based on a total bill of $146.73 including distribution rate protection and excluding the Ontario Electricity Rebate and HST. The chart may not total 100% due to rounding.

The sample bill above uses an average consumption level of 750kWh per month; however, your usage may vary above or below this assumed level. These types of variations would mostly impact your electricity (On, Mid and Off-Peak) charges.

Summary of Investment Plan

How Hydro One plans

Residential & Seasonal

Hydro One Customer Engagement Survey

How does Hydro One plan?

Every five years, Hydro One develops comprehensive plans that outline both short-term and long-term system needs. These plans are the combination of thousands of inputs from technical experts and customers.

The three key areas that inform Hydro One's plans are:

- **Customer feedback** collected through both ongoing interactions and specific engagements, such as this.
- Information and input from **internal engineering and technical experts**, who closely monitor the pressures on the system and develop solutions to address these challenges.
- Hydro One's **mandatory legal and regulatory requirements**, including connecting customers, moving equipment, and installing and maintaining customer meters.

What has Hydro One heard from customers so far?

In 2024, Hydro One collected feedback from thousands of customers across Ontario on their needs and priorities for electricity distribution and transmission services. This feedback was used to inform planners in developing the draft investment plans.

In this initial feedback, most customers expressed a desire for Hydro One to:

1. Prioritize **reasonable rates** and **reliable service**.
2. Make investments to **improve or maintain current levels of reliability**.
3. Make **targeted investments to improve reliability** for customers experiencing significantly poorer reliability than average.
4. Make investments to make the system **more resilient to severe weather**.
5. Make investments in technology to **accommodate customer requests and improve visibility into the system** (e.g., where and how much electricity is being used).

Summary of Investment Plan

Challenges impacting Hydro One's plans

Residential & Seasonal

Hydro One Customer Engagement Survey

What challenges are impacting Hydro One's plans?

Hydro One is facing challenges that require more resources, new solutions, or growing costs to manage.

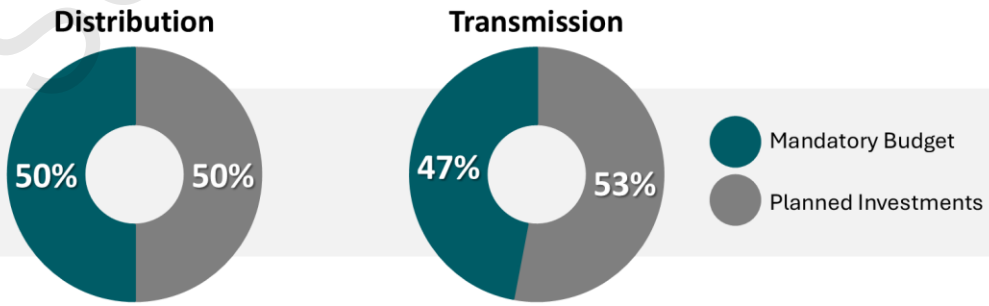
Some of these challenges, like the pace of addressing aging and deteriorating infrastructure are within Hydro One's control. Others, like the frequency of severe weather, are not.

When developing their plans, Hydro One must consider **external pressures**, including:

Increasing demand for electricity

According to the Independent Electricity System Operator (IESO), electricity demand in Ontario is forecasted to increase by 75% by 2050.

In fact, since 2021, growth in the province has far exceeded expectations, and customer requests for new connections have grown considerably: **demand for new connections to Hydro One's distribution system has outpaced projections** by, on average, 21% per year.



Rising cost pressures

Businesses across Ontario are **experiencing significant cost pressures** from factors including tariffs and inflation. Hydro One has been working to offset some of these cost pressures by finding savings and internal efficiencies. In 2024, Hydro One realized approximately $150 million in savings.

How does this impact how Hydro One plans?

Despite increasing demand for electricity, external rising cost pressures, and more frequent severe weather, Hydro One has been working to manage spending within their original budget that was approved by the OEB in 2022. This means that Hydro One has had to delay some planned work to accommodate unexpected higher growth and rising costs.

For the 2028-2032 period, **about half of Hydro One's draft capital budget is committed to work that is necessary to meet mandatory requirements**, including meeting safety, legal, and regulatory requirements, accommodating increased demand for electricity and supporting provincial economic growth.

Summary of Investment Plan

Objectives Hydro One is focused on

Residential & Seasonal

Hydro One Customer Engagement Survey

What objectives is Hydro One focused on?

Today, Hydro One has developed draft investment plans that focus on achieving objectives that balance customer feedback, economic growth in Ontario, engineering and technical analysis, and current and emerging pressures on the system.

While Hydro One's draft plans cover both the **distribution system** serving approximately 1.5 million customers, as well as the **transmission system** serving most Ontarians, each system has different needs and objectives.

Some of the highlights of Hydro One's draft plans include:

Distribution Objectives

1. Improving the **day-to-day reliability** of the system by addressing equipment that is at a higher risk of failure.
2. Preparing for the **impacts of severe weather** by investing in vulnerable lines, clearing more overgrown vegetation, and using technology to restore power more quickly.
3. Improving reliability for thousands of customers experiencing below average reliability by investing in **new battery storage technology**.
4. Ensuring the grid is prepared to **keep pace with evolving customer needs** and accommodate higher levels of growth.

Transmission Objectives

1. **Maintaining the overall health** of the transmission system by limiting the risk of equipment failure.
2. **Getting the most out of the system** by reinforcing and extending the life of equipment and limiting the impacts of severe weather.
3. **Keep pace with Ontario's economic development**, including meeting demand for new and expanded industry in the province

One of the benefits of being both the largest distributor and transmitter of electricity in Ontario is the ability to invest in technology systems, buildings, and facilities that benefit both systems.

Some of these shared objectives of Hydro One's draft plan include:

Shared Objectives

1. **Limiting the risk of potential damage to equipment** by addressing the most at-risk building components and making sites more resilient to severe weather.
2. **Maintaining the company's existing technology systems**, improving operational efficiency and resilience to cybersecurity threats, and **modernizing the system** to provide enhanced services to customers.

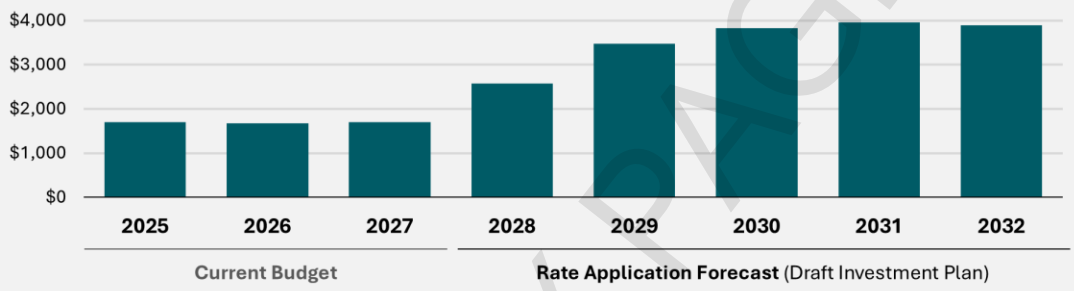
Summary of Investment Plan

Cost of Hydro One's draft distribution plan

Residential & Seasonal

Residential Version



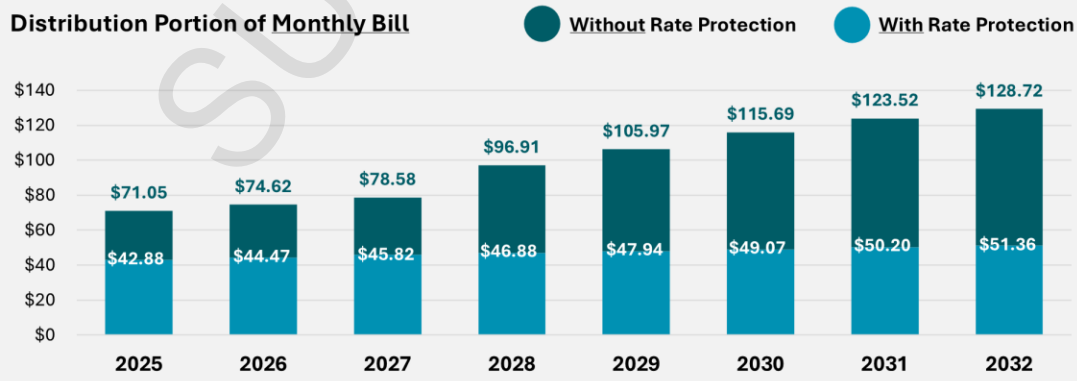
Hydro One Customer Engagement Survey

How much will Hydro One's draft distribution plan cost?

Hydro One has calculated the cost of their draft investment plans, which aim to achieve the objectives highlighted previously and meet Hydro One's legal and regulatory requirements.

The costs for **distribution system** investments are spread among all of Hydro One's 1.5 million distribution customers.

Distribution Budget: Current and Forecasted ($ millions)



The draft distribution investment plan would result in an average annual funding requirement of **$3.5 billion** for **distribution** for 2028-2032.

How will this plan impact the distribution portion of customer bills?

For the approximately 60% of Hydro One customers who receive **distribution rate protection**, in 2025, the distribution portion of their monthly bill is capped at $42.88. These customers won't pay more in distribution charges than the maximum set out by this program.

For a typical residential customer who does not receive rate protection, the **distribution** portion of their **monthly bill** is estimated to increase from $78.58 in 2027 to $128.72 by the end of 2032 – an increase of **$50.14** on the monthly bill. This represents an average increase of **$10.03** on the monthly bill each year.

Distribution Portion of Monthly Bill

Note:

- The Hydro One Distribution Portion of the monthly bill for customers receiving distribution rate protection beyond 2026 has been estimated based on Hydro One's forecast.
- Hydro One's rates until December 31, 2027, were approved by the OEB in an earlier application.
- These estimated rate increases and forecasted budgets are preliminary and are subject to change based on customer feedback, regulatory approval, and other factors.

Summary of Investment Plan

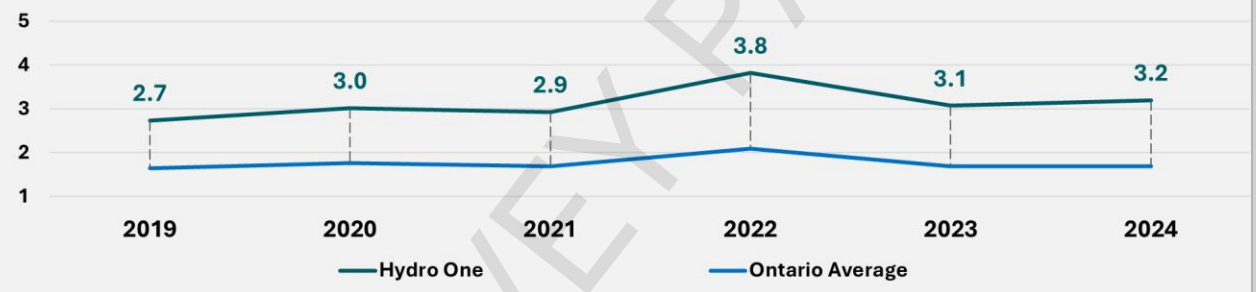
How Hydro One's distribution grid performs

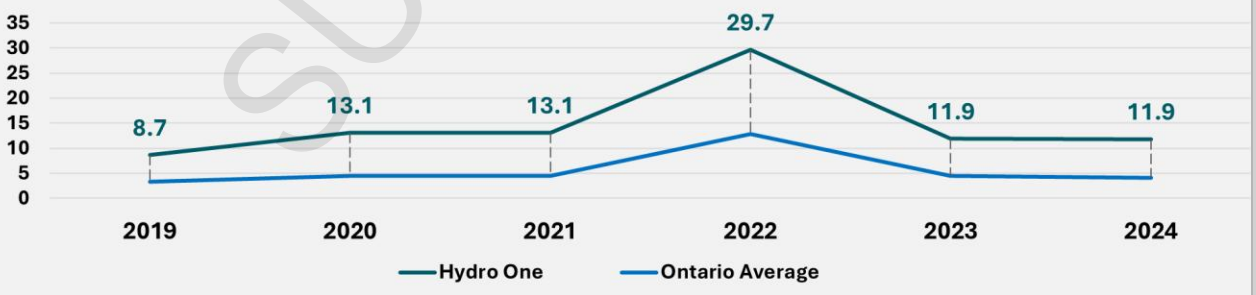
Residential & Seasonal

Hydro One Customer Engagement Survey



How does Hydro One's distribution grid perform?

Since most Hydro One customers live in rural areas, their distribution system looks different from other Ontario utilities. Serving more sparsely populated communities separated by significant distances means more equipment is needed, outages can take longer to locate, and power can take longer to restore.



On average, between 2019 and 2024, the typical Hydro One customer has experienced 1.4 more outages per year compared to the Ontario average.

Number of Outages (Average Outages Per Customer)

When it comes to the total time spent without electricity per year, the typical Hydro One customer has been without power for 14.7 hours each year on average, which is 9.1 hours more than the Ontario average.

Duration of Outages (Average Hours Per Customer)

Severe weather, **tree contacts**, and **equipment failure** account for most of these outages. Notably, the distribution system experienced widespread outages due to severe weather in both 2022 and again in April 2025.

SURVEY P

Investment Trade-Offs

Overall system reliability

Residential & Seasonal

Hydro One Customer Engagement Survey

Overall system reliability

The first investment category is related to the **day-to-day reliability** of Hydro One's **distribution system** that delivers electricity to homes and businesses.

Hydro One typically identifies investments in equipment by taking into consideration the overall age, health, and likelihood of equipment failure.

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to either improve or maintain current levels of reliability related to the distribution grid.

Hydro One generally tries to replace poor condition equipment before it fails. However, when equipment does fail, it can result in significant interruptions for customers.

In the past five years, outside of severe weather events, equipment failure has accounted for about 36% of all hours that Hydro One customers have been without power.

Hydro One's **current draft plan** is focused on improving the day-to-day reliability of the system, outside of severe weather events, by:

- **Repairing or replacing overhead line defects**: Over their 110,000km network of overhead lines, Hydro One has identified close to 500,000 defects such as broken or damaged support cables, leaning poles, or damaged insulators.
- **Maintaining, repairing, or replacing major stations' equipment:** Hydro One operates and maintains approximately 1,000 distribution stations that convert electricity to a lower voltage for safe delivery to homes and businesses. Over **250** of these stations' transformers are in poor condition and at increased risk of failure.
- **Replacing or repairing underground cables:** Hydro One has identified around 13% of all underground cables that are at increased risk of failure. In their current draft plan, Hydro One is proposing to replace or repair 10% of underground cables to reduce the risk of prolonged outages.

Additionally, Hydro One has identified 2% of their approximately 1.6 million wooden poles to be refurbished to extend their useful life.

Eventually, all poor condition or deteriorating equipment will need to be addressed; however, Hydro One would like your feedback on the pace. Doing less of these types of investments now could lead to more frequent or longer outages and higher emergency repair costs in the future. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Maintain current levels of day-to-day reliability	Improve day-to-day reliability by 2032	Further reduce the risk of outages by 2032
	Main Differences Between Plans		
Repairing or replacing overhead line defects	10% of known defects	40% of known defects	70% of known defects
Addressing stations transformers	60 poor condition transformers	90 poor condition transformers	120 poor condition transformers
Replacing or repairing underground cables	7% of all underground cables	10% of all underground cables	13% of all underground cables
Average Monthly Distribution Bill Impact	$2.20 less by 2032 (average of $0.44 less each year)	Included in Draft Plan	$2.18 more by 2032 (average of $0.44 more each year)

Managing the impacts of severe weather

hydro one

On average, between 2019 and 2024, severe weather events, such as ice storms, windstorms or thunderstorms, have contributed to 68% of all hours that the typical customer has been without power per year.

Share of Customer Hours Without Power by Cause

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to make the system more resilient to severe weather.

While some weather-related outages will likely be inevitable, in their **current draft plan**, Hydro One is proposing investments in making the system more resilient to severe weather events and generally perform better overall, including:

- **Relocating or reinforcing vulnerable power lines:** Hydro One has identified power lines that are more vulnerable to severe weather. Relocating or reinforcing these lines with more resilient equipment can help reduce future outage risks.
- **Clearing more overgrown trees and brush than historically:** Increasing the rate of clearing trees and brush can help reduce the risk of outages, the leading cause of weather-related outages.
- **Installing more automated "intelligent" switches:** In their draft plan, Hydro One proposes deploying 1,200 new automated switches that can help restore power more quickly from a control room rather than sending a repair crew to patrol the lines. There are currently approximately 1,100 intelligent switches operating across Hydro One's service territory.

While storms will continue to happen, making these proactive investments will help limit the impact of outages. Reducing these types of investments could leave the distribution system more vulnerable to widespread outages and more costly emergency repairs. While doing more could further reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Maintain the current risk of outages and restoration times related to severe weather	Reduce the risk of outages and shorten restoration times related to severe weather	Further reduce the risk of outages and shorten restoration times related to severe weather
	Main Differences Between Plans		
Relocating or reinforcing vulnerable power lines	3% of all power lines	6% of all power lines	9% of all power lines
Clearing overgrown trees and brush	Clear 25% of overgrown vegetation each year	Clear 30% of overgrown vegetation each year	Clear 35% of overgrown vegetation each year
Installing automated switches	750 new switches	1,200 new switches	1,650 new switches
Average Monthly Distribution Bill Impact	$1.44 less by 2032 (average of $0.29 less each year)	Included in Draft Plan	$1.43 more by 2032 (average of $0.29 more each year)

Investment Trade-Offs

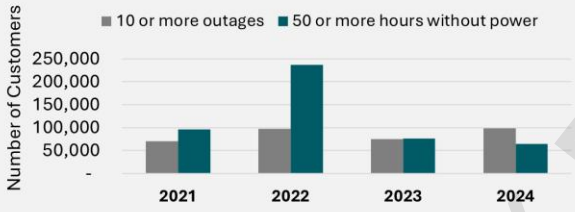
Targeted reliability improvements

Residential & Seasonal

Hydro One Customer Engagement Survey



Targeted reliability improvements

Hydro One customers experience different levels of reliability depending on where they live, the design of the system, the condition of the equipment supplying them, and weather patterns.

While some Hydro One customers might not have experienced any outages in the last four years, in any given year more than **70,000 customers were without power more than 10 times**, and more than **60,000 customers were in the dark for 50 hours or more**.

Today, rural and remote communities are more likely to experience poorer reliability, and the increased frequency of severe weather events create and will continue to create further challenges.

Number of Customers Experiencing Significantly Poorer Reliability than Average

Community-scale battery storage facility outside of Thunder Bay

In a 2024 survey, a majority of customers said that they want Hydro One to make targeted investments to improve reliability for customers who experience significantly poorer reliability than average.

In their **current draft plan**, Hydro One has developed a program that includes a combination of larger **community-scale** batteries and smaller **individual customer** batteries, which store electricity and provide backup power if an outage does occur.

Batteries are an effective way to target reliability improvements for individual customers and communities that experience the poorest reliability.

At the rate of investment being proposed in the draft plan, Hydro One anticipates reliability improvements for around **10,000** customers. However, based on customer feedback, Hydro One could install more or fewer batteries.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Improve reliability for around 3,500 customers	Improve reliability for around 10,000 customers	Improve reliability for around 13,500 customers
	Main Differences Between Plans		
Community-scale batteries	10 battery systems	30 battery systems	50 battery systems
Individual customer batteries	2,000 battery systems	5,000 battery systems	8,000 battery systems
Average Monthly Distribution Bill Impact	$1.49 less by 2032 (average of $0.30 less each year)	**Included in Draft Plan**	$1.49 more by 2032 (average of $0.30 more each year)

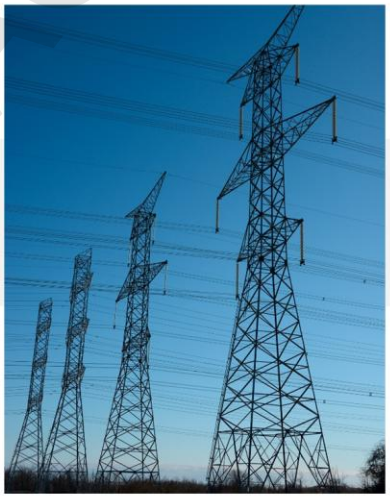
Summary of Investment Plan

Hydro One's transmission system

Residential & Seasonal

Hydro One Customer Engagement Survey

What is the transmission system and who does it serve?



Let's talk about the provincial transmission system. The transmission system is the highway for Ontario's electricity, bringing power from generation stations to your community.

Hydro One's transmission system serves most electricity customers in Ontario, including distribution companies across the province.

Outages on Hydro One's transmission system have significant impacts on communities and Ontario's economy. As such, the transmission system is designed to minimize both the frequency and duration of outages.

For example, most of Ontario's population centres are served by multiple transmission lines so that if one fails, there is always a backup to keep power flowing.

Since 2019, the typical Ontarian connected to Hydro One's transmission system has experienced, on average, **1 outage per year** related to the transmission system.

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to either increase or maintain current levels of reliability related to the transmission grid.

SURVEY BRIEF

Hydro One Customer Engagement Survey

Keeping pace with transmission renewal

hydro one

Portions of Hydro One's transmission system were built in the 1930s, 40s, and 50s.

Hydro One has identified several types of equipment that are at increased risk of failure due to age and condition and would have widespread impacts if they were to fail.

Transmission station equipment ensures electricity can safely travel from power plants to communities. Hydro One has identified close to 200 out of 700 transmission transformers and 400 out of 4,700 circuit breakers in poor condition that are at increased risk of failure. While an equipment failure may not result in an immediate outage, it leaves the system more vulnerable with limited backup.

Underground transmission cables serve many high-density areas. Hydro One has identified that 20 km of their network of around 270 km of cables are at increased risk of failure. Because of the complex nature of these cables, if they were to fail, the outage impacts would be widespread and time-consuming and costly to repair.

Hydro One's **current draft plan** is focused on managing the risk of equipment failure and supporting growth across the province by:

- **Replacing major transmission station equipment:** In their current draft plan, Hydro One plans to replace 70 of the nearly 200 transformers and 230 of the 400 breakers identified as being in poor condition in order to reduce the risk of failure and costly repairs.
- **Replacing high-impact underground transmission cables:** Replacing all 20 km of the underground cables that Hydro One has identified as being at increased risk of failure could take up to 10 years to complete. In their current draft plan, Hydro One is proposing to begin the replacement of all 20km of these underground cables, with 12km being replaced by 2032.

Eventually, all poor condition or deteriorating equipment will need to be addressed; however, Hydro One would like your feedback on the pace of replacement. Doing less of these types of investments in the near term could lead to more equipment failure and higher emergency repair costs in the future. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Higher risk of equipment failure	Maintain the current risk of equipment failure	Lower risk of equipment failure
	Main Differences Between Plans		
Replacing transformers and breakers	55 transformers & 195 breakers	70 transformers & 230 breakers	85 transformers & 265 breakers
Replacing underground cables	Begin replacing 20km of underground cables	Begin replacing 20km of underground cables, completing 12km by 2032	Replace 20km of underground cables by 2032
Average Monthly Transmission Bill Impact	$0.59 less by 2032 (average of $0.12 less each year)	**Included in Draft Plan**	$0.59 more by 2032 (average of $0.12 more each year)

Stewardship of the transmission system

Residential & Seasonal

Residential Version

Hydro One Customer Engagement Survey

Stewardship of the transmission system

Proactive maintenance and system monitoring are among the ways that Hydro One can ensure that equipment lasts as long as possible.

In their **current draft plan**, Hydro One is proposing a series of investments to get the most out of the existing system by:

- **Replacing at-risk transmission lines:** Hydro One has identified that 11% of their approximately 28,000 km of transmission lines are at increased risk of failure due to a combination of age and condition. As these lines are replaced, they are built to modern standards that are more resilient to severe weather.
- **Reinforcing wood poles and extending the life of steel towers:** Hydro One has identified that over 23,000 of their nearly 90,000 wood poles and steel transmission towers are at the end of their expected service life. In the current draft plan, Hydro One is proposing reinforcing or extending the life of many of these structures.
- **Increasing the rate of clearing overgrown trees and brush:** Contact with vegetation accounts for a significant portion of transmission outages and increasing the rate of clearing trees and brush can help reduce the risk of outages.

Additionally, Hydro One is proposing investments in new satellite technology that can help better monitor trees and brush encroaching on infrastructure, further helping reduce the risk of outages.

These investments would be complementary to the ongoing renewal of aging or poor condition equipment, as discussed earlier.

These investments are designed to reduce the risk of major equipment failures, outages, and emergency repair costs over time. Delaying or scaling back these investments will reduce short-term costs but may increase the likelihood of unplanned outages and result in more costly reactive repairs. While doing more could further reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Higher risk of equipment failure and impacts of severe weather compared to the draft plan	Lower the current risk of equipment failure and impacts of severe weather	Further lower risk of equipment failure and impacts of severe weather compared to the draft plan
	Main Differences Between Plans		
Replacing at-risk transmission lines	Replace 1,000 km of at-risk lines	Replace 1,400 km of at-risk lines	Replace 1,800 km of at-risk lines
Reinforcing wood poles and extending the life of steel towers	2,500 wood poles and 1,500 steel towers	6,000 wood poles and 2,750 steel towers	9,500 wood poles and 4,000 steel towers
Clearing overgrown trees and brush	Clear 16% (3,100 km) of overgrown vegetation each year	Clear 17% (3,400 km) of overgrown vegetation each year	Clear 18% (3,700 km) of overgrown vegetation each year
Average Monthly Transmission Bill Impact	$0.48 less by 2032 (average of $0.10 less each year)	Included in Draft Plan	$0.48 more by 2032 (average of $0.10 more each year)

Investment Trade-Offs

Maintaining buildings and facilities

Residential & Seasonal

Residential Version

Hydro One Customer Engagement Survey

Maintaining buildings and facilities

There are certain parts of Hydro One's draft plans that benefit both the transmission and local distribution systems. While the transmission portion of those investments is paid by most Ontarians, the distribution portion is paid by Hydro One customers only.

Hydro One operates and maintains approximately 1,500 facilities across Ontario.

In addition to housing Hydro One's nearly 10,000 employees, these facilities store specialized fleet equipment including bucket trucks and helicopters, protect sensitive equipment, serve as central dispatch for crews, act as training and development campuses, and allow experts to remotely monitor and operate the grid.

Each year, Hydro One classifies their building components into one of three categories – ***high risk***, ***medium risk*** or ***low risk***. This considers both the likelihood of failure and how critical the component is. For instance, a roof that is beyond its useful life and houses critical equipment would be deemed ***high risk***. Whereas older office equipment may be classified as ***low risk***.

In 2025, 25% of Hydro One's building components were assessed as either high or medium-risk.

In their **current draft plan**, Hydro One is focused on:

- **Addressing at-risk building components**: In their current draft plan, Hydro One plans to address 50% of high to medium-risk building components, prioritizing those that are most critical.
- **Making at-risk sites more resilient to severe weather**: In their draft plan, Hydro One plans to invest in reducing flooding risks at 2 of out 12 at-risk sites. For example, in 2024, severe rain flooded a transmission station, resulting in outages for nearly 170,000 customers.

Flooding at a Hydro One transmission station in 2024

- **Repairing or retrofitting field offices**: Many facilities that serve as dispatch for Hydro One crews were built more than 50 years ago. Since then, standards for accessibility have changed considerably. In their draft plan, Hydro One plans to invest in 70 of their 115 facilities that no longer meet modern standards.

Doing less of these types of investments now could increase the number of reactive repairs to facilities, as well as increase the risk of more frequent outages caused by severe weather and longer crew dispatch times. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Lower risk of critical asset failures, but address fewer aging field facilities than the draft plan	Lower risk of critical asset failures and make progress on addressing aging field facilities	Further lower risk of asset failures and address more aging field facilities than the draft plan
	Main Differences Between Plans		
Addressing at-risk building components	Same as draft plan	50% of at-risk building components	57% of at-risk building components
Making at-risk sites more resilient	Same as draft plan	2 at-risk sites	8 at-risk sites
Repairing or retrofitting facilities	50 facilities	70 facilities	90 facilities
Average Monthly Distribution Bill Impact	$0.34 less by 2032 (average of $0.07 less each year)	Included in Draft Plan	$0.31 more by 2032 (average of $0.06 more each year)
Average Monthly Transmission Bill Impact	$0.02 less by 2032 (average of $0.005 less each year)		$0.07 more by 2032 (average of $0.01 more each year)

There are certain parts of Hydro One's draft plans that benefit both the transmission and local distribution systems. While the transmission portion of those investments is paid by most Ontarians, the distribution portion is paid by Hydro One customers only.

Hydro One operates and maintains approximately 1,500 facilities across Ontario.

In addition to housing Hydro One's nearly 10,000 employees, these facilities store specialized fleet equipment including bucket trucks and helicopters, protect sensitive equipment, serve as central dispatch for crews, act as training and development campuses, and allow experts to remotely monitor and operate the grid.

Each year, Hydro One classifies their building components into one of three categories – ***high risk***, ***medium risk*** or ***low risk***. This considers both the likelihood of failure and how critical the component is. For instance, a roof that is beyond its useful life and houses critical equipment would be deemed ***high risk***. Whereas older office equipment may be classified as ***low risk***.

In 2025, 25% of Hydro One's building components were assessed as either high or medium-risk.

In their **current draft plan**, Hydro One is focused on:

- **Addressing at-risk building components**: In their current draft plan, Hydro One plans to address 50% of high to medium-risk building components, prioritizing those that are most critical.
- **Making at-risk sites more resilient to severe weather**: In their draft plan, Hydro One plans to invest in reducing flooding risks at 2 of out 12 at-risk sites. For example, in 2024, severe rain flooded a transmission station, resulting in outages for nearly 170,000 customers.

Flooding at a Hydro One transmission station in 2024

- **Repairing or retrofitting field offices**: Many facilities that serve as dispatch for Hydro One crews were built more than 50 years ago. Since then, standards for accessibility have changed considerably. In their draft plan, Hydro One plans to invest in 70 of their 115 facilities that no longer meet modern standards.

Doing less of these types of investments now could increase the number of reactive repairs to facilities, as well as increase the risk of more frequent outages caused by severe weather and longer crew dispatch times. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Lower risk of critical asset failures, but address fewer aging field facilities than the draft plan	Lower risk of critical asset failures and make progress on addressing aging field facilities	Further lower risk of asset failures and address more aging field facilities than the draft plan
	Main Differences Between Plans		
Addressing at-risk building components	Same as draft plan	50% of at-risk building components	57% of at-risk building components
Making at-risk sites more resilient	Same as draft plan	2 at-risk sites	8 at-risk sites
Repairing or retrofitting facilities	50 facilities	70 facilities	90 facilities
Average Monthly Distribution Bill Impact	$0.34 less by 2032 (average of $0.07 less each year)	Included in Draft Plan	$0.31 more by 2032 (average of $0.06 more each year)
Average Monthly Transmission Bill Impact	$0.01 less by 2032 (average of $0.002 less each year)		$0.03 more by 2032 (average of $0.01 more each year)

Information technology

Residential Version

Hydro One Customer Engagement Survey
Information technology

Hydro One's daily operations require technology systems for all aspects of their business, including billing, operating the grid, responding to outages, planning projects, and communicating with customers.

When deciding the right level of information technology (I.T.) investment, Hydro One must balance various factors, including the cost of new or updated systems, the risks related to current systems, and the benefits that new technologies could bring to the company and customers.

Hydro One's current draft plan is focused on:

- **Maintaining the current state of technology systems**: Like with poles and wires, technology systems need to be maintained so that crews can restore power and customers can access key services like their online account and the outage restoration map.
- **Enhancing customer service**: I.T. investments and advanced data can help Hydro One offer better services to customers, improve estimated restoration times during outages and notify customers when service will be back online.
- **Improving Hydro One's operational efficiency**: Investments in technology systems can help Hydro One dispatch crews and perform their work more effectively.
- **Protecting the grid from both cyber and physical security threats**: Investments in new technologies can provide more robust protection against external threats, enhancing the resilience of critical system infrastructure.

While a significant portion of Hydro One's I.T. budget is allocated to meet safety, legal, and regulatory requirements, Hydro One could defer investments focused on enhancing customer service, improving efficiency, and expanding capabilities beyond 2032.

Deferring these types of investments would delay these benefits and potentially limit Hydro One's ability to accommodate newer technologies in the future.

Which of the following options do you prefer?

	Spend Less	Draft Plan
	Maintain the current state of technology systems but make fewer investments to enhance service and efficiencies	Maintain the current state of technology systems while modernizing capabilities to enhance service and efficiencies
	Main Differences Between Plans	
Customer service	Limit or delay investments in systems focused on enhancing customer service	Invest in systems focused on enhancing customer service
Operational efficiency	Limit or delay investments in systems focused on improving operational efficiency	Invest in systems focused on improving operational efficiency
Average Monthly Distribution Bill Impact	$0.45 less by 2032 (average of $0.09 less each year)	**Included in Draft Plan**
Average Monthly Transmission Bill Impact	$0.16 less by 2032 (average of $0.03 less each year)

Hydro One Customer Engagement Survey

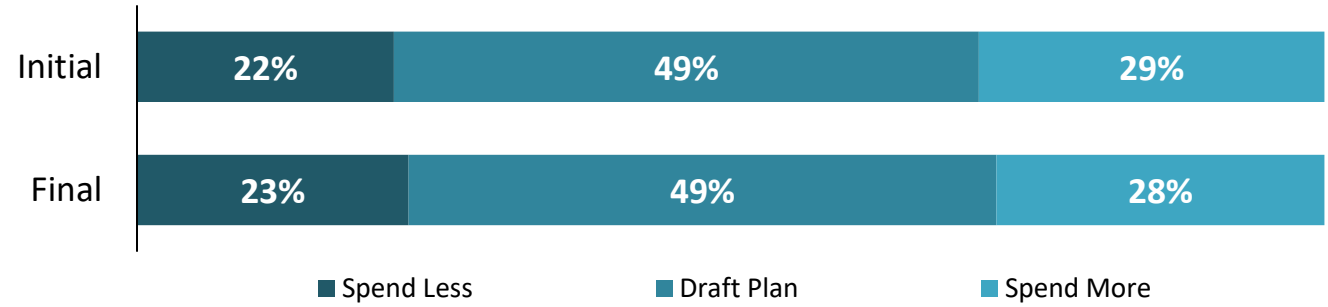
What is the impact of my choices?

hydro one

Throughout this survey, you have been asked about 7 key choices. Below is a summary of your choices.

At the bottom of this page, you will find the total bill impact of all your answers. You can change your responses if you desire, and the estimated impact on your bill will be recalculated.



The bill impacts associated with each choice represent the average increase on your monthly bill from 2027 to 2032, followed by the average increase on your monthly bill each year. The impacts under the "spend less" or "spend more" options are relative to the bill impact of the draft plan.

Overall evaluation of the draft plans

Residential Version

Hydro One Customer Engagement Survey

Evaluating Hydro One's 2028-2032 draft plan

Hydro One has calculated an overall cost for their draft plans. While the plans may change based on feedback from the earlier questions in this survey, Hydro One would like to know how you feel about the overall draft plans.

It is estimated that a typical **residential customer** who does not receive distribution rate protection would see:

- The **distribution** portion of their **monthly bill** increase from $78.58 in 2027 to $128.72 by the end of 2032 – an increase of **$50.14** on the monthly bill. This represents an average increase of **$10.03** on the monthly bill each year.
- The **transmission** portion of their **monthly bill** increase from $19.07 in 2027 to $24.90 by the end of 2032 – an increase of **$5.83** on the monthly bill. This represents an average increase of **$1.17** on the monthly bill each year.

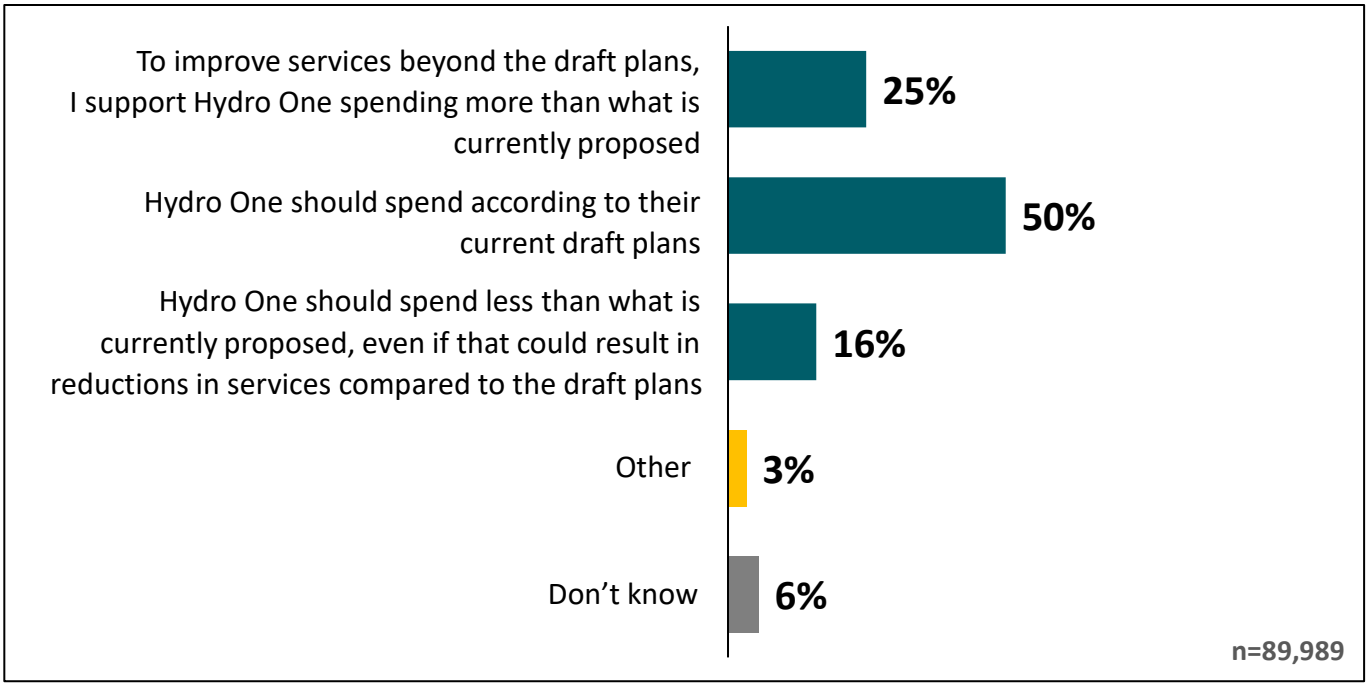
Seasonal Version

Hydro One Customer Engagement Survey

Evaluating Hydro One's 2028-2032 draft plan

Hydro One has calculated an overall cost for their draft plans. While the plans may change based on feedback from the earlier questions in this survey, Hydro One would like to know how you feel about the overall draft plans.

It is estimated that a typical **seasonal customer** would see:



- The **distribution** portion of their **monthly bill** increase from $78.58 in 2027 to $128.72 by the end of 2032 – an increase of **$50.14** on the monthly bill. This represents an average increase of **$10.03** on the monthly bill each year.
- The **transmission** portion of their **monthly bill** increase from $8.90 in 2027 to $11.62 by the end of 2032 – an increase of **$2.72** on the monthly bill. This represents an average increase of **$0.54** on the monthly bill each year.

First Nations On-Reserve Customers

Online Survey Results

Section 3

Online Survey
Methodology

Field Dates

The **First Nations On-Reserve Residential Customer Online Survey** was sent to all Hydro One on-reserve residential customers with an available email address. Customers had an opportunity to complete the survey between **November 13th and December 22nd, 2025**.

Each customer received a unique URL that could be linked back to their average monthly consumption, region and rate class.

In total, the on-reserve residential survey was sent to **12,747** customers from *customerexperience@hydroone.com*. A total of 3 reminder emails were sent on a rolling basis over the survey field window to those who had not yet completed the survey.

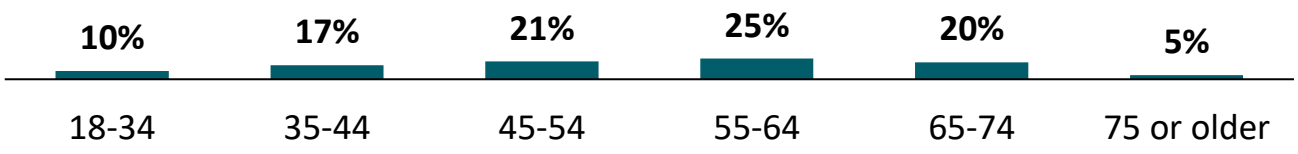
First Nations On-Reserve Customer Online Survey Completes

A total of **793** (unweighted) Hydro One on-reserve residential customers completed the online survey.

Sample Weighting

The First Nations On-Reserve Customer online survey sample was weighted to n=775 proportionately by consumption quartiles and region in order to be representative of the broader Hydro One customer base.

The table below summarizes the unweighted and weighted (in brackets) sample breakdown by consumption quartile and region. Totals may not correspond with cell values as some customers are missing region or consumption quartile information. Weights are calculated based off of all available information for a given customer.



Region	Consumption Quartiles				Total
	First	Second	Third	Fourth	
West	14 (19)	16 (21)	22 (25)	21 (18)	74 (85)
Central	66 (67)	56 (54)	39 (43)	39 (33)	203 (200)
East/Central East	49 (33)	53 (33)	41 (29)	35 (23)	182 (120)
North	62 (73)	77 (81)	92 (94)	96 (117)	334 (371)
Total	191 (191)	202 (189)	194 (191)	191 (191)	793 (775)

Note: *Graphs and tables may not always total 100% due to rounding values rather than any error in data. Sums are added before rounding numbers. Caution interpreting results with small n-sizes.*

Hydro One Customer Engagement Survey

Welcome to Hydro One's customer engagement survey!

hydro one

As Hydro One plans for the future, they need your input on choices that will impact the services you receive and the rates you pay.

- **Hydro One is looking for your feedback on their draft investment plans** for the years 2028 to 2032 to ensure they make spending decisions that matter to you, the customer.
- **You don't need to be an electricity expert to complete this survey.** It focuses on basic choices and provides the background information you need to answer the questions.
- The survey will take approximately 20-30 minutes to complete. If you need to pause and return later to finish the survey, your progress will be saved. If you are reading this on a mobile device, you may want to consider switching to a tablet or laptop so that it is easier for you to read.

Those who complete the survey will be invited to enter a draw to win one (1) of five (5) $500 cash prizes.

All individual responses will be kept confidential.
Innovative Research Group (www.innovativeresearch.ca), an independent research company, has been hired by Hydro One to gather your feedback while protecting your confidentiality. Your individual answers will not be shared with Hydro One in any identifiable way.

INNOVATIVE RESEARCH GROUP

SURVEY PAGE

Hydro One Customer Engagement Survey
What is this survey about?

Hydro One is funded by the rates paid by their customers. Every five years, Hydro One is required to file an application with the Ontario Energy Board (OEB), the energy regulator in Ontario, to set rates. Hydro One's next rate application will cover the years 2028-2032.

In this process, Hydro One's rate application will be examined in detail and Hydro One must demonstrate that customer needs and priorities were factored into their investment planning process.

Today, Hydro One wants your feedback on their draft investment plans, including specific investment choices where they need customer input. This feedback, along with other input, will be used to help Hydro One's planners refine and finalize the draft investment plans.

Next year, Hydro One will present their proposed plans and input provided by customers to the OEB.

SURVEY PAGE

Familiarity & Experience

Hydro One's role in Ontario's electricity system

First Nations On-Reserve

SURVEY PAGE

Hydro One Customer Engagement Survey

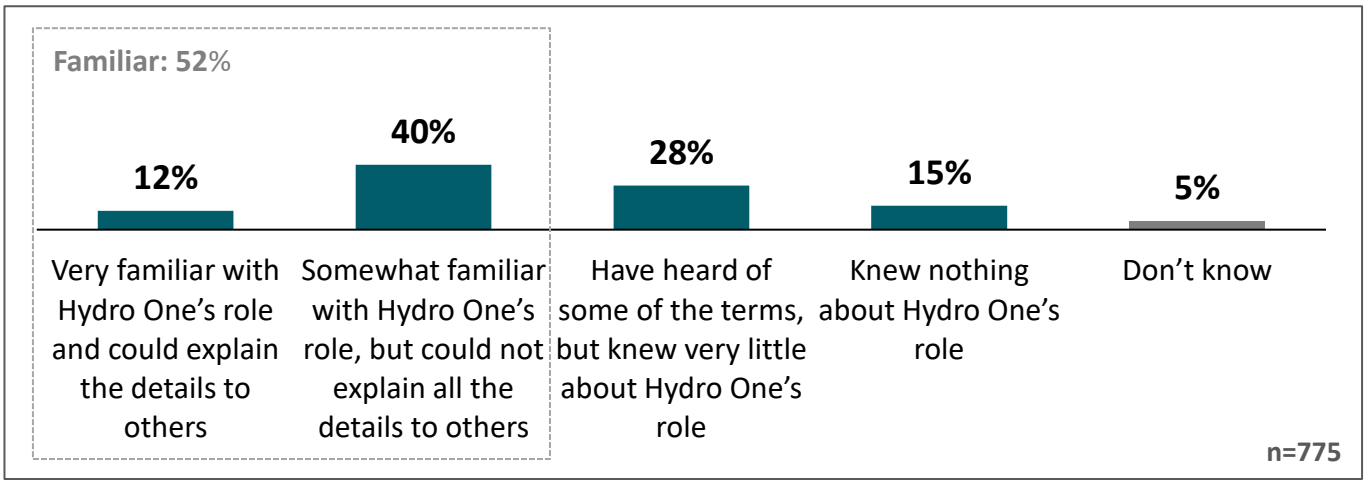
What is Hydro One's role in Ontario's electricity system?

Ontario's electricity system has three key components: **generation**, **transmission** and **distribution**.

Hydro One's transmission system takes electricity from generation stations and transports it via high-voltage transmission lines to local communities across the province.

In many communities, including your own, **Hydro One** is also responsible for the local distribution system, which delivers electricity to your home, seasonal property, or organization through a network of wires, poles and other equipment.

Hydro One does not generate electricity or set electricity prices.



Hydro One builds and maintains power lines, towers and poles, delivers electricity, reads meters, answers customer calls, responds during outages, and clears trees and brush from power lines.

Portion of the electricity bill that goes to Hydro One

First Nations On-Reserve

Hydro One Customer Engagement Survey

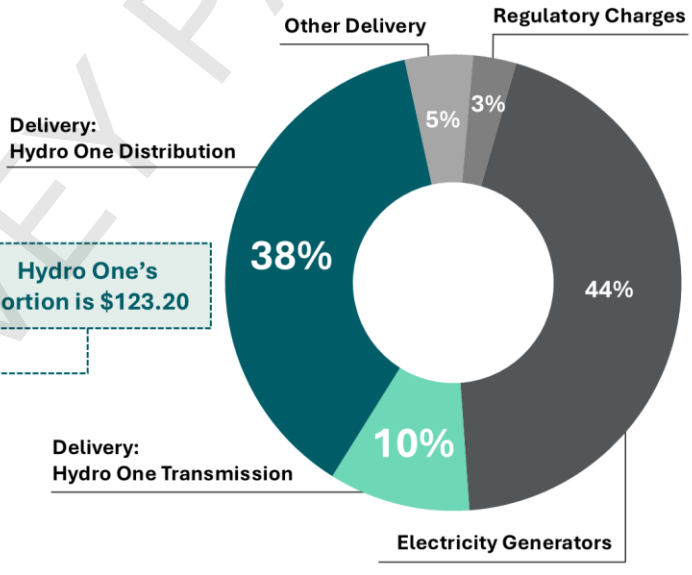
How much of my electricity bill goes to Hydro One?

Every item and charge on your bill is mandated by the provincial government or regulated by the OEB, the provincial energy regulator.

Although **Hydro One** is responsible for collecting payment from you for your entire electricity bill, the portion of your bill that goes to Hydro One, covering distribution and transmission delivery services, is offset by the **First Nations Delivery Credit**.

As of July 1, 2025, for a typical On-Reserve First Nations residential customer, the bill credit offsets about 48% of the bill, or $123.20, per month related to the services Hydro One provides, including both distribution and transmission.

The rest of your bill payment goes to power generation companies and regulatory agencies.



Sample Residential Monthly Bill
(based on consumption of 1,150 kWh as of July 1, 2025)

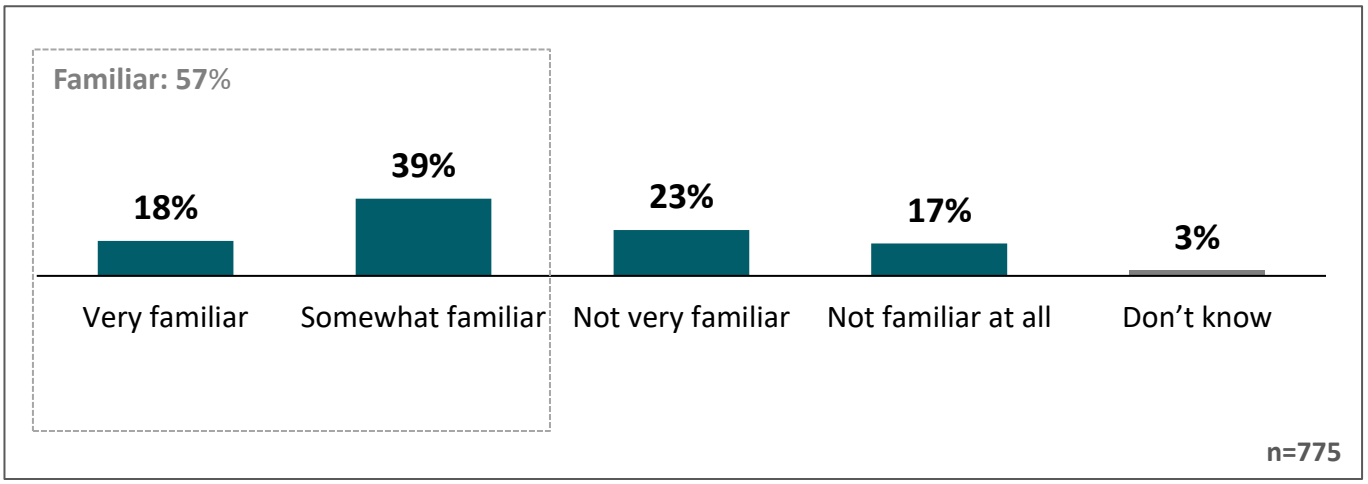
Account Number:
0000000000

Meter Number:
00000000

Your Electricity Charges	
Electricity	
On-Peak (highest price) @ 18.2 c/kWh	34.52
Mid-Peak (mid price) @ 12.2 c/kWh	25.25
Off-Peak (lowest price) @ 8.7 c/kWh	55.06
Delivery	135.78
First Nations Delivery Credit	-135.78
Regulatory Charges	7.87
Total Electricity Charges	$122.71
HST	---
Ontario Electricity Rebate	(-$16.08)
Total Amount	$106.64

Hydro One's portion is $123.20

The pie chart above is based on a total bill of $258.50 excluding the First Nations Delivery Credit, the Ontario Electricity Rebate, and HST. The chart may not total 100% due to rounding.



The sample bill above uses an average consumption level of 1,150kWh per month; however, your usage may vary above or below this assumed level. These types of variations would mostly impact your electricity (On, Mid and Off-Peak) charges.

Summary of Investment Plan

How Hydro One plans

First Nations On-Reserve

Hydro One Customer Engagement Survey

How does Hydro One plan?

Every five years, Hydro One develops comprehensive plans that outline both short-term and long-term system needs. These plans are the combination of thousands of inputs from technical experts and customers.

The three key areas that inform Hydro One's plans are:

- **Customer feedback** collected through both ongoing interactions and specific engagements, such as this.
- Information and input from **internal engineering and technical experts**, who closely monitor the pressures on the system and develop solutions to address these challenges.
- Hydro One's **mandatory legal and regulatory requirements**, including connecting customers, moving equipment, and installing and maintaining customer meters.

What has Hydro One heard from customers so far?

In 2024, Hydro One collected feedback from thousands of customers across Ontario on their needs and priorities for electricity distribution and transmission services. This feedback was used to inform planners in developing the draft investment plans.

In this initial feedback, most customers expressed a desire for Hydro One to:

1. Prioritize **reasonable rates** and **reliable service**.
2. Make investments to **improve or maintain current levels of reliability**.
3. Make **targeted investments to improve reliability** for customers experiencing significantly poorer reliability than average.
4. Make investments to make the system **more resilient to severe weather**.
5. Make investments in technology to **accommodate customer requests and improve visibility into the system** (e.g., where and how much electricity is being used).

SURVEY PAGE

Summary of Investment Plan

Challenges impacting Hydro One's plans

First Nations On-Reserve

Hydro One Customer Engagement Survey

What challenges are impacting Hydro One's plans?

Hydro One is facing challenges that require more resources, new solutions, or growing costs to manage.

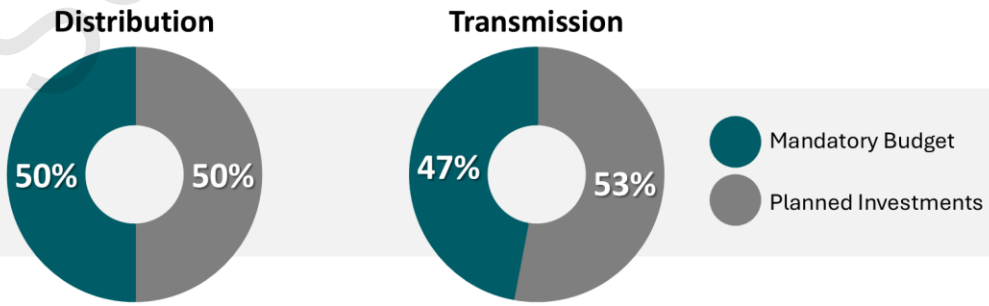
Some of these challenges, like the pace of addressing aging and deteriorating infrastructure are within Hydro One's control. Others, like the frequency of severe weather, are not.

When developing their plans, Hydro One must consider **external pressures**, including:

Increasing demand for electricity

According to the Independent Electricity System Operator (IESO), electricity demand in Ontario is forecasted to increase by 75% by 2050.

In fact, since 2021, growth in the province has far exceeded expectations, and customer requests for new connections have grown considerably: **demand for new connections to Hydro One's distribution system has outpaced projections** by, on average, 21% per year.



Rising cost pressures

Businesses across Ontario are **experiencing significant cost pressures** from factors including tariffs and inflation. Hydro One has been working to offset some of these cost pressures by finding savings and internal efficiencies. In 2024, Hydro One realized approximately $150 million in savings.

How does this impact how Hydro One plans?

Despite increasing demand for electricity, external rising cost pressures, and more frequent severe weather, Hydro One has been working to manage spending within their original budget that was approved by the OEB in 2022. This means that Hydro One has had to delay some planned work to accommodate unexpected higher growth and rising costs.

For the 2028-2032 period, **about half of Hydro One's draft capital budget is committed to work that is necessary to meet mandatory requirements**, including meeting safety, legal, and regulatory requirements, accommodating increased demand for electricity and supporting provincial economic growth.

SURVEY PAGE

Summary of Investment Plan

Objectives Hydro One is focused on

First Nations On-Reserve

Hydro One Customer Engagement Survey

What objectives is Hydro One focused on?

Today, Hydro One has developed draft investment plans that focus on achieving objectives that balance customer feedback, economic growth in Ontario, engineering and technical analysis, and current and emerging pressures on the system.

While Hydro One's draft plans cover both the **distribution system** serving approximately 1.5 million customers, as well as the **transmission system** serving most Ontarians, each system has different needs and objectives.

Some of the highlights of Hydro One's draft plans include:

Distribution Objectives

1. Improving the **day-to-day reliability** of the system by addressing equipment that is at a higher risk of failure.
2. Preparing for the **impacts of severe weather** by investing in vulnerable lines, clearing more overgrown vegetation, and using technology to restore power more quickly.
3. Improving reliability for thousands of customers experiencing below average reliability by investing in **new battery storage technology**.
4. Ensuring the grid is prepared to **keep pace with evolving customer needs** and accommodate higher levels of growth.

Transmission Objectives

1. **Maintaining the overall health** of the transmission system by limiting the risk of equipment failure.
2. **Getting the most out of the system** by reinforcing and extending the life of equipment and limiting the impacts of severe weather.
3. **Keep pace with Ontario's economic development**, including meeting demand for new and expanded industry in the province

One of the benefits of being both the largest distributor and transmitter of electricity in Ontario is the ability to invest in technology systems, buildings, and facilities that benefit both systems.

Some of these shared objectives of Hydro One's draft plan include:

Shared Objectives

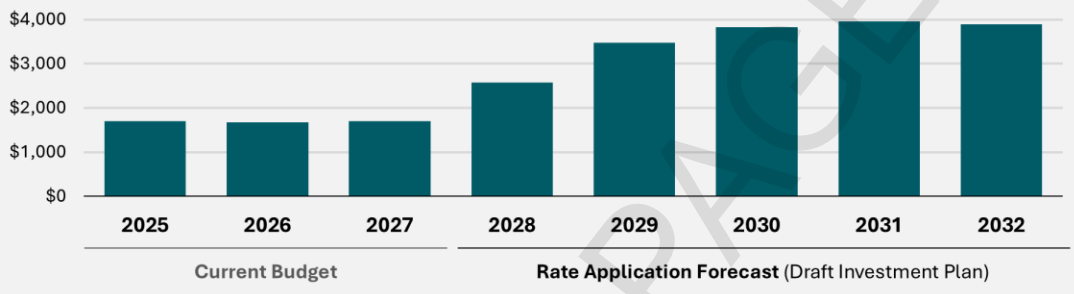
1. **Limiting the risk of potential damage to equipment** by addressing the most at-risk building components and making sites more resilient to severe weather.
2. **Maintaining the company's existing technology systems**, improving operational efficiency and resilience to cybersecurity threats, and **modernizing the system** to provide enhanced services to customers.

SURVEY PAGE

Summary of Investment Plan

Cost of Hydro One's draft distribution plan

First Nations On-Reserve



Hydro One Customer Engagement Survey

How much will Hydro One's draft distribution plan cost?

Hydro One has calculated the cost of their draft investment plans, which aim to achieve the objectives highlighted previously and meet Hydro One's legal and regulatory requirements.

The costs for **distribution system** investments are spread among all of Hydro One's 1.5 million distribution customers.

Distribution Budget: Current and Forecasted ($ millions)

The draft distribution investment plan would result in an average annual funding requirement of **$3.5 billion** for **distribution** for 2028-2032.

How will this plan impact the distribution portion of customer bills?

Because the portion of your bill that goes to Hydro One is offset by the **First Nations Delivery Credit, the costs discussed in the remainder of this survey reflect impacts for a typical residential customer living off-reserve.**

For a typical **residential customer living off-reserve** who does not receive distribution rate protection, the **distribution** portion of their **monthly bill** is estimated to increase from $78.58 in 2027 to $128.72 by the end of 2032 – an increase of **$50.14** on the monthly bill. This represents an average increase of **$10.03** on the monthly bill each year.

Distribution Portion of Monthly Bill

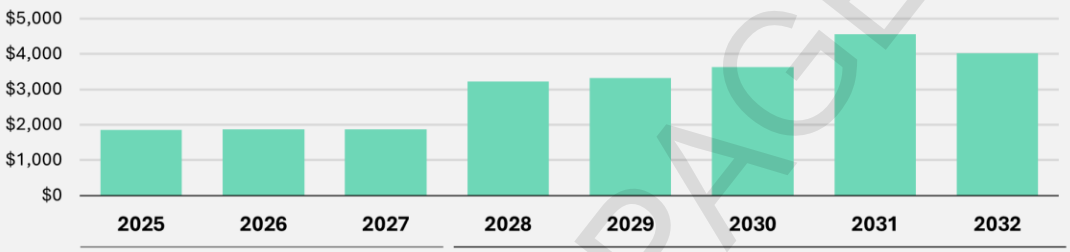
Note:
- Hydro One's rates until December 31, 2027, were approved by the OEB in an earlier application.
- These estimated rate increases and forecasted budgets are preliminary and are subject to change based on customer feedback, regulatory approval, and other factors.

SURVEY PAGE

Summary of Investment Plan

Cost of Hydro One's draft transmission plan

First Nations On-Reserve



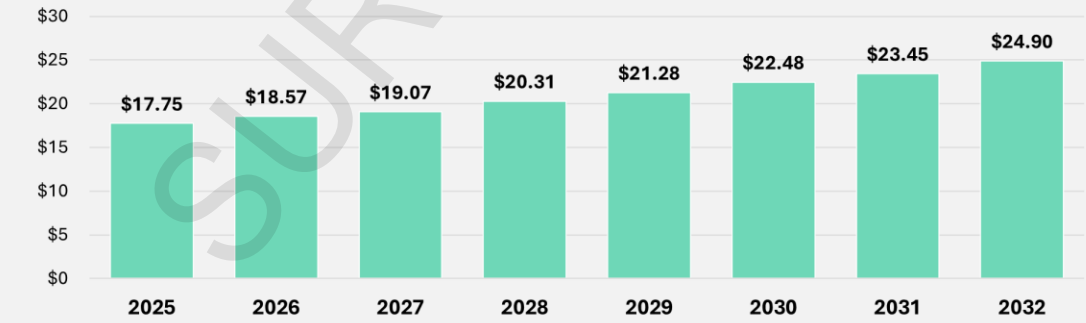
Hydro One Customer Engagement Survey

How much will Hydro One's draft transmission plan cost?

hydro one

For the **transmission system**, investment costs are shared by more than 5 million electricity rate payers in Ontario.

Transmission Budget: Current and Forecasted ($ millions)



The draft transmission investment plan would result in an average annual funding requirement of **$3.8 billion** for **transmission** for 2028-2032.

How will this plan impact the transmission portion of customer bills?

For a typical **residential customer living off-reserve**, the **transmission** portion of their **monthly bill** is estimated to increase from $19.07 in 2027 to $24.90 by the end of 2032 – an increase of **$5.83** on the monthly bill. This represents an average increase of **$1.17** on the monthly bill each year.

Transmission Portion of Monthly Bill

Note:
- Hydro One's rates until December 31, 2027, were approved by the OEB in an earlier application.
- These estimated rate increases and forecasted budgets are preliminary and are subject to change based on customer feedback, regulatory approval, and other factors.

SURVEY PAGE

Hydro One Customer Engagement Survey

What choices does Hydro One want my input on?

The remainder of this survey asks for your input on the total cost of the draft investment plans, plus **7 key choices** within the plan that Hydro One is looking for your guidance on.

- Each choice has a summary of the options that Hydro One is considering. In many cases, that includes options that would see Hydro One ***spend less*** or ***spend more*** than what is currently being proposed in the draft plan.
- For each option, Hydro One has estimated what impact it would have on customer bills **compared to the draft plan**. These impacts are approximate.
- Because the portion of your bill that goes to Hydro One is offset by the **First Nations Delivery Credit**, the estimated impacts for a **typical residential customer living off-reserve** have been used in this survey to represent the true cost of the choices.
- Following each question, you will also have an opportunity to provide additional feedback if you choose to.
- Once you have finished giving feedback on the key choices, you will have an opportunity to review and change your responses until you feel you have found the right balance between the level of investment and cost.

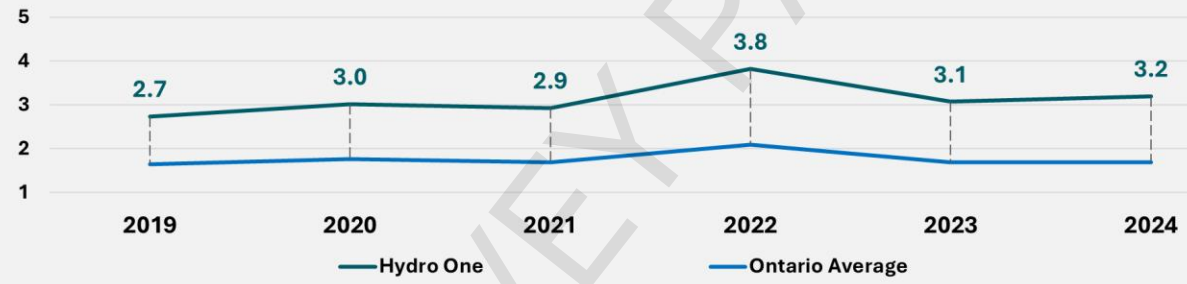
SURVEY PAGE

Summary of Investment Plan

How Hydro One's distribution grid performs

First Nations On-Reserve

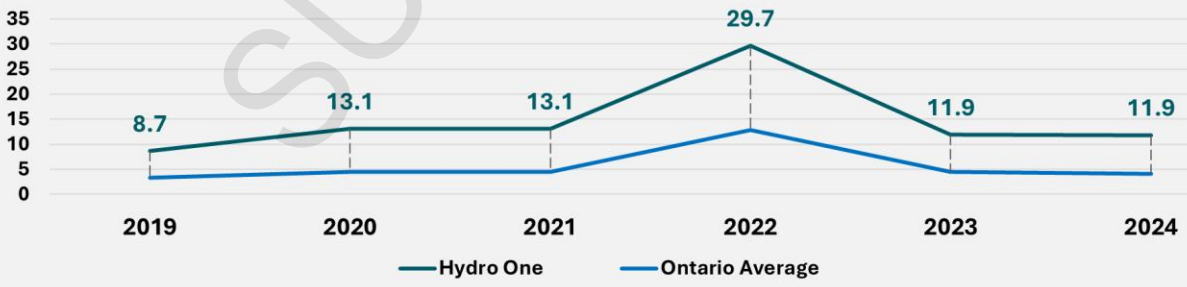
Hydro One Customer Engagement Survey



How does Hydro One's distribution grid perform?

Since most Hydro One customers live in rural areas, their distribution system looks different from other Ontario utilities. Serving more sparsely populated communities separated by significant distances means more equipment is needed, outages can take longer to locate, and power can take longer to restore.

On average, between 2019 and 2024, the typical Hydro One customer has experienced 1.4 more outages per year compared to the Ontario average.



Number of Outages (Average Outages Per Customer)

When it comes to the total time spent without electricity per year, the typical Hydro One customer has been without power for 14.7 hours each year on average, which is 9.1 hours more than the Ontario average.

Duration of Outages (Average Hours Per Customer)

Severe weather, **tree contacts**, and **equipment failure** account for most of these outages. Notably, the distribution system experienced widespread outages due to severe weather in both 2022 and again in April 2025.

SURVEY PR

Investment Trade-Offs

Overall system reliability

First Nations On-Reserve

Hydro One Customer Engagement Survey

Overall system reliability

The first investment category is related to the **day-to-day reliability** of Hydro One's **distribution system** that delivers electricity to homes and businesses.

Hydro One typically identifies investments in equipment by taking into consideration the overall age, health, and likelihood of equipment failure.

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to either improve or maintain current levels of reliability related to the distribution grid.

Hydro One generally tries to replace poor condition equipment before it fails. However, when equipment does fail, it can result in significant interruptions for customers.

In the past five years, outside of severe weather events, equipment failure has accounted for about 36% of all hours that Hydro One customers have been without power.

Hydro One's **current draft plan** is focused on improving the day-to-day reliability of the system, outside of severe weather events, by:

- **Repairing or replacing overhead line defects**: Over their 110,000km network of overhead lines, Hydro One has identified close to 500,000 defects such as broken or damaged support cables, leaning poles, or damaged insulators.
- **Maintaining, repairing, or replacing major stations' equipment:** Hydro One operates and maintains approximately 1,000 distribution stations that convert electricity to a lower voltage for safe delivery to homes and businesses. Over **250** of these stations' transformers are in poor condition and at increased risk of failure.
- **Replacing or repairing underground cables:** Hydro One has identified around 13% of all underground cables that are at increased risk of failure. In their current draft plan, Hydro One is proposing to replace or repair 10% of underground cables to reduce the risk of prolonged outages.

Additionally, Hydro One has identified 2% of their approximately 1.6 million wooden poles to be refurbished to extend their useful life.

Eventually, all poor condition or deteriorating equipment will need to be addressed; however, Hydro One would like your feedback on the pace. Doing less of these types of investments now could lead to more frequent or longer outages and higher emergency repair costs in the future. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Maintain current levels of day-to-day reliability	Improve day-to-day reliability by 2032	Further reduce the risk of outages by 2032
	Main Differences Between Plans		
Repairing or replacing overhead line defects	10% of known defects	40% of known defects	70% of known defects
Addressing stations transformers	60 poor condition transformers	90 poor condition transformers	120 poor condition transformers
Replacing or repairing underground cables	7% of all underground cables	10% of all underground cables	13% of all underground cables
Average Monthly Distribution Bill Impact	$2.20 less by 2032 (average of $0.44 less each year)	Included in Draft Plan	$2.18 more by 2032 (average of $0.44 more each year)

Investment Trade-Offs

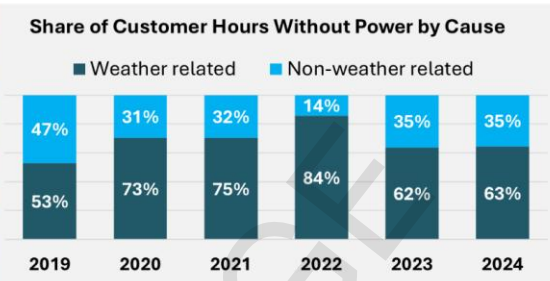
Managing the impacts of severe weather



First Nations On-Reserve

Hydro One Customer Engagement Survey

Managing the impacts of severe weather

On average, between 2019 and 2024, severe weather events, such as ice storms, windstorms or thunderstorms, have contributed to 68% of all hours that the typical customer has been without power per year.

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to make the system more resilient to severe weather.

While some weather-related outages will likely be inevitable, in their **current draft plan**, Hydro One is proposing investments in making the system more resilient to severe weather events and generally perform better overall, including:

- **Relocating or reinforcing vulnerable power lines:** Hydro One has identified power lines that are more vulnerable to severe weather. Relocating or reinforcing these lines with more resilient equipment can help reduce future outage risks.
- **Clearing more overgrown trees and brush than historically:** Increasing the rate of clearing trees and brush can help reduce the risk of outages, the leading cause of weather-related outages.
- **Installing more automated "intelligent" switches:** In their draft plan, Hydro One proposes deploying 1,200 new automated switches that can help restore power more quickly from a control room rather than sending a repair crew to patrol the lines. There are currently approximately 1,100 intelligent switches operating across Hydro One's service territory.

While storms will continue to happen, making these proactive investments will help limit the impact of outages. Reducing these types of investments could leave the distribution system more vulnerable to widespread outages and more costly emergency repairs. While doing more could further reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Maintain the current risk of outages and restoration times related to severe weather	Reduce the risk of outages and shorten restoration times related to severe weather	Further reduce the risk of outages and shorten restoration times related to severe weather
	Main Differences Between Plans		
Relocating or reinforcing vulnerable power lines	3% of all power lines	6% of all power lines	9% of all power lines
Clearing overgrown trees and brush	Clear 25% of overgrown vegetation each year	Clear 30% of overgrown vegetation each year	Clear 35% of overgrown vegetation each year
Installing automated switches	750 new switches	1,200 new switches	1,650 new switches
Average Monthly Distribution Bill Impact	$1.44 less by 2032 (average of $0.29 less each year)	Included in Draft Plan	$1.43 more by 2032 (average of $0.29 more each year)

Investment Trade-Offs

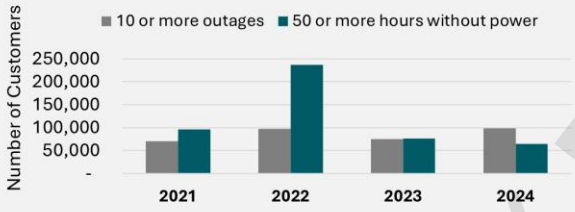
Targeted reliability improvements

Hydro One Customer Engagement Survey



Targeted reliability improvements

Hydro One customers experience different levels of reliability depending on where they live, the design of the system, the condition of the equipment supplying them, and weather patterns.

While some Hydro One customers might not have experienced any outages in the last four years, in any given year more than **70,000 customers were without power more than 10 times**, and more than **60,000 customers were in the dark for 50 hours or more**.

Today, rural and remote communities are more likely to experience poorer reliability, and the increased frequency of severe weather events create and will continue to create further challenges.

Number of Customers Experiencing Significantly Poorer Reliability than Average

Community-scale battery storage facility outside of Thunder Bay

In a 2024 survey, a majority of customers said that they want Hydro One to make targeted investments to improve reliability for customers who experience significantly poorer reliability than average.

In their **current draft plan**, Hydro One has developed a program that includes a combination of larger **community-scale** batteries and smaller **individual customer** batteries, which store electricity and provide backup power if an outage does occur.

Batteries are an effective way to target reliability improvements for individual customers and communities that experience the poorest reliability.

At the rate of investment being proposed in the draft plan, Hydro One anticipates reliability improvements for around **10,000** customers. However, based on customer feedback, Hydro One could install more or fewer batteries.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Improve reliability for around 3,500 customers	Improve reliability for around 10,000 customers	Improve reliability for around 13,500 customers

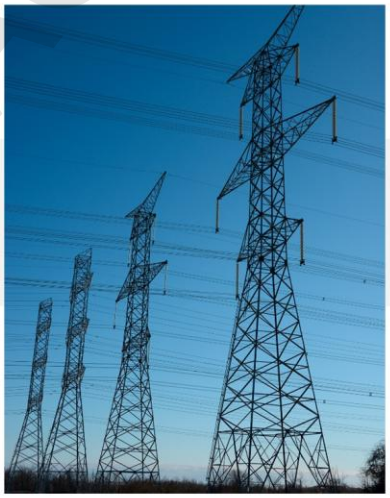
Summary of Investment Plan

Hydro One's transmission system

First Nations On-Reserve

Hydro One Customer Engagement Survey

What is the transmission system and who does it serve?



Let's talk about the provincial transmission system. The transmission system is the highway for Ontario's electricity, bringing power from generation stations to your community.

Hydro One's transmission system serves most electricity customers in Ontario, including distribution companies across the province.

Outages on Hydro One's transmission system have significant impacts on communities and Ontario's economy. As such, the transmission system is designed to minimize both the frequency and duration of outages.

For example, most of Ontario's population centres are served by multiple transmission lines so that if one fails, there is always a backup to keep power flowing.

Since 2019, the typical Ontarian connected to Hydro One's transmission system has experienced, on average, **1 outage per year** related to the transmission system.

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to either increase or maintain current levels of reliability related to the transmission grid.

Keeping pace with transmission renewal

First Nations On-Reserve

Hydro One Customer Engagement Survey

Keeping pace with transmission renewal

hydro one

Portions of Hydro One's transmission system were built in the 1930s, 40s, and 50s.

Hydro One has identified several types of equipment that are at increased risk of failure due to age and condition and would have widespread impacts if they were to fail.

Transmission station equipment ensures electricity can safely travel from power plants to communities. Hydro One has identified close to 200 out of 700 transmission transformers and 400 out of 4,700 circuit breakers in poor condition that are at increased risk of failure. While an equipment failure may not result in an immediate outage, it leaves the system more vulnerable with limited backup.

Underground transmission cables serve many high-density areas. Hydro One has identified that 20 km of their network of around 270 km of cables are at increased risk of failure. Because of the complex nature of these cables, if they were to fail, the outage impacts would be widespread and time-consuming and costly to repair.

Hydro One's **current draft plan** is focused on managing the risk of equipment failure and supporting growth across the province by:

- **Replacing major transmission station equipment:** In their current draft plan, Hydro One plans to replace 70 of the nearly 200 transformers and 230 of the 400 breakers identified as being in poor condition in order to reduce the risk of failure and costly repairs.
- **Replacing high-impact underground transmission cables:** Replacing all 20 km of the underground cables that Hydro One has identified as being at increased risk of failure could take up to 10 years to complete. In their current draft plan, Hydro One is proposing to begin the replacement of all 20km of these underground cables, with 12km being replaced by 2032.

Eventually, all poor condition or deteriorating equipment will need to be addressed; however, Hydro One would like your feedback on the pace of replacement. Doing less of these types of investments in the near term could lead to more equipment failure and higher emergency repair costs in the future. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Higher risk of equipment failure	Maintain the current risk of equipment failure	Lower risk of equipment failure
	Main Differences Between Plans		
Replacing transformers and breakers	55 transformers & 195 breakers	70 transformers & 230 breakers	85 transformers & 265 breakers
Replacing underground cables	Begin replacing 20km of underground cables	Begin replacing 20km of underground cables, completing 12km by 2032	Replace 20km of underground cables by 2032
Average Monthly Transmission Bill Impact	$0.59 less by 2032 (average of $0.12 less each year)	**Included in Draft Plan**	$0.59 more by 2032 (average of $0.12 more each year)

Hydro One Customer Engagement Survey
Stewardship of the transmission system

hydro one

Proactive maintenance and system monitoring are among the ways that Hydro One can ensure that equipment lasts as long as possible.

In their **current draft plan**, Hydro One is proposing a series of investments to get the most out of the existing system by:

- **Replacing at-risk transmission lines:** Hydro One has identified that 11% of their approximately 28,000 km of transmission lines are at increased risk of failure due to a combination of age and condition. As these lines are replaced, they are built to modern standards that are more resilient to severe weather.
- **Reinforcing wood poles and extending the life of steel towers:** Hydro One has identified that over 23,000 of their nearly 90,000 wood poles and steel transmission towers are at the end of their expected service life. In the current draft plan, Hydro One is proposing reinforcing or extending the life of many of these structures.
- **Increasing the rate of clearing overgrown trees and brush:** Contact with vegetation accounts for a significant portion of transmission outages and increasing the rate of clearing trees and brush can help reduce the risk of outages.

Additionally, Hydro One is proposing investments in new satellite technology that can help better monitor trees and brush encroaching on infrastructure, further helping reduce the risk of outages.

These investments would be complementary to the ongoing renewal of aging or poor condition equipment, as discussed earlier.

These investments are designed to reduce the risk of major equipment failures, outages, and emergency repair costs over time. Delaying or scaling back these investments will reduce short-term costs but may increase the likelihood of unplanned outages and result in more costly reactive repairs. While doing more could further reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Higher risk of equipment failure and impacts of severe weather compared to the draft plan	Lower the current risk of equipment failure and impacts of severe weather	Further lower risk of equipment failure and impacts of severe weather compared to the draft plan
	Main Differences Between Plans		
Replacing at-risk transmission lines	Replace 1,000 km of at-risk lines	Replace 1,400 km of at-risk lines	Replace 1,800 km of at-risk lines
Reinforcing wood poles and extending the life of steel towers	2,500 wood poles and 1,500 steel towers	6,000 wood poles and 2,750 steel towers	9,500 wood poles and 4,000 steel towers
Clearing overgrown trees and brush	Clear 16% (3,100 km) of overgrown vegetation each year	Clear 17% (3,400 km) of overgrown vegetation each year	Clear 18% (3,700 km) of overgrown vegetation each year
Average Monthly Transmission Bill Impact	$0.48 less by 2032 (average of $0.10 less each year)	**Included in Draft Plan**	$0.48 more by 2032 (average of $0.10 more each year)

Investment Trade-Offs
Maintaining buildings and facilities

First Nations On-Reserve

Hydro One Customer Engagement Survey
Maintaining buildings and facilities

hydro one

There are certain parts of Hydro One's draft plans that benefit both the transmission and local distribution systems. While the transmission portion of those investments is paid by most Ontarians, the distribution portion is paid by Hydro One customers only.

Hydro One operates and maintains approximately 1,500 facilities across Ontario.

In addition to housing Hydro One's nearly 10,000 employees, these facilities store specialized fleet equipment including bucket trucks and helicopters, protect sensitive equipment, serve as central dispatch for crews, act as training and development campuses, and allow experts to remotely monitor and operate the grid.

Each year, Hydro One classifies their building components into one of three categories – ***high risk***, ***medium risk*** or ***low risk***. This considers both the likelihood of failure and how critical the component is. For instance, a roof that is beyond its useful life and houses critical equipment would be deemed ***high risk***. Whereas older office equipment may be classified as ***low risk***.

In 2025, 25% of Hydro One's building components were assessed as either high or medium-risk.

In their **current draft plan**, Hydro One is focused on:

- **Addressing at-risk building components**: In their current draft plan, Hydro One plans to address 50% of high to medium-risk building components, prioritizing those that are most critical.
- **Making at-risk sites more resilient to severe weather**: In their draft plan, Hydro One plans to invest in reducing flooding risks at 2 of out 12 at-risk sites. For example, in 2024, severe rain flooded a transmission station, resulting in outages for nearly 170,000 customers.

Flooding at a Hydro One transmission station in 2024

- **Repairing or retrofitting field offices**: Many facilities that serve as dispatch for Hydro One crews were built more than 50 years ago. Since then, standards for accessibility have changed considerably. In their draft plan, Hydro One plans to invest in 70 of their 115 facilities that no longer meet modern standards.

Doing less of these types of investments now could increase the number of reactive repairs to facilities, as well as increase the risk of more frequent outages caused by severe weather and longer crew dispatch times. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Lower risk of critical asset failures, but address fewer aging field facilities than the draft plan	Lower risk of critical asset failures and make progress on addressing aging field facilities	Further lower risk of asset failures and address more aging field facilities than the draft plan
	Main Differences Between Plans		
Addressing at-risk building components	Same as draft plan	50% of at-risk building components	57% of at-risk building components
Making at-risk sites more resilient	Same as draft plan	2 at-risk sites	8 at-risk sites
Repairing or retrofitting facilities	50 facilities	70 facilities	90 facilities
Average Monthly Distribution Bill Impact	$0.34 less by 2032 (average of $0.07 less each year)	Included in Draft Plan	$0.31 more by 2032 (average of $0.06 more each year)
Average Monthly Transmission Bill Impact	$0.02 less by 2032 (average of $0.005 less each year)		$0.07 more by 2032 (average of $0.01 more each year)

Hydro One Customer Engagement Survey
Information technology

hydro one

Hydro One's daily operations require technology systems for all aspects of their business, including billing, operating the grid, responding to outages, planning projects, and communicating with customers.

When deciding the right level of information technology (I.T.) investment, Hydro One must balance various factors, including the cost of new or updated systems, the risks related to current systems, and the benefits that new technologies could bring to the company and customers.

Hydro One's current draft plan is focused on:

- **Maintaining the current state of technology systems**: Like with poles and wires, technology systems need to be maintained so that crews can restore power and customers can access key services like their online account and the outage restoration map.
- **Enhancing customer service**: I.T. investments and advanced data can help Hydro One offer better services to customers, improve estimated restoration times during outages and notify customers when service will be back online.
- **Improving Hydro One's operational efficiency**: Investments in technology systems can help Hydro One dispatch crews and perform their work more effectively.
- **Protecting the grid from both cyber and physical security threats**: Investments in new technologies can provide more robust protection against external threats, enhancing the resilience of critical system infrastructure.

While a significant portion of Hydro One's I.T. budget is allocated to meet safety, legal, and regulatory requirements, Hydro One could defer investments focused on enhancing customer service, improving efficiency, and expanding capabilities beyond 2032.

Deferring these types of investments would delay these benefits and potentially limit Hydro One's ability to accommodate newer technologies in the future.

Which of the following options do you prefer?

	Spend Less	Draft Plan
	Maintain the current state of technology systems but make fewer investments to enhance service and efficiencies	Maintain the current state of technology systems while modernizing capabilities to enhance service and efficiencies
	Main Differences Between Plans	
Customer service	Limit or delay investments in systems focused on enhancing customer service	Invest in systems focused on enhancing customer service
Operational efficiency	Limit or delay investments in systems focused on improving operational efficiency	Invest in systems focused on improving operational efficiency
Average Monthly Distribution Bill Impact	$0.45 less by 2032 (average of $0.09 less each year)	**Included in Draft Plan**
Average Monthly Transmission Bill Impact	$0.16 less by 2032 (average of $0.03 less each year)

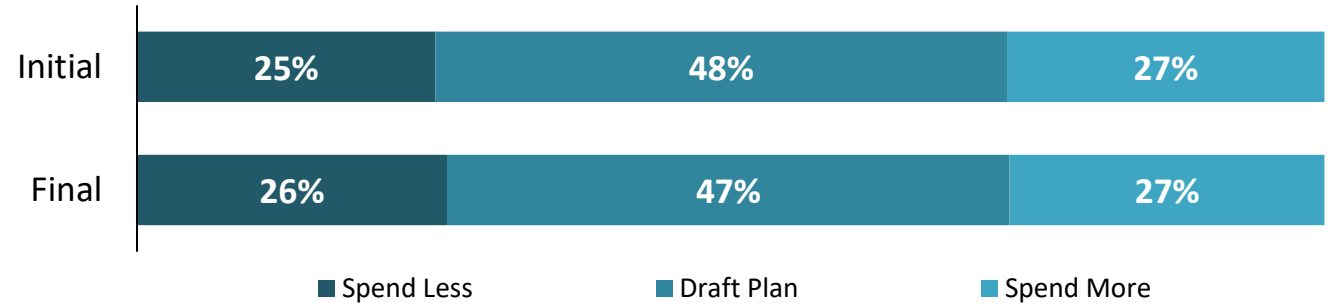
Hydro One Customer Engagement Survey

What is the impact of my choices?

hydro one

Throughout this survey, you have been asked about 7 key choices. Below is a summary of your choices.

At the bottom of this page, you will find the total bill impact of all your answers for **a typical residential customer living off-reserve**. You can change your responses if you desire, and the estimated impact will be recalculated.



The bill impacts associated with each choice represent the average increase on the monthly bill from 2027 to 2032, followed by the average increase on the monthly bill each year. The impacts under the "spend less" or "spend more" options are relative to the bill impact of the draft plan.

Hydro One Customer Engagement Survey

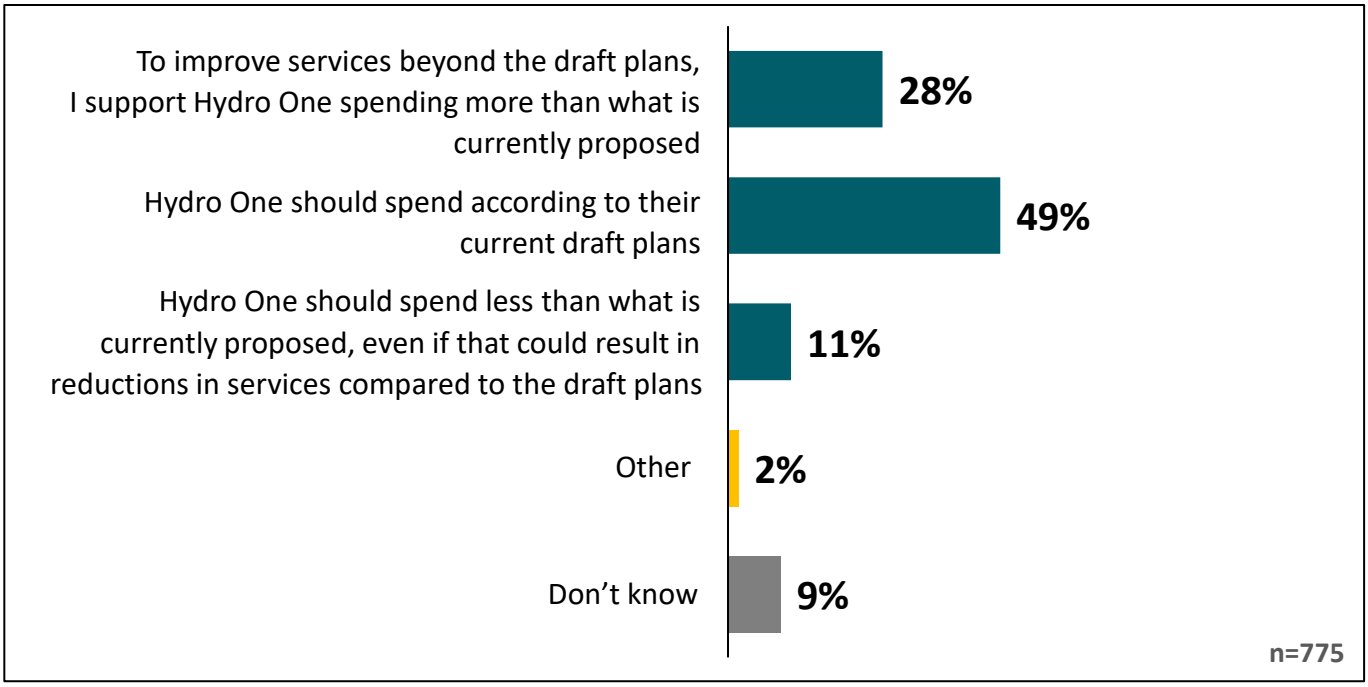
Evaluating Hydro One's 2028-2032 draft plan

hydro one

Hydro One has calculated an overall cost for their draft plans. While the plans may change based on feedback from the earlier questions in this survey, Hydro One would like to know how you feel about the overall draft plans.

It is estimated that a typical **residential customer living off-reserve** who does not receive rate protection would see:

- The **distribution** portion of their **monthly bill** increase from $78.58 in 2027 to $128.72 by the end of 2032 – an increase of **$50.14** on the monthly bill. This represents an average increase of **$10.03** on the monthly bill each year.
- The **transmission** portion of their **monthly bill** increase from $19.07 in 2027 to $24.90 by the end of 2032 – an increase of **$5.83** on the monthly bill. This represents an average increase of **$1.17** on the monthly bill each year.



Because the portion of your bill that goes to Hydro One is offset by the **First Nations Delivery Credit**, these costs would not be reflected on your bill but still represent the true cost of the choices for a typical residential customer living off-reserve.

Small Business Customers

Online Survey Results

Section 4

Online Survey
Methodology

Field Dates

The **Small Business (GS<50) Online Survey** was sent to all Hydro One small business customers with an available email address. Customers had an opportunity to complete the survey between **November 14th and December 22nd, 2025**.

Each customer received a unique URL that could be linked back to their average monthly consumption, region and rate class.

In total, the small business survey was sent to **50,003** customers from *customerexperience@hydroone.com*. A total of 3 reminder emails were sent on a rolling basis over the survey field window to those who had not yet completed the survey.

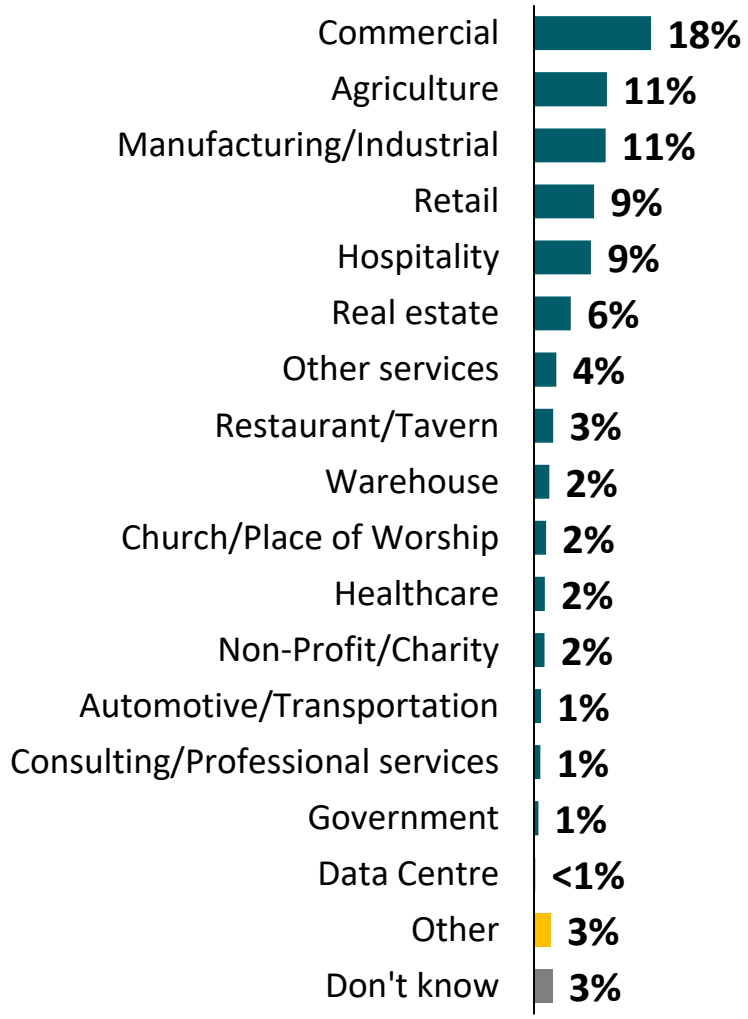
Small Business Online Survey Completes

A total of **2,791** (unweighted) Hydro One small business customers completed the online survey.

Sample Weighting

The small business online survey sample was weighted to n=2,790 proportionately by consumption quartile and region in order to be representative of the broader Hydro One customer base.

The table below summarizes the unweighted and weighted (in brackets) sample breakdown by consumption quartile and region. Totals may not correspond with cell values as some customers are missing region or consumption quartile information. Weights are calculated based off of all available information for a given customer.



Region	Consumption Quartiles				Total
	First	Second	Third	Fourth	
West	156 (150)	137 (136)	151 (142)	146 (145)	603 (585)
Central	176 (163)	161 (166)	173 (166)	137 (166)	664 (675)
Central East	163 (176)	182 (185)	176 (188)	142 (176)	672 (736)
East	113 (98)	108 (102)	81 (94)	84 (92)	395 (394)
North	101 (98)	123 (95)	120 (95)	105 (105)	457 (401)
Total	709 (685)	711 (685)	701 (685)	614 (685)	2,791 (2,790)

Note: *Graphs and tables may not always total 100% due to rounding values rather than any error in data. Sums are added before rounding numbers. Caution interpreting results with small n-sizes.*

Hydro One Customer Engagement Survey

Welcome to Hydro One's customer engagement survey!

As Hydro One plans for the future, they need your input on choices that will impact the services you receive and the rates you pay.

- **Hydro One is looking for your feedback on their draft investment plans** for the years 2028 to 2032 to ensure they make spending decisions that matter to you, the customer.
- **You don't need to be an electricity expert to complete this survey.** It focuses on basic choices and provides the background information you need to answer the questions.
- The survey will take approximately 20-30 minutes to complete. If you need to pause and return later to finish the survey, your progress will be saved. If you are reading this on a mobile device, you may want to consider switching to a tablet or laptop so that it is easier for you to read.

Those who complete the survey will be invited to enter a draw to win one (1) of five (5) $500 cash prizes.

All individual responses will be kept confidential.
Innovative Research Group (www.innovativeresearch.ca), an independent research company, has been hired by Hydro One to gather your feedback while protecting your confidentiality. Your individual answers will not be shared with Hydro One in any identifiable way.

SURVEY PAGE

Hydro One Customer Engagement Survey
What is this survey about?

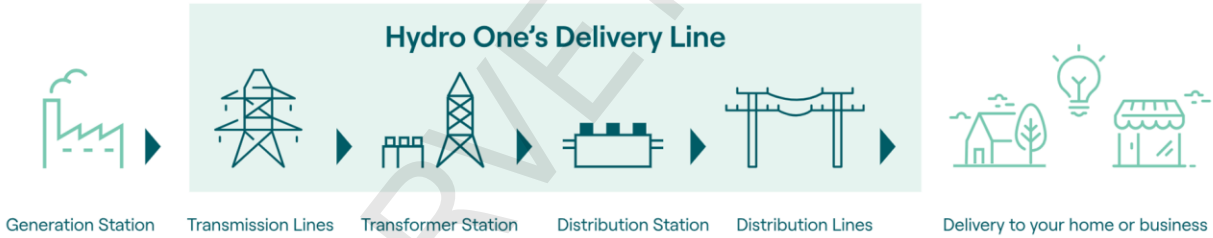
Hydro One is funded by the rates paid by their customers. Every five years, Hydro One is required to file an application with the Ontario Energy Board (OEB), the energy regulator in Ontario, to set rates. Hydro One's next rate application will cover the years 2028-2032.

In this process, Hydro One's rate application will be examined in detail and Hydro One must demonstrate that customer needs and priorities were factored into their investment planning process.

Today, Hydro One wants your feedback on their draft investment plans, including specific investment choices where they need customer input. This feedback, along with other input, will be used to help Hydro One's planners refine and finalize the draft investment plans.

Next year, Hydro One will present their proposed plans and input provided by customers to the OEB.

SURVEY PREVIEW



Hydro One Customer Engagement Survey

What is Hydro One's role in Ontario's electricity system?

Ontario's electricity system has three key components: **generation**, **transmission** and **distribution**.

Hydro One's transmission system takes electricity from generation stations and transports it via high-voltage transmission lines to local communities across the province.

In many communities, including your own, **Hydro One** is also responsible for the local distribution system, which delivers electricity to your home, seasonal property, or organization through a network of wires, poles and other equipment.

Hydro One does not generate electricity or set electricity prices.

Hydro One builds and maintains power lines, towers and poles, delivers electricity, reads meters, answers customer calls, responds during outages, and clears trees and brush from power lines.

Portion of the electricity bill that goes to Hydro One

Small Business

Hydro One Customer Engagement Survey

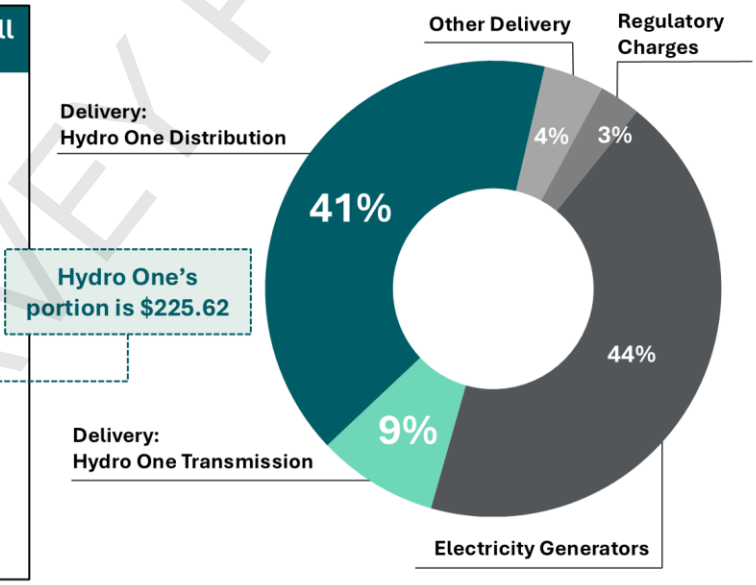
How much of my electricity bill goes to Hydro One?

Every item and charge on your bill is mandated by the provincial government or regulated by the OEB, the provincial energy regulator.

Although **Hydro One** is responsible for collecting payment from you for your entire electricity bill, only a portion goes to Hydro One. As of **July 1, 2025**, for a typical small business customer, about 49% of the bill, or $225.62, goes to Hydro One per month. This amount is split into $186.38 for distribution and $39.24 for transmission.

The rest of your bill payment goes to power generation companies, taxes, and regulatory agencies.

Sample Small Business Monthly Bill
(based on consumption of 2,000 kWh as of July 1, 2025)



Account Number:
0000000000

Meter Number:
00000000

Your Electricity Charges

Electricity	
On-Peak (highest price) @ 18.2 c/kWh	**60.04**
Mid-Peak (mid price) @ 12.2 c/kWh	**43.92**
Off-Peak (lowest price) @ 8.7 c/kWh	**95.76**
Delivery	**245.21**
Regulatory Charges	**13.40**
Total Electricity Charges	**$458.33**
HST	59.58
Ontario Electricity Rebate	**(-$60.04)**
Total Amount	**$457.87**

Hydro One's portion is $225.62

The pie chart above is based on a total bill of $458.33 excluding the Ontario Electricity Rebate and HST. The chart may not total 100% due to rounding.

The sample bill above uses an average consumption level of 2,000kWh per month; however, your usage may vary above or below this assumed level. These types of variations would mostly impact your electricity (On, Mid and Off-Peak) charges.

Summary of Investment Plan

How Hydro One plans

Small Business

Hydro One Customer Engagement Survey

How does Hydro One plan?

Every five years, Hydro One develops comprehensive plans that outline both short-term and long-term system needs. These plans are the combination of thousands of inputs from technical experts and customers.

The three key areas that inform Hydro One's plans are:

- **Customer feedback** collected through both ongoing interactions and specific engagements, such as this.
- Information and input from **internal engineering and technical experts**, who closely monitor the pressures on the system and develop solutions to address these challenges.
- Hydro One's **mandatory legal and regulatory requirements**, including connecting customers, moving equipment, and installing and maintaining customer meters.

What has Hydro One heard from customers so far?

In 2024, Hydro One collected feedback from thousands of customers across Ontario on their needs and priorities for electricity distribution and transmission services. This feedback was used to inform planners in developing the draft investment plans.

In this initial feedback, most customers expressed a desire for Hydro One to:

1. Prioritize **reasonable rates** and **reliable service**.
2. Make investments to **improve or maintain current levels of reliability**.
3. Make **targeted investments to improve reliability** for customers experiencing significantly poorer reliability than average.
4. Make investments to make the system **more resilient to severe weather**.
5. Make investments in technology to **accommodate customer requests and improve visibility into the system** (e.g., where and how much electricity is being used).

SURVEY PAGE

Summary of Investment Plan

Challenges impacting Hydro One's plans

Small Business

Hydro One Customer Engagement Survey

What challenges are impacting Hydro One's plans?

Hydro One is facing challenges that require more resources, new solutions, or growing costs to manage.

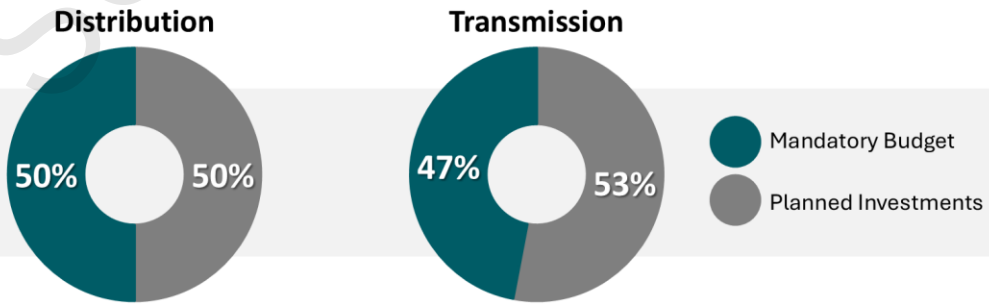
Some of these challenges, like the pace of addressing aging and deteriorating infrastructure are within Hydro One's control. Others, like the frequency of severe weather, are not.

When developing their plans, Hydro One must consider **external pressures**, including:

Increasing demand for electricity

According to the Independent Electricity System Operator (IESO), electricity demand in Ontario is forecasted to increase by 75% by 2050.

In fact, since 2021, growth in the province has far exceeded expectations, and customer requests for new connections have grown considerably: **demand for new connections to Hydro One's distribution system has outpaced projections** by, on average, 21% per year.



Rising cost pressures

Businesses across Ontario are **experiencing significant cost pressures** from factors including tariffs and inflation. Hydro One has been working to offset some of these cost pressures by finding savings and internal efficiencies. In 2024, Hydro One realized approximately $150 million in savings.

How does this impact how Hydro One plans?

Despite increasing demand for electricity, external rising cost pressures, and more frequent severe weather, Hydro One has been working to manage spending within their original budget that was approved by the OEB in 2022. This means that Hydro One has had to delay some planned work to accommodate unexpected higher growth and rising costs.

For the 2028-2032 period, **about half of Hydro One's draft capital budget is committed to work that is necessary to meet mandatory requirements**, including meeting safety, legal, and regulatory requirements, accommodating increased demand for electricity and supporting provincial economic growth.

SURVEY PAGE

Summary of Investment Plan

Objectives Hydro One is focused on

Small Business

Hydro One Customer Engagement Survey

What objectives is Hydro One focused on?

Today, Hydro One has developed draft investment plans that focus on achieving objectives that balance customer feedback, economic growth in Ontario, engineering and technical analysis, and current and emerging pressures on the system.

While Hydro One's draft plans cover both the **distribution system** serving approximately 1.5 million customers, as well as the **transmission system** serving most Ontarians, each system has different needs and objectives.

Some of the highlights of Hydro One's draft plans include:

Distribution Objectives

1. Improving the **day-to-day reliability** of the system by addressing equipment that is at a higher risk of failure.
2. Preparing for the **impacts of severe weather** by investing in vulnerable lines, clearing more overgrown vegetation, and using technology to restore power more quickly.
3. Improving reliability for thousands of customers experiencing below average reliability by investing in **new battery storage technology**.
4. Ensuring the grid is prepared to **keep pace with evolving customer needs** and accommodate higher levels of growth.

Transmission Objectives

1. **Maintaining the overall health** of the transmission system by limiting the risk of equipment failure.
2. **Getting the most out of the system** by reinforcing and extending the life of equipment and limiting the impacts of severe weather.
3. **Keep pace with Ontario's economic development**, including meeting demand for new and expanded industry in the province

One of the benefits of being both the largest distributor and transmitter of electricity in Ontario is the ability to invest in technology systems, buildings, and facilities that benefit both systems.

Some of these shared objectives of Hydro One's draft plan include:

Shared Objectives

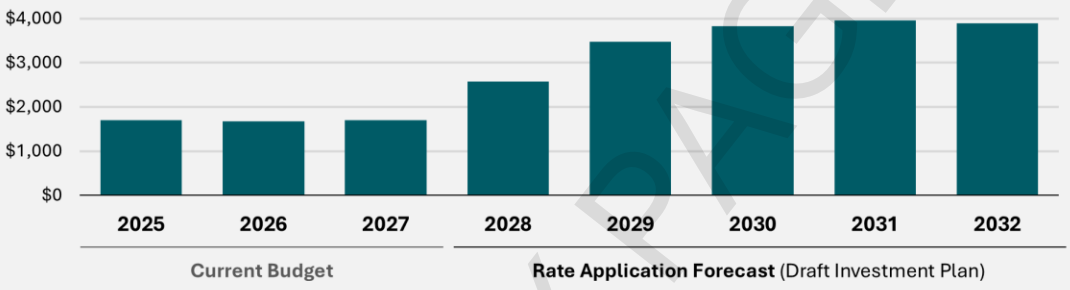
1. **Limiting the risk of potential damage to equipment** by addressing the most at-risk building components and making sites more resilient to severe weather.
2. **Maintaining the company's existing technology systems**, improving operational efficiency and resilience to cybersecurity threats, and **modernizing the system** to provide enhanced services to customers.

SURVEY PAGE

Summary of Investment Plan

Cost of Hydro One's draft distribution plan

Small Business



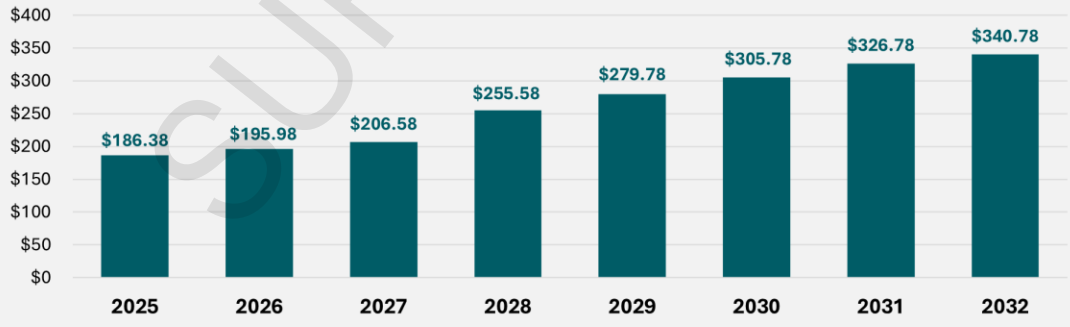
Hydro One Customer Engagement Survey

How much will Hydro One's draft distribution plan cost?

Hydro One has calculated the cost of their draft investment plans, which aim to achieve the objectives highlighted previously and meet Hydro One's legal and regulatory requirements.

The costs for **distribution system** investments are spread among all of Hydro One's 1.5 million distribution customers.

Distribution Budget: Current and Forecasted ($ millions)



The draft distribution investment plan would result in an average annual funding requirement of **$3.5 billion** for **distribution** for 2028-2032.

How will this plan impact the distribution portion of customer bills?

For a typical **small business customer**, the **distribution** portion of their **monthly bill** is estimated to increase from $206.58 in 2027 to $340.78 by the end of 2032 – an increase of **$134.20** on the monthly bill. This represents an average increase of **$26.84** on the monthly bill each year.

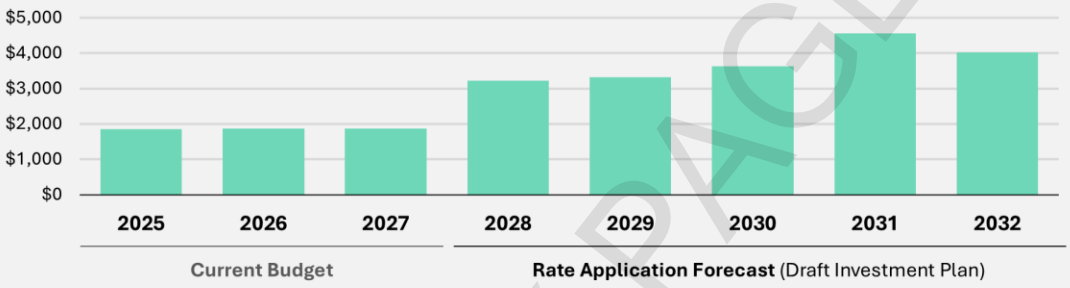
Distribution Portion of Monthly Bill

Note:
- Hydro One's rates until December 31, 2027, were approved by the OEB in an earlier application.
- These estimated rate increases and forecasted budgets are preliminary and are subject to change based on customer feedback, regulatory approval, and other factors.

SURVEY PAGE

Summary of Investment Plan

Cost of Hydro One's draft transmission plan



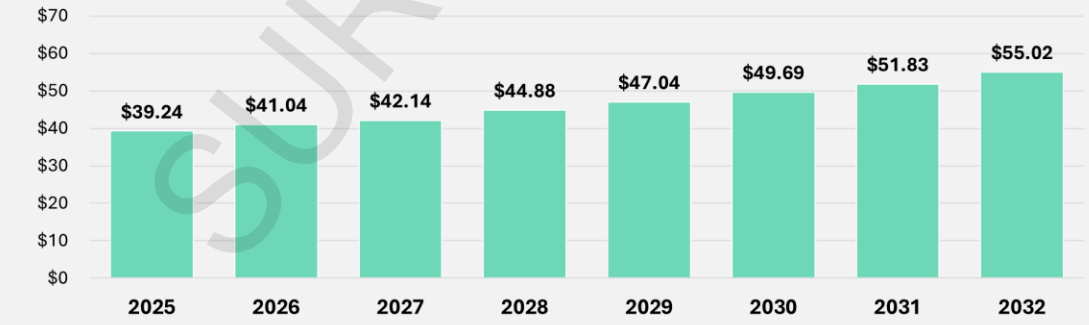
Small Business

Hydro One Customer Engagement Survey

How much will Hydro One's draft transmission plan cost?

For the **transmission system**, investment costs are shared by more than 5 million electricity rate payers in Ontario.

Transmission Budget: Current and Forecasted ($ millions)



The draft transmission investment plan would result in an average annual funding requirement of **$3.8 billion** for **transmission** for 2028-2032.

How will this plan impact the transmission portion of customer bills?

For a typical **small business customer**, the **transmission** portion of their **monthly bill** is estimated to increase from $42.14 in 2027 to $55.02 by the end of 2032 – an increase of **$12.88** on the monthly bill. This represents an average increase of **$2.58** on the monthly bill each year.

Transmission Portion of Monthly Bill

Note:
- Hydro One's rates until December 31, 2027, were approved by the OEB in an earlier application.
- These estimated rate increases and forecasted budgets are preliminary and are subject to change based on customer feedback, regulatory approval, and other factors.

How to make choices

Small Business

Hydro One Customer Engagement Survey

What choices does Hydro One want my input on?

The remainder of this survey asks for your input on the total cost of the draft investment plans, plus **7 key choices** within the plan that Hydro One is looking for your guidance on.

- Each choice has a summary of the options that Hydro One is considering. In many cases, that includes options that would see Hydro One ***spend less*** or ***spend more*** than what is currently being proposed in the draft plan.
- For each option, Hydro One has estimated what impact it would have on customer bills **compared to the draft plan**. These impacts are approximate.
- Following each question, you will also have an opportunity to provide additional feedback if you choose to.
- Once you have finished giving feedback on the key choices, you will have an opportunity to review and change your responses until you feel you have found the right balance between the level of investment and cost for you.

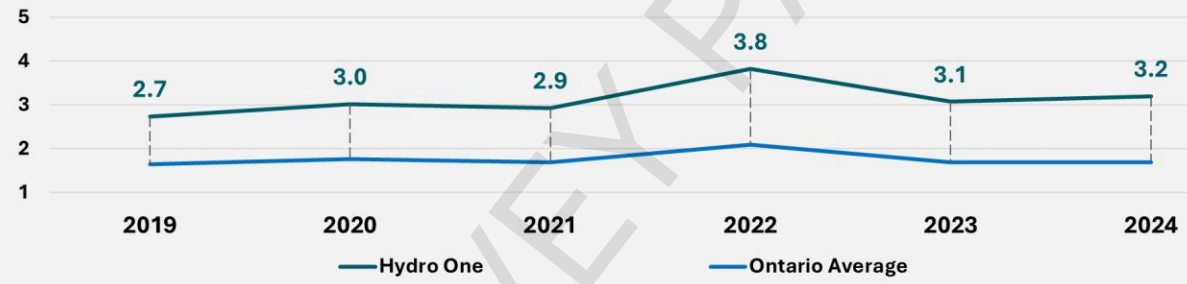
SURVEY PAGE

Summary of Investment Plan

How Hydro One's distribution grid performs

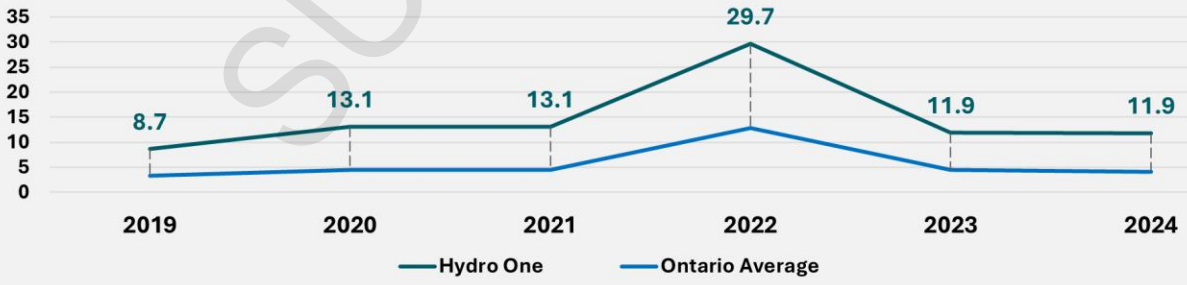
Small Business

Hydro One Customer Engagement Survey



How does Hydro One's distribution grid perform?

Since most Hydro One customers live in rural areas, their distribution system looks different from other Ontario utilities. Serving more sparsely populated communities separated by significant distances means more equipment is needed, outages can take longer to locate, and power can take longer to restore.



On average, between 2019 and 2024, the typical Hydro One customer has experienced 1.4 more outages per year compared to the Ontario average.

Number of Outages (Average Outages Per Customer)

When it comes to the total time spent without electricity per year, the typical Hydro One customer has been without power for 14.7 hours each year on average, which is 9.1 hours more than the Ontario average.

Duration of Outages (Average Hours Per Customer)

Severe weather, **tree contacts**, and **equipment failure** account for most of these outages. Notably, the distribution system experienced widespread outages due to severe weather in both 2022 and again in April 2025.

SURVEY PR

Investment Trade-Offs

Overall system reliability

Small Business

Hydro One Customer Engagement Survey

Overall system reliability

The first investment category is related to the **day-to-day reliability** of Hydro One's **distribution system** that delivers electricity to homes and businesses.

Hydro One typically identifies investments in equipment by taking into consideration the overall age, health, and likelihood of equipment failure.

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to either improve or maintain current levels of reliability related to the distribution grid.

Hydro One generally tries to replace poor condition equipment before it fails. However, when equipment does fail, it can result in significant interruptions for customers.

In the past five years, outside of severe weather events, equipment failure has accounted for about 36% of all hours that Hydro One customers have been without power.

Hydro One's **current draft plan** is focused on improving the day-to-day reliability of the system, outside of severe weather events, by:

- **Repairing or replacing overhead line defects**: Over their 110,000km network of overhead lines, Hydro One has identified close to 500,000 defects such as broken or damaged support cables, leaning poles, or damaged insulators.
- **Maintaining, repairing, or replacing major stations' equipment:** Hydro One operates and maintains approximately 1,000 distribution stations that convert electricity to a lower voltage for safe delivery to homes and businesses. Over **250** of these stations' transformers are in poor condition and at increased risk of failure.
- **Replacing or repairing underground cables:** Hydro One has identified around 13% of all underground cables that are at increased risk of failure. In their current draft plan, Hydro One is proposing to replace or repair 10% of underground cables to reduce the risk of prolonged outages.

Additionally, Hydro One has identified 2% of their approximately 1.6 million wooden poles to be refurbished to extend their useful life.

Eventually, all poor condition or deteriorating equipment will need to be addressed; however, Hydro One would like your feedback on the pace. Doing less of these types of investments now could lead to more frequent or longer outages and higher emergency repair costs in the future. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Maintain current levels of day-to-day reliability	Improve day-to-day reliability by 2032	Further reduce the risk of outages by 2032
	Main Differences Between Plans		
Repairing or replacing overhead line defects	10% of known defects	40% of known defects	70% of known defects
Addressing stations transformers	60 poor condition transformers	90 poor condition transformers	120 poor condition transformers
Replacing or repairing underground cables	7% of all underground cables	10% of all underground cables	13% of all underground cables
Average Monthly Distribution Bill Impact	$5.80 less by 2032 (average of $1.16 less each year)	Included in Draft Plan	$5.80 more by 2032 (average of $1.16 more each year)

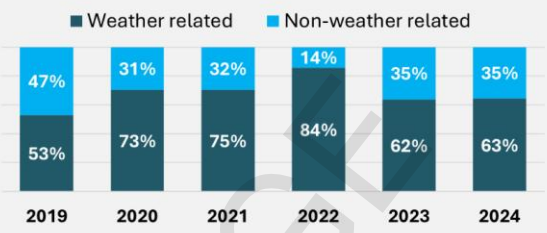
Managing the impacts of severe weather

Small Business

Hydro One Customer Engagement Survey



Managing the impacts of severe weather

hydro one

On average, between 2019 and 2024, severe weather events, such as ice storms, windstorms or thunderstorms, have contributed to 68% of all hours that the typical customer has been without power per year.

Share of Customer Hours Without Power by Cause

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to make the system more resilient to severe weather.

While some weather-related outages will likely be inevitable, in their **current draft plan**, Hydro One is proposing investments in making the system more resilient to severe weather events and generally perform better overall, including:

- **Relocating or reinforcing vulnerable power lines:** Hydro One has identified power lines that are more vulnerable to severe weather. Relocating or reinforcing these lines with more resilient equipment can help reduce future outage risks.
- **Clearing more overgrown trees and brush than historically:** Increasing the rate of clearing trees and brush can help reduce the risk of outages, the leading cause of weather-related outages.
- **Installing more automated "intelligent" switches:** In their draft plan, Hydro One proposes deploying 1,200 new automated switches that can help restore power more quickly from a control room rather than sending a repair crew to patrol the lines. There are currently approximately 1,100 intelligent switches operating across Hydro One's service territory.

While storms will continue to happen, making these proactive investments will help limit the impact of outages. Reducing these types of investments could leave the distribution system more vulnerable to widespread outages and more costly emergency repairs. While doing more could further reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Maintain the current risk of outages and restoration times related to severe weather	Reduce the risk of outages and shorten restoration times related to severe weather	Further reduce the risk of outages and shorten restoration times related to severe weather
	Main Differences Between Plans		
Relocating or reinforcing vulnerable power lines	3% of all power lines	6% of all power lines	9% of all power lines
Clearing overgrown trees and brush	Clear 25% of overgrown vegetation each year	Clear 30% of overgrown vegetation each year	Clear 35% of overgrown vegetation each year
Installing automated switches	750 new switches	1,200 new switches	1,650 new switches
Average Monthly Distribution Bill Impact	$3.80 less by 2032 (average of $0.76 less each year)	Included in Draft Plan	$3.80 more by 2032 (average of $0.76 more each year)

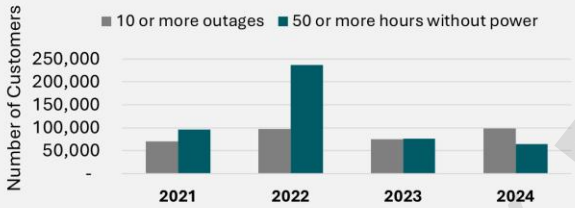
Targeted reliability improvements

Small Business

Hydro One Customer Engagement Survey



Targeted reliability improvements

Hydro One customers experience different levels of reliability depending on where they live, the design of the system, the condition of the equipment supplying them, and weather patterns.

While some Hydro One customers might not have experienced any outages in the last four years, in any given year more than **70,000 customers were without power more than 10 times**, and more than **60,000 customers were in the dark for 50 hours or more**.

Today, rural and remote communities are more likely to experience poorer reliability, and the increased frequency of severe weather events create and will continue to create further challenges.

Number of Customers Experiencing Significantly Poorer Reliability than Average

Community-scale battery storage facility outside of Thunder Bay

In a 2024 survey, a majority of customers said that they want Hydro One to make targeted investments to improve reliability for customers who experience significantly poorer reliability than average.

In their **current draft plan**, Hydro One has developed a program that includes a combination of larger **community-scale** batteries and smaller **individual customer** batteries, which store electricity and provide backup power if an outage does occur.

Batteries are an effective way to target reliability improvements for individual customers and communities that experience the poorest reliability.

At the rate of investment being proposed in the draft plan, Hydro One anticipates reliability improvements for around **10,000** customers. However, based on customer feedback, Hydro One could install more or fewer batteries.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Improve reliability for around 3,500 customers	Improve reliability for around 10,000 customers	Improve reliability for around 13,500 customers

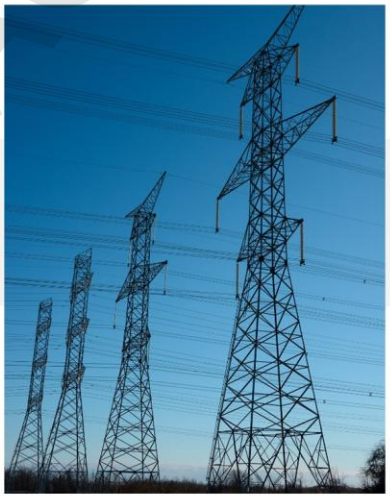
Summary of Investment Plan

Hydro One's transmission system

Small Business

Hydro One Customer Engagement Survey

What is the transmission system and who does it serve?



Let's talk about the provincial transmission system. The transmission system is the highway for Ontario's electricity, bringing power from generation stations to your community.

Hydro One's transmission system serves most electricity customers in Ontario, including distribution companies across the province.

Outages on Hydro One's transmission system have significant impacts on communities and Ontario's economy. As such, the transmission system is designed to minimize both the frequency and duration of outages.

For example, most of Ontario's population centres are served by multiple transmission lines so that if one fails, there is always a backup to keep power flowing.

Since 2019, the typical Ontarian connected to Hydro One's transmission system has experienced, on average, **1 outage per year** related to the transmission system.

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to either increase or maintain current levels of reliability related to the transmission grid.

SURVEY PAGE

Investment Trade-Offs

Keeping pace with transmission renewal

Small Business

Hydro One Customer Engagement Survey

Keeping pace with transmission renewal

Portions of Hydro One's transmission system were built in the 1930s, 40s, and 50s.

Hydro One has identified several types of equipment that are at increased risk of failure due to age and condition and would have widespread impacts if they were to fail.

Transmission station equipment ensures electricity can safely travel from power plants to communities. Hydro One has identified close to 200 out of 700 transmission transformers and 400 out of 4,700 circuit breakers in poor condition that are at increased risk of failure. While an equipment failure may not result in an immediate outage, it leaves the system more vulnerable with limited backup.

Underground transmission cables serve many high-density areas. Hydro One has identified that 20 km of their network of around 270 km of cables are at increased risk of failure. Because of the complex nature of these cables, if they were to fail, the outage impacts would be widespread and time-consuming and costly to repair.

Hydro One's **current draft plan** is focused on managing the risk of equipment failure and supporting growth across the province by:

- **Replacing major transmission station equipment:** In their current draft plan, Hydro One plans to replace 70 of the nearly 200 transformers and 230 of the 400 breakers identified as being in poor condition in order to reduce the risk of failure and costly repairs.
- **Replacing high-impact underground transmission cables:** Replacing all 20 km of the underground cables that Hydro One has identified as being at increased risk of failure could take up to 10 years to complete. In their current draft plan, Hydro One is proposing to begin the replacement of all 20km of these underground cables, with 12km being replaced by 2032.

Eventually, all poor condition or deteriorating equipment will need to be addressed; however, Hydro One would like your feedback on the pace of replacement. Doing less of these types of investments in the near term could lead to more equipment failure and higher emergency repair costs in the future. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Higher risk of equipment failure	Maintain the current risk of equipment failure	Lower risk of equipment failure
	Main Differences Between Plans		
Replacing transformers and breakers	55 transformers & 195 breakers	70 transformers & 230 breakers	85 transformers & 265 breakers
Replacing underground cables	Begin replacing 20km of underground cables	Begin replacing 20km of underground cables, completing 12km by 2032	Replace 20km of underground cables by 2032
Average Monthly Transmission Bill Impact	$1.31 less by 2032 (average of $0.26 less each year)	**Included in Draft Plan**	$1.31 more by 2032 (average of $0.26 more each year)

Hydro One Customer Engagement Survey
Stewardship of the transmission system

Proactive maintenance and system monitoring are among the ways that Hydro One can ensure that equipment lasts as long as possible.

In their **current draft plan**, Hydro One is proposing a series of investments to get the most out of the existing system by:

- **Replacing at-risk transmission lines:** Hydro One has identified that 11% of their approximately 28,000 km of transmission lines are at increased risk of failure due to a combination of age and condition. As these lines are replaced, they are built to modern standards that are more resilient to severe weather.
- **Reinforcing wood poles and extending the life of steel towers:** Hydro One has identified that over 23,000 of their nearly 90,000 wood poles and steel transmission towers are at the end of their expected service life. In the current draft plan, Hydro One is proposing reinforcing or extending the life of many of these structures.
- **Increasing the rate of clearing overgrown trees and brush:** Contact with vegetation accounts for a significant portion of transmission outages and increasing the rate of clearing trees and brush can help reduce the risk of outages.

Additionally, Hydro One is proposing investments in new satellite technology that can help better monitor trees and brush encroaching on infrastructure, further helping reduce the risk of outages.

These investments would be complementary to the ongoing renewal of aging or poor condition equipment, as discussed earlier.

These investments are designed to reduce the risk of major equipment failures, outages, and emergency repair costs over time. Delaying or scaling back these investments will reduce short-term costs but may increase the likelihood of unplanned outages and result in more costly reactive repairs. While doing more could further reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Higher risk of equipment failure and impacts of severe weather compared to the draft plan	Lower the current risk of equipment failure and impacts of severe weather	Further lower risk of equipment failure and impacts of severe weather compared to the draft plan
	Main Differences Between Plans		
Replacing at-risk transmission lines	Replace 1,000 km of at-risk lines	Replace 1,400 km of at-risk lines	Replace 1,800 km of at-risk lines
Reinforcing wood poles and extending the life of steel towers	2,500 wood poles and 1,500 steel towers	6,000 wood poles and 2,750 steel towers	9,500 wood poles and 4,000 steel towers
Clearing overgrown trees and brush	Clear 16% (3,100 km) of overgrown vegetation each year	Clear 17% (3,400 km) of overgrown vegetation each year	Clear 18% (3,700 km) of overgrown vegetation each year
Average Monthly Transmission Bill Impact	$1.05 less by 2032 (average of $0.21 less each year)	**Included in Draft Plan**	$1.05 more by 2032 (average of $0.21 more each year)

Investment Trade-Offs

Maintaining buildings and facilities

Small Business

Hydro One Customer Engagement Survey

Maintaining buildings and facilities

There are certain parts of Hydro One's draft plans that benefit both the transmission and local distribution systems. While the transmission portion of those investments is paid by most Ontarians, the distribution portion is paid by Hydro One customers only.

Hydro One operates and maintains approximately 1,500 facilities across Ontario.

In addition to housing Hydro One's nearly 10,000 employees, these facilities store specialized fleet equipment including bucket trucks and helicopters, protect sensitive equipment, serve as central dispatch for crews, act as training and development campuses, and allow experts to remotely monitor and operate the grid.

Each year, Hydro One classifies their building components into one of three categories – ***high risk***, ***medium risk*** or ***low risk***. This considers both the likelihood of failure and how critical the component is. For instance, a roof that is beyond its useful life and houses critical equipment would be deemed ***high risk***. Whereas older office equipment may be classified as ***low risk***.

In 2025, 25% of Hydro One's building components were assessed as either high or medium-risk.

In their **current draft plan**, Hydro One is focused on:

- **Addressing at-risk building components**: In their current draft plan, Hydro One plans to address 50% of high to medium-risk building components, prioritizing those that are most critical.
- **Making at-risk sites more resilient to severe weather**: In their draft plan, Hydro One plans to invest in reducing flooding risks at 2 of out 12 at-risk sites. For example, in 2024, severe rain flooded a transmission station, resulting in outages for nearly 170,000 customers.

Flooding at a Hydro One transmission station in 2024

- **Repairing or retrofitting field offices**: Many facilities that serve as dispatch for Hydro One crews were built more than 50 years ago. Since then, standards for accessibility have changed considerably. In their draft plan, Hydro One plans to invest in 70 of their 115 facilities that no longer meet modern standards.

Doing less of these types of investments now could increase the number of reactive repairs to facilities, as well as increase the risk of more frequent outages caused by severe weather and longer crew dispatch times. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Lower risk of critical asset failures, but address fewer aging field facilities than the draft plan	Lower risk of critical asset failures and make progress on addressing aging field facilities	Further lower risk of asset failures and address more aging field facilities than the draft plan
	Main Differences Between Plans		
Addressing at-risk building components	Same as draft plan	50% of at-risk building components	57% of at-risk building components
Making at-risk sites more resilient	Same as draft plan	2 at-risk sites	8 at-risk sites
Repairing or retrofitting facilities	50 facilities	70 facilities	90 facilities
Average Monthly Distribution Bill Impact	$1.00 less by 2032 (average of $0.20 less each year)	Included in Draft Plan	$0.80 more by 2032 (average of $0.16 more each year)
Average Monthly Transmission Bill Impact	$0.05 less by 2032 (average of $0.01 less each year)		$0.16 more by 2032 (average of $0.03 more each year)

Investment Trade-Offs
Information technology

Small Business

Hydro One Customer Engagement Survey
Information technology

hydro one

Hydro One's daily operations require technology systems for all aspects of their business, including billing, operating the grid, responding to outages, planning projects, and communicating with customers.

When deciding the right level of information technology (I.T.) investment, Hydro One must balance various factors, including the cost of new or updated systems, the risks related to current systems, and the benefits that new technologies could bring to the company and customers.

Hydro One's current draft plan is focused on:

- **Maintaining the current state of technology systems**: Like with poles and wires, technology systems need to be maintained so that crews can restore power and customers can access key services like their online account and the outage restoration map.
- **Enhancing customer service**: I.T. investments and advanced data can help Hydro One offer better services to customers, improve estimated restoration times during outages and notify customers when service will be back online.
- **Improving Hydro One's operational efficiency**: Investments in technology systems can help Hydro One dispatch crews and perform their work more effectively.
- **Protecting the grid from both cyber and physical security threats**: Investments in new technologies can provide more robust protection against external threats, enhancing the resilience of critical system infrastructure.

While a significant portion of Hydro One's I.T. budget is allocated to meet safety, legal, and regulatory requirements, Hydro One could defer investments focused on enhancing customer service, improving efficiency, and expanding capabilities beyond 2032.

Deferring these types of investments would delay these benefits and potentially limit Hydro One's ability to accommodate newer technologies in the future.

Which of the following options do you prefer?

	Spend Less	Draft Plan
	Maintain the current state of technology systems but make fewer investments to enhance service and efficiencies	Maintain the current state of technology systems while modernizing capabilities to enhance service and efficiencies
	Main Differences Between Plans	
Customer service	Limit or delay investments in systems focused on enhancing customer service	Invest in systems focused on enhancing customer service
Operational efficiency	Limit or delay investments in systems focused on improving operational efficiency	Invest in systems focused on improving operational efficiency
Average Monthly Distribution Bill Impact	$1.20 less by 2032 (average of $0.24 less each year)	**Included in Draft Plan**
Average Monthly Transmission Bill Impact	$0.34 less by 2032 (average of $0.07 less each year)

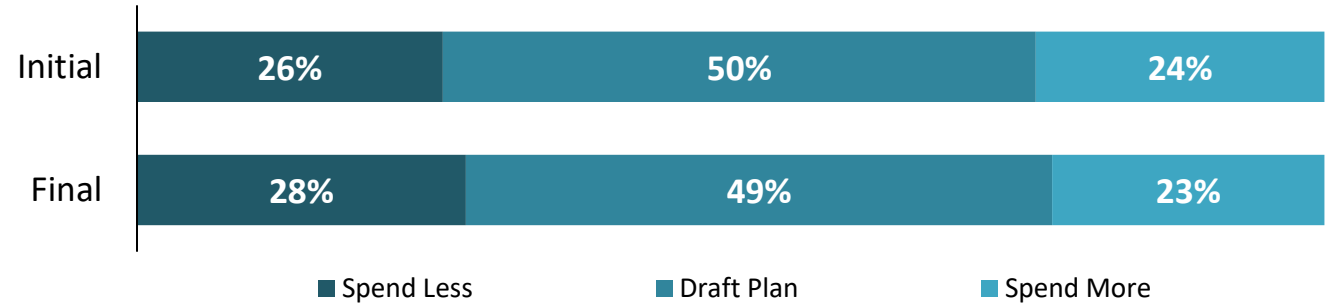
Hydro One Customer Engagement Survey

What is the impact of my choices?

hydro one

Throughout this survey, you have been asked about 7 key choices. Below is a summary of your choices.

At the bottom of this page, you will find the total bill impact of all your answers. You can change your responses if you desire, and the estimated impact on your bill will be recalculated.



The bill impacts associated with each choice represent the average increase on your monthly bill from 2027 to 2032, followed by the average increase on your monthly bill each year. The impacts under the "spend less" or "spend more" options are relative to the bill impact of the draft plan.

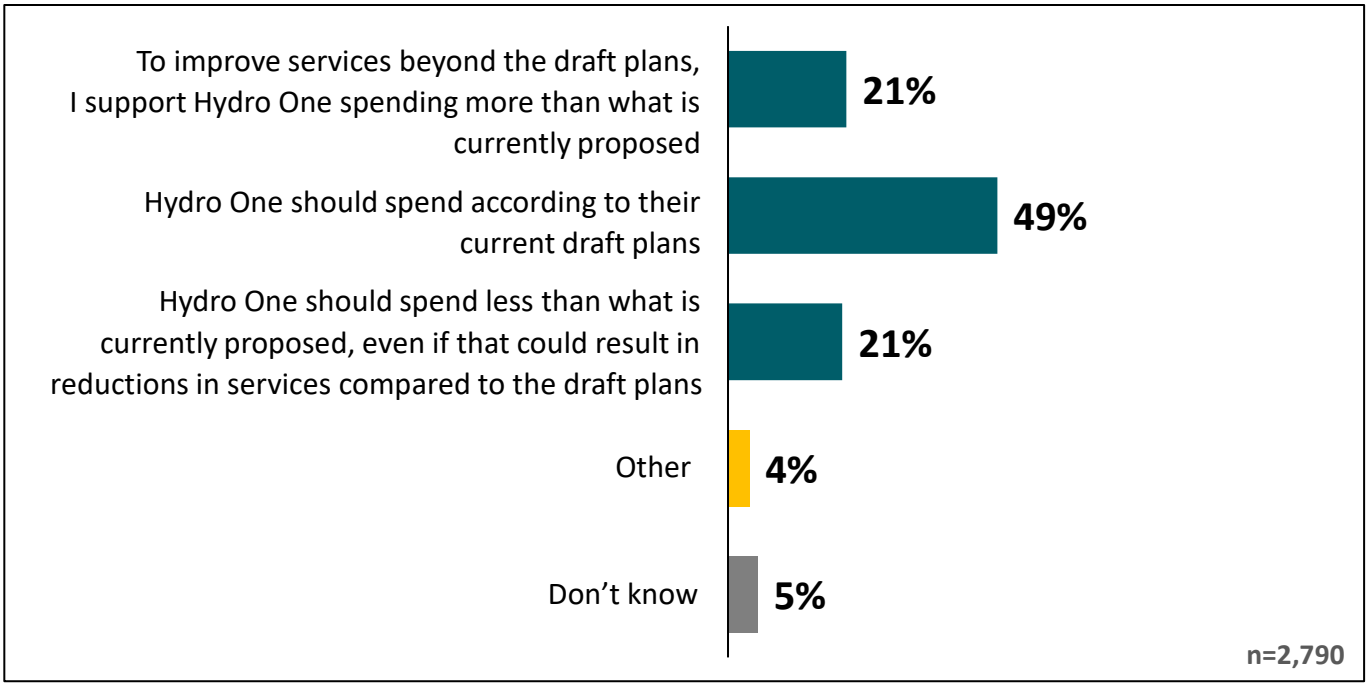
Hydro One Customer Engagement Survey

Evaluating Hydro One's 2028-2032 draft plan

Hydro One has calculated an overall cost for their draft plans. While the plans may change based on feedback from the earlier questions in this survey, Hydro One would like to know how you feel about the overall draft plans.

It is estimated that a typical **small business customer** would see:



- The **distribution** portion of their **monthly bill** increase from $206.58 in 2027 to $340.78 by the end of 2032 – an increase of **$134.20** on the monthly bill. This represents an average increase of **$26.84** on the monthly bill each year.
- The **transmission** portion of their **monthly bill** increase from $42.14 in 2027 to $55.02 by the end of 2032 – an increase of **$12.88** on the monthly bill. This represents an average increase of **$2.58** on the monthly bill each year.

Commercial & Industrial Customers

Online Survey Results

Section 5

Online Survey
Methodology

Field Dates

The **Commercial & Industrial Online Survey** was sent to all Hydro One commercial & industrial customers with an available email address. Customers had an opportunity to complete the survey between **November 14th and December 22nd, 2025**.

Each customer received a unique URL that could be linked back to their average monthly demand, region and rate class. Survey pages that differed by customer type are identified as GSd (general service demand), ST-Low (sub transmission low), ST-Med (sub transmission medium), and ST-High (sub transmission high) versions throughout this report.

In total, the commercial & industrial survey was sent to **5,105** customers from *customerexperience@hydroone.com*. A total of four reminder emails were sent on a rolling basis over the survey field window to those who had not yet completed the survey.

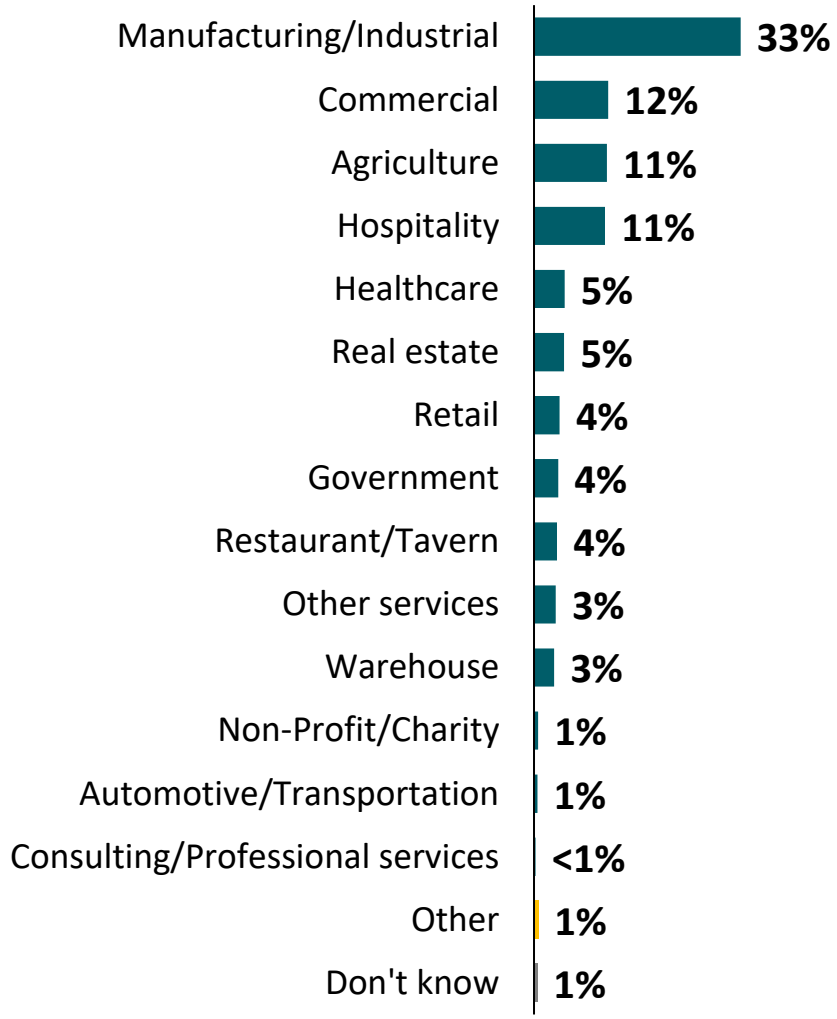
Commercial & Industrial Online Survey Completes

A total of **368** (unweighted) Hydro One commercial & industrial customers completed the online survey.

Sample Weighting

The commercial & industrial online survey sample was weighted to n=350 proportionately by consumption quartile and region in order to be representative of the broader Hydro One customer base.

The table below summarizes the unweighted and weighted (in brackets) sample breakdown by consumption quartile and region. Totals may not correspond with cell values as some customers are missing region or consumption quartile information. Weights are calculated based off of all available information for a given customer.



Region	Consumption Quartiles				Total
	First	Second	Third	Fourth	
West	32 (25)	28 (27)	30 (22)	34 (24)	124 (98)
Central	28 (25)	20 (21)	26 (23)	24 (21)	98 (90)
Central East	20 (22)	13 (17)	21 (24)	15 (16)	69 (78)
East	10 (9)	10 (11)	8 (7)	18 (15)	46 (43)
North	6 (7)	8 (11)	8 (11)	9 (12)	31 (40)
Total	96 (88)	79 (87)	93 (87)	100 (88)	368 (350)

Note: *Graphs and tables may not always total 100% due to rounding values other than any error in data. Sums are added before rounding numbers. Caution interpreting results with small n-sizes.*

Hydro One Customer Engagement Survey

Welcome to Hydro One's customer engagement survey!

As Hydro One plans for the future, they need your input on choices that will impact the services you receive and the rates you pay.

- **Hydro One is looking for your feedback on their draft investment plans** for the years 2028 to 2032 to ensure they make spending decisions that matter to you, the customer.
- **You don't need to be an electricity expert to complete this survey.** It focuses on basic choices and provides the background information you need to answer the questions.
- The survey will take approximately 20-30 minutes to complete. If you need to pause and return later to finish the survey, your progress will be saved. If you are reading this on a mobile device, you may want to consider switching to a tablet or laptop so that it is easier for you to read.

While you may have multiple accounts with **Hydro One**, for this survey, we want you to think about your overall experience as a large business customer.

Note: *The estimates throughout this survey are for illustrative purposes only and may not reflect the actual size of your organization's monthly electricity bill.*

For the purpose of this exercise, the estimates are based on a typical customer in the general service demand rate class with an average monthly demand of 110 kW and average monthly consumption of 34,334 kWh.

All individual responses will be kept confidential.
Innovative Research Group (www.innovativeresearch.ca), an independent research company, has been hired by Hydro One to gather your feedback while protecting your confidentiality. Your individual answers will not be shared with Hydro One in any identifiable way.

SURVEY PAGE

Hydro One Customer Engagement Survey
What is this survey about?

Hydro One is funded by the rates paid by their customers. Every five years, Hydro One is required to file an application with the Ontario Energy Board (OEB), the energy regulator in Ontario, to set rates. Hydro One's next rate application will cover the years 2028-2032.

In this process, Hydro One's rate application will be examined in detail and Hydro One must demonstrate that customer needs and priorities were factored into their investment planning process.

Today, Hydro One wants your feedback on their draft investment plans, including specific investment choices where they need customer input. This feedback, along with other input, will be used to help Hydro One's planners refine and finalize the draft investment plans.

Next year, Hydro One will present their proposed plans and input provided by customers to the OEB.

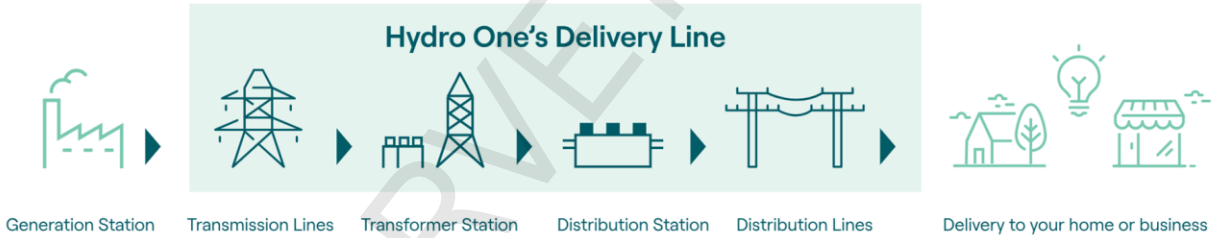
Hydro One's role in Ontario's electricity system

Commercial & Industrial

SURVEY PAGE



Hydro One Customer Engagement Survey

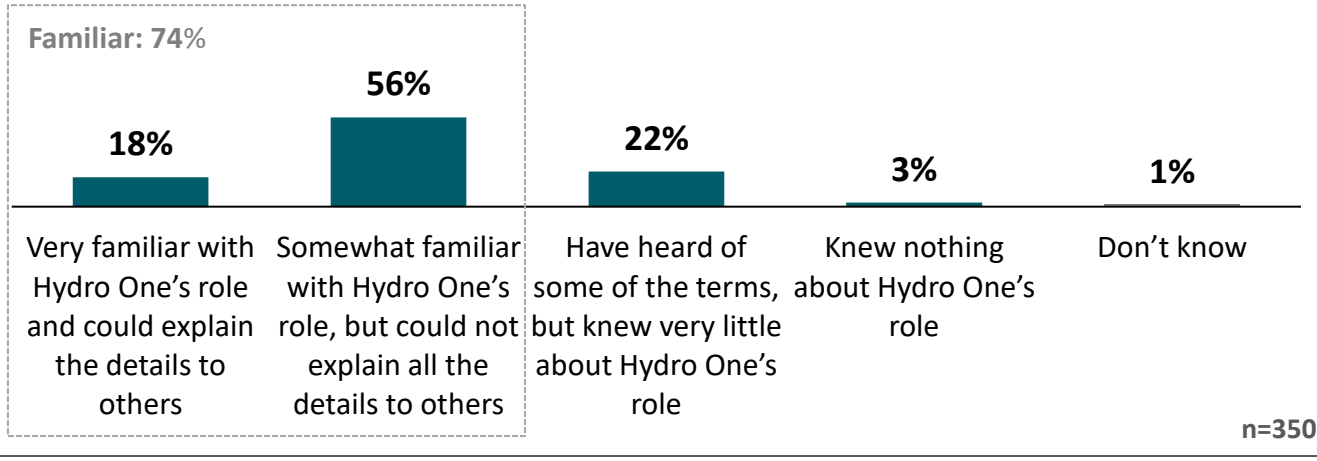
What is Hydro One's role in Ontario's electricity system?

Ontario's electricity system has three key components: **generation**, **transmission** and **distribution**.

Hydro One's transmission system takes electricity from generation stations and transports it via high-voltage transmission lines to local communities across the province.

In many communities, including your own, **Hydro One** is also responsible for the local distribution system, which delivers electricity to your home, seasonal property, or organization through a network of wires, poles and other equipment.

Hydro One does not generate electricity or set electricity prices.



Hydro One builds and maintains power lines, towers and poles, delivers electricity, reads meters, answers customer calls, responds during outages, and clears trees and brush from power lines.

Portion of the electricity bill that goes to Hydro One

Commercial & Industrial

GSd Version

Hydro One Customer Engagement Survey

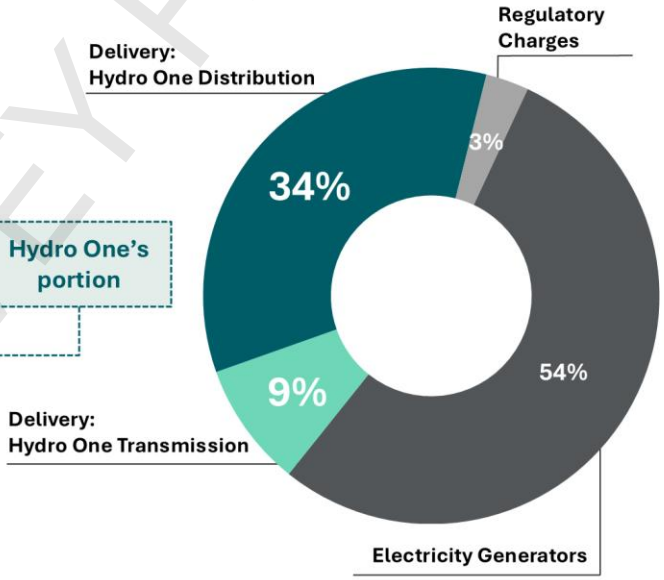
How much of my electricity bill goes to Hydro One?

hydro one

Every item and charge on your bill is mandated by the provincial government or regulated by the OEB, the provincial energy regulator.

Although **Hydro One** is responsible for collecting payment from you for your entire electricity bill, only a portion goes to Hydro One. As of **July 1, 2025**, for a typical general service demand customer, about 43% of the bill, or $3,093.42, goes to Hydro One per month. This amount is split into $2,459.41 for distribution and $634.01 for transmission.

The rest of your bill payment goes to power generation companies, taxes, and regulatory agencies.



Sample Monthly Bill
(based on consumption of 34,334 kWh and demand of 110 kW as of July 1, 2025)

Account Number:
0000000000

Meter Number:
00000000

Your Electricity Charges	
Electricity	3,856.35
Delivery	3,093.42
Regulatory Charges	218.82
Total Electricity Charges	$7,168.59
HST	931.92
Total Amount	$8,100.51

Hydro One's portion

The pie chart above is based on a total bill of $7,168.59 excluding HST. The chart may not total 100% due to rounding.

The sample bill above uses an average consumption level of 34,334 kWh and demand of 110 kW per month; however, your usage may vary above or below this assumed level. These types of variations would mostly impact your electricity charges.

Summary of Investment Plan

How Hydro One plans

Commercial & Industrial

Hydro One Customer Engagement Survey

How does Hydro One plan?

Every five years, Hydro One develops comprehensive plans that outline both short-term and long-term system needs. These plans are the combination of thousands of inputs from technical experts and customers.

The three key areas that inform Hydro One's plans are:

- **Customer feedback** collected through both ongoing interactions and specific engagements, such as this.
- Information and input from **internal engineering and technical experts**, who closely monitor the pressures on the system and develop solutions to address these challenges.
- Hydro One's **mandatory legal and regulatory requirements**, including connecting customers, moving equipment, and installing and maintaining customer meters.

What has Hydro One heard from customers so far?

In 2024, Hydro One collected feedback from thousands of customers across Ontario on their needs and priorities for electricity distribution and transmission services. This feedback was used to inform planners in developing the draft investment plans.

In this initial feedback, most customers expressed a desire for Hydro One to:

1. Prioritize **reasonable rates** and **reliable service**.
2. Make investments to **improve or maintain current levels of reliability**.
3. Make **targeted investments to improve reliability** for customers experiencing significantly poorer reliability than average.
4. Make investments to make the system **more resilient to severe weather**.
5. Make investments in technology to **accommodate customer requests and improve visibility into the system** (e.g., where and how much electricity is being used).

SURVEY PAGE

Summary of Investment Plan

Challenges impacting Hydro One's plans

Commercial & Industrial

Hydro One Customer Engagement Survey

What challenges are impacting Hydro One's plans?

Hydro One is facing challenges that require more resources, new solutions, or growing costs to manage.

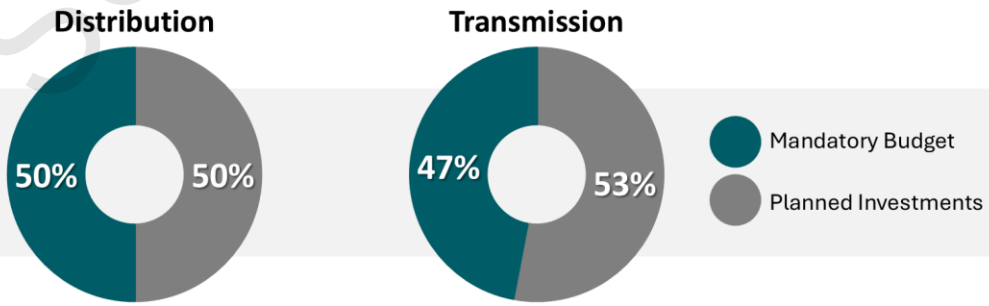
Some of these challenges, like the pace of addressing aging and deteriorating infrastructure are within Hydro One's control. Others, like the frequency of severe weather, are not.

When developing their plans, Hydro One must consider **external pressures**, including:

Increasing demand for electricity

According to the Independent Electricity System Operator (IESO), electricity demand in Ontario is forecasted to increase by 75% by 2050.

In fact, since 2021, growth in the province has far exceeded expectations, and customer requests for new connections have grown considerably: **demand for new connections to Hydro One's distribution system has outpaced projections** by, on average, 21% per year.



Rising cost pressures

Businesses across Ontario are **experiencing significant cost pressures** from factors including tariffs and inflation. Hydro One has been working to offset some of these cost pressures by finding savings and internal efficiencies. In 2024, Hydro One realized approximately $150 million in savings.

How does this impact how Hydro One plans?

Despite increasing demand for electricity, external rising cost pressures, and more frequent severe weather, Hydro One has been working to manage spending within their original budget that was approved by the OEB in 2022. This means that Hydro One has had to delay some planned work to accommodate unexpected higher growth and rising costs.

For the 2028-2032 period, **about half of Hydro One's draft capital budget is committed to work that is necessary to meet mandatory requirements**, including meeting safety, legal, and regulatory requirements, accommodating increased demand for electricity and supporting provincial economic growth.

SURVEY PAGE

Summary of Investment Plan

Objectives Hydro One is focused on

Commercial & Industrial

Hydro One Customer Engagement Survey

What objectives is Hydro One focused on?

Today, Hydro One has developed draft investment plans that focus on achieving objectives that balance customer feedback, economic growth in Ontario, engineering and technical analysis, and current and emerging pressures on the system.

While Hydro One's draft plans cover both the **distribution system** serving approximately 1.5 million customers, as well as the **transmission system** serving most Ontarians, each system has different needs and objectives.

Some of the highlights of Hydro One's draft plans include:

Distribution Objectives

1. Improving the **day-to-day reliability** of the system by addressing equipment that is at a higher risk of failure.
2. Preparing for the **impacts of severe weather** by investing in vulnerable lines, clearing more overgrown vegetation, and using technology to restore power more quickly.
3. Improving reliability for thousands of customers experiencing below average reliability by investing in **new battery storage technology**.
4. Ensuring the grid is prepared to **keep pace with evolving customer needs** and accommodate higher levels of growth.

Transmission Objectives

1. **Maintaining the overall health** of the transmission system by limiting the risk of equipment failure.
2. **Getting the most out of the system** by reinforcing and extending the life of equipment and limiting the impacts of severe weather.
3. **Keep pace with Ontario's economic development**, including meeting demand for new and expanded industry in the province

One of the benefits of being both the largest distributor and transmitter of electricity in Ontario is the ability to invest in technology systems, buildings, and facilities that benefit both systems.

Some of these shared objectives of Hydro One's draft plan include:

Shared Objectives

1. **Limiting the risk of potential damage to equipment** by addressing the most at-risk building components and making sites more resilient to severe weather.
2. **Maintaining the company's existing technology systems**, improving operational efficiency and resilience to cybersecurity threats, and **modernizing the system** to provide enhanced services to customers.

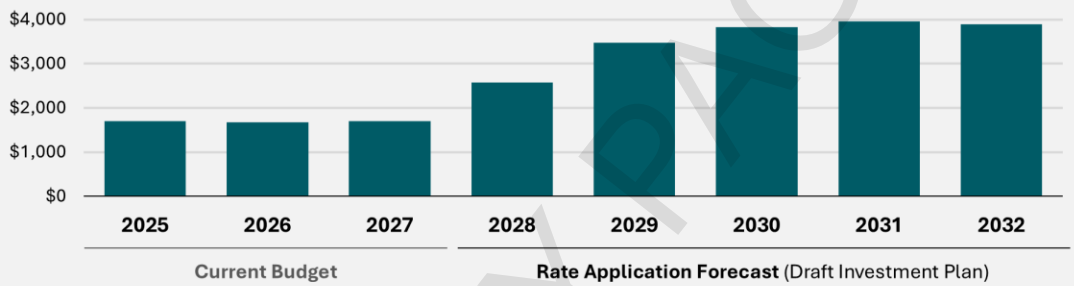
Summary of Investment Plan

Cost of Hydro One's draft distribution plan

Commercial & Industrial

GSd Version



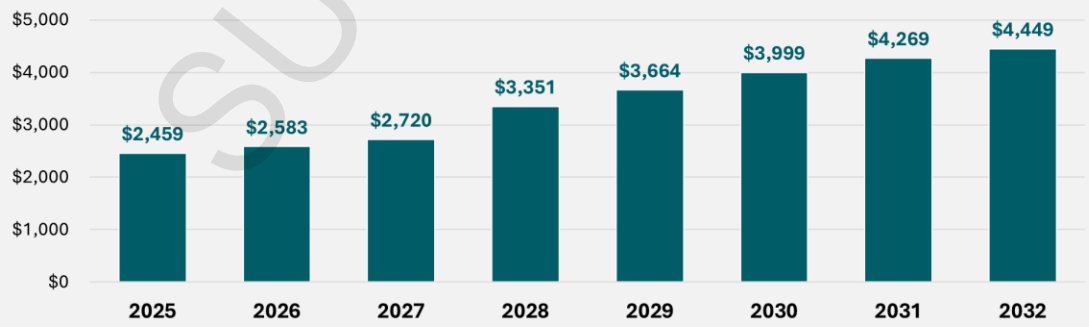
Hydro One Customer Engagement Survey

How much will Hydro One's draft distribution plan cost?

Hydro One has calculated the cost of their draft investment plans, which aim to achieve the objectives highlighted previously and meet Hydro One's legal and regulatory requirements.

The costs for **distribution system** investments are spread among all of Hydro One's 1.5 million distribution customers.

Distribution Budget: Current and Forecasted ($ millions)



The draft distribution investment plan would result in an average annual funding requirement of **$3.5 billion** for **distribution** for 2028-2032.

How will this plan impact the distribution portion of customer bills?

For a typical **general service demand customer**, the **distribution** portion of their **monthly bill** is estimated to increase from $2,720 in 2027 to $4,449 by the end of 2032 – an increase of **$1,729** on the monthly bill. This represents an average increase of **$346** on the monthly bill each year.

Distribution Portion of Monthly Bill

Note:
- Hydro One's rates until December 31, 2027, were approved by the OEB in an earlier application.
- These estimated rate increases and forecasted budgets are preliminary and are subject to change based on customer feedback, regulatory approval, and other factors.

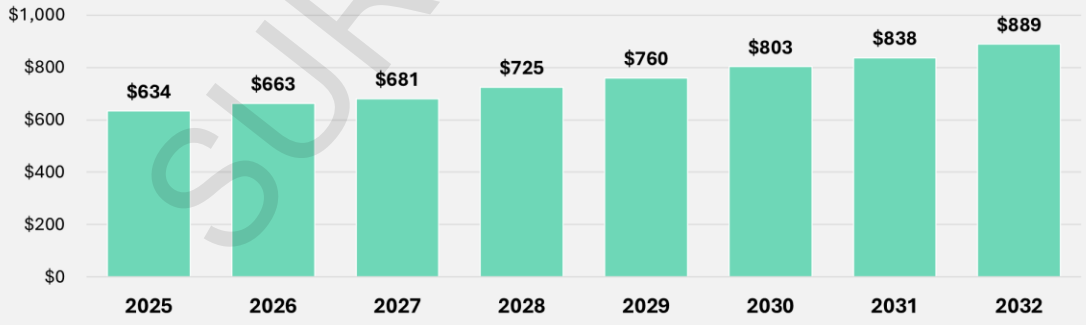
hydro one

For the **transmission system**, investment costs are shared by more than 5 million electricity rate payers in Ontario.

Transmission Budget: Current and Forecasted ($ millions)



The draft transmission investment plan would result in an average annual funding requirement of **$3.8 billion** for **transmission** for 2028-2032.

How will this plan impact the transmission portion of customer bills?

For a typical **general service demand customer**, the **transmission** portion of their **monthly bill** is estimated to increase from $681 in 2027 to $889 by the end of 2032 – an increase of **$208** on the monthly bill. This represents an average increase of **$42** on the monthly bill each year.

Transmission Portion of Monthly Bill

Note:
- Hydro One's rates until December 31, 2027, were approved by the OEB in an earlier application.
- These estimated rate increases and forecasted budgets are preliminary and are subject to change based on customer feedback, regulatory approval, and other factors.

What choices does Hydro One want my input on?

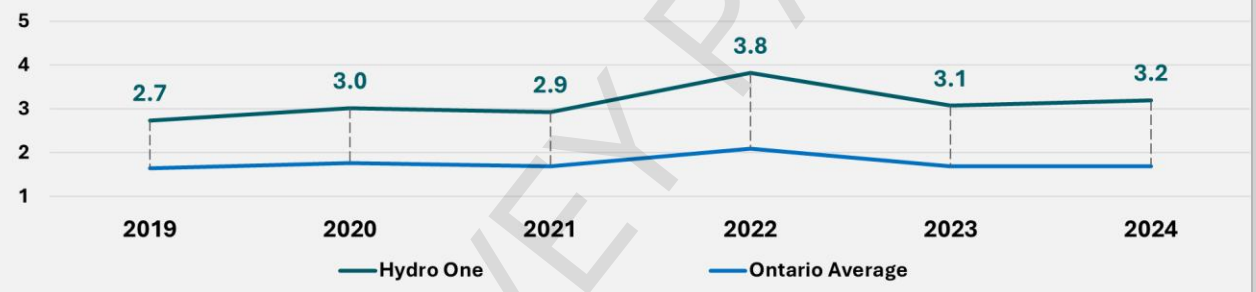
hydro one

The remainder of this survey asks for your input on the total cost of the draft investment plans, plus **7 key choices** within the plan that Hydro One is looking for your guidance on.

- Each choice has a summary of the options that Hydro One is considering. In many cases, that includes options that would see Hydro One ***spend less*** or ***spend more*** than what is currently being proposed in the draft plan.
- For each option, Hydro One has estimated what impact it would have on customer bills **compared to the draft plan**. These impacts are approximate.
- Following each question, you will also have an opportunity to provide additional feedback if you choose to.
- Once you have finished giving feedback on the key choices, you will have an opportunity to review and change your responses until you feel you have found the right balance between the level of investment and cost for you.

SURVEY PAGE

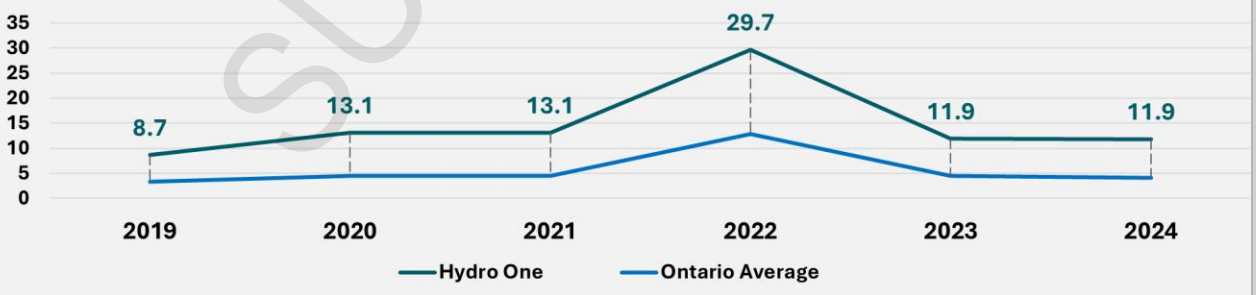
Hydro One Customer Engagement Survey



How does Hydro One's distribution grid perform?

Since most Hydro One customers live in rural areas, their distribution system looks different from other Ontario utilities. Serving more sparsely populated communities separated by significant distances means more equipment is needed, outages can take longer to locate, and power can take longer to restore.

On average, between 2019 and 2024, the typical Hydro One customer has experienced 1.4 more outages per year compared to the Ontario average.



Number of Outages (Average Outages Per Customer)

When it comes to the total time spent without electricity per year, the typical Hydro One customer has been without power for 14.7 hours each year on average, which is 9.1 hours more than the Ontario average.

Duration of Outages (Average Hours Per Customer)

Severe weather, **tree contacts**, and **equipment failure** account for most of these outages. Notably, the distribution system experienced widespread outages due to severe weather in both 2022 and again in April 2025.

SURVEY PAGE

Hydro One Customer Engagement Survey

Overall system reliability

The first investment category is related to the **day-to-day reliability** of Hydro One's **distribution system** that delivers electricity to homes and businesses.

Hydro One typically identifies investments in equipment by taking into consideration the overall age, health, and likelihood of equipment failure.

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to either improve or maintain current levels of reliability related to the distribution grid.

Hydro One generally tries to replace poor condition equipment before it fails. However, when equipment does fail, it can result in significant interruptions for customers.

In the past five years, outside of severe weather events, equipment failure has accounted for about 36% of all hours that Hydro One customers have been without power.

Hydro One's **current draft plan** is focused on improving the day-to-day reliability of the system, outside of severe weather events, by:

- **Repairing or replacing overhead line defects**: Over their 110,000km network of overhead lines, Hydro One has identified close to 500,000 defects such as broken or damaged support cables, leaning poles, or damaged insulators.
- **Maintaining, repairing, or replacing major stations' equipment:** Hydro One operates and maintains approximately 1,000 distribution stations that convert electricity to a lower voltage for safe delivery to homes and businesses. Over **250** of these stations' transformers are in poor condition and at increased risk of failure.
- **Replacing or repairing underground cables:** Hydro One has identified around 13% of all underground cables that are at increased risk of failure. In their current draft plan, Hydro One is proposing to replace or repair 10% of underground cables to reduce the risk of prolonged outages.

Additionally, Hydro One has identified 2% of their approximately 1.6 million wooden poles to be refurbished to extend their useful life.

Eventually, all poor condition or deteriorating equipment will need to be addressed; however, Hydro One would like your feedback on the pace. Doing less of these types of investments now could lead to more frequent or longer outages and higher emergency repair costs in the future. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Maintain current levels of day-to-day reliability	Improve day-to-day reliability by 2032	Further reduce the risk of outages by 2032
	Main Differences Between Plans		
Repairing or replacing overhead line defects	10% of known defects	40% of known defects	70% of known defects
Addressing stations transformers	60 poor condition transformers	90 poor condition transformers	120 poor condition transformers
Replacing or repairing underground cables	7% of all underground cables	10% of all underground cables	13% of all underground cables
Average Monthly Distribution Bill Impact	$75 less by 2032 (average of $15 less each year)	Included in Draft Plan	$75 more by 2032 (average of $15 more each year)

Hydro One Customer Engagement Survey

Managing the impacts of severe weather

hydro one

On average, between 2019 and 2024, severe weather events, such as ice storms, windstorms or thunderstorms, have contributed to 68% of all hours that the typical customer has been without power per year.

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to make the system more resilient to severe weather.

While some weather-related outages will likely be inevitable, in their **current draft plan**, Hydro One is proposing investments in making the system more resilient to severe weather events and generally perform better overall, including:

- **Relocating or reinforcing vulnerable power lines:** Hydro One has identified power lines that are more vulnerable to severe weather. Relocating or reinforcing these lines with more resilient equipment can help reduce future outage risks.
- **Clearing more overgrown trees and brush than historically:** Increasing the rate of clearing trees and brush can help reduce the risk of outages, the leading cause of weather-related outages.
- **Installing more automated "intelligent" switches:** In their draft plan, Hydro One proposes deploying 1,200 new automated switches that can help restore power more quickly from a control room rather than sending a repair crew to patrol the lines. There are currently approximately 1,100 intelligent switches operating across Hydro One's service territory.

While storms will continue to happen, making these proactive investments will help limit the impact of outages. Reducing these types of investments could leave the distribution system more vulnerable to widespread outages and more costly emergency repairs. While doing more could further reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Maintain the current risk of outages and restoration times related to severe weather	Reduce the risk of outages and shorten restoration times related to severe weather	Further reduce the risk of outages and shorten restoration times related to severe weather
	Main Differences Between Plans

Targeted reliability improvements

Hydro One customers experience different levels of reliability depending on where they live, the design of the system, the condition of the equipment supplying them, and weather patterns.

While some Hydro One customers might not have experienced any outages in the last four years, in any given year more than **70,000 customers were without power more than 10 times**, and more than **60,000 customers were in the dark for 50 hours or more**.

Today, rural and remote communities are more likely to experience poorer reliability, and the increased frequency of severe weather events create and will continue to create further challenges.

Number of Customers Experiencing Significantly Poorer Reliability than Average

Community-scale battery storage facility outside of Thunder Bay

In a 2024 survey, a majority of customers said that they want Hydro One to make targeted investments to improve reliability for customers who experience significantly poorer reliability than average.

In their **current draft plan**, Hydro One has developed a program that includes a combination of larger **community-scale** batteries and smaller **individual customer** batteries, which store electricity and provide backup power if an outage does occur.

Batteries are an effective way to target reliability improvements for individual customers and communities that experience the poorest reliability.

At the rate of investment being proposed in the draft plan, Hydro One anticipates reliability improvements for around **10,000** customers. However, based on customer feedback, Hydro One could install more or fewer batteries.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Improve reliability for around 3,500 customers	Improve reliability for around 10,000 customers	Improve reliability for around 13,500 customers
	Main Differences Between Plans		
Community-scale batteries	10 battery systems	30 battery systems	50 battery systems
Individual customer batteries	2,000 battery systems	5,000 battery systems	8,000 battery systems
Average Monthly Distribution Bill Impact	$51 less by 2032 (average of $10 less each year)	Included in Draft Plan	$51 more by 2032 (average of $10 more each year)

Hydro One Customer Engagement Survey

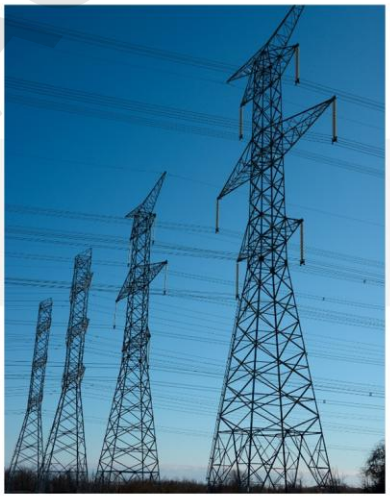
What is the transmission system and who does it serve?



Let's talk about the provincial transmission system. The transmission system is the highway for Ontario's electricity, bringing power from generation stations to your community.

Hydro One's transmission system serves most electricity customers in Ontario, including distribution companies across the province.

Outages on Hydro One's transmission system have significant impacts on communities and Ontario's economy. As such, the transmission system is designed to minimize both the frequency and duration of outages.

For example, most of Ontario's population centres are served by multiple transmission lines so that if one fails, there is always a backup to keep power flowing.

Since 2019, the typical Ontarian connected to Hydro One's transmission system has experienced, on average, **1 outage per year** related to the transmission system.

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to either increase or maintain current levels of reliability related to the transmission grid.

SURVEY PROOF

Hydro One Customer Engagement Survey

Keeping pace with transmission renewal

hydro one

Portions of Hydro One's transmission system were built in the 1930s, 40s, and 50s.

Hydro One has identified several types of equipment that are at increased risk of failure due to age and condition and would have widespread impacts if they were to fail.

Transmission station equipment ensures electricity can safely travel from power plants to communities. Hydro One has identified close to 200 out of 700 transmission transformers and 400 out of 4,700 circuit breakers in poor condition that are at increased risk of failure. While an equipment failure may not result in an immediate outage, it leaves the system more vulnerable with limited backup.

Underground transmission cables serve many high-density areas. Hydro One has identified that 20 km of their network of around 270 km of cables are at increased risk of failure. Because of the complex nature of these cables, if they were to fail, the outage impacts would be widespread and time-consuming and costly to repair.

Hydro One's **current draft plan** is focused on managing the risk of equipment failure and supporting growth across the province by:

- **Replacing major transmission station equipment:** In their current draft plan, Hydro One plans to replace 70 of the nearly 200 transformers and 230 of the 400 breakers identified as being in poor condition in order to reduce the risk of failure and costly repairs.
- **Replacing high-impact underground transmission cables:** Replacing all 20 km of the underground cables that Hydro One has identified as being at increased risk of failure could take up to 10 years to complete. In their current draft plan, Hydro One is proposing to begin the replacement of all 20km of these underground cables, with 12km being replaced by 2032.

Eventually, all poor condition or deteriorating equipment will need to be addressed; however, Hydro One would like your feedback on the pace of replacement. Doing less of these types of investments in the near term could lead to more equipment failure and higher emergency repair costs in the future. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Higher risk of equipment failure	Maintain the current risk of equipment failure	Lower risk of equipment failure
	Main Differences Between Plans		
Replacing transformers and breakers	55 transformers & 195 breakers	70 transformers & 230 breakers	85 transformers & 265 breakers
Replacing underground cables	Begin replacing 20km of underground cables	Begin replacing 20km of underground cables, completing 12km by 2032	Replace 20km of underground cables by 2032
Average Monthly Transmission Bill Impact	$21 less by 2032 (average of $4 less each year)	**Included in Draft Plan**	$21 more by 2032 (average of $4 more each year)

Stewardship of the transmission system

Commercial & Industrial

GSd Version

Hydro One Customer Engagement Survey

Stewardship of the transmission system

Proactive maintenance and system monitoring are among the ways that Hydro One can ensure that equipment lasts as long as possible.

In their **current draft plan**, Hydro One is proposing a series of investments to get the most out of the existing system by:

- **Replacing at-risk transmission lines:** Hydro One has identified that 11% of their approximately 28,000 km of transmission lines are at increased risk of failure due to a combination of age and condition. As these lines are replaced, they are built to modern standards that are more resilient to severe weather.
- **Reinforcing wood poles and extending the life of steel towers:** Hydro One has identified that over 23,000 of their nearly 90,000 wood poles and steel transmission towers are at the end of their expected service life. In the current draft plan, Hydro One is proposing reinforcing or extending the life of many of these structures.
- **Increasing the rate of clearing overgrown trees and brush:** Contact with vegetation accounts for a significant portion of transmission outages and increasing the rate of clearing trees and brush can help reduce the risk of outages.

Additionally, Hydro One is proposing investments in new satellite technology that can help better monitor trees and brush encroaching on infrastructure, further helping reduce the risk of outages.

These investments would be complementary to the ongoing renewal of aging or poor condition equipment, as discussed earlier.

These investments are designed to reduce the risk of major equipment failures, outages, and emergency repair costs over time. Delaying or scaling back these investments will reduce short-term costs but may increase the likelihood of unplanned outages and result in more costly reactive repairs. While doing more could further reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Higher risk of equipment failure and impacts of severe weather compared to the draft plan	Lower the current risk of equipment failure and impacts of severe weather	Further lower risk of equipment failure and impacts of severe weather compared to the draft plan
	Main Differences Between Plans		
Replacing at-risk transmission lines	Replace 1,000 km of at-risk lines	Replace 1,400 km of at-risk lines	Replace 1,800 km of at-risk lines
Reinforcing wood poles and extending the life of steel towers	2,500 wood poles and 1,500 steel towers	6,000 wood poles and 2,750 steel towers	9,500 wood poles and 4,000 steel towers
Clearing overgrown trees and brush	Clear 16% (3,100 km) of overgrown vegetation each year	Clear 17% (3,400 km) of overgrown vegetation each year	Clear 18% (3,700 km) of overgrown vegetation each year
Average Monthly Transmission Bill Impact	$17 less by 2032 (average of $3 less each year)	Included in Draft Plan	$17 more by 2032 (average of $3 more each year)

Stewardship of the transmission system

Commercial & Industrial

ST-High Version

Hydro One Customer Engagement Survey

Stewardship of the transmission system

hydro one

Proactive maintenance and system monitoring are among the ways that Hydro One can ensure that equipment lasts as long as possible.

In their **current draft plan**, Hydro One is proposing a series of investments to get the most out of the existing system by:

- **Replacing at-risk transmission lines:** Hydro One has identified that 11% of their approximately 28,000 km of transmission lines are at increased risk of failure due to a combination of age and condition. As these lines are replaced, they are built to modern standards that are more resilient to severe weather.
- **Reinforcing wood poles and extending the life of steel towers:** Hydro One has identified that over 23,000 of their nearly 90,000 wood poles and steel transmission towers are at the end of their expected service life. In the current draft plan, Hydro One is proposing reinforcing or extending the life of many of these structures.
- **Increasing the rate of clearing overgrown trees and brush:** Contact with vegetation accounts for a significant portion of transmission outages and increasing the rate of clearing trees and brush can help reduce the risk of outages.

Additionally, Hydro One is proposing investments in new satellite technology that can help better monitor trees and brush encroaching on infrastructure, further helping reduce the risk of outages.

These investments would be complementary to the ongoing renewal of aging or poor condition equipment, as discussed earlier.

These investments are designed to reduce the risk of major equipment failures, outages, and emergency repair costs over time. Delaying or scaling back these investments will reduce short-term costs but may increase the likelihood of unplanned outages and result in more costly reactive repairs. While doing more could further reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Higher risk of equipment failure and impacts of severe weather compared to the draft plan	Lower the current risk of equipment failure and impacts of severe weather	Further lower risk of equipment failure and impacts of severe weather compared to the draft plan
	Main Differences Between Plans		
Replacing at-risk transmission lines	Replace 1,000 km of at-risk lines	Replace 1,400 km of at-risk lines	Replace 1,800 km of at-risk lines
Reinforcing wood poles and extending the life of steel towers	2,500 wood poles and 1,500 steel towers	6,000 wood poles and 2,750 steel towers	9,500 wood poles and 4,000 steel towers
Clearing overgrown trees and brush	Clear 16% (3,100 km) of overgrown vegetation each year	Clear 17% (3,400 km) of overgrown vegetation each year	Clear 18% (3,700 km) of overgrown vegetation each year
Average Monthly Transmission Bill Impact	$3,625 less by 2032 (average of $725 less each year)	Included in Draft Plan	$3,624 more by 2032 (average of $725 more each year)

Maintaining buildings and facilities

Commercial & Industrial

GSd Version

Hydro One Customer Engagement Survey

Maintaining buildings and facilities

There are certain parts of Hydro One's draft plans that benefit both the transmission and local distribution systems. While the transmission portion of those investments is paid by most Ontarians, the distribution portion is paid by Hydro One customers only.

Hydro One operates and maintains approximately 1,500 facilities across Ontario.

In addition to housing Hydro One's nearly 10,000 employees, these facilities store specialized fleet equipment including bucket trucks and helicopters, protect sensitive equipment, serve as central dispatch for crews, act as training and development campuses, and allow experts to remotely monitor and operate the grid.

Each year, Hydro One classifies their building components into one of three categories – ***high risk***, ***medium risk*** or ***low risk***. This considers both the likelihood of failure and how critical the component is. For instance, a roof that is beyond its useful life and houses critical equipment would be deemed ***high risk***. Whereas older office equipment may be classified as ***low risk***.

In 2025, 25% of Hydro One's building components were assessed as either high or medium-risk.

In their **current draft plan**, Hydro One is focused on:

- **Addressing at-risk building components**: In their current draft plan, Hydro One plans to address 50% of high to medium-risk building components, prioritizing those that are most critical.
- **Making at-risk sites more resilient to severe weather**: In their draft plan, Hydro One plans to invest in reducing flooding risks at 2 of out 12 at-risk sites. For example, in 2024, severe rain flooded a transmission station, resulting in outages for nearly 170,000 customers.

Flooding at a Hydro One transmission station in 2024

- **Repairing or retrofitting field offices**: Many facilities that serve as dispatch for Hydro One crews were built more than 50 years ago. Since then, standards for accessibility have changed considerably. In their draft plan, Hydro One plans to invest in 70 of their 115 facilities that no longer meet modern standards.

Doing less of these types of investments now could increase the number of reactive repairs to facilities, as well as increase the risk of more frequent outages caused by severe weather and longer crew dispatch times. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Lower risk of critical asset failures, but address fewer aging field facilities than the draft plan	Lower risk of critical asset failures and make progress on addressing aging field facilities	Further lower risk of asset failures and address more aging field facilities than the draft plan
	Main Differences Between Plans		
Addressing at-risk building components	Same as draft plan	50% of at-risk building components	57% of at-risk building components
Making at-risk sites more resilient	Same as draft plan	2 at-risk sites	8 at-risk sites
Repairing or retrofitting facilities	50 facilities	70 facilities	90 facilities
Average Monthly Distribution Bill Impact	$11 less by 2032 (average of $2 less each year)	Included in Draft Plan	$11 more by 2032 (average of $2 more each year)
Average Monthly Transmission Bill Impact	$1 less by 2032 (average of $0.17 less each year)		$3 more by 2032 (average of $1 more each year)

Hydro One Customer Engagement Survey
Information technology

hydro one

Hydro One's daily operations require technology systems for all aspects of their business, including billing, operating the grid, responding to outages, planning projects, and communicating with customers.

When deciding the right level of information technology (I.T.) investment, Hydro One must balance various factors, including the cost of new or updated systems, the risks related to current systems, and the benefits that new technologies could bring to the company and customers.

Hydro One's current draft plan is focused on:

- **Maintaining the current state of technology systems**: Like with poles and wires, technology systems need to be maintained so that crews can restore power and customers can access key services like their online account and the outage restoration map.
- **Enhancing customer service**: I.T. investments and advanced data can help Hydro One offer better services to customers, improve estimated restoration times during outages and notify customers when service will be back online.
- **Improving Hydro One's operational efficiency**: Investments in technology systems can help Hydro One dispatch crews and perform their work more effectively.
- **Protecting the grid from both cyber and physical security threats**: Investments in new technologies can provide more robust protection against external threats, enhancing the resilience of critical system infrastructure.

While a significant portion of Hydro One's I.T. budget is allocated to meet safety, legal, and regulatory requirements, Hydro One could defer investments focused on enhancing customer service, improving efficiency, and expanding capabilities beyond 2032.

Deferring these types of investments would delay these benefits and potentially limit Hydro One's ability to accommodate newer technologies in the future.

Which of the following options do you prefer?

	Spend Less	Draft Plan
	Maintain the current state of technology systems but make fewer investments to enhance service and efficiencies	Maintain the current state of technology systems while modernizing capabilities to enhance service and efficiencies
	Main Differences Between Plans	
Customer service	Limit or delay investments in systems focused on enhancing customer service	Invest in systems focused on enhancing customer service
Operational efficiency	Limit or delay investments in systems focused on improving operational efficiency	Invest in systems focused on improving operational efficiency
Average Monthly Distribution Bill Impact	$16 less by 2032 (average of $3 less each year)	**Included in Draft Plan**
Average Monthly Transmission Bill Impact	$6 less by 2032 (average of $1 less each year)

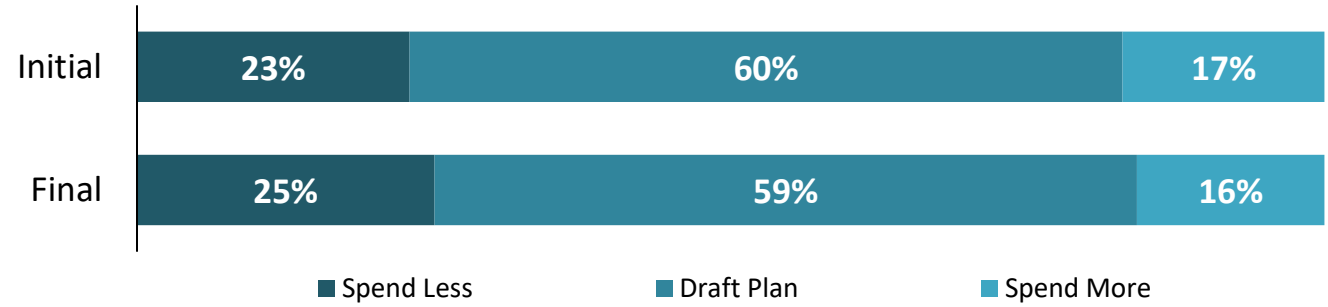
What is the impact of my choices?

hydro one

Throughout this survey, you have been asked about 7 key choices. Below is a summary of your choices.

At the bottom of this page, you will find the total bill impact of all your answers. You can change your responses if you desire, and the estimated impact on your bill will be recalculated.



The bill impacts associated with each choice represent the average increase on your monthly bill from 2027 to 2032, followed by the average increase on your monthly bill each year. The impacts under the "spend less" or "spend more" options are relative to the bill impact of the draft plan.

Hydro One Customer Engagement Survey

Evaluating Hydro One's 2028-2032 draft plan

Hydro One has calculated an overall cost for their draft plans. While the plans may change based on feedback from the earlier questions in this survey, Hydro One would like to know how you feel about the overall draft plans.

It is estimated that a typical **general service demand customer** would see:

- The **distribution** portion of their **monthly bill** increase from $2,720 in 2027 to $4,449 by the end of 2032 – an increase of **$1,729** on the monthly bill. This represents an average increase of **$346** on the monthly bill each year.
- The **transmission** portion of their **monthly bill** increase from $681 in 2027 to $889 by the end of 2032 – an increase of **$208** on the monthly bill. This represents an average increase of **$42** on the monthly bill each year.

Hydro One has calculated an overall cost for their draft plans. While the plans may change based on feedback from the earlier questions in this survey, Hydro One would like to know how you feel about the overall draft plans.

It is estimated that a typical **sub-transmission low consumption customer** would see:

- The **distribution** portion of their **monthly bill** increase from $2,221 in 2027 to $2,963 by the end of 2032 – an increase of **$742** on the monthly bill. This represents an average increase of **$148** on the monthly bill each year.
- The **transmission** portion of their **monthly bill** increase from $5,279 in 2027 to $6,891 by the end of 2032 – an increase of **$1,613** on the monthly bill. This represents an average increase of **$323** on the monthly bill each year.

Large Distribution Account Customers

Online Survey Results

Section 6

Field Dates

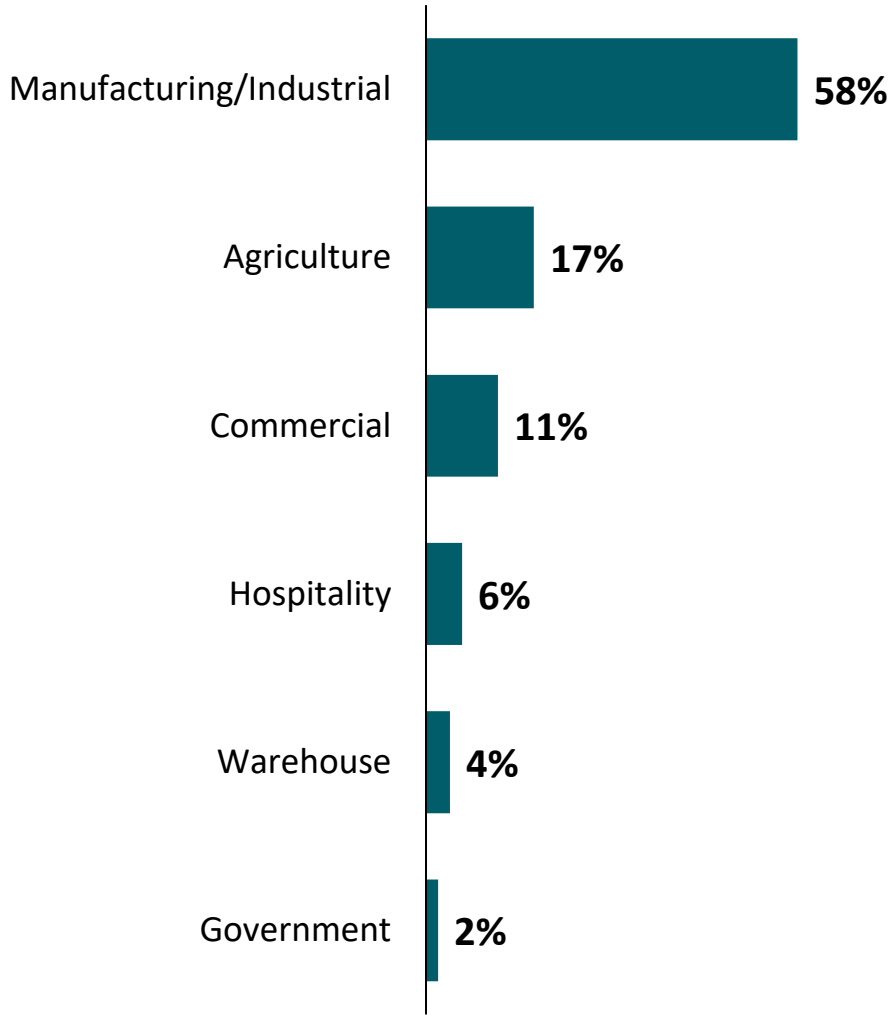
The **Large Distribution Account Customer Online Survey** was sent to all large distribution customers with an available email address. Customers had an opportunity to complete the survey between **November 14th and December 22nd, 2025**.

Each customer received a unique URL that could be linked back to their average monthly demand, region and rate class. Survey pages that differed by customer type are identified as GSd (general service demand), ST-Low (sub transmission low), ST-Med (sub transmission medium), and ST-High (sub transmission high) versions throughout this report.

In total, the large distribution account customer survey was sent to **313** customers from *customerexperience@hydroone.com*. A total of four reminder emails were sent on a rolling basis over the survey field window to those who had not yet completed the survey.

Commercial & Industrial Online Survey Completes

A total of **53** (unweighted) Hydro One large distribution account customers completed the online survey.



Sample Weighting

The large distribution account online survey sample was not weighted.

Hydro One Customer Engagement Survey

Welcome to Hydro One's customer engagement survey!

As Hydro One plans for the future, they need your input on choices that will impact the services you receive and the rates you pay.

- **Hydro One is looking for your feedback on their draft investment plans** for the years 2028 to 2032 to ensure they make spending decisions that matter to you, the customer.
- **You don't need to be an electricity expert to complete this survey.** It focuses on basic choices and provides the background information you need to answer the questions.
- The survey will take approximately 20-30 minutes to complete. If you need to pause and return later to finish the survey, your progress will be saved. If you are reading this on a mobile device, you may want to consider switching to a tablet or laptop so that it is easier for you to read.

While you may have multiple accounts with **Hydro One**, for this survey, we want you to think about your overall experience as a large business customer.

Note: *The estimates throughout this survey are for illustrative purposes only and may not reflect the actual size of your organization's monthly electricity bill.*

For the purpose of this exercise, the estimates are based on a typical customer in the general service demand rate class with an average monthly demand of 110 kW and average monthly consumption of 34,334 kWh.

All individual responses will be kept confidential.
Innovative Research Group (www.innovativeresearch.ca), an independent research company, has been hired by Hydro One to gather your feedback while protecting your confidentiality. Your individual answers will not be shared with Hydro One in any identifiable way.

SURVEY PAGE

Hydro One Customer Engagement Survey
What is this survey about?

Hydro One is funded by the rates paid by their customers. Every five years, Hydro One is required to file an application with the Ontario Energy Board (OEB), the energy regulator in Ontario, to set rates. Hydro One's next rate application will cover the years 2028-2032.

In this process, Hydro One's rate application will be examined in detail and Hydro One must demonstrate that customer needs and priorities were factored into their investment planning process.

Today, Hydro One wants your feedback on their draft investment plans, including specific investment choices where they need customer input. This feedback, along with other input, will be used to help Hydro One's planners refine and finalize the draft investment plans.

Next year, Hydro One will present their proposed plans and input provided by customers to the OEB.

SURVEY PAGE

Hydro One Customer Engagement Survey

What is Hydro One's role in Ontario's electricity system?

Ontario's electricity system has three key components: **generation**, **transmission** and **distribution**.

Hydro One's transmission system takes electricity from generation stations and transports it via high-voltage transmission lines to local communities across the province.

In many communities, including your own, **Hydro One** is also responsible for the local distribution system, which delivers electricity to your home, seasonal property, or organization through a network of wires, poles and other equipment.

Hydro One does not generate electricity or set electricity prices.

Hydro One builds and maintains power lines, towers and poles, delivers electricity, reads meters, answers customer calls, responds during outages, and clears trees and brush from power lines.

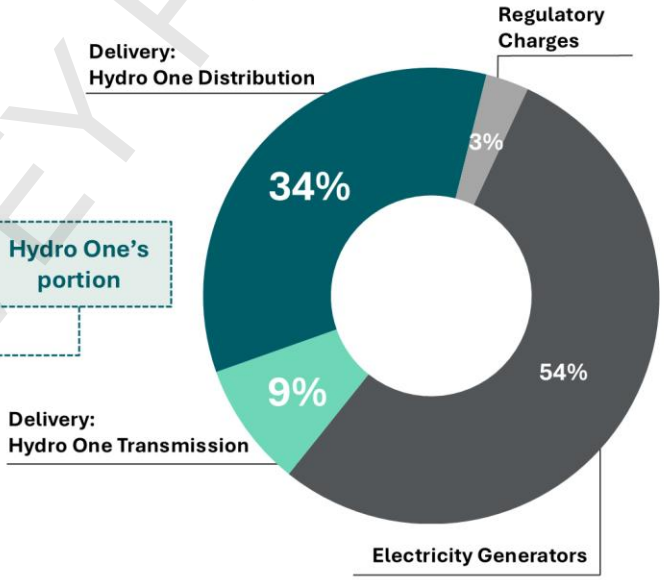
How much of my electricity bill goes to Hydro One?

Every item and charge on your bill is mandated by the provincial government or regulated by the OEB, the provincial energy regulator.

Although **Hydro One** is responsible for collecting payment from you for your entire electricity bill, only a portion goes to Hydro One. As of **July 1, 2025**, for a typical general service demand customer, about 43% of the bill, or $3,093.42, goes to Hydro One per month. This amount is split into $2,459.41 for distribution and $634.01 for transmission.

The rest of your bill payment goes to power generation companies, taxes, and regulatory agencies.



Sample Monthly Bill

Summary of Investment Plan

How Hydro One plans

Large Distribution

Hydro One Customer Engagement Survey

How does Hydro One plan?

Every five years, Hydro One develops comprehensive plans that outline both short-term and long-term system needs. These plans are the combination of thousands of inputs from technical experts and customers.

The three key areas that inform Hydro One's plans are:

- **Customer feedback** collected through both ongoing interactions and specific engagements, such as this.
- Information and input from **internal engineering and technical experts**, who closely monitor the pressures on the system and develop solutions to address these challenges.
- Hydro One's **mandatory legal and regulatory requirements**, including connecting customers, moving equipment, and installing and maintaining customer meters.

What has Hydro One heard from customers so far?

In 2024, Hydro One collected feedback from thousands of customers across Ontario on their needs and priorities for electricity distribution and transmission services. This feedback was used to inform planners in developing the draft investment plans.

In this initial feedback, most customers expressed a desire for Hydro One to:

1. Prioritize **reasonable rates** and **reliable service**.
2. Make investments to **improve or maintain current levels of reliability**.
3. Make **targeted investments to improve reliability** for customers experiencing significantly poorer reliability than average.
4. Make investments to make the system **more resilient to severe weather**.
5. Make investments in technology to **accommodate customer requests and improve visibility into the system** (e.g., where and how much electricity is being used).

SURVEY PAGE

Summary of Investment Plan

Challenges impacting Hydro One's plans

Large Distribution

Hydro One Customer Engagement Survey

What challenges are impacting Hydro One's plans?

Hydro One is facing challenges that require more resources, new solutions, or growing costs to manage.

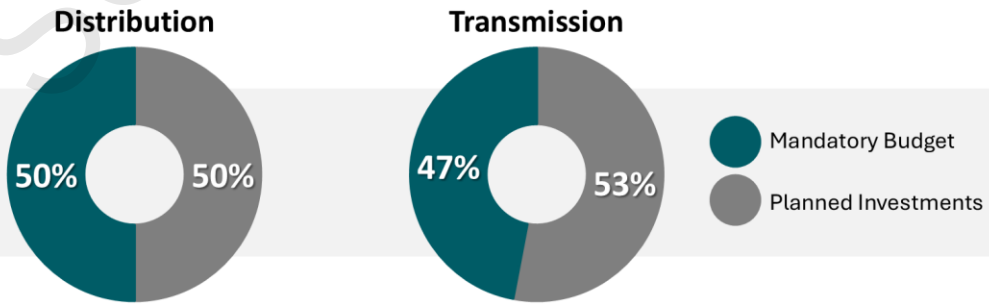
Some of these challenges, like the pace of addressing aging and deteriorating infrastructure are within Hydro One's control. Others, like the frequency of severe weather, are not.

When developing their plans, Hydro One must consider **external pressures**, including:

Increasing demand for electricity

According to the Independent Electricity System Operator (IESO), electricity demand in Ontario is forecasted to increase by 75% by 2050.

In fact, since 2021, growth in the province has far exceeded expectations, and customer requests for new connections have grown considerably: **demand for new connections to Hydro One's distribution system has outpaced projections** by, on average, 21% per year.



Rising cost pressures

Businesses across Ontario are **experiencing significant cost pressures** from factors including tariffs and inflation. Hydro One has been working to offset some of these cost pressures by finding savings and internal efficiencies. In 2024, Hydro One realized approximately $150 million in savings.

How does this impact how Hydro One plans?

Despite increasing demand for electricity, external rising cost pressures, and more frequent severe weather, Hydro One has been working to manage spending within their original budget that was approved by the OEB in 2022. This means that Hydro One has had to delay some planned work to accommodate unexpected higher growth and rising costs.

For the 2028-2032 period, **about half of Hydro One's draft capital budget is committed to work that is necessary to meet mandatory requirements**, including meeting safety, legal, and regulatory requirements, accommodating increased demand for electricity and supporting provincial economic growth.

SURVEY PAGE

Summary of Investment Plan

Objectives Hydro One is focused on

Large Distribution

Hydro One Customer Engagement Survey

What objectives is Hydro One focused on?

Today, Hydro One has developed draft investment plans that focus on achieving objectives that balance customer feedback, economic growth in Ontario, engineering and technical analysis, and current and emerging pressures on the system.

While Hydro One's draft plans cover both the **distribution system** serving approximately 1.5 million customers, as well as the **transmission system** serving most Ontarians, each system has different needs and objectives.

Some of the highlights of Hydro One's draft plans include:

Distribution Objectives

1. Improving the **day-to-day reliability** of the system by addressing equipment that is at a higher risk of failure.
2. Preparing for the **impacts of severe weather** by investing in vulnerable lines, clearing more overgrown vegetation, and using technology to restore power more quickly.
3. Improving reliability for thousands of customers experiencing below average reliability by investing in **new battery storage technology**.
4. Ensuring the grid is prepared to **keep pace with evolving customer needs** and accommodate higher levels of growth.

Transmission Objectives

1. **Maintaining the overall health** of the transmission system by limiting the risk of equipment failure.
2. **Getting the most out of the system** by reinforcing and extending the life of equipment and limiting the impacts of severe weather.
3. **Keep pace with Ontario's economic development**, including meeting demand for new and expanded industry in the province

One of the benefits of being both the largest distributor and transmitter of electricity in Ontario is the ability to invest in technology systems, buildings, and facilities that benefit both systems.

Some of these shared objectives of Hydro One's draft plan include:

Shared Objectives

1. **Limiting the risk of potential damage to equipment** by addressing the most at-risk building components and making sites more resilient to severe weather.
2. **Maintaining the company's existing technology systems**, improving operational efficiency and resilience to cybersecurity threats, and **modernizing the system** to provide enhanced services to customers.

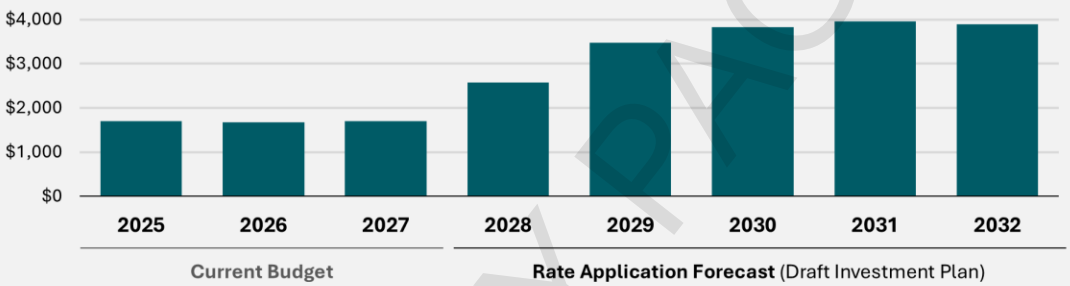
SURVEY PAGE

Summary of Investment Plan

Cost of Hydro One's draft distribution plan

Large Distribution

GSd Version



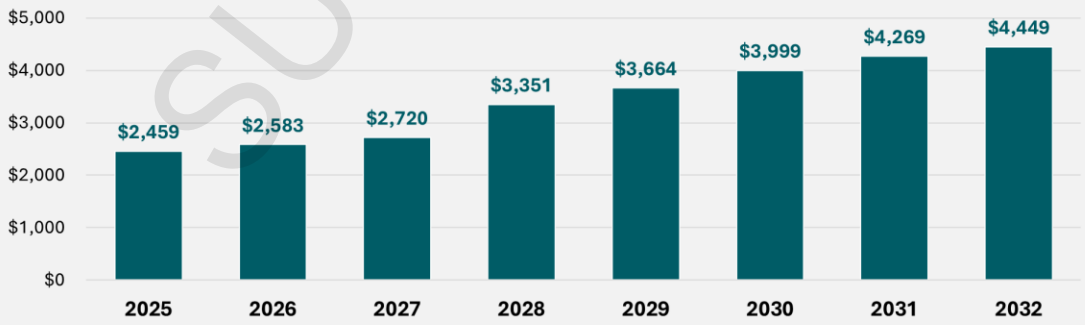
Hydro One Customer Engagement Survey

How much will Hydro One's draft distribution plan cost?

Hydro One has calculated the cost of their draft investment plans, which aim to achieve the objectives highlighted previously and meet Hydro One's legal and regulatory requirements.

The costs for **distribution system** investments are spread among all of Hydro One's 1.5 million distribution customers.

Distribution Budget: Current and Forecasted ($ millions)



The draft distribution investment plan would result in an average annual funding requirement of **$3.5 billion** for **distribution** for 2028-2032.

How will this plan impact the distribution portion of customer bills?

For a typical **general service demand customer**, the **distribution** portion of their **monthly bill** is estimated to increase from $2,720 in 2027 to $4,449 by the end of 2032 – an increase of **$1,729** on the monthly bill. This represents an average increase of **$346** on the monthly bill each year.

Distribution Portion of Monthly Bill

Note:
- Hydro One's rates until December 31, 2027, were approved by the OEB in an earlier application.
- These estimated rate increases and forecasted budgets are preliminary and are subject to change based on customer feedback, regulatory approval, and other factors.

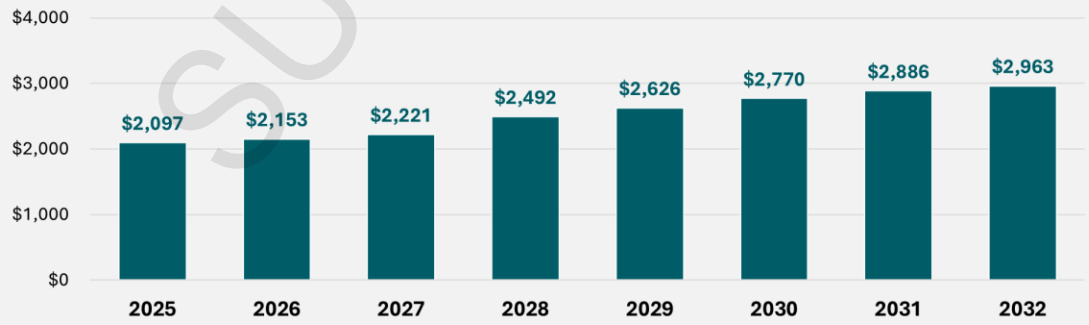
Hydro One Customer Engagement Survey

How much will Hydro One's draft distribution plan cost?

Hydro One has calculated the cost of their draft investment plans, which aim to achieve the objectives highlighted previously and meet Hydro One's legal and regulatory requirements.

The costs for **distribution system** investments are spread among all of Hydro One's 1.5 million distribution customers.

Distribution Budget: Current and Forecasted ($ millions)



The draft distribution investment plan would result in an average annual funding requirement of **$3.5 billion** for **distribution** for 2028-2032.

How will this plan impact the distribution portion of customer bills?

For a typical **sub-transmission low consumption customer**, the **distribution** portion of their **monthly bill** is estimated to increase from $2,221 in 2027 to $2,963 by the end of 2032 – an increase of **$742** on the monthly bill. This represents an average increase of **$148** on the monthly bill each year.

Distribution Portion of Monthly Bill

Note:
- Hydro One's rates until December 31, 2027, were approved by the OEB in an earlier application.
- These estimated rate increases and forecasted budgets are preliminary and are subject to change based on customer feedback, regulatory approval, and other factors.

Hydro One Customer Engagement Survey

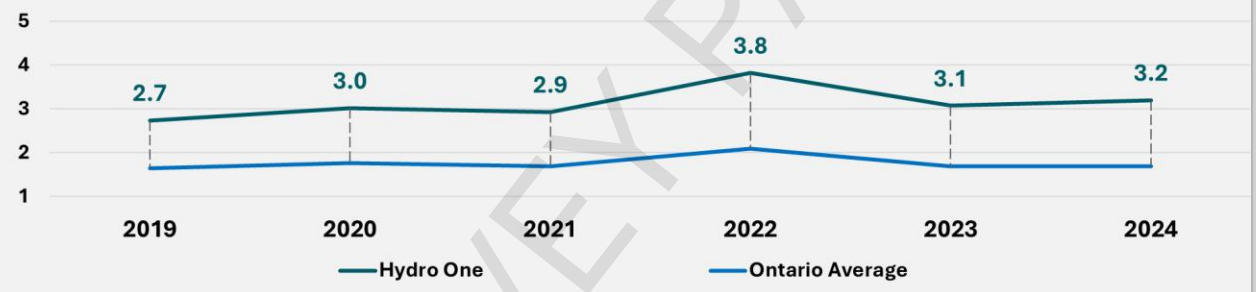
What choices does Hydro One want my input on?

The remainder of this survey asks for your input on the total cost of the draft investment plans, plus **7 key choices** within the plan that Hydro One is looking for your guidance on.

- Each choice has a summary of the options that Hydro One is considering. In many cases, that includes options that would see Hydro One ***spend less*** or ***spend more*** than what is currently being proposed in the draft plan.
- For each option, Hydro One has estimated what impact it would have on customer bills **compared to the draft plan**. These impacts are approximate.
- Following each question, you will also have an opportunity to provide additional feedback if you choose to.
- Once you have finished giving feedback on the key choices, you will have an opportunity to review and change your responses until you feel you have found the right balance between the level of investment and cost for you.

SURVEY PAGE

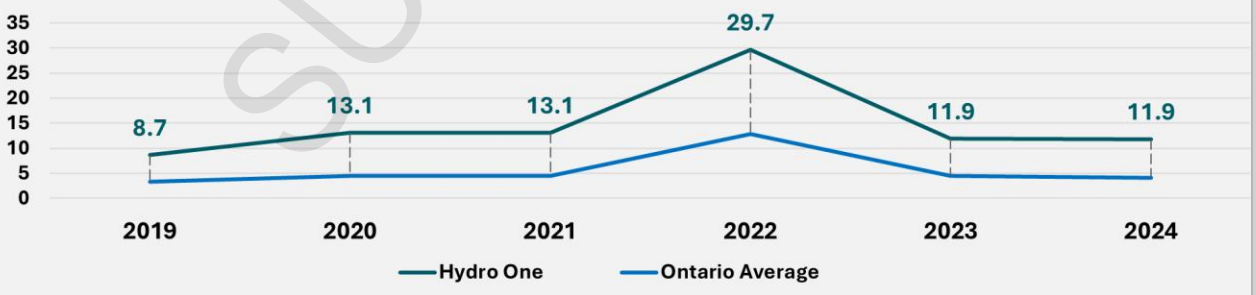
Hydro One Customer Engagement Survey



How does Hydro One's distribution grid perform?

Since most Hydro One customers live in rural areas, their distribution system looks different from other Ontario utilities. Serving more sparsely populated communities separated by significant distances means more equipment is needed, outages can take longer to locate, and power can take longer to restore.

On average, between 2019 and 2024, the typical Hydro One customer has experienced 1.4 more outages per year compared to the Ontario average.



Number of Outages (Average Outages Per Customer)

When it comes to the total time spent without electricity per year, the typical Hydro One customer has been without power for 14.7 hours each year on average, which is 9.1 hours more than the Ontario average.

Duration of Outages (Average Hours Per Customer)

Severe weather, **tree contacts**, and **equipment failure** account for most of these outages. Notably, the distribution system experienced widespread outages due to severe weather in both 2022 and again in April 2025.

Investment Trade-Offs

Overall system reliability

Large Distribution

GSd Version

Hydro One Customer Engagement Survey

Overall system reliability

hydro one

The first investment category is related to the **day-to-day reliability** of Hydro One's **distribution system** that delivers electricity to homes and businesses.

Hydro One typically identifies investments in equipment by taking into consideration the overall age, health, and likelihood of equipment failure.

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to either improve or maintain current levels of reliability related to the distribution grid.

Hydro One generally tries to replace poor condition equipment before it fails. However, when equipment does fail, it can result in significant interruptions for customers.

In the past five years, outside of severe weather events, equipment failure has accounted for about 36% of all hours that Hydro One customers have been without power.

Hydro One's **current draft plan** is focused on improving the day-to-day reliability of the system, outside of severe weather events, by:

- **Repairing or replacing overhead line defects**: Over their 110,000km network of overhead lines, Hydro One has identified close to 500,000 defects such as broken or damaged support cables, leaning poles, or damaged insulators.
- **Maintaining, repairing, or replacing major stations' equipment:** Hydro One operates and maintains approximately 1,000 distribution stations that convert electricity to a lower voltage for safe delivery to homes and businesses. Over **250** of these stations' transformers are in poor condition and at increased risk of failure.
- **Replacing or repairing underground cables:** Hydro One has identified around 13% of all underground cables that are at increased risk of failure. In their current draft plan, Hydro One is proposing to replace or repair 10% of underground cables to reduce the risk of prolonged outages.

Additionally, Hydro One has identified 2% of their approximately 1.6 million wooden poles to be refurbished to extend their useful life.

Eventually, all poor condition or deteriorating equipment will need to be addressed; however, Hydro One would like your feedback on the pace. Doing less of these types of investments now could lead to more frequent or longer outages and higher emergency repair costs in the future. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Maintain current levels of day-to-day reliability	Improve day-to-day reliability by 2032	Further reduce the risk of outages by 2032
	Main Differences Between Plans		
Repairing or replacing overhead line defects	10% of known defects	40% of known defects	70% of known defects
Addressing stations transformers	60 poor condition transformers	90 poor condition transformers	120 poor condition transformers
Replacing or repairing underground cables	7% of all underground cables	10% of all underground cables	13% of all underground cables
Average Monthly Distribution Bill Impact	$75 less by 2032 (average of $15 less each year)	Included in Draft Plan	$75 more by 2032 (average of $15 more each year)

Hydro One Customer Engagement Survey

Managing the impacts of severe weather

On average, between 2019 and 2024, severe weather events, such as ice storms, windstorms or thunderstorms, have contributed to 68% of all hours that the typical customer has been without power per year.

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to make the system more resilient to severe weather.

While some weather-related outages will likely be inevitable, in their **current draft plan**, Hydro One is proposing investments in making the system more resilient to severe weather events and generally perform better overall, including:

- **Relocating or reinforcing vulnerable power lines:** Hydro One has identified power lines that are more vulnerable to severe weather. Relocating or reinforcing these lines with more resilient equipment can help reduce future outage risks.
- **Clearing more overgrown trees and brush than historically:** Increasing the rate of clearing trees and brush can help reduce the risk of outages, the leading cause of weather-related outages.
- **Installing more automated "intelligent" switches:** In their draft plan, Hydro One proposes deploying 1,200 new automated switches that can help restore power more quickly from a control room rather than sending a repair crew to patrol the lines. There are currently approximately 1,100 intelligent switches operating across Hydro One's service territory.

While storms will continue to happen, making these proactive investments will help limit the impact of outages. Reducing these types of investments could leave the distribution system more vulnerable to widespread outages and more costly emergency repairs. While doing more could further reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Maintain the current risk of outages and restoration times related to severe weather	Reduce the risk of outages and shorten restoration times related to severe weather	Further reduce the risk of outages and shorten restoration times related to severe weather
	Main Differences Between Plans		
Relocating or reinforcing vulnerable power lines	3% of all power lines	6% of all power lines	9% of all power lines
Clearing overgrown trees and brush	Clear 25% of overgrown vegetation each year	Clear 30% of overgrown vegetation each year	Clear 35% of overgrown vegetation each year
Installing automated switches	750 new switches	1,200 new switches	1,650 new switches
Average Monthly Distribution Bill Impact	$50 less by 2032 (average $10 less each year)	Included in Draft Plan	$50 more by 2032 (average of $10 more each year)

Q Which of the following options do you prefer?

Q Additional Feedback (Optional)

Verbatim comments (94% No comment)
"Doubling distribution costs in 7 years is too steep. The options presented in these slides are somewhat tilted towards getting folks to click "included in draft plan". There needs to be a more nuanced approach to prioritizing dist/tx investments that balances cost with reliability. As a [REDACTED] customer at both our Ontario sites, reliability is OK. Our full electricity bills have risen dramatically due to electricity market price inflation and erosion of GA/ICI program savings with decreases in GA. To remain competitive with other jurisdictions, Hydro One needs to stabilize and lower the rate of bill inflation for industrial customers."
"Is there an option to maintain vegetation below power lines through community responsibility or an alternate resource up to a point where the work would not be hazardous? I expect the cost for Hydro One to maintain vegetation levels could be much higher than other options, but Hydro One would be required once the work involves an electrical hazard."
"Same as last comment. Too expensive."

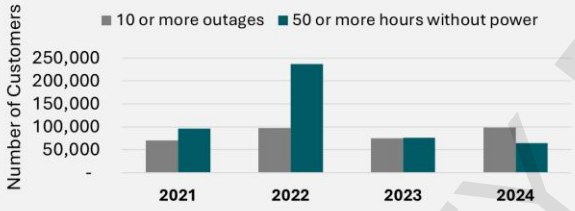
SURVEY PAGE

Hydro One Customer Engagement Survey



Targeted reliability improvements

Hydro One customers experience different levels of reliability depending on where they live, the design of the system, the condition of the equipment supplying them, and weather patterns.

While some Hydro One customers might not have experienced any outages in the last four years, in any given year more than **70,000 customers were without power more than 10 times**, and more than **60,000 customers were in the dark for 50 hours or more**.

Today, rural and remote communities are more likely to experience poorer reliability, and the increased frequency of severe weather events create and will continue to create further challenges.

Number of Customers Experiencing Significantly Poorer Reliability than Average

Community-scale battery storage facility outside of Thunder Bay

In a 2024 survey, a majority of customers said that they want Hydro One to make targeted investments to improve reliability for customers who experience significantly poorer reliability than average.

In their **current draft plan**, Hydro One has developed a program that includes a combination of larger **community-scale** batteries and smaller **individual customer** batteries, which store electricity and provide backup power if an outage does occur.

Batteries are an effective way to target reliability improvements for individual customers and communities that experience the poorest reliability.

At the rate of investment being proposed in the draft plan, Hydro One anticipates reliability improvements for around **10,000** customers. However, based on customer feedback, Hydro One could install more or fewer batteries.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Improve reliability for around 3,500 customers	Improve reliability for around 10,000 customers	Improve reliability for around 13,500 customers
	Main Differences Between Plans		
Community-scale batteries	10 battery systems	30 battery systems	50 battery systems
Individual customer batteries	2,000 battery systems	5,000 battery systems	8,000 battery systems
Average Monthly Distribution Bill Impact	$51 less by 2032 (average of $10 less each year)	Included in Draft Plan	$51 more by 2032 (average of $10 more each year)

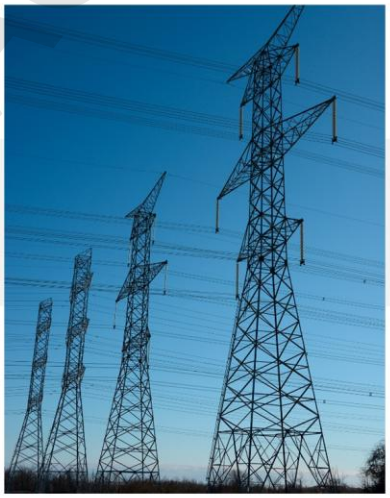
Summary of Investment Plan

Hydro One's transmission system

Large Distribution

Hydro One Customer Engagement Survey

What is the transmission system and who does it serve?



Let's talk about the provincial transmission system. The transmission system is the highway for Ontario's electricity, bringing power from generation stations to your community.

Hydro One's transmission system serves most electricity customers in Ontario, including distribution companies across the province.

Outages on Hydro One's transmission system have significant impacts on communities and Ontario's economy. As such, the transmission system is designed to minimize both the frequency and duration of outages.

For example, most of Ontario's population centres are served by multiple transmission lines so that if one fails, there is always a backup to keep power flowing.

Since 2019, the typical Ontarian connected to Hydro One's transmission system has experienced, on average, **1 outage per year** related to the transmission system.

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to either increase or maintain current levels of reliability related to the transmission grid.

SURVEY PAGE

Investment Trade-Offs

Keeping pace with transmission renewal

Large Distribution

GSd Version

Hydro One Customer Engagement Survey

Keeping pace with transmission renewal

Portions of Hydro One's transmission system were built in the 1930s, 40s, and 50s.

Hydro One has identified several types of equipment that are at increased risk of failure due to age and condition and would have widespread impacts if they were to fail.

Transmission station equipment ensures electricity can safely travel from power plants to communities. Hydro One has identified close to 200 out of 700 transmission transformers and 400 out of 4,700 circuit breakers in poor condition that are at increased risk of failure. While an equipment failure may not result in an immediate outage, it leaves the system more vulnerable with limited backup.

Underground transmission cables serve many high-density areas. Hydro One has identified that 20 km of their network of around 270 km of cables are at increased risk of failure. Because of the complex nature of these cables, if they were to fail, the outage impacts would be widespread and time-consuming and costly to repair.

Hydro One's **current draft plan** is focused on managing the risk of equipment failure and supporting growth across the province by:

- **Replacing major transmission station equipment:** In their current draft plan, Hydro One plans to replace 70 of the nearly 200 transformers and 230 of the 400 breakers identified as being in poor condition in order to reduce the risk of failure and costly repairs.
- **Replacing high-impact underground transmission cables:** Replacing all 20 km of the underground cables that Hydro One has identified as being at increased risk of failure could take up to 10 years to complete. In their current draft plan, Hydro One is proposing to begin the replacement of all 20km of these underground cables, with 12km being replaced by 2032.

Eventually, all poor condition or deteriorating equipment will need to be addressed; however, Hydro One would like your feedback on the pace of replacement. Doing less of these types of investments in the near term could lead to more equipment failure and higher emergency repair costs in the future. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Higher risk of equipment failure	Maintain the current risk of equipment failure	Lower risk of equipment failure
	Main Differences Between Plans		
Replacing transformers and breakers	55 transformers & 195 breakers	70 transformers & 230 breakers	85 transformers & 265 breakers
Replacing underground cables	Begin replacing 20km of underground cables	Begin replacing 20km of underground cables, completing 12km by 2032	Replace 20km of underground cables by 2032
Average Monthly Transmission Bill Impact	$21 less by 2032 (average of $4 less each year)	**Included in Draft Plan**	$21 more by 2032 (average of $4 more each year)

Stewardship of the transmission system

Large Distribution

GSd Version

Hydro One Customer Engagement Survey

Stewardship of the transmission system

Proactive maintenance and system monitoring are among the ways that Hydro One can ensure that equipment lasts as long as possible.

In their **current draft plan**, Hydro One is proposing a series of investments to get the most out of the existing system by:

- **Replacing at-risk transmission lines:** Hydro One has identified that 11% of their approximately 28,000 km of transmission lines are at increased risk of failure due to a combination of age and condition. As these lines are replaced, they are built to modern standards that are more resilient to severe weather.
- **Reinforcing wood poles and extending the life of steel towers:** Hydro One has identified that over 23,000 of their nearly 90,000 wood poles and steel transmission towers are at the end of their expected service life. In the current draft plan, Hydro One is proposing reinforcing or extending the life of many of these structures.
- **Increasing the rate of clearing overgrown trees and brush:** Contact with vegetation accounts for a significant portion of transmission outages and increasing the rate of clearing trees and brush can help reduce the risk of outages.

Additionally, Hydro One is proposing investments in new satellite technology that can help better monitor trees and brush encroaching on infrastructure, further helping reduce the risk of outages.

These investments would be complementary to the ongoing renewal of aging or poor condition equipment, as discussed earlier.

These investments are designed to reduce the risk of major equipment failures, outages, and emergency repair costs over time. Delaying or scaling back these investments will reduce short-term costs but may increase the likelihood of unplanned outages and result in more costly reactive repairs. While doing more could further reduce risk, it would impact customer bills.

Which of the following options do you prefer?

Hydro One Customer Engagement Survey

Stewardship of the transmission system

Proactive maintenance and system monitoring are among the ways that Hydro One can ensure that equipment lasts as long as possible.

In their **current draft plan**, Hydro One is proposing a series of investments to get the most out of the existing system by:

- **Replacing at-risk transmission lines:** Hydro One has identified that 11% of their approximately 28,000 km of transmission lines are at increased risk of failure due to a combination of age and condition. As these lines are replaced, they are built to modern standards that are more resilient to severe weather.
- **Reinforcing wood poles and extending the life of steel towers:** Hydro One has identified that over 23,000 of their nearly 90,000 wood poles and steel transmission towers are at the end of their expected service life. In the current draft plan, Hydro One is proposing reinforcing or extending the life of many of these structures.
- **Increasing the rate of clearing overgrown trees and brush:** Contact with vegetation accounts for a significant portion of transmission outages and increasing the rate of clearing trees and brush can help reduce the risk of outages.

Additionally, Hydro One is proposing investments in new satellite technology that can help better monitor trees and brush encroaching on infrastructure, further helping reduce the risk of outages.

These investments would be complementary to the ongoing renewal of aging or poor condition equipment, as discussed earlier.

These investments are designed to reduce the risk of major equipment failures, outages, and emergency repair costs over time. Delaying or scaling back these investments will reduce short-term costs but may increase the likelihood of unplanned outages and result in more costly reactive repairs. While doing more could further reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Higher risk of equipment failure and impacts of severe weather compared to the draft plan	Lower the current risk of equipment failure and impacts of severe weather	Further lower risk of equipment failure and impacts of severe weather compared to the draft plan
	Main Differences Between Plans		
Replacing at-risk transmission lines	Replace 1,000 km of at-risk lines	Replace 1,400 km of at-risk lines	Replace 1,800 km of at-risk lines
Reinforcing wood poles and extending the life of steel towers	2,500 wood poles and 1,500 steel towers	6,000 wood poles and 2,750 steel towers	9,500 wood poles and 4,000 steel towers
Clearing overgrown trees and brush	Clear 16% (3,100 km) of overgrown vegetation each year	Clear 17% (3,400 km) of overgrown vegetation each year	Clear 18% (3,700 km) of overgrown vegetation each year
Average Monthly Transmission Bill Impact	$3,625 less by 2032 (average of $725 less each year)	Included in Draft Plan	$3,624 more by 2032 (average of $725 more each year)

Hydro One Customer Engagement Survey

Maintaining buildings and facilities

There are certain parts of Hydro One's draft plans that benefit both the transmission and local distribution systems. While the transmission portion of those investments is paid by most Ontarians, the distribution portion is paid by Hydro One customers only.

Hydro One operates and maintains approximately 1,500 facilities across Ontario.

In addition to housing Hydro One's nearly 10,000 employees, these facilities store specialized fleet equipment including bucket trucks and helicopters, protect sensitive equipment, serve as central dispatch for crews, act as training and development campuses, and allow experts to remotely monitor and operate the grid.

Each year, Hydro One classifies their building components into one of three categories – ***high risk***, ***medium risk*** or ***low risk***. This considers both the likelihood of failure and how critical the component is. For instance, a roof that is beyond its useful life and houses critical equipment would be deemed ***high risk***. Whereas older office equipment may be classified as ***low risk***.

In 2025, 25% of Hydro One's building components were assessed as either high or medium-risk.

In their **current draft plan**, Hydro One is focused on:

- **Addressing at-risk building components**: In their current draft plan, Hydro One plans to address 50% of high to medium-risk building components, prioritizing those that are most critical.
- **Making at-risk sites more resilient to severe weather**: In their draft plan, Hydro One plans to invest in reducing flooding risks at 2 of out 12 at-risk sites. For example, in 2024, severe rain flooded a transmission station, resulting in outages for nearly 170,000 customers.

Flooding at a Hydro One transmission station in 2024

- **Repairing or retrofitting field offices**: Many facilities that serve as dispatch for Hydro One crews were built more than 50 years ago. Since then, standards for accessibility have changed considerably. In their draft plan, Hydro One plans to invest in 70 of their 115 facilities that no longer meet modern standards.

Doing less of these types of investments now could increase the number of reactive repairs to facilities, as well as increase the risk of more frequent outages caused by severe weather and longer crew dispatch times. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Lower risk of critical asset failures, but address fewer aging field facilities than the draft plan	Lower risk of critical asset failures and make progress on addressing aging field facilities	Further lower risk of asset failures and address more aging field facilities than the draft plan
	Main Differences Between Plans		
Addressing at-risk building components	Same as draft plan	50% of at-risk building components	57% of at-risk building components
Making at-risk sites more resilient	Same as draft plan	2 at-risk sites	8 at-risk sites
Repairing or retrofitting facilities	50 facilities	70 facilities	90 facilities
Average Monthly Distribution Bill Impact	$11 less by 2032 (average of $2 less each year)	Included in Draft Plan	$11 more by 2032 (average of $2 more each year)
Average Monthly Transmission Bill Impact	$1 less by 2032 (average of $0.17 less each year)		$3 more by 2032 (average of $1 more each year)

Hydro One Customer Engagement Survey
Information technology

hydro one

Hydro One's daily operations require technology systems for all aspects of their business, including billing, operating the grid, responding to outages, planning projects, and communicating with customers.

When deciding the right level of information technology (I.T.) investment, Hydro One must balance various factors, including the cost of new or updated systems, the risks related to current systems, and the benefits that new technologies could bring to the company and customers.

Hydro One's current draft plan is focused on:

- **Maintaining the current state of technology systems**: Like with poles and wires, technology systems need to be maintained so that crews can restore power and customers can access key services like their online account and the outage restoration map.
- **Enhancing customer service**: I.T. investments and advanced data can help Hydro One offer better services to customers, improve estimated restoration times during outages and notify customers when service will be back online.
- **Improving Hydro One's operational efficiency**: Investments in technology systems can help Hydro One dispatch crews and perform their work more effectively.
- **Protecting the grid from both cyber and physical security threats**: Investments in new technologies can provide more robust protection against external threats, enhancing the resilience of critical system infrastructure.

While a significant portion of Hydro One's I.T. budget is allocated to meet safety, legal, and regulatory requirements, Hydro One could defer investments focused on enhancing customer service, improving efficiency, and expanding capabilities beyond 2032.

Deferring these types of investments would delay these benefits and potentially limit Hydro One's ability to accommodate newer technologies in the future.

Which of the following options do you prefer?

	Spend Less	Draft Plan
	Maintain the current state of technology systems but make fewer investments to enhance service and efficiencies	Maintain the current state of technology systems while modernizing capabilities to enhance service and efficiencies
	Main Differences Between Plans

Hydro One Customer Engagement Survey

Evaluating Hydro One's 2028-2032 draft plan

Hydro One has calculated an overall cost for their draft plans. While the plans may change based on feedback from the earlier questions in this survey, Hydro One would like to know how you feel about the overall draft plans.

It is estimated that a typical **general service demand customer** would see:

- The **distribution** portion of their **monthly bill** increase from $2,720 in 2027 to $4,449 by the end of 2032 – an increase of **$1,729** on the monthly bill. This represents an average increase of **$346** on the monthly bill each year.
- The **transmission** portion of their **monthly bill** increase from $681 in 2027 to $889 by the end of 2032 – an increase of **$208** on the monthly bill. This represents an average increase of **$42** on the monthly bill each year.

ST-Low Version

Hydro One Customer Engagement Survey

Evaluating Hydro One's 2028-2032 draft plan

Hydro One has calculated an overall cost for their draft plans. While the plans may change based on feedback from the earlier questions in this survey, Hydro One would like to know how you feel about the overall draft plans.

It is estimated that a typical **sub-transmission low consumption customer** would see:

- The **distribution** portion of their **monthly bill** increase from $2,221 in 2027 to $2,963 by the end of 2032 – an increase of **$742** on the monthly bill. This represents an average increase of **$148** on the monthly bill each year.
- The **transmission** portion of their **monthly bill** increase from $5,279 in 2027 to $6,891 by the end of 2032 – an increase of **$1,613** on the monthly bill. This represents an average increase of **$323** on the monthly bill each year.

Final comments on the draft plans

Large Distribution

Q Do you have any final comments regarding Hydro One's draft plans for 2028–2032 and the proposed rate increase? (Optional)

Verbatim comments (92% No comment)
"Access to electrical power is a benefit with a related cost to the people of Ontario. While some people could afford a higher cost for a better level of service, I expect it is not practical to provide a "two-tiered" level of service. I suggest the spending plan take into account the level of service that the average person in Ontario could reasonably afford."
"The draft plans could already be over ambitious and not realistic if there is not resource availability to execute. I do not know Hydro One's history on meeting planned maintenance and project work. I would assume that any over collection – i.e. not being able to meet plans would mean returning that funding to customers – typical what occurs in a rate regulated environment. We support the draft plan assuming proper oversight and accountability to reasonably meet the targets in the draft plans."
"The rate increases will have a negative impact on manufacturing companies. Forecasted increases will help with future budgeting."
"We must make improvements for overall reliability, but we can't stay in business if our rates increase dramatically. I think the draft plan is middle of the road and the appropriate action."

Q Was there any content missing that you would have liked to have seen included in this customer engagement? (Optional)

Verbatim comments (87% No comment)
"Can add some electricity generation cost and estimation of GA to create grate picture."
"How Hydro One plans to increase capacity and an improved system to evaluate business opportunities that need specific power commitments."
"Hydro One and OPG employee salaries are the highest in the province. How much do these inflated salaries contribute to the cost of electricity and the increasing cost of electricity?"
"I'd like to see the projected increase as a percent increase, rather than doing that math in my head. If it's a 5%/year, say that rather than example of XX$ to XX$."
"No info is just enough. It could be a good idea based on Class A and Class B and Residential customers."
"No risk analysis, no qualitative comparison of benefits of the different options. The options were presented in such a way that the average/reasonable person would pick "draft plan" - I would have liked to see costs, benefits, and risks, quantified for each option (i.e. battery investments should defer or be more cost effective than distribution system expansion). The proposed doubling of distribution rates in 5 years, against a background of ballooning electricity commodity prices, is not well received. There is too much political interference in the Ontario power market, a bill structure that is opaque with incentives for conservation that have been eroded, and a rate structure that makes prediction of future costs very difficult to predict compared to other jurisdictions."
"We are in desperate need of more power in our area so we can expand our operations. There was no question in regards to expanding capacity. Bringing power to companies that would like to grow and create jobs should be a top priority."

Survey Diagnostics
Outstanding questions

Q Is there anything that you would still like answered? (Optional)

Verbatim comments (89% No comment)
"An improved system to evaluate business opportunities that need specific power requirements."
"Comparison of the overall cost of electricity (generation, delivery, administration) across Canada. There may be opportunities to learn how to be more efficient from other electrical systems."
"Contract pricing for agricultural greenhouse, cannot compete at current prices."
"Just accurate forecasting of increases so companies can budget accordingly."
"We seem to experience momentary power blips frequently. I have been told that additional reclosure switches will help isolate us from some of them is that a true fact. Thank you."
"Yes, we would like to see more done to bring new power lines to companies like ourselves that are looking to grow and create jobs."

Online Survey
Methodology

Field Dates

To obtain feedback from **Other LDC Residential customers**, a random sample of online panelists were invited to complete the survey from a set of partner panels based on the Lucid exchange platform.

In order to qualify to complete the survey, respondents must be Ontarians 18+ who at least share responsibility for paying the electricity bill in their household, excluding Hydro One distribution customers.

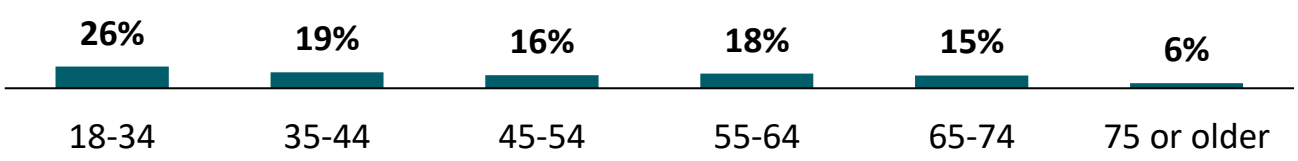
Survey responses were collected between **December 4th and December 16th, 2025**.

Other LDC Residential Online Survey Completes

A total of **2,071** (unweighted) other LDC residential customers completed the online survey.

Sample Weighting

The Other LDC Residential online survey sample was weighted to n=2,000 proportionately by age, gender, region and education in order to be representative of the broader Ontario population based on Census data.



The table below summarizes the unweighted and weighted (in brackets) sample breakdown by age, gender, and region. Totals may not correspond with cell values, as some respondents prefer to self-describe their gender. Weights are calculated based off of all available information for a given respondent.

Region	Age-Gender						Total
	Men 18-34	Men 35-54	Men 55+	Women 18-34	Women 35-54	Women 55+	
Toronto	66 (68)	90 (75)	81 (73)	64 (65)	93 (90)	87 (83)	481 (454)
Rest of GTA	78 (83)	118 (113)	125 (117)	66 (65)	105 (109)	120 (117)	612 (605)
South/West	69 (78)	104 (99)	113 (101)	56 (52)	86 (88)	119 (116)	548 (535)
North/East	55 (62)	77 (69)	96 (87)	51 (45)	58 (56)	93 (87)	430 (406)
Total	268 (292)	389 (356)	415 (378)	237 (227)	342 (343)	419 (403)	2,071 (2,000)

Note: *Graphs and tables may not always total 100% due to rounding values rather than any error in data. Sums are added before rounding numbers. Caution interpreting results with small n-sizes.*

Hydro One Customer Engagement Survey

Welcome to Hydro One's customer engagement survey!

As Hydro One plans for the future, they need your input on choices that will impact the services you receive and the rates you pay.

- **Hydro One is looking for your feedback on their draft investment plan** for the years 2028 to 2032 to ensure they make spending decisions that matter to you, the customer.
- **You don't need to be an electricity expert to complete this survey.** It focuses on basic choices and provides the background information you need to answer the questions.
- The survey will take approximately 10-15 minutes to complete. If you are reading this on a mobile device, you may want to consider switching to a tablet or laptop so that it is easier for you to read.

All individual responses will be kept confidential.
Innovative Research Group (www.innovativeresearch.ca), an independent research company, has been hired by Hydro One to gather your feedback while protecting your confidentiality. Your individual answers will not be shared with Hydro One in any identifiable way.

SURVEY PAGE

Hydro One Customer Engagement Survey
What is this survey about?

Hydro One is funded by the rates paid by most Ontarians. Every five years, Hydro One is required to file an application with the Ontario Energy Board (OEB), the energy regulator in Ontario, to set rates. Hydro One's next rate application will cover the years 2028-2032.

In this process, Hydro One's rate application will be examined in detail and Hydro One must demonstrate that customer needs and priorities were factored into their investment planning process.

Today, Hydro One wants your feedback on their draft investment plan, including specific investment choices where they need customer input. This feedback, along with other input, will be used to help Hydro One's planners refine and finalize the draft investment plan.

Next year, Hydro One will present their proposed plan and input provided by customers to the OEB.

SURVEY PDF

Familiarity & Experience

Hydro One's role in Ontario's electricity system

SURVEY PAGE

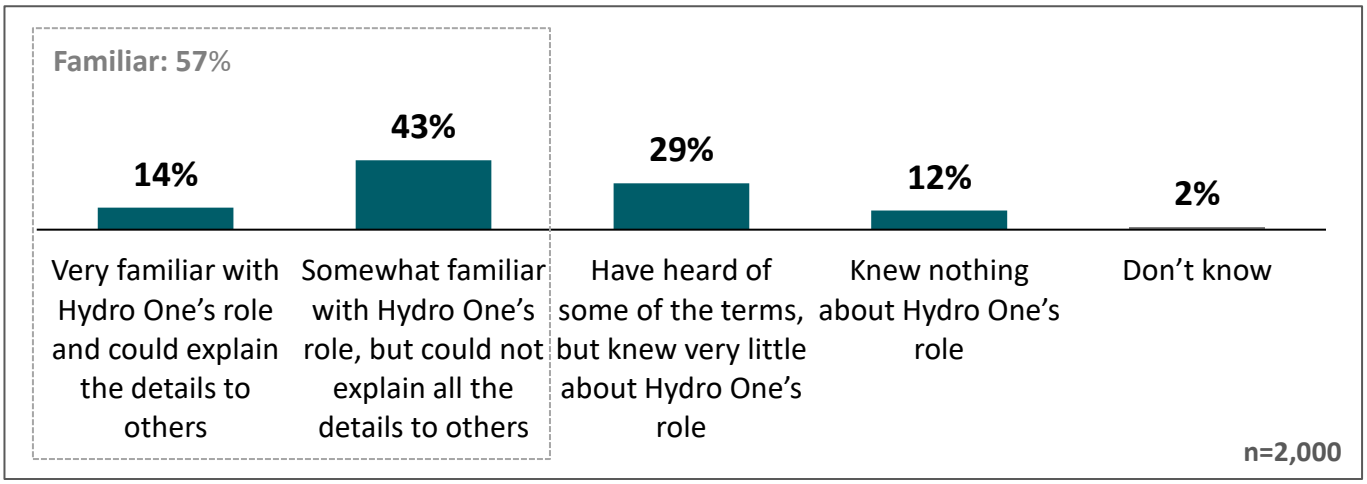
Hydro One Customer Engagement Survey

What is Hydro One's role in Ontario's electricity system?

Ontario's electricity system has three key components: **generation**, **transmission** and **distribution**.

Hydro One's transmission system takes electricity from generation stations and transports it via high-voltage transmission lines to local communities across the province.

In many communities, **Hydro One** is also responsible for the local distribution system, which delivers electricity to homes, seasonal properties, or organizations through a network of wires, poles and other equipment.



Hydro One does not generate electricity or set electricity prices.

Portion of the electricity bill that goes to Hydro One

Other LDC Residential

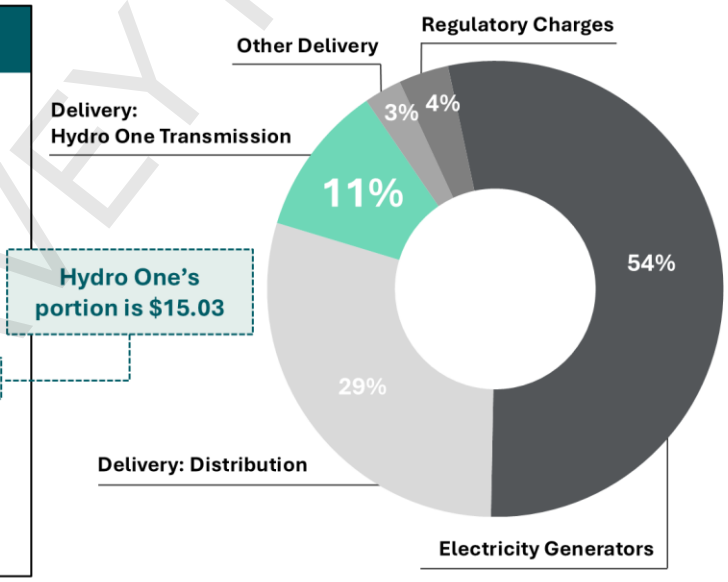
Hydro One Customer Engagement Survey

How much of my electricity bill goes to Hydro One?

Every item and charge on your bill is mandated by the provincial government or regulated by the OEB, the provincial energy regulator.

As of **July 1, 2025**, for a typical Ontario residential customer, about 11% of the bill, or $15.03, goes to Hydro One per month to pay for the transmission of electricity from generation stations to your local electricity distributor.

The rest of your bill payment goes to your local electricity distributor, power generation companies, taxes, and regulatory agencies.



Sample Residential Monthly Bill
(based on consumption of 750 kWh as of July 1, 2025)

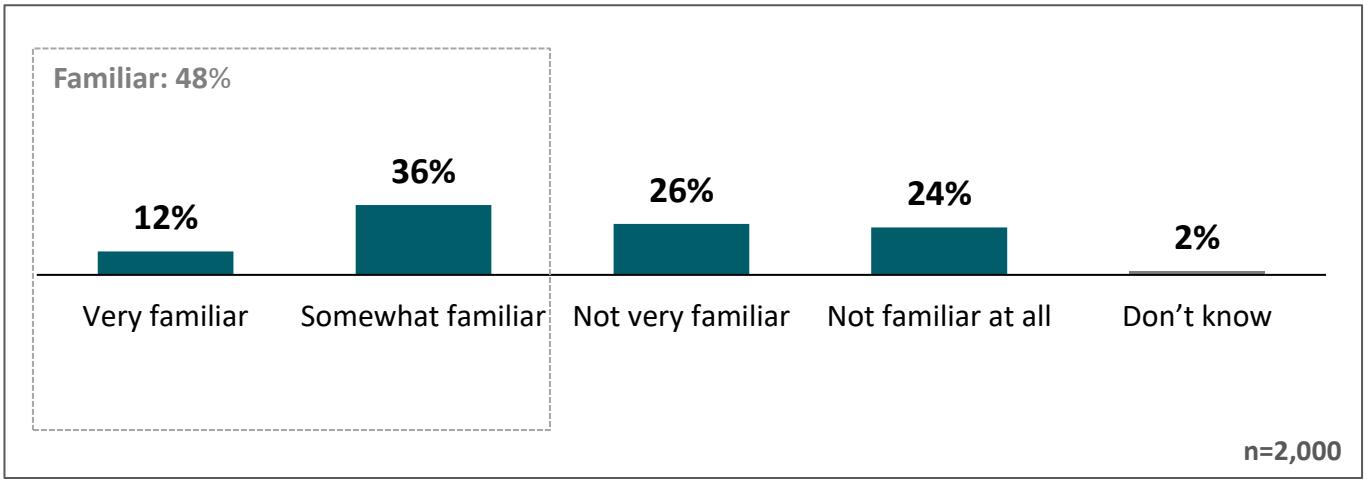
Account Number:
0000000000

Meter Number:
00000000

Your Electricity Charges	
Electricity	
On-Peak (highest price) @ 18.2 c/kWh	22.52
Mid-Peak (mid price) @ 12.2 c/kWh	16.47
Off-Peak (lowest price) @ 8.7 c/kWh	35.91
Delivery	59.79
Regulatory Charges	4.95
Total Electricity Charges	$139.63
HST	18.15
Ontario Electricity Rebate	(-$18.29)
Total Amount	$139.49

Hydro One's portion is $15.03

The pie chart above is based on a total bill of $139.63 excluding the Ontario Electricity Rebate and HST. The chart may not total 100% due to rounding.



The sample bill above uses an average consumption level of 750kWh per month; however, your usage may vary above or below this assumed level. These types of variations would mostly impact your electricity (On, Mid and Off-Peak) charges.

Summary of Investment Plan

How Hydro One plans

Other LDC Residential

Hydro One Customer Engagement Survey

How does Hydro One plan?

Every five years, Hydro One develops comprehensive plans that outline both short-term and long-term system needs. These plans are the combination of thousands of inputs from technical experts and customers.

The three key areas that inform Hydro One's plans are:

- **Customer feedback** collected through both ongoing interactions and specific engagements, such as this.
- Information and input from **internal engineering and technical experts**, who closely monitor the pressures on the system and develop solutions to address these challenges.
- Hydro One's **mandatory legal and regulatory requirements**, including connecting customers, moving equipment, and installing and maintaining customer meters.

What has Hydro One heard from customers so far?

In 2024, Hydro One collected feedback from thousands of customers across Ontario on their needs and priorities for electricity transmission services. This feedback was used to inform planners in developing the draft investment plan.

In this initial feedback, most customers expressed a desire for Hydro One to:

1. Prioritize **reasonable rates** and **reliable service**.
2. Make investments to **improve or maintain current levels of reliability**.

SURVEY PAGE

Summary of Investment Plan

Challenges impacting Hydro One's plans

Other LDC Residential

Hydro One Customer Engagement Survey

What challenges are impacting Hydro One's plans?

Hydro One is facing challenges that require more resources, new solutions, or growing costs to manage.

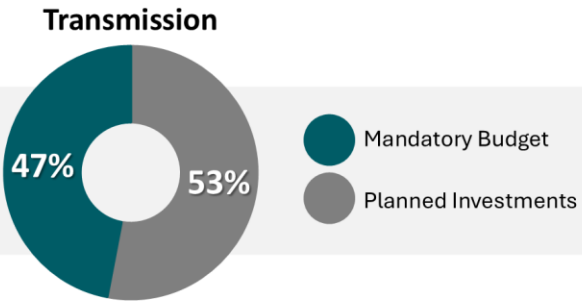
Some of these challenges, like the pace of addressing aging and deteriorating infrastructure are within Hydro One's control. Others, like the frequency of severe weather, are not.

When developing their plans, Hydro One must consider **external pressures**, including:

Increasing demand for electricity

According to the Independent Electricity System Operator (IESO), electricity demand in Ontario is forecasted to increase by 75% by 2050.

In fact, since 2021, growth in the province has far exceeded expectations and customer requests for new connections have grown considerably: **demand for new connections to Hydro One's distribution system has outpaced projections** by, on average, 21% per year.



Rising cost pressures

Businesses across Ontario are **experiencing significant cost pressures** from factors including tariffs and inflation. Hydro One has been working to offset some of these cost pressures by finding savings and internal efficiencies. In 2024, Hydro One realized approximately $150 million in savings.

How does this impact how Hydro One plans?

Despite increasing demand for electricity, external rising cost pressures, and more frequent severe weather, Hydro One has been working to manage spending within their original budget that was approved by the OEB in 2022. This means that Hydro One has had to delay some planned work to accommodate unexpected higher growth and rising costs.

For the 2028-2032 period, **about half of Hydro One's draft capital budget is committed to work that is necessary to meet mandatory requirements**, including meeting safety, legal, and regulatory requirements, accommodating increased demand for electricity and supporting provincial economic growth.

SURVEY PAGE

Summary of Investment Plan

Objectives Hydro One is focused on

Other LDC Residential

Hydro One Customer Engagement Survey

What objectives is Hydro One focused on?

hydro one

Today, Hydro One has developed draft investment plans that focus on achieving objectives that balance customer feedback, economic growth in Ontario, engineering and technical analysis, and current and emerging pressures on the system.

Hydro One's draft plans cover both the **transmission system** serving most Ontarians and the **distribution system** serving their approximately 1.5 million customers.

Some of the highlights of Hydro One's draft plans include:

Transmission Objectives

1. **Maintaining the overall health** of the transmission system by limiting the risk of equipment failure.
2. **Getting the most out of the system** by reinforcing and extending the life of equipment and limiting the impacts of severe weather.
3. **Keep pace with Ontario's economic development**, including meeting demand for new and expanded industry in the province

One of the benefits of being both the largest transmitter and distributor of electricity in Ontario is the ability to invest in technology systems, buildings, and facilities that benefit both systems.

Some of these shared objectives of Hydro One's draft plans include:

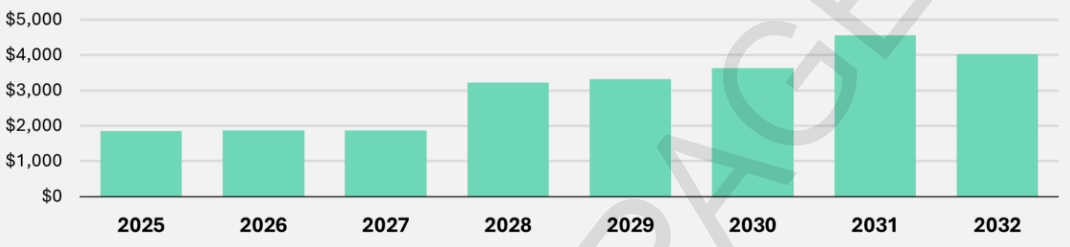
Shared Transmission and Distribution Objectives

1. **Limiting the risk of potential damage to equipment** by addressing the most at-risk building components and making sites more resilient to severe weather.
2. **Maintaining the company's existing technology systems**, improving operational efficiency and resilience to cybersecurity threats, and **modernizing the system** to provide enhanced services to customers.

SURVEY PAGE

Summary of Investment Plan

Cost of Hydro One's draft transmission plan



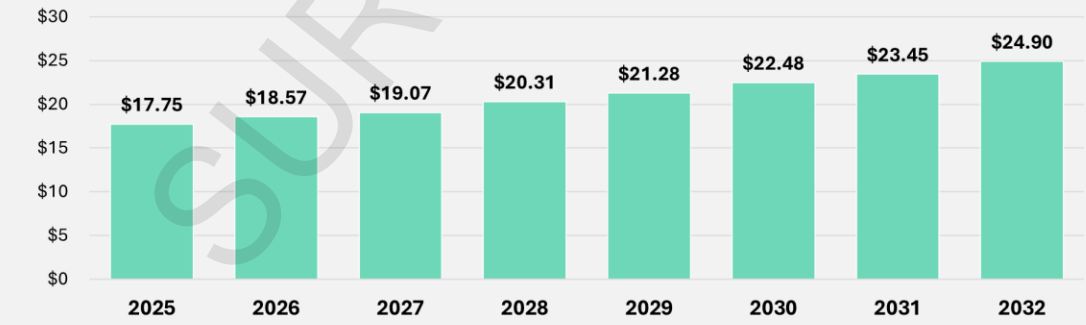
Other LDC Residential

Hydro One Customer Engagement Survey

How much will Hydro One's draft transmission plan cost?

For the **transmission system**, investment costs are shared by more than 5 million electricity rate payers in Ontario.

Transmission Budget: Current and Forecasted ($ millions)



The draft transmission investment plan would result in an average annual funding requirement of **$3.8 billion** for **transmission** for 2028-2032.

How will this plan impact the transmission portion of customer bills?

For a typical Ontario **residential customer**, the **transmission** portion of their **monthly bill** is estimated to increase from $19.07 in 2027 to $24.90 by the end of 2032 – an increase of **$5.83** on the monthly bill. This represents an average increase of **$1.17** on the monthly bill each year.

Transmission Portion of Monthly Bill

Note:
- The transmission portion of the monthly bill and associated estimated bill impacts are based on a typical Hydro One residential customer for illustrative purposes.
- Hydro One's rates until December 31, 2027, were approved by the OEB in an earlier application.
- These estimated rate increases and forecasted budgets are preliminary and are subject to change based on customer feedback, regulatory approval, and other factors.

SURVEY PAGE

Summary of Investment Plan

How to make choices

Other LDC Residential

Hydro One Customer Engagement Survey

What choices does Hydro One want my input on?

The remainder of this survey asks for your input on the total cost of the draft transmission investment plan, plus **4 key choices** within the plan that Hydro One is looking for your guidance on.

- Each choice has a summary of the options that Hydro One is considering. In many cases, that includes options that would see Hydro One ***spend less*** or ***spend more*** than what is currently being proposed in the draft plan.
- For each option, Hydro One has estimated what impact it would have on customer bills **compared to the draft plan**. These impacts are approximate.
- Following each question, you will also have an opportunity to provide additional feedback if you choose to.
- Once you have finished giving feedback on the key choices, you will have an opportunity to review and change your responses until you feel you have found the right balance between the level of investment and cost for you.

SURVEY PAGE

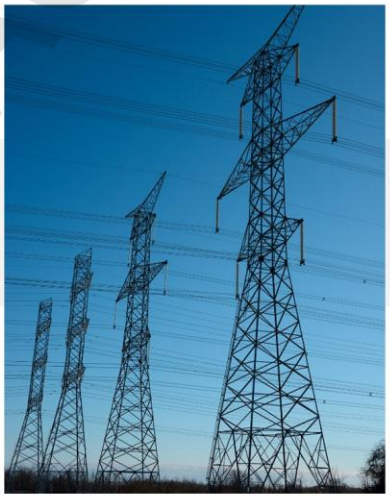
Summary of Investment Plan

Hydro One's transmission system

Other LDC Residential

Hydro One Customer Engagement Survey

What is the transmission system and who does it serve?



Let's talk about the provincial transmission system. The transmission system is the highway for Ontario's electricity, bringing power from generation stations to your community.

Hydro One's transmission system serves most electricity customers in Ontario, including distribution companies across the province.

Outages on Hydro One's transmission system have significant impacts on communities and Ontario's economy. As such, the transmission system is designed to minimize both the frequency and duration of outages.

For example, most of Ontario's population centres are served by multiple transmission lines so that if one fails, there is always a backup to keep power flowing.

Since 2019, the typical Ontarian connected to Hydro One's transmission system has experienced, on average, **1 outage per year** related to the transmission system.

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to either increase or maintain current levels of reliability related to the transmission grid.

SURVEY PAGE

Hydro One Customer Engagement Survey
Keeping pace with transmission renewal

hydro one

Portions of Hydro One's transmission system were built in the 1930s, 40s, and 50s.

Hydro One has identified several types of equipment that are at increased risk of failure due to age and condition and would have widespread impacts if they were to fail.

Transmission station equipment ensures electricity can safely travel from power plants to communities. Hydro One has identified close to 200 out of 700 transmission transformers and 400 out of 4,700 circuit breakers in poor condition that are at increased risk of failure. While an equipment failure may not result in an immediate outage, it leaves the system more vulnerable with limited backup.

Underground transmission cables serve many high-density areas. Hydro One has identified that 20 km of their network of around 270 km of cables are at increased risk of failure. Because of the complex nature of these cables, if they were to fail, the outage impacts would be widespread and time-consuming and costly to repair.

Hydro One's **current draft plan** is focused on managing the risk of equipment failure and supporting growth across the province by:

- **Replacing major transmission station equipment:** In their current draft plan, Hydro One plans to replace 70 of the nearly 200 transformers and 230 of the 400 breakers identified as being in poor condition in order to reduce the risk of failure and costly repairs.
- **Replacing high-impact underground transmission cables:** Replacing all 20 km of the underground cables that Hydro One has identified as being at increased risk of failure could take up to 10 years to complete. In their current draft plan, Hydro One is proposing to begin the replacement of all 20km of these underground cables, with 12km being replaced by 2032.

Eventually, all poor condition or deteriorating equipment will need to be addressed; however, Hydro One would like your feedback on the pace of replacement. Doing less of these types of investments in the near term could lead to more equipment failure and higher emergency repair costs in the future. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Higher risk of equipment failure	Maintain the current risk of equipment failure	Lower risk of equipment failure
	Main Differences Between Plans		
Replacing transformers and breakers	55 transformers & 195 breakers	70 transformers & 230 breakers	85 transformers & 265 breakers
Replacing underground cables	Begin replacing 20km of underground cables	Begin replacing 20km of underground cables, completing 12km by 2032	Replace 20km of underground cables by 2032
Average Monthly Transmission Bill Impact	$0.59 less by 2032 (average of $0.12 less each year)	**Included in Draft Plan**	$0.59 more by 2032 (average of $0.12 more each year)

Hydro One Customer Engagement Survey
Stewardship of the transmission system

Proactive maintenance and system monitoring are among the ways that Hydro One can ensure that equipment lasts as long as possible.

In their **current draft plan**, Hydro One is proposing a series of investments to get the most out of the existing system by:

- **Replacing at-risk transmission lines:** Hydro One has identified that 11% of their approximately 28,000 km of transmission lines are at increased risk of failure due to a combination of age and condition. As these lines are replaced, they are built to modern standards that are more resilient to severe weather.
- **Reinforcing wood poles and extending the life of steel towers:** Hydro One has identified that over 23,000 of their nearly 90,000 wood poles and steel transmission towers are at the end of their expected service life. In the current draft plan, Hydro One is proposing reinforcing or extending the life of many of these structures.
- **Increasing the rate of clearing overgrown trees and brush:** Contact with vegetation accounts for a significant portion of transmission outages and increasing the rate of clearing trees and brush can help reduce the risk of outages.

Additionally, Hydro One is proposing investments in new satellite technology that can help better monitor trees and brush encroaching on infrastructure, further helping reduce the risk of outages.

These investments would be complementary to the ongoing renewal of aging or poor condition equipment, as discussed earlier.

These investments are designed to reduce the risk of major equipment failures, outages, and emergency repair costs over time. Delaying or scaling back these investments will reduce short-term costs but may increase the likelihood of unplanned outages and result in more costly reactive repairs. While doing more could further reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Higher risk of equipment failure and impacts of severe weather compared to the draft plan	Lower the current risk of equipment failure and impacts of severe weather	Further lower risk of equipment failure and impacts of severe weather compared to the draft plan
	Main Differences Between Plans		
Replacing at-risk transmission lines	Replace 1,000 km of at-risk lines	Replace 1,400 km of at-risk lines	Replace 1,800 km of at-risk lines
Reinforcing wood poles and extending the life of steel towers	2,500 wood poles and 1,500 steel towers	6,000 wood poles and 2,750 steel towers	9,500 wood poles and 4,000 steel towers
Clearing overgrown trees and brush	Clear 16% (3,100 km) of overgrown vegetation each year	Clear 17% (3,400 km) of overgrown vegetation each year	Clear 18% (3,700 km) of overgrown vegetation each year
Average Monthly Transmission Bill Impact	$0.48 less by 2032 (average of $0.10 less each year)	**Included in Draft Plan**	$0.48 more by 2032 (average of $0.10 more each year)

Investment Trade-Offs
Maintaining buildings and facilities

Other LDC Residential

Hydro One Customer Engagement Survey
Maintaining buildings and facilities

There are certain parts of Hydro One's draft plans that benefit both the transmission and local distribution systems. While the transmission portion of those investments is paid by most Ontarians, the distribution portion is paid by Hydro One distribution customers only.

Hydro One operates and maintains approximately 1,500 facilities across Ontario.

In addition to housing Hydro One's nearly 10,000 employees, these facilities store specialized fleet equipment including bucket trucks and helicopters, protect sensitive equipment, serve as central dispatch for crews, act as training and development campuses, and allow experts to remotely monitor and operate the grid.

Each year, Hydro One classifies their building components into one of three categories – ***high risk***, ***medium risk*** or ***low risk***. This considers both the likelihood of failure and how critical the component is. For instance, a roof that is beyond its useful life and houses critical equipment would be deemed ***high risk***. Whereas older office equipment may be classified as ***low risk***.

In 2025, 25% of Hydro One's building components were assessed as either high or medium-risk.

In their **current draft plan**, Hydro One is focused on:

- **Addressing at-risk building components**: In their current draft plan, Hydro One plans to address 50% of high to medium-risk building components, prioritizing those that are most critical.
- **Making at-risk sites more resilient to severe weather**: In their draft plan, Hydro One plans to invest in reducing flooding risks at 2 of out 12 at-risk sites. For example, in 2024, severe rain flooded a transmission station, resulting in outages for nearly 170,000 customers.

Flooding at a Hydro One transmission station in 2024

- **Repairing or retrofitting field offices**: Many facilities that serve as dispatch for Hydro One crews were built more than 50 years ago. Since then, standards for accessibility have changed considerably. In their draft plan, Hydro One plans to invest in 70 of their 115 facilities that no longer meet modern standards.

Doing less of these types of investments now could increase the number of reactive repairs to facilities, as well as increase the risk of more frequent outages caused by severe weather and longer crew dispatch times. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Lower risk of critical asset failures, but address fewer aging field facilities than the draft plan	Lower risk of critical asset failures and make progress on addressing aging field facilities	Further lower risk of asset failures and address more aging field facilities than the draft plan
	Main Differences Between Plans		
Addressing at-risk building components	Same as draft plan	50% of at-risk building components	57% of at-risk building components
Making at-risk sites more resilient	Same as draft plan	2 at-risk sites	8 at-risk sites
Repairing or retrofitting facilities	50 facilities	70 facilities	90 facilities
Average Monthly Transmission Bill Impact	$0.02 less by 2032 (average of $0.005 less each year)	**Included in Draft Plan**	$0.07 more by 2032 (average of $0.01 more each year)

Investment Trade-Offs
Information technology

Hydro One Customer Engagement Survey
Information technology

Hydro One's daily operations require technology systems for all aspects of their business, including billing, operating the grid, responding to outages, planning projects, and communicating with customers.

When deciding the right level of information technology (I.T.) investment, Hydro One must balance various factors, including the cost of new or updated systems, the risks related to current systems, and the benefits that new technologies could bring to the company and customers.

Hydro One's current draft plan is focused on:

- **Maintaining the current state of technology systems**: Like with poles and wires, technology systems need to be maintained so that crews can restore power and customers can access key services like their online account and the outage restoration map.
- **Enhancing customer service**: I.T. investments and advanced data can help Hydro One offer better services to customers, improve estimated restoration times during outages and notify customers when service will be back online.
- **Improving Hydro One's operational efficiency**: Investments in technology systems can help Hydro One dispatch crews and perform their work more effectively.
- **Protecting the grid from both cyber and physical security threats**: Investments in new technologies can provide more robust protection against external threats, enhancing the resilience of critical system infrastructure.

While a significant portion of Hydro One's I.T. budget is allocated to meet safety, legal, and regulatory requirements, Hydro One could defer investments focused on enhancing customer service, improving efficiency, and expanding capabilities beyond 2032.

Deferring these types of investments would delay these benefits and potentially limit Hydro One's ability to accommodate newer technologies in the future.

Which of the following options do you prefer?

	Spend Less	Draft Plan
	Maintain the current state of technology systems but make fewer investments to enhance service and efficiencies	Maintain the current state of technology systems while modernizing capabilities to enhance service and efficiencies
	Main Differences Between Plans

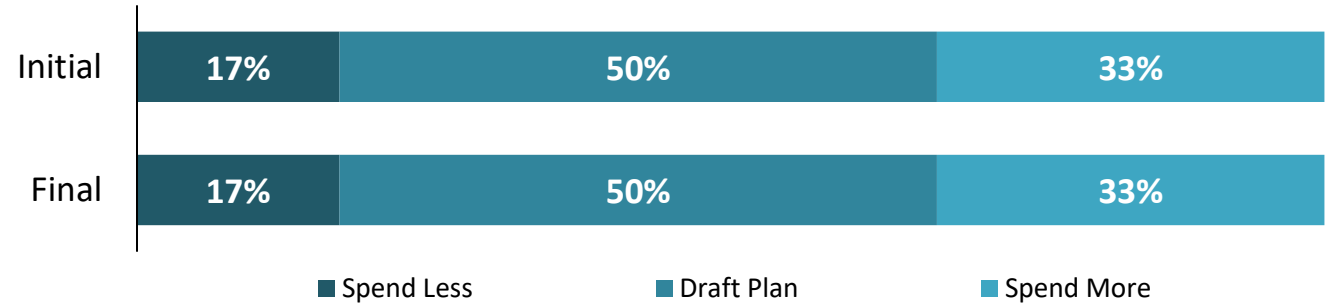
Hydro One Customer Engagement Survey

What is the impact of my choices?

Throughout this survey, you have been asked about 4 key choices. Below is a summary of your choices.

At the bottom of this page, you will find the total bill impact of all your answers. You can change your responses if you desire, and the estimated impact on the monthly bill will be recalculated.



The bill impacts associated with each choice represent the average estimated increase on the transmission portion of the monthly bill from 2027 to 2032, followed by the average estimated increase on the transmission portion of the monthly bill each year. The impacts under the "spend less" or "spend more" options are relative to the bill impact of the draft plan.

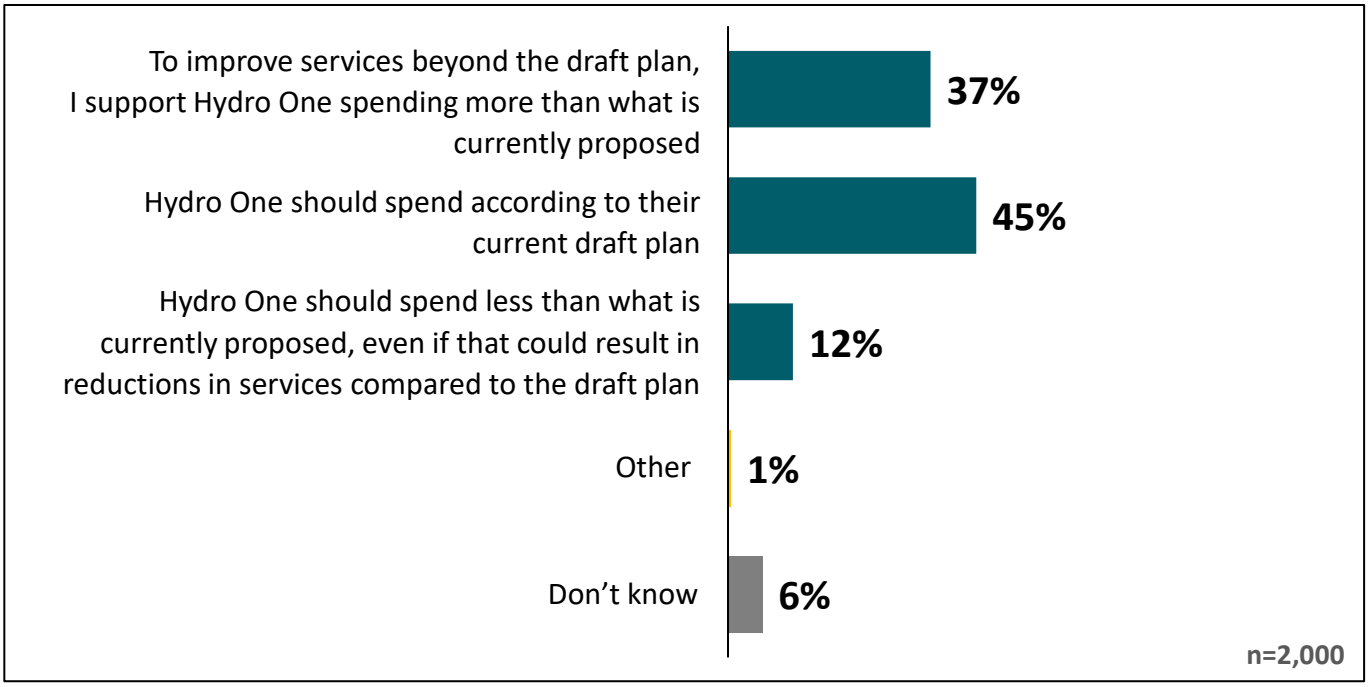
Evaluating Hydro One's 2028-2032 draft plan

Hydro One has calculated an overall cost for their draft plan. While the plan may change based on feedback from the earlier questions in this survey, Hydro One would like to know how you feel about the overall draft plan.



It is estimated that a typical Ontario **residential customer** would see the **transmission** portion of their **monthly bill** increase from $19.07 in 2027 to $24.90 by the end of 2032 – an increase of **$5.83** on the monthly bill. This represents an average increase of **$1.17** on the monthly bill each year.

Online Survey
Methodology

Field Dates

To obtain feedback from **Other LDC Small Business (GS<50) customers**, a random sample of online panelists were invited to complete the survey from a set of partner panels based on the Dynata exchange platform.

In order to qualify to complete the survey, respondents must satisfy each of the following conditions:

- Represent an organization with fewer than 50 employees
- At least share responsibility for the electricity bill or engage in electricity decision-making at their organization (dealing with electrical utility companies, understanding and selecting electricity-based equipment, or managing electricity use)
- Receive electrical service from a company other than Hydro One

Survey responses were collected between **December 4th and December 16th, 2025**.

Other LDC Small Business Online Survey Completes

A total of **305** (unweighted) businesses completed the online survey.

Note: *Graphs and tables may not always total 100% due to rounding values other than any error in data. Sums are added before rounding numbers. Caution interpreting results with small n-sizes.*

INNOVATIVE RESEARCH GROUP

Hydro One Customer Engagement Survey

Welcome to Hydro One's customer engagement survey!

hydro one

As Hydro One plans for the future, they need your input on choices that will impact the services you receive and the rates you pay.

- **Hydro One is looking for your feedback on their draft investment plan** for the years 2028 to 2032 to ensure they make spending decisions that matter to you, the customer.
- **You don't need to be an electricity expert to complete this survey.** It focuses on basic choices and provides the background information you need to answer the questions.
- The survey will take approximately 10-15 minutes to complete. If you are reading this on a mobile device, you may want to consider switching to a tablet or laptop so that it is easier for you to read.

All individual responses will be kept confidential.
Innovative Research Group (www.innovativeresearch.ca), an independent research company, has been hired by Hydro One to gather your feedback while protecting your confidentiality. Your individual answers will not be shared with Hydro One in any identifiable way.

INNOVATIVE RESEARCH GROUP

SURVEY PAGE

Hydro One Customer Engagement Survey
What is this survey about?

Hydro One is funded by the rates paid by most Ontarians. Every five years, Hydro One is required to file an application with the Ontario Energy Board (OEB), the energy regulator in Ontario, to set rates. Hydro One's next rate application will cover the years 2028-2032.

In this process, Hydro One's rate application will be examined in detail and Hydro One must demonstrate that customer needs and priorities were factored into their investment planning process.

Today, Hydro One wants your feedback on their draft investment plan, including specific investment choices where they need customer input. This feedback, along with other input, will be used to help Hydro One's planners refine and finalize the draft investment plan.

Next year, Hydro One will present their proposed plan and input provided by customers to the OEB.

SURVEY PREVIEW

Familiarity & Experience

Hydro One's role in Ontario's electricity system

Other LDC
Small Business

SURVEY PAGE

Hydro One Customer Engagement Survey

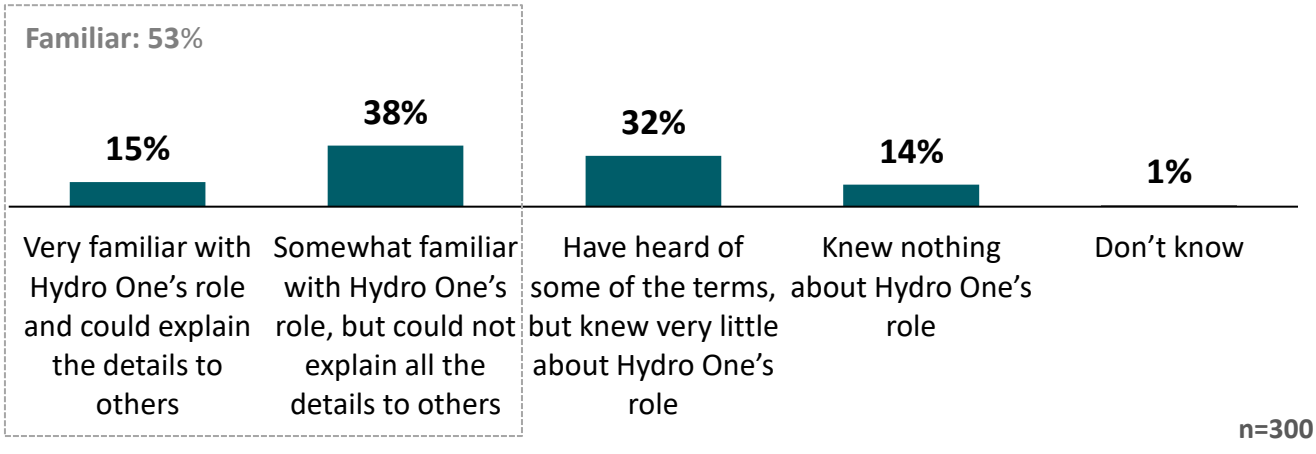
What is Hydro One's role in Ontario's electricity system?

hydro one

Ontario's electricity system has three key components: **generation**, **transmission** and **distribution**.

Hydro One's transmission system takes electricity from generation stations and transports it via high-voltage transmission lines to local communities across the province.

In many communities, **Hydro One** is also responsible for the local distribution system, which delivers electricity to homes, seasonal properties, or organizations through a network of wires, poles and other equipment.



Hydro One does not generate electricity or set electricity prices.

Familiarity & Experience

Hydro One's role in Ontario's electricity system

Other LDC Small Business

Q Before this survey, how familiar were you with Hydro One's role in Ontario's electricity system?

Familiarity & Experience

Portion of the electricity bill that goes to Hydro One

Other LDC Small Business

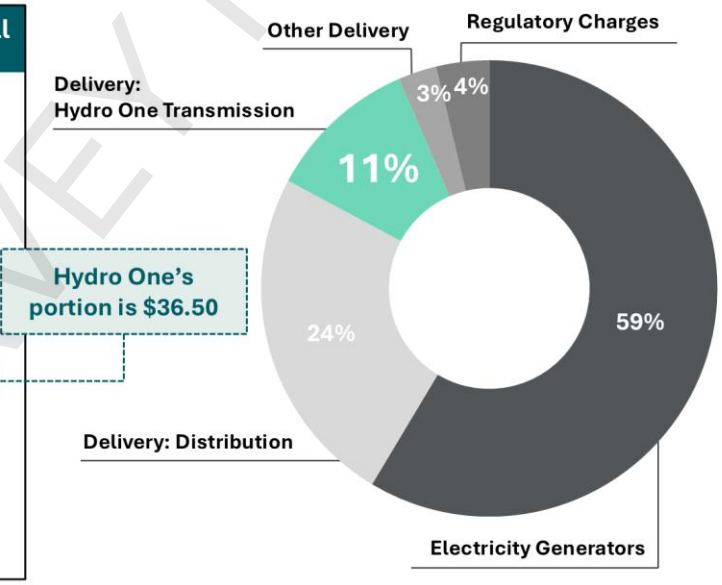
Hydro One Customer Engagement Survey

How much of my electricity bill goes to Hydro One?

Every item and charge on your bill is mandated by the provincial government or regulated by the OEB, the provincial energy regulator.

As of **July 1, 2025**, for a typical Ontario small business customer, about 11% of the bill, or $36.50, goes to Hydro One per month to pay for the transmission of electricity from generation stations to your local electricity distributor.

The rest of your bill payment goes to your local electricity distributor power generation companies, taxes, and regulatory agencies.



Sample Small Business Monthly Bill
(based on consumption of 2,000 kWh as of July 1, 2025)

Account Number:
0000000000

Meter Number:
00000000

Your Electricity Charges	
Electricity	
On-Peak (highest price) @ 18.2 c/kWh	60.04
Mid-Peak (mid price) @ 12.2 c/kWh	43.92
Off-Peak (lowest price) @ 8.7 c/kWh	95.76
Delivery	128.41
Regulatory Charges	12.78
Total Electricity Charges	$340.91
HST	44.32
Ontario Electricity Rebate	(-$44.66)
Total Amount	$340.57

Hydro One's portion is $36.50

The pie chart above is based on a total bill of $340.91 excluding the Ontario Electricity Rebate and HST. The chart may not total 100% due to rounding.

The sample bill above uses an average consumption level of 2,000kWh per month; however, your usage may vary above or below this assumed level. These types of variations would mostly impact your electricity (On, Mid and Off-Peak) charges.

Summary of Investment Plan

How Hydro One plans

Other LDC
Small Business

Hydro One Customer Engagement Survey

How does Hydro One plan?

Every five years, Hydro One develops comprehensive plans that outline both short-term and long-term system needs. These plans are the combination of thousands of inputs from technical experts and customers.

The three key areas that inform Hydro One's plans are:

- **Customer feedback** collected through both ongoing interactions and specific engagements, such as this.
- Information and input from **internal engineering and technical experts**, who closely monitor the pressures on the system and develop solutions to address these challenges.
- Hydro One's **mandatory legal and regulatory requirements**, including connecting customers, moving equipment, and installing and maintaining customer meters.

What has Hydro One heard from customers so far?

In 2024, Hydro One collected feedback from thousands of customers across Ontario on their needs and priorities for electricity transmission services. This feedback was used to inform planners in developing the draft investment plan.

In this initial feedback, most customers expressed a desire for Hydro One to:

1. Prioritize **reasonable rates** and **reliable service**.
2. Make investments to **improve or maintain current levels of reliability**.

SURVEY PAGE

Summary of Investment Plan

Challenges impacting Hydro One's plans

Other LDC Small Business

Hydro One Customer Engagement Survey

What challenges are impacting Hydro One's plans?

Hydro One is facing challenges that require more resources, new solutions, or growing costs to manage.

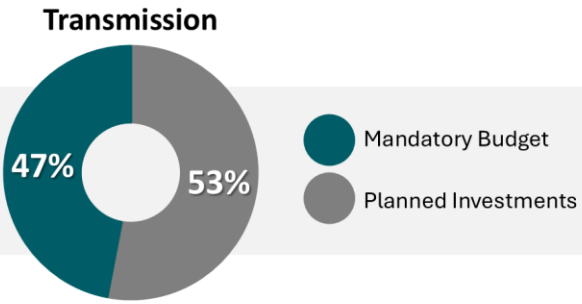
Some of these challenges, like the pace of addressing aging and deteriorating infrastructure are within Hydro One's control. Others, like the frequency of severe weather, are not.

When developing their plans, Hydro One must consider **external pressures**, including:

Increasing demand for electricity

According to the Independent Electricity System Operator (IESO), electricity demand in Ontario is forecasted to increase by 75% by 2050.

In fact, since 2021, growth in the province has far exceeded expectations and customer requests for new connections have grown considerably: **demand for new connections to Hydro One's distribution system has outpaced projections** by, on average, 21% per year.



Rising cost pressures

Businesses across Ontario are **experiencing significant cost pressures** from factors including tariffs and inflation. Hydro One has been working to offset some of these cost pressures by finding savings and internal efficiencies. In 2024, Hydro One realized approximately $150 million in savings.

How does this impact how Hydro One plans?

Despite increasing demand for electricity, external rising cost pressures, and more frequent severe weather, Hydro One has been working to manage spending within their original budget that was approved by the OEB in 2022. This means that Hydro One has had to delay some planned work to accommodate unexpected higher growth and rising costs.

For the 2028-2032 period, **about half of Hydro One's draft capital budget is committed to work that is necessary to meet mandatory requirements**, including meeting safety, legal, and regulatory requirements, accommodating increased demand for electricity and supporting provincial economic growth.

SURVEY PAGE

Summary of Investment Plan

Objectives Hydro One is focused on

Other LDC Small Business

Hydro One Customer Engagement Survey

What objectives is Hydro One focused on?

Today, Hydro One has developed draft investment plans that focus on achieving objectives that balance customer feedback, economic growth in Ontario, engineering and technical analysis, and current and emerging pressures on the system.

Hydro One's draft plans cover both the **transmission system** serving most Ontarians and the **distribution system** serving their approximately 1.5 million customers.

Some of the highlights of Hydro One's draft plans include:

Transmission Objectives

1. **Maintaining the overall health** of the transmission system by limiting the risk of equipment failure.
2. **Getting the most out of the system** by reinforcing and extending the life of equipment and limiting the impacts of severe weather.
3. **Keep pace with Ontario's economic development**, including meeting demand for new and expanded industry in the province

One of the benefits of being both the largest transmitter and distributor of electricity in Ontario is the ability to invest in technology systems, buildings, and facilities that benefit both systems.

Some of these shared objectives of Hydro One's draft plans include:

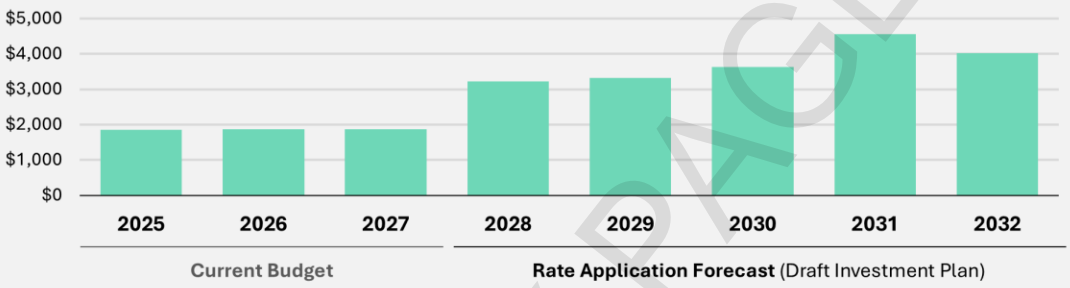
Shared Transmission and Distribution Objectives

1. **Limiting the risk of potential damage to equipment** by addressing the most at-risk building components and making sites more resilient to severe weather.
2. **Maintaining the company's existing technology systems**, improving operational efficiency and resilience to cybersecurity threats, and **modernizing the system** to provide enhanced services to customers.

SURVEY PAGE

Summary of Investment Plan

Cost of Hydro One's draft transmission plan



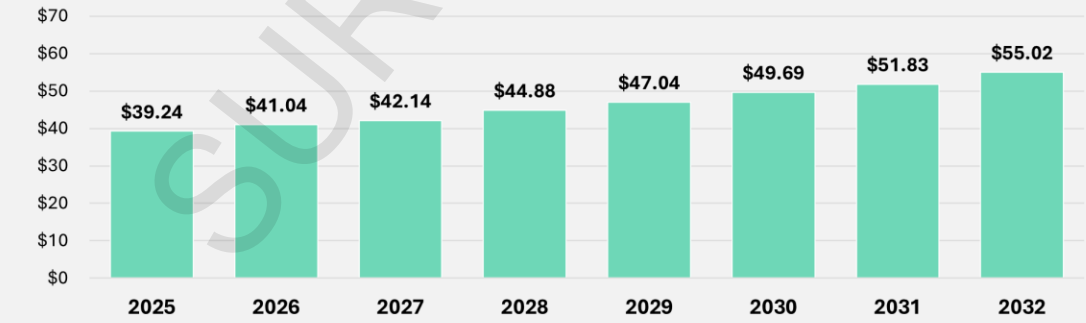
Other LDC
Small Business

Hydro One Customer Engagement Survey

How much will Hydro One's draft transmission plan cost?

For the **transmission system**, investment costs are shared by more than 5 million electricity rate payers in Ontario.

Transmission Budget: Current and Forecasted ($ millions)



The draft transmission investment plan would result in an average annual funding requirement of **$3.8 billion** for **transmission** for 2028-2032.

How will this plan impact the transmission portion of customer bills?

For a typical Ontario **small business customer**, the **transmission** portion of their **monthly bill** is estimated to increase from $42.14 in 2027 to $55.02 by the end of 2032 – an increase of **$12.88** on the monthly bill. This represents an average increase of **$2.58** on the monthly bill each year.

Transmission Portion of Monthly Bill

Note:
- The transmission portion of the monthly bill and associated estimated bill impacts are based on a typical Hydro One small business customer for illustrative purposes.
- Hydro One's rates until December 31, 2027, were approved by the OEB in an earlier application.
- These estimated rate increases and forecasted budgets are preliminary and are subject to change based on customer feedback, regulatory approval, and other factors.

SURVEY PAGE

Summary of Investment Plan

How to make choices

Other LDC Small Business

Hydro One Customer Engagement Survey

What choices does Hydro One want my input on?

The remainder of this survey asks for your input on the total cost of the draft transmission investment plan, plus **4 key choices** within the plan that Hydro One is looking for your guidance on.

- Each choice has a summary of the options that Hydro One is considering. In many cases, that includes options that would see Hydro One ***spend less*** or ***spend more*** than what is currently being proposed in the draft plan.
- For each option, Hydro One has estimated what impact it would have on customer bills **compared to the draft plan**. These impacts are approximate.
- Following each question, you will also have an opportunity to provide additional feedback if you choose to.
- Once you have finished giving feedback on the key choices, you will have an opportunity to review and change your responses until you feel you have found the right balance between the level of investment and cost for you.

SURVEY PAGE

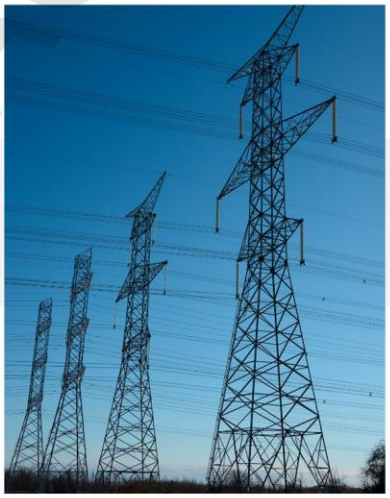
Summary of Investment Plan

Hydro One's transmission system

Other LDC
Small Business

Hydro One Customer Engagement Survey

What is the transmission system and who does it serve?



Let's talk about the provincial transmission system. The transmission system is the highway for Ontario's electricity, bringing power from generation stations to your community.

Hydro One's transmission system serves most electricity customers in Ontario, including distribution companies across the province.

Outages on Hydro One's transmission system have significant impacts on communities and Ontario's economy. As such, the transmission system is designed to minimize both the frequency and duration of outages.

For example, most of Ontario's population centres are served by multiple transmission lines so that if one fails, there is always a backup to keep power flowing.

Since 2019, the typical Ontarian connected to Hydro One's transmission system has experienced, on average, **1 outage per year** related to the transmission system.

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to either increase or maintain current levels of reliability related to the transmission grid.

SURVEY PAGE

Investment Trade-Offs

Keeping pace with transmission renewal

Other LDC
Small Business

Hydro One Customer Engagement Survey

Keeping pace with transmission renewal

Portions of Hydro One's transmission system were built in the 1930s, 40s, and 50s.

Hydro One has identified several types of equipment that are at increased risk of failure due to age and condition and would have widespread impacts if they were to fail.

Transmission station equipment ensures electricity can safely travel from power plants to communities. Hydro One has identified close to 200 out of 700 transmission transformers and 400 out of 4,700 circuit breakers in poor condition that are at increased risk of failure. While an equipment failure may not result in an immediate outage, it leaves the system more vulnerable with limited backup.

Underground transmission cables serve many high-density areas. Hydro One has identified that 20 km of their network of around 270 km of cables are at increased risk of failure. Because of the complex nature of these cables, if they were to fail, the outage impacts would be widespread and time-consuming and costly to repair.

Hydro One's **current draft plan** is focused on managing the risk of equipment failure and supporting growth across the province by:

- **Replacing major transmission station equipment:** In their current draft plan, Hydro One plans to replace 70 of the nearly 200 transformers and 230 of the 400 breakers identified as being in poor condition in order to reduce the risk of failure and costly repairs.
- **Replacing high-impact underground transmission cables:** Replacing all 20 km of the underground cables that Hydro One has identified as being at increased risk of failure could take up to 10 years to complete. In their current draft plan, Hydro One is proposing to begin the replacement of all 20km of these underground cables, with 12km being replaced by 2032.

Eventually, all poor condition or deteriorating equipment will need to be addressed; however, Hydro One would like your feedback on the pace of replacement. Doing less of these types of investments in the near term could lead to more equipment failure and higher emergency repair costs in the future. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Higher risk of equipment failure	Maintain the current risk of equipment failure	Lower risk of equipment failure
	Main Differences Between Plans		
Replacing transformers and breakers	55 transformers & 195 breakers	70 transformers & 230 breakers	85 transformers & 265 breakers
Replacing underground cables	Begin replacing 20km of underground cables	Begin replacing 20km of underground cables, completing 12km by 2032	Replace 20km of underground cables by 2032
Average Monthly Transmission Bill Impact	$1.31 less by 2032 (average of $0.26 less each year)	**Included in Draft Plan**	$1.31 more by 2032 (average of $0.26 more each year)

Hydro One Customer Engagement Survey

Stewardship of the transmission system

Proactive maintenance and system monitoring are among the ways that Hydro One can ensure that equipment lasts as long as possible.

In their **current draft plan**, Hydro One is proposing a series of investments to get the most out of the existing system by:

- **Replacing at-risk transmission lines:** Hydro One has identified that 11% of their approximately 28,000 km of transmission lines are at increased risk of failure due to a combination of age and condition. As these lines are replaced, they are built to modern standards that are more resilient to severe weather.
- **Reinforcing wood poles and extending the life of steel towers:** Hydro One has identified that over 23,000 of their nearly 90,000 wood poles and steel transmission towers are at the end of their expected service life. In the current draft plan, Hydro One is proposing reinforcing or extending the life of many of these structures.
- **Increasing the rate of clearing overgrown trees and brush:** Contact with vegetation accounts for a significant portion of transmission outages and increasing the rate of clearing trees and brush can help reduce the risk of outages.

Additionally, Hydro One is proposing investments in new satellite technology that can help better monitor trees and brush encroaching on infrastructure, further helping reduce the risk of outages.

These investments would be complementary to the ongoing renewal of aging or poor condition equipment, as discussed earlier.

These investments are designed to reduce the risk of major equipment failures, outages, and emergency repair costs over time. Delaying or scaling back these investments will reduce short-term costs but may increase the likelihood of unplanned outages and result in more costly reactive repairs. While doing more could further reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Higher risk of equipment failure and impacts of severe weather compared to the draft plan	Lower the current risk of equipment failure and impacts of severe weather	Further lower risk of equipment failure and impacts of severe weather compared to the draft plan
	Main Differences Between Plans		
Replacing at-risk transmission lines	Replace 1,000 km of at-risk lines	Replace 1,400 km of at-risk lines	Replace 1,800 km of at-risk lines
Reinforcing wood poles and extending the life of steel towers	2,500 wood poles and 1,500 steel towers	6,000 wood poles and 2,750 steel towers	9,500 wood poles and 4,000 steel towers
Clearing overgrown trees and brush	Clear 16% (3,100 km) of overgrown vegetation each year	Clear 17% (3,400 km) of overgrown vegetation each year	Clear 18% (3,700 km) of overgrown vegetation each year
Average Monthly Transmission Bill Impact	$1.05 less by 2032 (average of $0.21 less each year)	**Included in Draft Plan**	$1.05 more by 2032 (average of $0.21 more each year)

Hydro One Customer Engagement Survey
Maintaining buildings and facilities

hydro one

There are certain parts of Hydro One's draft plans that benefit both the transmission and local distribution systems. While the transmission portion of those investments is paid by most Ontarians, the distribution portion is paid by Hydro One distribution customers only.

Hydro One operates and maintains approximately 1,500 facilities across Ontario.

In addition to housing Hydro One's nearly 10,000 employees, these facilities store specialized fleet equipment including bucket trucks and helicopters, protect sensitive equipment, serve as central dispatch for crews, act as training and development campuses, and allow experts to remotely monitor and operate the grid.

Each year, Hydro One classifies their building components into one of three categories – ***high risk***, ***medium risk*** or ***low risk***. This considers both the likelihood of failure and how critical the component is. For instance, a roof that is beyond its useful life and houses critical equipment would be deemed ***high risk***. Whereas older office equipment may be classified as ***low risk***.

In 2025, 25% of Hydro One's building components were assessed as either high or medium-risk.

In their **current draft plan**, Hydro One is focused on:

- **Addressing at-risk building components**: In their current draft plan, Hydro One plans to address 50% of high to medium-risk building components, prioritizing those that are most critical.
- **Making at-risk sites more resilient to severe weather**: In their draft plan, Hydro One plans to invest in reducing flooding risks at 2 of out 12 at-risk sites. For example, in 2024, severe rain flooded a transmission station, resulting in outages for nearly 170,000 customers.

Flooding at a Hydro One transmission station in 2024

- **Repairing or retrofitting field offices**: Many facilities that serve as dispatch for Hydro One crews were built more than 50 years ago. Since then, standards for accessibility have changed considerably. In their draft plan, Hydro One plans to invest in 70 of their 115 facilities that no longer meet modern standards.

Doing less of these types of investments now could increase the number of reactive repairs to facilities, as well as increase the risk of more frequent outages caused by severe weather and longer crew dispatch times. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Lower risk of critical asset failures, but address fewer aging field facilities than the draft plan	Lower risk of critical asset failures and make progress on addressing aging field facilities	Further lower risk of asset failures and address more aging field facilities than the draft plan
	Main Differences Between Plans		
Addressing at-risk building components	Same as draft plan	50% of at-risk building components	57% of at-risk building components
Making at-risk sites more resilient	Same as draft plan	2 at-risk sites	8 at-risk sites
Repairing or retrofitting facilities	50 facilities	70 facilities	90 facilities
Average Monthly Transmission Bill Impact	$0.05 less by 2032 (average of $0.01 less each year)	**Included in Draft Plan**	$0.16 more by 2032 (average of $0.03 more each year)

Hydro One Customer Engagement Survey
Information technology

Hydro One

Hydro One's daily operations require technology systems for all aspects of their business, including billing, operating the grid, responding to outages, planning projects, and communicating with customers.

When deciding the right level of information technology (I.T.) investment, Hydro One must balance various factors, including the cost of new or updated systems, the risks related to current systems, and the benefits that new technologies could bring to the company and customers.

Hydro One's current draft plan is focused on:

- **Maintaining the current state of technology systems**: Like with poles and wires, technology systems need to be maintained so that crews can restore power and customers can access key services like their online account and the outage restoration map.
- **Enhancing customer service**: I.T. investments and advanced data can help Hydro One offer better services to customers, improve estimated restoration times during outages and notify customers when service will be back online.
- **Improving Hydro One's operational efficiency**: Investments in technology systems can help Hydro One dispatch crews and perform their work more effectively.
- **Protecting the grid from both cyber and physical security threats**: Investments in new technologies can provide more robust protection against external threats, enhancing the resilience of critical system infrastructure.

While a significant portion of Hydro One's I.T. budget is allocated to meet safety, legal, and regulatory requirements, Hydro One could defer investments focused on enhancing customer service, improving efficiency, and expanding capabilities beyond 2032.

Deferring these types of investments would delay these benefits and potentially limit Hydro One's ability to accommodate newer technologies in the future.

Which of the following options do you prefer?

	Spend Less	Draft Plan
	Maintain the current state of technology systems but make fewer investments to enhance service and efficiencies	Maintain the current state of technology systems while modernizing capabilities to enhance service and efficiencies

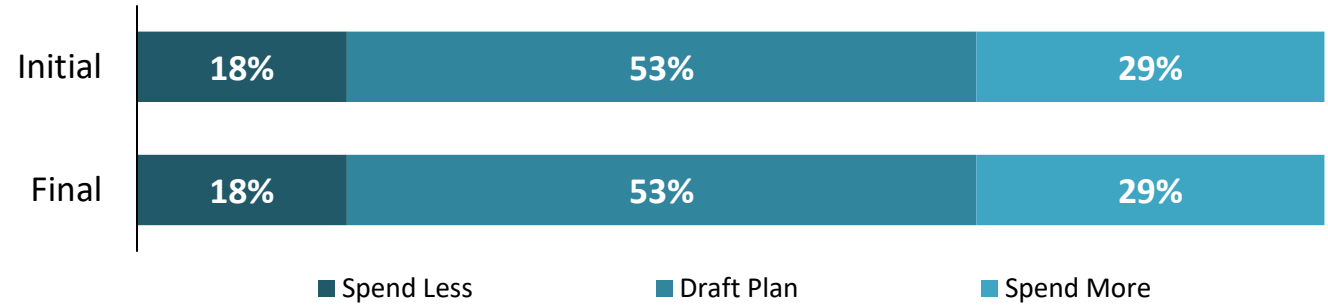
What is the impact of my choices?

Throughout this survey, you have been asked about 4 key choices. Below is a summary of your choices.

At the bottom of this page, you will find the total bill impact of all your answers. You can change your responses if you desire, and the estimated impact on the monthly bill will be recalculated.



The bill impacts associated with each choice represent the average estimated increase on the transmission portion of the monthly bill from 2027 to 2032, followed by the average estimated increase on the transmission portion of the monthly bill each year. The impacts under the "spend less" or "spend more" options are relative to the bill impact of the draft plan.

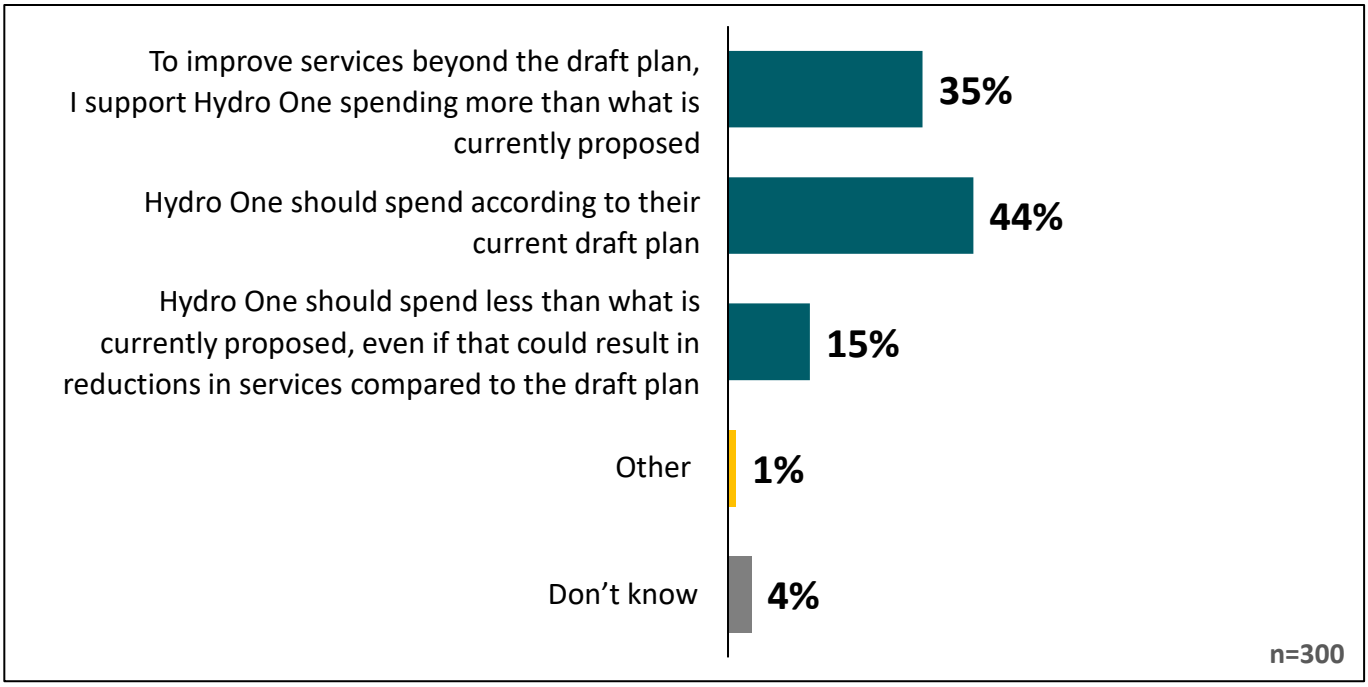
Evaluating Hydro One's 2028-2032 draft plan

Hydro One has calculated an overall cost for their draft plan. While the plan may change based on feedback from the earlier questions in this survey, Hydro One would like to know how you feel about the overall draft plan.



It is estimated that a typical Ontario **small business customer** would see the **transmission** portion of their **monthly bill** increase from $42.14 in 2027 to $55.02 by the end of 2032 – an increase of **$12.88** on the monthly bill. This represents an average increase of **$2.58** on the monthly bill each year.

Large Transmission Account Customers

Online Survey Results

Section 9

Online Survey
Methodology

Field Dates

The **Large Transmission Customer Online Survey** was sent to all Hydro One large transmission account customers with an available email address. Customers had an opportunity to complete the survey between **November 14th and December 22nd, 2025.**

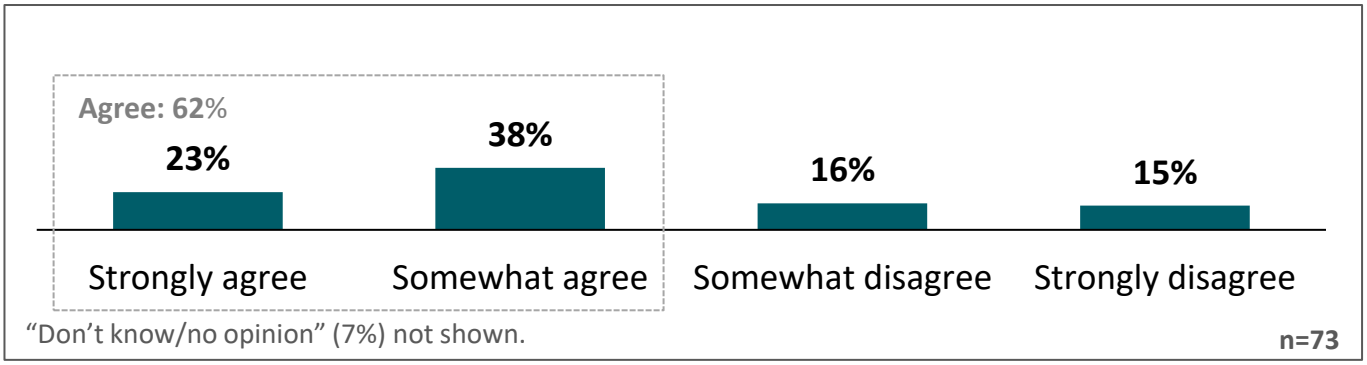
Each customer received a unique URL that could be linked back to their region and customer type (End-User, Generator, or LDC). Survey pages that differed by customer type are identified as end-user/LDC or generator versions throughout this report.

In total, the large transmission customer survey was sent to **197** customers from *customerexperience@hydroone.com*. A total of four reminder emails were sent on a rolling basis over the survey field window to those who had not yet completed the survey.

Large Transmission Accounts Online Survey Completes

A total of **73** (unweighted) Hydro One large transmission account customers completed the online survey.

Sample Weighting

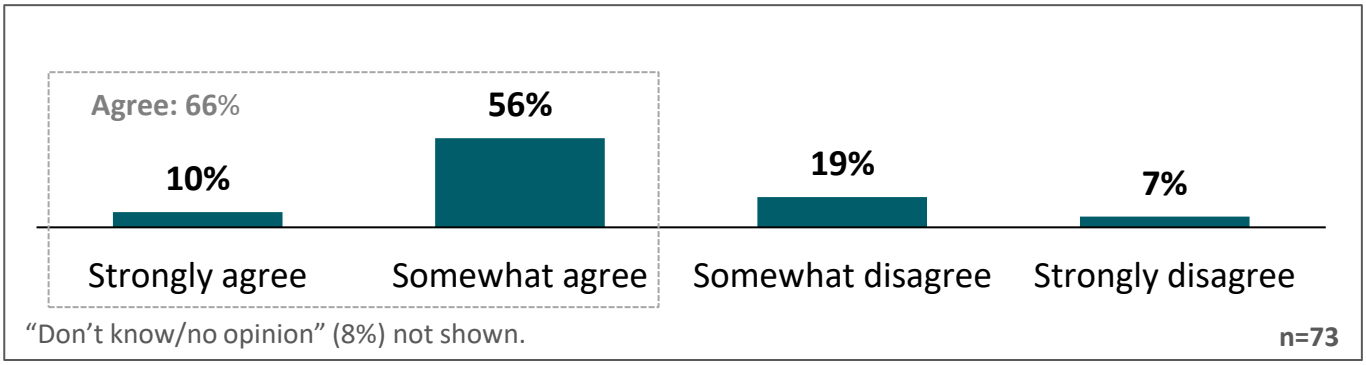


The large transmission account online survey sample was not weighted.

Note: *Graphs and tables may not always total 100% due to rounding values rather than any error in data. Sums are added before rounding numbers. Caution interpreting results with small n sizes.*

Environmental Controls

To what extent do you agree or disagree with the following statements?



Q The cost of my organization's electricity bill has a major impact on the bottom line of my organization and results in some important spending priorities and investments being put off.

Hydro One Customer Engagement Survey

Welcome to Hydro One's customer engagement survey!

As Hydro One plans for the future, they need your input on choices that will impact the services you receive and the rates you pay.

- **Hydro One is looking for your feedback on their draft investment plan** for the years 2028 to 2032 to ensure they make spending decisions that matter to you, the customer.
- **You don't need to be an electricity expert to complete this survey.** It focuses on basic choices and provides the background information you need to answer the questions.
- The survey will take approximately 10-15 minutes to complete. If you need to pause and return later to finish the survey, your progress will be saved. If you are reading this on a mobile device, you may want to consider switching to a tablet or laptop so that it is easier for you to read.

While you may have multiple accounts with **Hydro One**, for this survey, we want you to think about your overall experience as a transmission-connected customer.

Note: *The estimates throughout this survey are for illustrative purposes only and may not reflect the actual size of your organization's monthly electricity bill.*

All individual responses will be kept confidential.
Innovative Research Group (www.innovativeresearch.ca), an independent research company, has been hired by Hydro One to gather your feedback while protecting your confidentiality. Your individual answers will not be shared with Hydro One in any identifiable way.

SURVEY PAGE

Hydro One Customer Engagement Survey
What is this survey about?

Hydro One is funded by the rates paid by their customers. Every five years, Hydro One is required to file an application with the Ontario Energy Board (OEB), the energy regulator in Ontario, to set rates. Hydro One's next rate application will cover the years 2028-2032.

In this process, Hydro One's rate application will be examined in detail and Hydro One must demonstrate that customer needs and priorities were factored into their investment planning process.

Today, Hydro One wants your feedback on their draft investment plan, including specific investment choices where they need customer input. This feedback, along with other input, will be used to help Hydro One's planners refine and finalize the draft investment plan.

Next year, Hydro One will present their proposed plan and input provided by customers to the OEB.

SURVEY PAGE

Hydro One Customer Engagement Survey

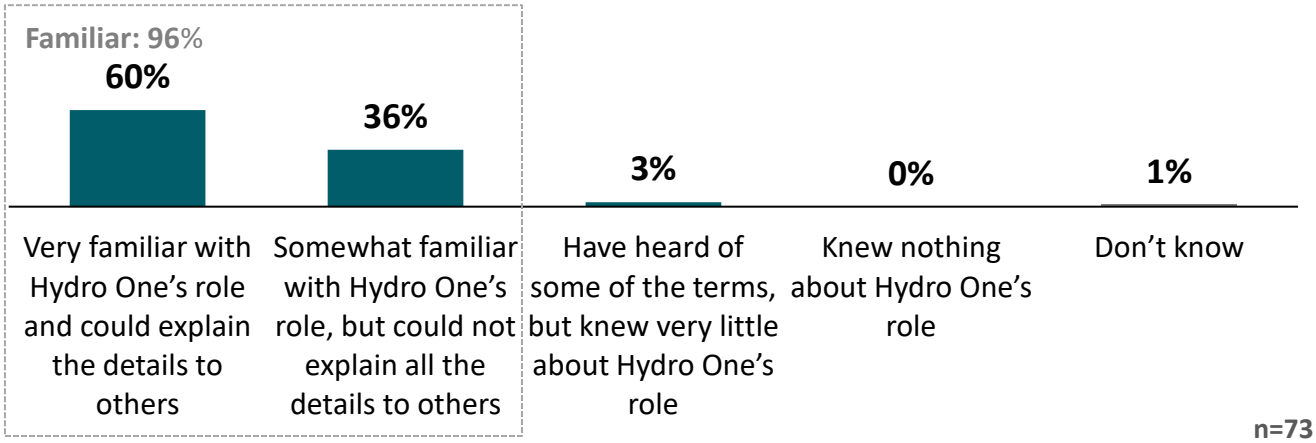
What is Hydro One's role in Ontario's electricity system?

Ontario's electricity system has three key components: **generation**, **transmission** and **distribution**.

Hydro One's transmission system takes electricity from generation stations and transports it via high-voltage transmission lines to local communities across the province.

In many communities, **Hydro One** is also responsible for the local distribution system, which delivers electricity to homes, seasonal properties, or organizations through a network of wires, poles and other equipment.

Hydro One does not generate electricity or set electricity prices.



Hydro One builds and maintains power lines, towers and poles, delivers electricity, reads meters, answers customer calls, responds during outages, and clears trees and brush from power lines.

SURVEY PAGE

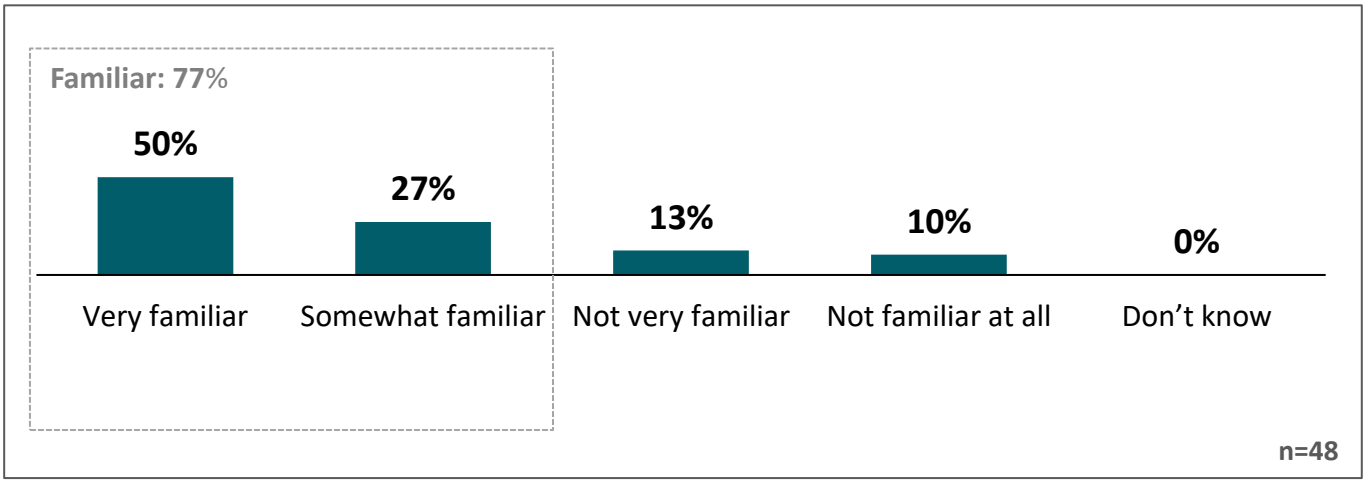
Hydro One Customer Engagement Survey

How much of my electricity bill goes to Hydro One?

Every item and charge on your bill is mandated by the provincial government or regulated by the OEB, the provincial energy regulator.



Hydro One is responsible for most of the transmission charges on your organization's monthly bill. For an average transmission-connected customer, transmission charges represent about **12.6%** of the total electricity bill. This share may vary for your organization, depending on your organization's load profile.

The rest of your bill payment goes to power generation companies, taxes, and regulatory agencies.

Familiarity & Experience

Bill familiarity

Q Before this survey, how familiar were you with the amount of your electricity bill that went to Hydro One? *[Asked only of End-Users and Local Distribution Companies]*

Hydro One Customer Engagement Survey

How does Hydro One plan?

Every five years, Hydro One develops comprehensive plans that outline both short-term and long-term system needs. These plans are the combination of thousands of inputs from technical experts and customers.

The three key areas that inform Hydro One's plans are:

- **Customer feedback** collected through both ongoing interactions and specific engagements, such as this.
- Information and input from **internal engineering and technical experts**, who closely monitor the pressures on the system and develop solutions to address these challenges.
- Hydro One's **mandatory legal and regulatory requirements**, including connecting customers, moving equipment, and installing and maintaining customer meters.

What has Hydro One heard from customers so far?

In 2024, Hydro One collected feedback from thousands of customers across Ontario on their needs and priorities for electricity transmission services. This feedback was used to inform planners in developing the draft investment plan.

In this initial feedback, most customers expressed a desire for Hydro One to:

1. Prioritize **reasonable rates** and **reliable service**.
2. Make investments to **improve or maintain current levels of reliability**.

SURVEY PAGE

Hydro One Customer Engagement Survey

What challenges are impacting Hydro One's plans?

Hydro One is facing challenges that require more resources, new solutions, or growing costs to manage.

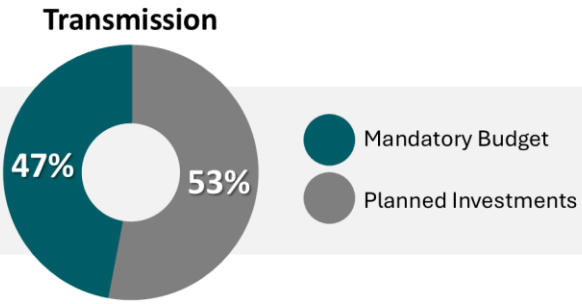
Some of these challenges, like the pace of addressing aging and deteriorating infrastructure are within Hydro One's control. Others, like the frequency of severe weather, are not.

When developing their plans, Hydro One must consider **external pressures**, including:

Increasing demand for electricity

According to the Independent Electricity System Operator (IESO), electricity demand in Ontario is forecasted to increase by 75% by 2050.

In fact, since 2021, growth in the province has far exceeded expectations and customer requests for new connections have grown considerably: **demand for new connections to Hydro One's distribution system has outpaced projections** by, on average, 21% per year.



Rising cost pressures

Businesses across Ontario are **experiencing significant cost pressures** from factors including tariffs and inflation. Hydro One has been working to offset some of these cost pressures by finding savings and internal efficiencies. In 2024, Hydro One realized approximately $150 million in savings.

How does this impact how Hydro One plans?

Despite increasing demand for electricity, external rising cost pressures, and more frequent severe weather, Hydro One has been working to manage spending within their original budget that was approved by the OEB in 2022. This means that Hydro One has had to delay some planned work to accommodate unexpected higher growth and rising costs.

For the 2028-2032 period, **about half of Hydro One's draft capital budget is committed to work that is necessary to meet mandatory requirements**, including meeting safety, legal, and regulatory requirements, accommodating increased demand for electricity and supporting provincial economic growth.

SURVEY PAGE

Summary of Investment Plan

Objectives Hydro One is focused on

Hydro One Customer Engagement Survey

What objectives is Hydro One focused on?

Today, Hydro One has developed draft investment plans that focus on achieving objectives that balance customer feedback, economic growth in Ontario, engineering and technical analysis, and current and emerging pressures on the system.

Hydro One's draft plans cover both the **transmission system** serving most Ontarians and the **distribution system** serving approximately 1.5 million customers.

Some of the highlights of Hydro One's draft plans include:

Transmission Objectives

1. **Maintaining the overall health** of the transmission system by limiting the risk of equipment failure.
2. **Getting the most out of the system** by reinforcing and extending the life of equipment and limiting the impacts of severe weather.
3. **Keep pace with Ontario's economic development**, including meeting demand for new and expanded industry in the province

One of the benefits of being both the largest transmitter and distributor of electricity in Ontario is the ability to invest in technology systems, buildings, and facilities that benefit both systems.

Some of these shared objectives of Hydro One's draft plans include:

Shared Transmission and Distribution Objectives

1. **Limiting the risk of potential damage to equipment** by addressing the most at-risk building components and making sites more resilient to severe weather.
2. **Maintaining the company's existing technology systems**, improving operational efficiency and resilience to cybersecurity threats, and **modernizing the system** to provide enhanced services to customers.

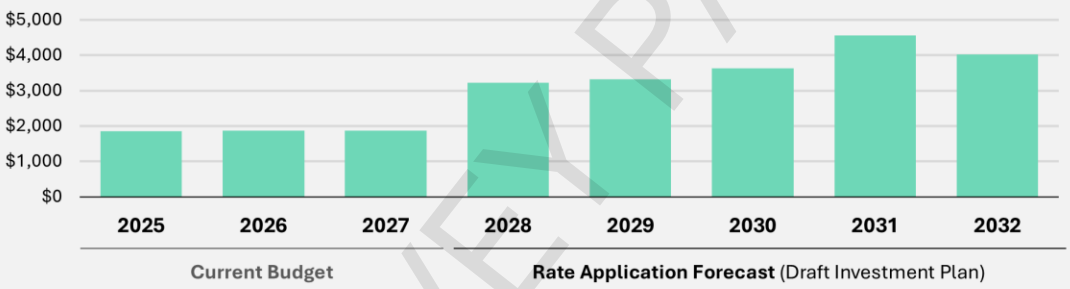
Summary of Investment Plan

Cost of Hydro One's draft transmission plan

Large Transmission

End-Users/LDCs Version

SURVEY PAGE



Hydro One Customer Engagement Survey

How much will Hydro One's draft transmission plan cost?

hydro one

For the **transmission system**, investment costs are shared by more than 5 million electricity rate payers in Ontario.

Transmission Budget: Current and Forecasted ($ millions)

The draft transmission investment plan would result in an average annual funding requirement of **$3.8 billion** for **transmission** for 2028-2032.

How will this plan impact the transmission portion of customer bills?

For a typical **transmission-connected customer**, transmission charges are estimated to increase by an average of **5.5%** each year for the period 2028 – 2032. As a result, the **total monthly bill** is estimated to increase by an average of **0.69%** each year for the period 2028 – 2032.

Note:

- The estimated increase in transmission charges and total monthly bill, and forecasted budgets are preliminary and are subject to change based on customer feedback, regulatory approval, and other factors.

End-Users/LDCs Version

Hydro One Customer Engagement Survey

What choices does Hydro One want my input on?

The remainder of this survey asks for your input on the total cost of the draft investment plan, plus **4 key choices** within the plan that Hydro One is looking for your guidance on.

- Each choice has a summary of the options that Hydro One is considering. In many cases, that includes options that would see Hydro One ***spend less*** or ***spend more*** than what is currently being proposed in the draft plan.
- For each option, Hydro One has estimated what impact it would have on customer bills **compared to the draft plan**. These impacts are approximate.
- Following each question, you will also have an opportunity to provide additional feedback if you choose to.
- Once you have finished giving feedback on the key choices, you will have an opportunity to review and change your responses until you feel you have found the right balance between the level of investment and cost.

Hydro One Customer Engagement Survey

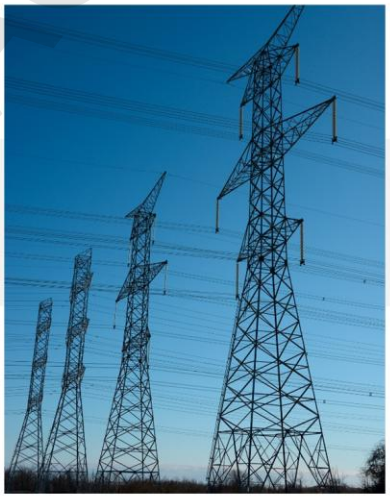
What is the transmission system and who does it serve?



Let's talk about the provincial transmission system. The transmission system is the highway for Ontario's electricity, bringing power from generation stations to your community.

Hydro One's transmission system serves most electricity customers in Ontario, including distribution companies across the province.

Outages on Hydro One's transmission system have significant impacts on communities and Ontario's economy. As such, the transmission system is designed to minimize both the frequency and duration of outages.

For example, most of Ontario's population centres are served by multiple transmission lines so that if one fails, there is always a backup to keep power flowing.

Since 2019, the typical Ontarian connected to Hydro One's transmission system has experienced, on average, **1 outage per year** related to the transmission system.

In a 2024 survey, a majority of customers said that they want Hydro One to make investments to either increase or maintain current levels of reliability related to the transmission grid.

Investment Trade-Offs

Keeping pace with transmission renewal

Large Transmission

End-Users/LDCs Version

SURVEY PREVIEW

Hydro One Customer Engagement Survey

Keeping pace with transmission renewal

Portions of Hydro One's transmission system were built in the 1930s, 40s, and 50s.

Hydro One has identified several types of equipment that are at increased risk of failure due to age and condition and would have widespread impacts if they were to fail.

Transmission station equipment ensures electricity can safely travel from power plants to communities. Hydro One has identified close to 200 out of 700 transmission transformers and 400 out of 4,700 circuit breakers in poor condition that are at increased risk of failure. While an equipment failure may not result in an immediate outage, it leaves the system more vulnerable with limited backup.

Underground transmission cables serve many high-density areas. Hydro One has identified that 20 km of their network of around 270 km of cables are at increased risk of failure. Because of the complex nature of these cables, if they were to fail, the outage impacts would be widespread and time-consuming and costly to repair.

Hydro One's **current draft plan** is focused on managing the risk of equipment failure and supporting growth across the province by:

- **Replacing major transmission station equipment:** In their current draft plan, Hydro One plans to replace 70 of the nearly 200 transformers and 230 of the 400 breakers identified as being in poor condition in order to reduce the risk of failure and costly repairs.
- **Replacing high-impact underground transmission cables:** Replacing all 20 km of the underground cables that Hydro One has identified as being at increased risk of failure could take up to 10 years to complete. In their current draft plan, Hydro One is proposing to begin the replacement of all 20km of these underground cables, with 12km being replaced by 2032.

Eventually, all poor condition or deteriorating equipment will need to be addressed; however, Hydro One would like your feedback on the pace of replacement. Doing less of these types of investments in the near term could lead to more equipment failure and higher emergency repair costs in the future. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Higher risk of equipment failure	Maintain the current risk of equipment failure	Lower risk of equipment failure
	Main Differences Between Plans		
Replacing transformers and breakers	55 transformers & 195 breakers	70 transformers & 230 breakers	85 transformers & 265 breakers
Replacing underground cables	Begin replacing 20km of underground cables	Begin replacing 20km of underground cables, completing 12km by 2032	Replace 20km of underground cables by 2032
Total Monthly Bill Impact	Average of 0.06% less each year	**Included in Draft Plan**	Average of 0.06% more each year

Investment Trade-Offs

Keeping pace with transmission renewal

Large Transmission

Q Additional Feedback (Optional)

Verbatim comments (89% No comment)
"As an industrial customer with a current life of mine to [REDACTED], we want to ensure the lowest risk of failure to ensure smooth operations."
"Hydro One should not wait to repair/replace its infrastructure. A comprehensive Preventative Maintenance program would have easily identified the condition of these assets and allowed for planned replacement. For example, a 1930's transformer could have been replaced in 1970 or 1980 and then again in 2020 rather than wait for failure."
"I'd like Hydro One to spend more efficiently. I think there should be less spending on innovative ideas that don't always pan out. We need to spend on prudent technology and most importantly, spend efficiently. Right now, Hydro One costs to build transmission infrastructure is too high."
"Is there a more cost-effective and quicker method to replace the 20km of cables nearing end-of-life. 20km is a relatively short run for transmission. Possibly outsource the work to a more cost-effective contractor and not Hydro One construction crews. Are these underground cables in a large urban centre? For example, if these cables are within the GTA, should those costs not be specifically applied to distribution utilities to pass on to local rate payers? Lead time for transformers and most HV equipment is around 18-36 months once contracts are signed. Seeing as 2026 is a month away and there are budget/approval/engineering/procurement processes to follow, is it reasonable to expect this work to begin in 2028?"
"Less interest in replacing underground cable. The primary driver for underground is aesthetic for city residents. Views for city residents is not a reasonable priority for costly investment. Spend more on the transformers and breakers. Less on the underground lines."
"The options presented do not correlate to outage frequency, so it is challenging to understand the impacts. Also, the 'spend less and spend more' ranges appear to be quite minimal in impact, which is reducing the effectiveness of making a choice."
"While I support an increased pace for the replacement of aging infrastructure, these plans should also include increases in station capacity. i.e. all aging station transformers should be proactively upsized as part of this capital plan to accommodate the IESO's forecasted 75% increase in demand."
"Would like to see more focus on reinvestment in Eastern Ontario."

Investment Trade-Offs

Stewardship of the transmission system

Large Transmission

End-Users/LDCs Version

Hydro One Customer Engagement Survey

Stewardship of the transmission system

Proactive maintenance and system monitoring are among the ways that Hydro One can ensure that equipment lasts as long as possible.

In their **current draft plan**, Hydro One is proposing a series of investments to get the most out of the existing system by:

- **Replacing at-risk transmission lines:** Hydro One has identified that 11% of their approximately 28,000 km of transmission lines are at increased risk of failure due to a combination of age and condition. As these lines are replaced, they are built to modern standards that are more resilient to severe weather.
- **Reinforcing wood poles and extending the life of steel towers:** Hydro One has identified that over 23,000 of their nearly 90,000 wood poles and steel transmission towers are at the end of their expected service life. In the current draft plan, Hydro One is proposing reinforcing or extending the life of many of these structures.
- **Increasing the rate of clearing overgrown trees and brush:** Contact with vegetation accounts for a significant portion of transmission outages and increasing the rate of clearing trees and brush can help reduce the risk of outages.

Additionally, Hydro One is proposing investments in new satellite technology that can help better monitor trees and brush encroaching on infrastructure, further helping reduce the risk of outages.

These investments would be complementary to the ongoing renewal of aging or poor condition equipment, as discussed earlier.

These investments are designed to reduce the risk of major equipment failures, outages, and emergency repair costs over time. Delaying or scaling back these investments will reduce short-term costs but may increase the likelihood of unplanned outages and result in more costly reactive repairs. While doing more could further reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Higher risk of equipment failure and impacts of severe weather compared to the draft plan	Lower the current risk of equipment failure and impacts of severe weather	Further lower risk of equipment failure and impacts of severe weather compared to the draft plan
	Main Differences Between Plans		
Replacing at-risk transmission lines	Replace 1,000 km of at-risk lines	Replace 1,400 km of at-risk lines	Replace 1,800 km of at-risk lines
Reinforcing wood poles and extending the life of steel towers	2,500 wood poles and 1,500 steel towers	6,000 wood poles and 2,750 steel towers	9,500 wood poles and 4,000 steel towers
Clearing overgrown trees and brush	Clear 16% (3,100 km) of overgrown vegetation each year	Clear 17% (3,400 km) of overgrown vegetation each year	Clear 18% (3,700 km) of overgrown vegetation each year
Total Monthly Bill Impact	Average of 0.05% less each year	Included in Draft Plan	Average of 0.05% more each year

Verbatim comments (89% No comment)
"Once again, I'd like Hydro One to spend more efficiently. I think the picture that this survey paints does not include all the options that are there. We can spend less and not have 1000 km lines at risk."
"Reducing outages and emergency repairs has a payback that is worth the investment."
"System reliability should be the overriding priority for Hydro One."
"The lines being updated to be more 'resilient to weather' should also be upgraded to provide more capacity to the province."
"Using modern assessment technology like satellite and Ai can improve efficiency. Has there been a cost benefit analysis to compare this satellite assessment vegetation management against current personnel physical inspections? Thinking the larger personnel costs are uncontrolled OT for vegetation crews and call-outs. Are efficiencies being sought on the OpEx side too? Is it more cost effective and faster to outsource this non-critical vegetation management work to local contractors using modern vegetation management practices."
"Vegetation clearing plan is unclear, given that HONI has laid off significant portions of the forestry team. Is vegetation clearing then actually increased over the original plan since it is now behind due to the reduction over the past year?"
"Why is Hydro One waiting for assets to be at the end of useful life before replacing? That is akin to replacing on failure, which usually costs much more than planned. Stop operating to failure."
"Would like to see old 115kV transmission towers and stations upgraded to 230kV in Eastern Ontario."

Investment Trade-Offs

Maintaining buildings and facilities

Large Transmission

End-Users/LDCs Version

Hydro One Customer Engagement Survey

Maintaining buildings and facilities

There are certain parts of Hydro One's draft plans that benefit both the transmission and local distribution systems. While the transmission portion of those investments is paid by most Ontarians, the distribution portion is paid by Hydro One distribution customers only.

Hydro One operates and maintains approximately 1,500 facilities across Ontario.

In addition to housing Hydro One's nearly 10,000 employees, these facilities store specialized fleet equipment including bucket trucks and helicopters, protect sensitive equipment, serve as central dispatch for crews, act as training and development campuses, and allow experts to remotely monitor and operate the grid.

Each year, Hydro One classifies their building components into one of three categories – ***high risk***, ***medium risk*** or ***low risk***. This considers both the likelihood of failure and how critical the component is. For instance, a roof that is beyond its useful life and houses critical equipment would be deemed ***high risk***. Whereas older office equipment may be classified as ***low risk***.

In 2025, 25% of Hydro One's building components were assessed as either high or medium-risk.

In their **current draft plan**, Hydro One is focused on:

- **Addressing at-risk building components**: In their current draft plan, Hydro One plans to address 50% of high to medium-risk building components, prioritizing those that are most critical.
- **Making at-risk sites more resilient to severe weather**: In their draft plan, Hydro One plans to invest in reducing flooding risks at 2 of out 12 at-risk sites. For example, in 2024, severe rain flooded a transmission station, resulting in outages for nearly 170,000 customers.

Flooding at a Hydro One transmission station in 2024

- **Repairing or retrofitting field offices**: Many facilities that serve as dispatch for Hydro One crews were built more than 50 years ago. Since then, standards for accessibility have changed considerably. In their draft plan, Hydro One plans to invest in 70 of their 115 facilities that no longer meet modern standards.

Doing less of these types of investments now could increase the number of reactive repairs to facilities, as well as increase the risk of more frequent outages caused by severe weather and longer crew dispatch times. While doing more could reduce risk, it would impact customer bills.

Which of the following options do you prefer?

	Spend Less	Draft Plan	Spend More
	Lower risk of critical asset failures, but address fewer aging field facilities than the draft plan	Lower risk of critical asset failures and make progress on addressing aging field facilities	Further lower risk of asset failures and address more aging field facilities than the draft plan
	Main Differences Between Plans		
Addressing at-risk building components	Same as draft plan	50% of at-risk building components	57% of at-risk building components
Making at-risk sites more resilient	Same as draft plan	2 at-risk sites	8 at-risk sites
Repairing or retrofitting facilities	50 facilities	70 facilities	90 facilities
Total Monthly Bill Impact	Average of 0.003% less each year	Included in Draft Plan	Average of 0.01% more each year

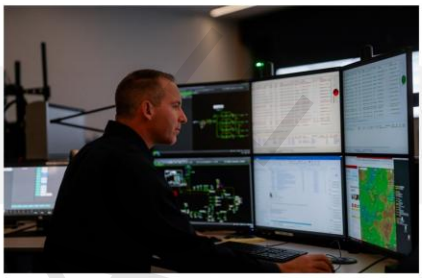
Q Which of the following options do you prefer?

Q Additional Feedback (Optional)



Verbatim comments (96% No comment)
"Consider more innovation on facilities vs investing in these if possible. Focus on things that will impact restoration or cause outages."
"Large urban centres need to bear some of this responsibility for flooded facilities. Urban sprawl in the GTA coupled with global warming (increasing torrential rains) have created the conditions that lead to poor run-off management. Has Hydro One considered pulling back as urban centres grow? Pass on the equipment and risk to distribution utilities to manage, place accountability and costs where they should fall. Can also move away from brick & mortar substation buildings (shutter those) in the older stations and towards modern steel buildings on concrete pilings."
"Spend more efficiently. Same as the previous 2 comments. There is a significant opportunity to do more with less spending."

End-Users/LDCs Version

Hydro One Customer Engagement Survey
Information technology

Hydro One's daily operations require technology systems for all aspects of their business, including billing, operating the grid, responding to outages, planning projects, and communicating with customers.

When deciding the right level of information technology (I.T.) investment, Hydro One must balance various factors, including the cost of new or updated systems, the risks related to current systems, and the benefits that new technologies could bring to the company and customers.

Hydro One's current draft plan is focused on:

- **Maintaining the current state of technology systems**: Like with poles and wires, technology systems need to be maintained so that crews can restore power and customers can access key services like their online account and the outage restoration map.
- **Enhancing customer service**: I.T. investments and advanced data can help Hydro One offer better services to customers, improve estimated restoration times during outages and notify customers when service will be back online.
- **Improving Hydro One's operational efficiency**: Investments in technology systems can help Hydro One dispatch crews and perform their work more effectively.
- **Protecting the grid from both cyber and physical security threats**: Investments in new technologies can provide more robust protection against external threats, enhancing the resilience of critical system infrastructure.

While a significant portion of Hydro One's I.T. budget is allocated to meet safety, legal, and regulatory requirements, Hydro One could defer investments focused on enhancing customer service, improving efficiency, and expanding capabilities beyond 2032.

Deferring these types of investments would delay these benefits and potentially limit Hydro One's ability to accommodate newer technologies in the future.

Which of the following options do you prefer?

	Spend Less	Draft Plan
	Maintain the current state of technology systems but make fewer investments to enhance service and efficiencies	Maintain the current state of technology systems while modernizing capabilities to enhance service and efficiencies
	Main Differences Between Plans	
Customer service	Limit or delay investments in systems focused on enhancing customer service	Invest in systems focused on enhancing customer service
Operational efficiency	Limit or delay investments in systems focused on improving operational efficiency	Invest in systems focused on improving operational efficiency
Total Monthly Bill Impact	Average of 0.02% less each year	**Included in Draft Plan**

What is the impact of my choices?

Throughout this survey, you have been asked about 4 key choices. Below is a summary of your choices.

At the bottom of this page, you will find the total bill impact of all your answers. You can change your responses if you desire, and the estimated impact on your bill will be recalculated.

The bill impacts associated with each choice represent the average increase on your total monthly bill each year for the period 2028 – 2032. The impacts under the "spend less" or "spend more" options are relative to the bill impact of the draft plan.

Hydro One Customer Engagement Survey

What is the impact of my choices?

Throughout this survey, you have been asked about 4 key choices. Below is a summary of your choices.

At the bottom of this page, you will find the total impact of all your answers. You can change your responses if you desire, and the estimated impact on transmission charges will be recalculated.

The impacts associated with each choice represent the average increase in transmission charges each year for the period 2028 – 2032. The impacts under the "spend less" or "spend more" options are relative to the impact of the draft plan.

Hydro One Customer Engagement Survey

Evaluating Hydro One's 2028-2032 draft plan

Hydro One has calculated an overall cost for their draft plan. While the plan may change based on feedback from the earlier questions in this survey, Hydro One would like to know how you feel about the overall draft plan.

For a typical **transmission-connected customer**, transmission charges are estimated to increase by an average of **5.5%** each year for the period 2028 – 2032. As a result, the **total monthly bill** is estimated to increase by an average of **0.69%** each year for the period 2028 – 2032.

Final comments on the draft plan

Large Transmission

Q Do you have any final comments regarding Hydro One's draft plan for 2028–2032 and the proposed rate increase? (Optional)

Verbatim comments (81% No comment)
"As a large industrial customer, our Mine depends on a reliable transmission and distribution system to maintain safe, continuous operations. Our current Life-of-Mine extends to [REDACTED], and Hydro One's investment plans for 2028–2032 will directly affect our ability to operate. Support improved reliability and resilience in Northwest Ontario along with operational readiness and communication."
"Being a large user and an Industrial facility reliable distribution is critical to operations."
"Due to the increasing probability of worsening weather events in the future and increased system load demands, the power system reliability should be the primary focus of Hydro One to ensure continuity of service with the provincial power grid."
"Hydro One should accept and facilitate other transmitters in Ontario."
"I estimate that the choices offered only provided a total reduction opportunity of about 10% on the transmission portion of the bill. Total Bill data is not helpful, and there will be a 5% Tx increase regardless of the Customer input."
"I think the increase from the draft plan is marginal and will help lower costs in the future where I expect costs will be more expensive than in the current period plan."
"In light of aging electrical infrastructure and significant projected increases in the demand for electricity, I believe that this is a critical time for HONI to invest heavily in electrical infrastructure throughout Ontario, and I fully support the proposed investments. The proposed investments will help to strengthen Ontario's economy, which is a key investment into our future and the future of our children."
"Increase stability of the [REDACTED] transmission line. This year, on [REDACTED], the [REDACTED] line had a fault between [REDACTED]. The outcome was that our G2 generator burned down, and we are still trying to get it fixed. We have a big loss of income because of this. A [REDACTED] fault occurred on the line [REDACTED]."
"More investment in reducing outages and their duration. Less investment in customer service - the best customer service is better reliability."
"Please consider spending more efficiently in the plan. Hydro One is very important to our province, but the costs to build transmission infrastructure are significantly more expensive than alternative options."

Investment Trade-Offs

Final comments on the draft plan continued

Large Transmission

Q Do you have any final comments regarding Hydro One's draft plan for 2028–2032 and the proposed rate increase? (Optional)

Verbatim comments (81% No comment)
"Please reinvest in Eastern Ontario Transmission System as it is vital to the economic development of the region."
"Support the investments in the transmission grid to ensure adequate capacity and reliability. Hydro One should focus on completing work on time and within budget. Focus should be on customer-centric practices, which don't require capital investment but improvements in customer service practices."
"There was a period of recent time where Hydro One barely spent on CapEx. The consumer is unlikely to be able to continue to carry the burden of 5.5% compounding cost increases, even with the provincial government subsidizing electricity rates. There should be a minimum electrical efficiency standard for any new equipment/loads connecting to the grid. Data centers should not be given large discounts and should provide more of their own electricity needs by incorporating generation. Would also like to see Hydro One compounding of OpEx costs be reduced proportionally to compounding CapEx cost increases."
"We support an increase in spending at [REDACTED] because there is an acute shortage of investment relating to Hydro One-owned assets, which reside in [REDACTED] service territory in the Town of [REDACTED], Ontario. Of particular concern are a number of deteriorated wood poles along [REDACTED] St in the Town, which carry a 44kV circuit that have not been addressed by Hydro One for many years. There is a high degree of concern on our part that these assets will fail catastrophically. Increasing investment is imperative to safeguard public safety."

Survey Diagnostics

Favourability and amount of information

These last few questions are about the customer engagement that you just completed. In order to do better in the future, Hydro One wants to hear about your experience with this survey.

Q Overall, did you have a favourable or unfavourable impression of the customer engagement you just completed?

Q In this customer engagement, do you feel that Hydro One provided too much information, not enough, or just the right amount?

Survey Diagnostics
Other information not included

Q Was there any content missing that you would have liked to have seen included in this customer engagement? (Optional)

Verbatim comments (70% No comment)
"1) Greater detail on how these investments will drive savings or lower rates in the future. 2) What would be the plan and impact to customers if Hydro One were forced to: a) hold rates steady, b) increase rates annually by no more than the rate of inflation? 3) A description of what customer group/industry/sector/geographic region is driving the investment and how much is being allocated to each. 4) If I support your 5.5% increase each year for 5 years, how will this affect my community?"
"As a resident of Northern Ontario, I would like to have seen which parts of Ontario that HONI's investments are earmarked for. I would understand how much of the proposed increased fund investments to the benefit of Northern Ontarians."
"Budget shows chunks of money that make up the operating expenses. I would like to understand what that is composed when rate payers are being asked to increase, how is the increase in that chunk relative to the reason for the need additional for the parts discussed in this survey?"
"Content/questions related to expansion or new infrastructure spending. If electricity demand is expected to double by 2050, how is Hydro One addressing infrastructure needs in spending?"
"Did not address the cost and performance of customer connections."
"I wish there was focus for individual areas. I am representing [REDACTED] company in [REDACTED] Ontario. The key item for my company is the old bell cables and replacing the infrastructure with fiberoptic or new bell cables. The old bell cables drop out often and the IESO response is to drop the transmission line [REDACTED]. Local companies are looking for Hydro One and IESO to take the lead on this."
"I would have liked the investment options to have a wider spectrum. The differences in more or less investment were essentially trivial."
"I would like to receive specific information regarding Sector 1 L7S circuit changes/ upgrades/ maintenance."
"In order to agree to spend on the draft plan and not less, it would have been beneficial to see what type of additional services would be provided. The high level education did not give me the comfort to agree to spend to draft plan."
"It would be helpful to know to what extent the mandatory increases arise from the increase in load projected by the Province."

Survey Diagnostics

Other information not included continued

Q Was there any content missing that you would have liked to have seen included in this customer engagement? (Optional)

Verbatim comments (70% No comment)
"It would have been beneficial to provide additional details on specific station work or infrastructure upgrades/replacements that could affect me as a customer. I know its difficult to provide the entire program however having some insights into what Hydro One is planning may have altered our responses."
"It would have been helpful to understand reliability impacts of deferring investments."
"More information about trade-offs. For example, how does increased investment in renewal impact future reliability? What targets does Hydro One set for Transmission reliability and power quality? Also, there was a reference to growth based on the IESO forecasts, but there were no options for capacity improvements on the Transmission system. Perhaps these expansions were part of the mandatory/obligated investments. We would have supported higher investments in transmission capacity projects. Also, is Hydro One investing in integrating battery storage and other distributed energy resources? Alternatives to traditional transmission projects would have been helpful."
"More specific information on Distribution expenditures."
"OpEx planning, plenty of focus on CapEx. But when it comes to customer costs both are equally important."
"Perhaps having access to regional information in terms of investments/future plans. Having the information accessible, but not embedded, would be a nice feature."
"Region specific information for Eastern Ontario."
"The theme of my response is spending more efficiently. I would love to understand how Hydro One is driving efficiency."
"Where does the bulk of the Tx rate increase come from? Are major infrastructure spends like 230kv lines and transmission to Northern Ontario part of the budget spend increase?"
"Your account executives are overloaded with too much work and can't provide a good level of support. You need more account executives to support your costumers properly. The current level of support is not acceptable."

Survey Diagnostics
Outstanding questions

Q Is there anything that you would still like answered? (Optional)

Verbatim comments (86% No comment)
"Again, is there more information on Distribution expenditures. Important upgrades to Hydro One distribution infrastructure, such as for those assets that reside along [REDACTED] St in the Town of [REDACTED], are sorely needed to safeguard public safety."
"As an industrial customer, the survey should focus a little on Hydro One and IESO interactions as well."
"Has Hydro One completed all the work proposed in their last plan? If so, was it completed on schedule and within budget? Historical performance provides context for the adequacy of plans."
"If the annual increase is 5.5%, then why is the monthly increase also not 5.5%. This area is confusing. Also, the total percent increase does not equal the sum of the increases from each area, and the reason for this is not made clear."
"See above."
"Totally unrelated to this report, but for planned power outages the .csv report that gets sent out has a lot of extraneous information. If that could be limited to just the outages that impact our facility that would be great!"
"What are the major investments for Eastern Ontario?"
"When will the cover process be streamlined to ensure critical generation assets can re-connect to the system in a timely manner? As outages become harder to obtain or change, months of planning/review of may not be feasible."
"When you have a fault on the transmission [REDACTED] line, and it damages the customer's generator, is there a way you can help with damages done to our equipment?"
"Yes - How hydro one is driving efficiency and enabling the Ontario economy?"

Voluntary Stream Results

Voluntary Stream Results

Summary of Results

Those without an available email address on file had the opportunity to participate in the customer engagement through an open-access survey link. Verified customers (those who supplied their account number and the first three characters of a postal code associated with one of their accounts) were routed into the "representative" stream.

Customers who chose not to verify their account information or were unable to do so could still participate by self-selecting the appropriate survey version (residential, including seasonal, First Nations On-Reserve residential, or small business) and were included in the "voluntary", unverified stream. Feedback provided through the voluntary stream is summarized below.

SECTION 1.6 – ATTACHMENT 2 – ADDRESSING NEEDS AND PREFERENCES OF INDIGENOUS COMMUNITIES

1.0 INTRODUCTION

SPF Section 1.6 addresses customer engagement activities involving Indigenous Peoples, including First Nations communities and Métis individuals, including through the application-specific IRG Study and other ongoing engagement. The sections below address Hydro One's Indigenous Relations Policy and summarize steps taken to address the needs and preferences of Indigenous communities and customers, including procurement opportunities.

2.0 INDIGENOUS RELATIONS POLICY

Hydro One's Indigenous Relations Policy, updated in 2023, sets out the Company's commitment to building partnerships with Indigenous people and communities. The policy delineates Hydro One's commitment to, among other things, increase procurement opportunities for Indigenous businesses, increase Indigenous representation in Hydro One's workforce, consult on projects that may impact Aboriginal and Treaty rights, ensure Hydro One employees have the training to advance relationships and understanding with Indigenous communities, and advance positive and lasting socio-economic outcomes with Indigenous communities through partnership. Please refer to the appendix of this attachment for the Indigenous Relations Policy.

3.0 ADDRESSING THE NEEDS AND PREFERENCES OF INDIGENOUS COMMUNITIES AND CUSTOMERS

Hydro One is taking various steps which are responsive to and assist in addressing the needs and preferences of Indigenous customers and communities as they expressed through customer engagement activities. These include the steps summarized below.

Reliability. As described in SPF Section 1.6, First Nations customers, surveyed as part of the IRG Study, prioritized reliability outcomes and supported investments that would

improve reliability. Interviews with First Nations communities identified reliability and power quality as a priority. Métis Nation of Ontario representatives also identified reliability as a priority for rural and remote areas.

Distribution reliability to First Nations communities is described in DSP Section 3.11, D-SS-04, Attachment 1. Hydro One is expanding the grid-scale and residential Battery Energy Storage System (BESS) program to improve distribution reliability for First Nations communities and some residential customers currently experiencing poor reliability (DSP Section 3.11, D-SS-04). In addition, Hydro One is embarking on several province-wide distribution reliability and resilience-improvement initiatives such as installation of switches to sectionalize and automate system restoration post outage where feasible (DSP Section 3.11, D-SS-05), accelerating replacement of poor condition poles (DSP Section 3.11, D-SR-07), and expanding expenditure on vegetation management programs as outlined in Exhibit E-03-02, Section 2.4.1.

Hydro One's proposed transmission investments will also respond to reliability concerns through targeted system renewal and reinforcement work. Planned activities include refurbishing aging transmission lines and stations, reinforcing the transmission system in northern Ontario with new transmission lines, and continuing line maintenance inspections and vegetation management. These investments and activities will improve delivery point performance and enhance the reliability of supply to First Nations communities and remote areas. Transmission reliability to First Nations communities and the associated reliability improvement initiatives are further described in TSP Section 2.4 Attachment 1.

Over the 2028-2032 period, Hydro One's Indigenous Partnership and Business Development (IPBD) Group will continue to support the Transmission and Distribution businesses by relaying community concerns and goals that will support in implementing reliability improvement initiatives.

System Access. Hydro One will provide customers, including Indigenous customers and communities, with timely access to the network through customer connections and paced

regional expansions. Hydro One will enable approximately 18,600 new connections and upgrade services for approximately 7,700 existing load customers annually. Further details are included in DSP Section 3.1[1] and DSP Section 3.11 D-SA-02.

Procurement Opportunities. Hydro One supports the Indigenous Relations Policy through its procurement opportunities for qualified Indigenous businesses. This is intended to develop and expand the number and capacity of Indigenous suppliers who can provide goods and services to Hydro One. Hydro One procures materials and services through a framework of policies and procedures that are intended to deliver productivity and allow the company to achieve greater value in its sourcing.

Hydro One's Indigenous Procurement Policy has steadily increased procurement opportunities for qualified Indigenous businesses from 1.62% ($16.5M) in 2016 to 7.1% ($215.9M) of spend under management in 2025. In 2021, Hydro One set a new target of 5% of spend under management for procurement opportunities for qualified Indigenous businesses by 2026. For 2025, Hydro One exceeded 5% and has achieved this goal.

The measures Hydro One continues to implement to increase access to procurement opportunities and ensure that Indigenous communities will access meaningful benefits from Hydro One's activities, and that new relationships will be established and strengthened, include the following.

- Hydro One's Indigenous Procurement Procedure is designed to increase opportunities for Indigenous businesses to supply Hydro One with services and materials through a variety of sourcing processes such as competitive bids and direct awards.
- Hydro One has implemented criteria related to Indigenous participation requirements included in all Requests for Proposal (RFP) documents regarding the use of an Indigenous businesses and sub-contractor(s) to complete the goods and services requirements, local Indigenous participation commitment, and active Indigenous diversity programs, policies and/or initiatives.

[1] DSP Section 3.1, System Access, page 41 – 43 and System Service, page 47 – 50

- Hydro One hosts meetings with Indigenous suppliers and communities to share information about Hydro One's procurement process, learn about products and services local Indigenous communities and businesses can provide, and share upcoming procurement opportunities with them.
- In 2022, Hydro One launched a "Retain & Grow" program to improve internal cultural alignment around Indigenous procurement, and to build upon existing relationships with Indigenous suppliers through: connection-based mentoring and networking; performance evaluations and feedback; and tracking and monitoring of collaboration. This program has since evolved to support high-performing Indigenous suppliers into leading suppliers for Hydro One, while also providing Hydro One stakeholders with an important opportunity to learn more about the Indigenous communities and Peoples they serve.
- In 2024, Hydro One held an Indigenous Supplier Business Fair to provide a platform for Indigenous businesses to showcase their products and services. The Company also hosted the second Engineering, Procurement and Construction Safety Summit to foster conversations with our contractors, including Indigenous contractors, on collaboration and safety.

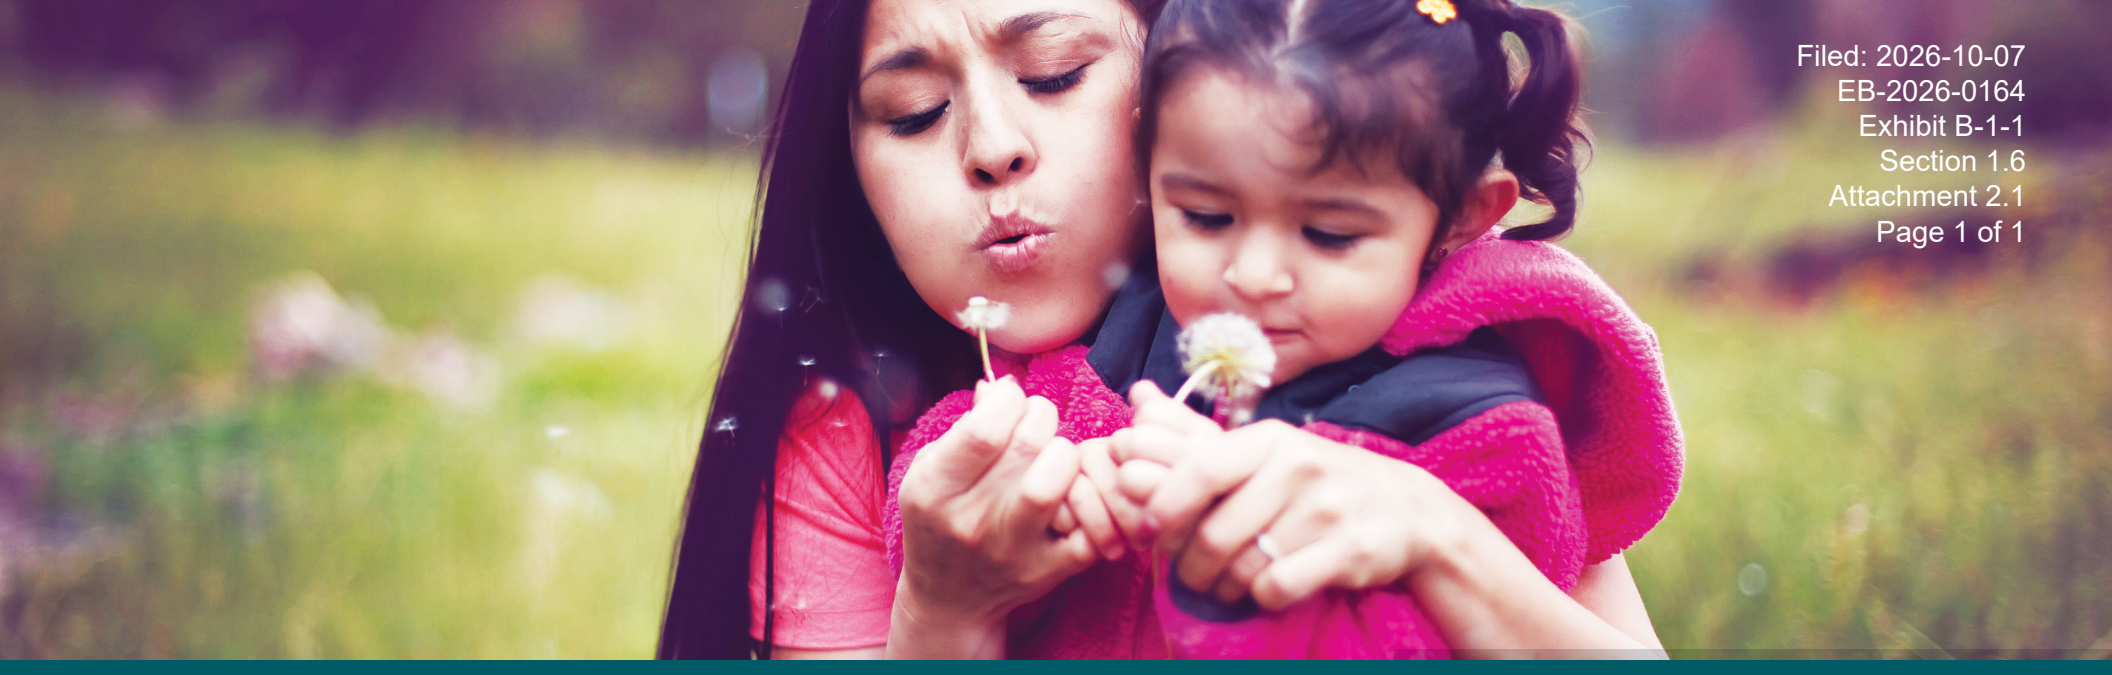
Indigenous businesses currently supply a diverse and growing range of materials and services to Hydro One. Examples include emergency storm response, engineering services, facility maintenance, security services and general contracting.

Procurement targets will be set for each year of the application period, and Hydro One's IPBD team will continue to work with Supply Chain to set clear expectations with external vendors to support increased Indigenous procurement. Hydro One has also continued to refine its contract process for Indigenous businesses. For further information on Hydro One's procurement management, refer to Exhibit E-05-01, and for details of Hydro One's spend under management, refer to Exhibit C-09-04, Section 2.0.

Employment. Hydro One is advancing its commitment to Indigenous employment by strengthening its long-term talent pipeline through targeted recruitment events,

scholarships and early-talent programs, as well as partnering with Indigenous communities in project delivery efforts.

Communications. Hydro One's IPBD team is reviewing the Indigenous Relations Policy, and implementing standardized engagement tools, templates and processes to strengthen consistency and transparency in engagement approaches. The IPBD team also works with the Distribution Lines and Forestry teams to ensure timely communication with Indigenous communities where routine or emergency maintenance work is planned or underway, with IPBD providing additional support if concerns arise. Hydro One will continue the focus on relationship building and supporting timely, consistent engagement with Indigenous communities across operations over the 2028-2032 period.



Affordability. If the proposed 2028 – 2032 investment plan is approved, the monthly bill for a typical Hydro One year-round medium density residential will increase by an average of $1.14 each year for transmission and decrease by an average of $0.10 each year for distribution, from 2028 to 2032.

Hydro One does not have authority to apply the First Nations Delivery Credit beyond what is specified in the legislation. However, Hydro One supports affordability for customers by providing information and assistance on available financial and energy-efficiency programs. Depending on eligibility, these include the Low-Income Energy Assistance Program, the Ontario Electricity Support Program, payment arrangements and the First Nations Conservation Program.

4.0 CONCLUSION

Hydro One is continuing to focus on ensuring it is meeting the aspirations, goals, interests and needs of First Nations communities and Métis organizations, partners, customers and employees. Feedback received from First Nations communities, Métis organizations, and customers have resulted in Hydro One introducing measures that will help address a number of the concerns raised, though Hydro One recognizes that more work needs to be done. Hydro One will continue to engage and work with First Nations communities and

Métis organizations as it develops and executes programs intended to provide improved service and customer care, and Hydro One will continue to build and maintain positive partnerships with First Nations communities and Métis organizations across Ontario.

Hydro One
Indigenous Relations Policy

Key Beliefs

At Hydro One:

- We acknowledge that Indigenous communities have historically borne impacts of development without benefiting from it.
- We acknowledge that Indigenous communities have real issues and grievances arising from past and current development.
- We commit to a journey of Reconciliation that is guided by this context and by the unique Indigenous communities we work with during engagement and for the life cycle of our assets.
- We understand that our success is dependent on demonstrating leadership in Indigenous Relations and embracing partnerships with Indigenous communities.

Our Guiding Principles and UNDRIP

- We approach Indigenous communities with **transparency** and **respect**.
- We meet Indigenous communities **where they are** in their governance, capacity and priorities, as participants in industry and environmental practice, and as the **original stewards** of the lands that make up Ontario and Canada.
- We respect the **cultures, traditions and rights** unique to each Indigenous community.
- We recognize the **obligations** industry has in **Reconciliation** with Indigenous people, to address meaningful and measurable change in cultural understanding and economic outcomes.
- We understand that Hydro One succeeds when Indigenous communities succeed and that all Hydro One employees benefit from a greater understanding of Indigenous issues, opportunities and knowledge.

UNDRIP

We understand that our relationships and interactions with Indigenous communities in Canada require a paradigm shift. Guided by the evolving legal obligations and opportunities for consultation and engagement, we embrace the United Nations Declaration on the Rights of Indigenous Peoples as it supports human rights, language, education and governance for Indigenous people. It is a critical lens on our relationship with Indigenous communities. We are committed to supporting UNDRIP.

It remains our goal to achieve the agreement and support, articulated in UNDRIP as “Free Prior and Informed Consent”, of Indigenous peoples. We will use FPIC as a goal and a guide in every engagement. We understand that UNDRIP and FPIC are an important lens to view our relationship with Indigenous people, along with the evolving law, practices, and the guidance of Indigenous communities in Ontario.

Our focus is on meaningful reconciliation under Call to Action #92, which includes increasing and retaining our Indigenous employee base, offering equity investment opportunities to Indigenous communities when we build new capital Transmission projects, challenging ourselves to set aggressive procurement targets for Indigenous businesses and focusing on the input and guidance of Indigenous communities as we develop and implement our strategic goals.

David Lebeter
President and CEO
Hydro One Ltd.

February 2023

The Hydro One Indigenous Relations Policy reflects our Vision and Guiding Principles. Our engagement, advocacy and strategic direction are set by the Indigenous Relations Policy and led in collaboration with the Indigenous communities (First Nations, Inuit and Métis Nation) we work with every day.

Our Vision

A better and brighter future for all.

Our Goals

- We will be the partner of choice for Indigenous communities
- We will attract, retain and learn from Indigenous employees as their employer of choice
- We will advance meaningful economic Reconciliation as partners with Ontario Indigenous communities

hydro One

SECTION 1.7 – SPF – INVESTMENT PLANNING PROCESS

1.7.1 OVERVIEW

This section describes Hydro One's integrated planning framework known as the 'system planning process' which supports the development of Hydro One's investment plan underpinning this Application. The output of these interrelated processes is a detailed, multi-year investment plan comprised of investments described in the Transmission System Plan (TSP), Distribution System Plan (DSP), and General Plant System Plan (GSP) (together the System Plans) and the company's OM&A requirements.

1.7.1.1 THE INVESTMENT PLANNING PROCESS

Planning teams from across Hydro One develop the investment plan through a risk-based process, which develops and assesses candidate investments based on safety, reliability and environmental risk, mandated requirements, and consideration of customer input, management insight, and the company's strategic priorities and objectives. The process allows Hydro One to address asset needs and operational risks, meet mandated obligations, as well as respond to customer needs and preferences.

Hydro One follows a three-phase, risk-based process to identify, prioritize and optimize investments set out in the TSP, DSP and GSP. As presented in Figure 1 and summarized below, the three phases of the system planning process are: i) Corporate Strategy and Context, ii) Asset Management, and iii) Investment Planning.

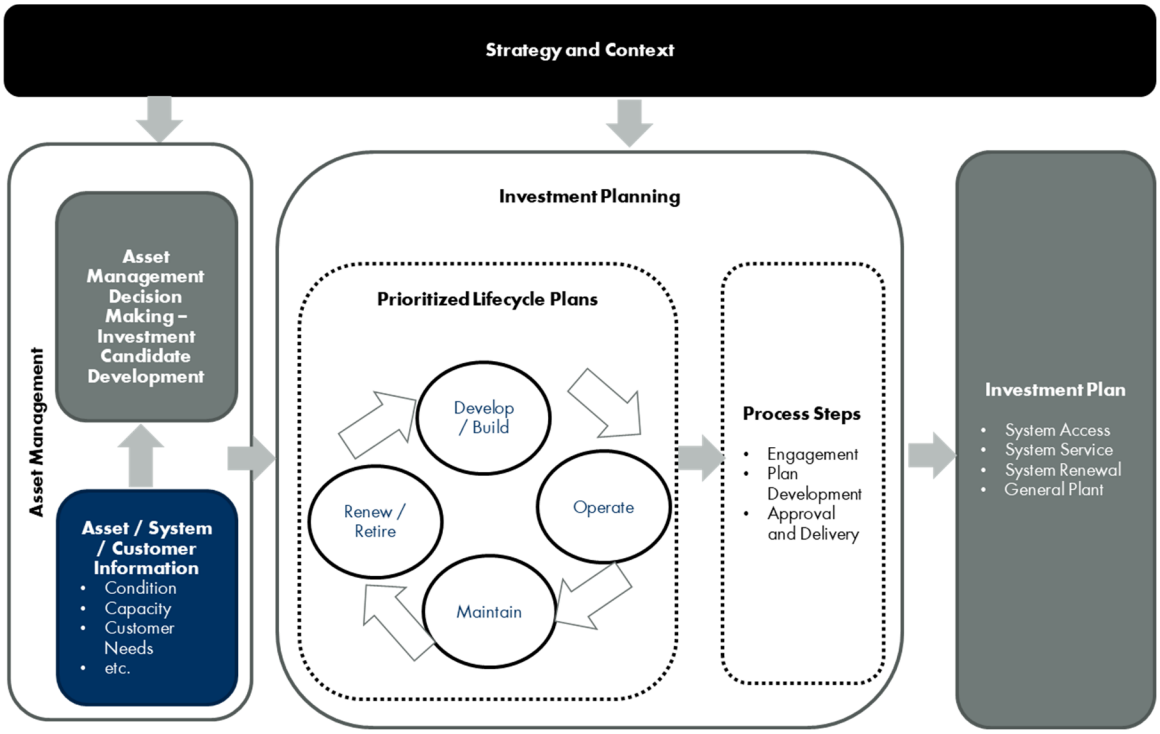


Figure 1: System Planning Process Diagram

Strategy and Context: Hydro One identifies long-term system needs within the context of customer needs, asset condition, system performance, and system capability. In addition, Hydro One's Strategic Priorities, alignment with the OEB's RRF outcomes and the results of the customer engagement process described in SPF Section 1.6 are considered.

Asset Management: Hydro One employs a lifecycle management approach that balances asset performance, costs and associated risks during the asset service life. During the asset management process, Hydro One assesses the current state of its assets, evaluates the needs of the system and customers, and develops a list of potential candidate investments. Further information on the Asset Management approach that Hydro One has employed when preparing the System Plans is provided in Section 1.7.4 below.

Investment Planning: Based on the candidate investments, Hydro One uses its investment planning process to identify, prioritize and optimize investment decisions considering customer needs, system and asset risks. Risk taxonomies guide the assessment of candidate investments, based on safety, reliability and environmental risks. These assessments underpin the prioritization and optimization of the candidate investments to produce a draft portfolio of investments. This approach allows Hydro One to manage costs, address asset and system operational risks, address customer needs and preferences and mitigate customer rate impacts.

1.7.1.2 APPROACH TO TRANSMISSION AND DISTRIBUTION SEGMENTS

Hydro One prioritizes transmission and distribution system investments separately, consistent with separate OEB approvals and separate revenue requirements. Common corporate costs and general plant investments are allocated based on the shared asset allocation study provided in E-04-08.

The discrete drivers that inform the System Plans vary across the Transmission (including HOSSM) and Distribution lines of business. For example, a significant portion of the distribution investment plan is responsive to external factors including new customer connections, joint use and relocations, and storm response. Conversely, transmission investments are typically large, complex, multi-year projects that require extensive coordination with customers, generators, and the IESO to execute.

Hydro One prioritizes transmission and distribution investments based on a range of factors. Many lifecycle-driven investments are classified as System Renewal and prioritized on the basis of risk. Mandated investments driven by external sources such as the IESO, local area and regional supply plans, and customer requests are classified as System Service and System Access. These investments are required to comply with the terms of Hydro One’s Transmission and Distribution licences and are prioritized in a manner consistent with the requirements driving the investments.

1.7.1.3 THE DEVELOPMENT OF THE 2028-2032 SYSTEM PLANS

The system planning process for the 2028-2032 investment plan started in early 2025, following the completion of Phase I of Customer Engagement. Lines of Business developed preliminary plans which were responsive to the needs of the system and customer needs and preferences identified in Phase I of customer engagement. Hydro One developed the draft investment plan and two other investment scenarios – a spend less plan (Scenario 1) and a spend more plan (Scenario 3) – and the resulting bill impacts, which were presented for customer feedback during Phase II of Customer Engagement in the late fall of 2025.

In early 2026, Hydro One received the results of Phase II of Customer Engagement. This feedback, together with consideration of ongoing IESO Bulk Planning studies, updated system and asset data, and updated cost and execution considerations, helped refine the investment plan for this Application.

1.7.1.4 TIMELINE TO DEVELOP THE 2028 - 2032 SYSTEM PLANS

Figure 2 sets out the major milestones to develop the 2028-2032 System Plans.

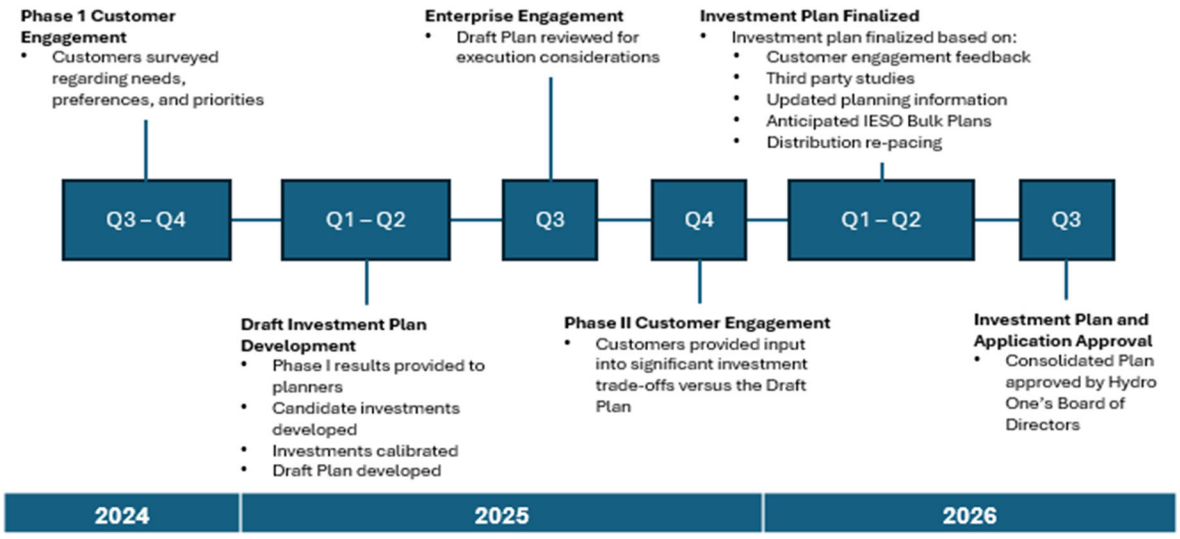

Figure 2: 2028-2032 System Plan Development Timeline

The sections that follow discuss each phase of the system planning process shown in Figure 1 further above.

1.7.2 STRATEGY AND CONTEXT

1.7.2.1 HYDRO ONE'S STRATEGIC PRIORITIES

Hydro One's planning process begins with a consideration of Hydro One's Strategic Priorities, the OEB's Renewed Regulatory Framework (RRF) outcomes, and customer engagement results. These factors establish the focus of the System Plans by identifying areas that are valued by the Company's diverse stakeholders, customers and regulators. Hydro One's Strategic Priorities are presented in Figure 3 below.

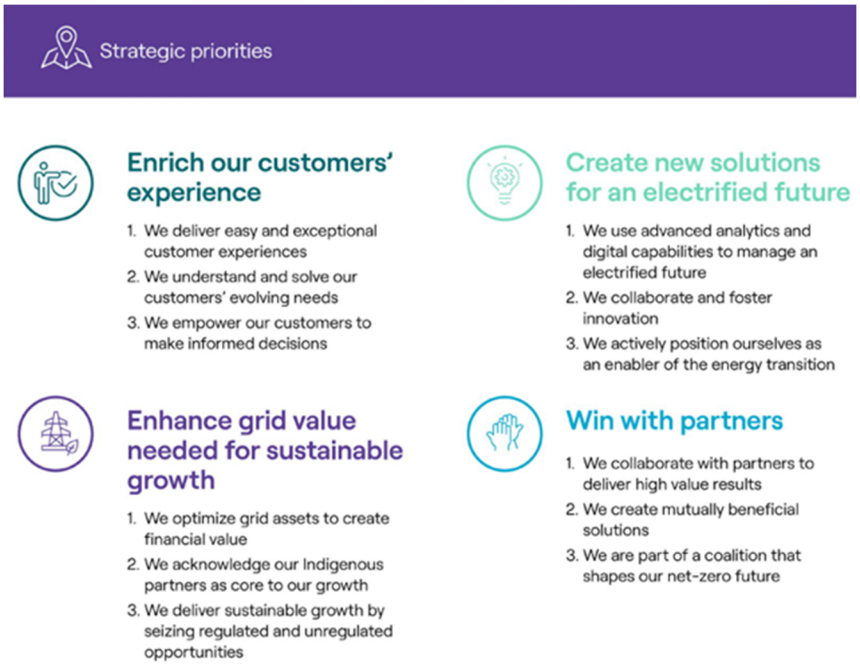

Figure 3: Hydro One's Strategic Priorities

1.7.2.2 THE OEB'S RENEWED REGULATORY FRAMEWORK

Hydro One's System Plans are guided by the four outcomes identified in the OEB's RRF:

- **Customer Focus** – services are provided in a manner that responds to identified needs and customer preferences;

- **Operational Effectiveness** – continuous improvement in productivity and cost performance is achieved; and distributors and transmitters deliver on system reliability and quality objectives;
- **Public Policy Responsiveness** – distributors and transmitters deliver on obligations mandated by government (e.g., in legislation and in regulatory requirements imposed further to Ministerial directives to the Board); and
- **Financial Performance** – Financial viability is maintained; and savings from operational effectiveness initiatives are sustainable.

In managing assets that are critical to customers and Ontario's economy, Hydro One is committed to meeting the RRF outcomes and has integrated them into its Investment Planning process. Table 1 below demonstrates how the System Plan outcomes are aligned with the RRF outcomes.

Table 1 - Hydro One's RRF Performance Outcome Objectives

RRF Outcomes	System Plan Outcomes
Customer Focus	• Improve current levels of customer satisfaction • Deliver exceptional experiences and empower customers
Operational Effectiveness	• Achieve top-tier safety performance and eliminate serious injuries
	• Focus on continuous improvement to enhance efficiency, productivity, and reliability
	• Achieve and maintain employee engagement
	• Deliver on operational commitments to renew, expand, and enhance the grid • Maintain Transmission reliability and improve Distribution reliability
Public Policy Responsiveness	• Deliver on obligations mandated by government through legislation and regulatory requirements
	• Lower Hydro One's environmental footprint through greenhouse gas reduction
Financial Performance	• Responsible investment in rate base assets to ensure the safety and reliability of the grid • Reasonable and stable rate impacts over the course of the planning period

1.7.2.3 CUSTOMER ENGAGEMENT

The investment planning process is also informed by customer engagement. Hydro One's customer engagement initiatives are designed to:

- increase Hydro One's understanding of customer needs and preferences;
- enhance Hydro One's ability to provide services that meet these needs;
- produce outcomes that are valued by customers; and
- improve overall customer satisfaction.

Hydro One relied upon customer engagement in developing the 2028-2032 System Plans, discussed further in TSP Section 2.7, DSP Section 3.7, and GSP Section 4.7. To identify customer needs and preferences, Hydro One engaged an independent third-party research firm, Innovative Research Group (IRG), to design and conduct a comprehensive, two-phased, customer engagement study, further discussed in SPF Section 1.6. This engagement allowed Hydro One to both shape and refine its investments based on customer input and implement explicit trade-offs between spending levels and outcomes, further discussed in section 1.7.5.6.2 below.

1.7.2.4 ECONOMIC PLANNING ASSUMPTIONS

Hydro One has used the Ontario Consumer Price Index for the inflation assumption in the investment planning process.

1.7.2.5 ASSET MANAGEMENT PROCESS

Hydro One's asset management goal is to monitor system assets and determine the appropriate timing of asset maintenance and capital investments throughout the asset lifecycle. This approach allows Hydro One to manage risks and to support Hydro One's Strategic Priorities, customer and operational needs, and RRF outcomes, while managing total cost and customer rate impacts. The asset management process is a key component of the investment planning process.

Hydro One monitors and assesses the current state of the system and its assets on an ongoing basis. The development of candidate investments is underpinned by a needs

assessment considering (i) asset condition, (ii) customer needs and preferences, (iii) power system and operational needs (including regional and bulk planning considerations), and (iv) other external influences. Each of these components is discussed in the sections that follow.

1.7.2.6 ASSET CONDITION NEEDS

Hydro One planners perform an asset needs assessment to identify candidate investments and collect the data necessary to assess risks and facilitate the subsequent calibration process. A systematic assessment of asset-specific investment needs is an essential input into investment planning. The investment candidates are further scored and prioritized through the investment planning process to achieve the optimal balance of risk and benefits.

The asset needs assessment process is structured to determine individual asset needs. The process relies on asset data, including condition, utilization, performance, obsolescence and other factors, and focusses on major equipment groups in transmission (such as transformers, conductors, breakers, and protection and control systems) and distribution (such as station transformers and poles) that directly affect system reliability. This process ensures a consistent view of asset information. As part of the preliminary needs assessment, asset condition and other factors are assessed against current and future requirements to identify investment candidates.

Asset condition, criticality, utilization and performance are key factors that help identify asset risks that require further screening and confirmation:

- **Condition** – The degradation of asset condition over time increases the probability of failure, which presents a risk to the system. Asset condition is determined using different criteria for different assets. For example, the condition of a transmission or distribution station transformer is confirmed by visual inspections and analysis of the oil within the transformer. The condition of a wood pole is assessed by a visual inspection, a sounding test, and if required, a boring test. While condition evaluation methods to evaluate condition vary, all assets of a given type are

evaluated through objective criteria. Assets that have a high condition risk are candidates for refurbishment or replacement.

- **Criticality** – Assets whose failure would result in an interruption to a larger amount of load would have an asset criticality that is higher than assets whose failure would have a smaller impact on the system load. Asset criticality is used to prioritize the refurbishment or replacement of assets whose condition, performance, utilization, or economic risk has already resulted in the asset being considered a candidate for refurbishment or replacement.
- **Utilization** - The deterioration of some assets is highly dependent on their loading and number of loading cycles. For example, transformers that are heavily loaded relative to their nameplate rating deteriorate faster than those that are lightly loaded. Similarly, circuit breakers utilized for capacitor and reactor switching which are subject to significant operations experience accelerated mechanical and electrical wear-out. Therefore, the asset utilization risk for transformers and circuit breakers considers their relative deterioration based on loading and operational history.
- **Performance** - Past performance can be a good indicator of expected future performance. Therefore, assets with a high-performance risk can be considered candidates for refurbishment or replacement.

Hydro One considers additional factors including load forecasts, equipment ratings, operating restrictions, security incidents, environmental risks and requirements, compliance obligations, equipment defects, obsolescence including vendor support, and health and safety considerations to help ensure that capital expenditures target an appropriate mix of assets. While age is not the primary driver for any specific investment, demographics provide insight into long-term fleet level needs.

On-site assessments with field personnel are conducted to validate and confirm asset conditions, based on site-specific considerations. For high-value assets such as transformers, subject matter experts perform a thorough assessment of asset condition and consider and advise on issues such as equipment obsolescence, manufacturer support, and “repair vs. replace” evaluations. Detailed asset assessment and field review,

inspection, and validation are tools that ensure the identified needs reflect the condition of the assets in the field.

Through asset lifecycle strategies, developed for major system components, Hydro One considers refurbishment as an alternative to replacement when technically feasible. Considerations differ among assets with further information provided in TSP Section 2.2, DSP Section 3.2 and GSP Section 4.2 - Asset Information and Lifecycle Strategies.

Investments largely underpinned by asset condition data from ongoing asset assessments are found within the System Renewal category in TSP Section 2.12, DSP Section 3.11 and GSP Section 4.11.

1.7.2.7 CUSTOMER NEEDS

Understanding customer needs is critical to Hydro One's business and investment planning. Ongoing customer processes help the Company proactively identify customer needs. The needs of new, large customers are often identified through direct customer connection requests, needs assessments and customer consultations conducted as part of the Regional Planning process. The needs of existing customers are identified through continuous monitoring of the power system and engagement with major customers (such as transmission connected local distribution companies, transmission connected industrials, and large distribution accounts).

In addition to broad customer preferences on priorities and trade-offs gathered through Hydro One's two-phase customer engagement (see SPF Section 1.6), specific customer needs in terms of connection to the system, as well as broader local, regional, and bulk growth requirements have directly driven various investments within the System Access and System Service category in TSP Section 2.12 and DSP Section 3.11.

1.7.2.8 POWER SYSTEM NEEDS

Power System needs relate to work that is necessary to maintain and operate the transmission and distribution system to reliably and securely deliver power to customers

and meet current and forecast requirements resulting from new load customers, generation facilities and other distributed energy resources. System needs include:

- Providing adequate capacity to reliably deliver electricity to the local areas connected to Hydro One's system.
- Addressing local area reliability performance, including pockets of distribution customers who may experience poor reliability.
- Implementing mitigation measures to minimize high-impact events to ensure the safe, secure and reliable operation of Hydro One's transmission system in accordance with the IESO's Market Rules, the OEB's Transmission System Code, and other mandatory industry standards such as those established by the North American Electric Reliability Corporation (NERC) and Northeast Power Coordinating Council (NPCC);
- Implementing IESO Bulk System planning needs and regional transmission facility needs identified as part of the Regional Planning process;
- Local distribution upgrades and enhancements to relieve system capacity constraints and meet forecast load growth, consistent with the requirements of the Distribution System Code; and
- Protecting critical infrastructure from physical and cyber threats.

Under the electricity sector structure in Ontario, the need for new transmission system facilities or system enhancements may be identified by Hydro One Transmission, the IESO, the Government of Ontario, or customers. The regional planning process identifies distribution-level investments necessary to address regional needs more effectively, instead of other transmission or resource options. Needs are identified and assessed by Hydro One in conjunction with customers, the IESO and LDCs under the regional planning process (outlined in SPF Section 1.2) or by the IESO as part of the planning for the bulk electric system for ensuring supply to more than one distributor (discussed in TSP Section 2.6).

Investments resulting from IESO Bulk System planning and Regional Planning have directly driven various investments within the System Service category in TSP Section 2.12 and DSP Section 3.11, as well as some investments in GSP Section 4.11.

1.7.2.9 EXTERNAL AND OTHER INFLUENCES

Hydro One uses information on industry best practices, trends and benchmarking to evaluate its performance against peer utilities. These studies and comparisons generate insight regarding Hydro One's operations relative to benchmark comparators, which can guide continuous improvement efforts and inform investment decision-making. A description of the studies related to the System Plans is included in SPF Section 1.3, and further discussed in TSP Section 2.3, DSP Section 3.3 and GSP Section 4.3.

In addition, Hydro One's investment plan has been influenced by new regulatory requirements including the OEB's Vulnerability Assessment and System Hardening requirements and Non-Wires Solutions requirements; these two requirements have informed various investments found in DSP Section 3.11 and Exhibit E-03-02.

1.7.2.10 INVESTMENT CANDIDATE DEVELOPMENT

After evaluating the current state of the system, Hydro One considers reasonable opportunities to group and bundle related needs, based on logical, functional and geographic groups. For example, if multiple assets are identified for intervention on a common circuit or feeder, these needs may be grouped together to form an integrated investment. Through this process, diverse individual needs are brought together to form potential projects or programs that may be brought forward as candidate investments.

These groupings of potential candidate investments are then scoped and defined based on identified asset needs, customer feedback, coordination with system needs, and other inputs. The outputs of these assessments are potential investments which are considered further during the Investment Planning process and are evaluated on the risk factors described below.

The current state assessment establishes the necessary fact base to assess the probability and consequence of safety, reliability and environmental risks at the scoring stage of the Investment Planning process described in section 0 below. Risks related to asset condition, performance and utilization inform the probability score, and risks relating to asset criticality directly inform the consequence score.

1.7.3 POWER SYSTEMS INVESTMENT PLANNING

The following section describes the investment planning process for the Transmission and Distribution systems. General Plant such as Fleet, Facilities and Real Estate, Information Systems and System Operations utilize a similar approach to assess risk and develop candidate investments (see GSP Section 4.7).

1.7.3.1 CANDIDATE LIFECYCLE RISK ASSESSMENT

Following investment candidate identification, potential investments are assessed and calibrated. This stage involves the following activities (each of which is described further below):

- assessing the risk mitigation impact of investment candidates.
- assessing the impact of investment candidates on desired outcomes; and
- calibrating risk assessments to enable consistent assessments across investments.

Risk assessment considers both the probability and the consequence of an event. Risks relating to asset condition, performance and utilization directly inform the probability score. Risks relating to asset criticality directly inform the consequence score. The assessments reflect a current evaluation of existing baseline operational risks without investment and the residual risks remaining following an investment.

The risk assessment process is conducted in the following six steps:

1. **Understand the primary purpose of the candidate investment**: Identify the primary objective of the investment and the risks addressed (safety, reliability, environmental).

2. **Define worst reasonable direct impact (WRDI)**: Identify the worst reasonable direct impact of not making the investment, based on credible scenarios experienced by Hydro One and other utilities.[1]
3. **Determine the consequence of the baseline risk**: Establish the consequence of the WRDI in the event the investment is not completed, using the risk taxonomies.
4. **Determine the probability of the baseline event**: If no investment occurs, evaluate the consequence and probability of the WRDI occurring using the risk-based framework.
5. **Determine the residual consequence and probability**: Determine the consequence and probability of the WRDI occurring even if the investment is made.
6. **Calculate the final mitigated risk score**: Determine the final mitigated risk score based on the difference in baseline and residual risk score for each of the three risk areas (safety, reliability, and environment).

The risk assessment process relies primarily on three risk ratings that have been developed to classify safety, reliability and environmental risks.[2] Each risk rating features clear definitions and consistent assessments, which permits a proper comparison between candidate investments. These risk ratings exclude extreme events such as natural disasters or health pandemics.

[1] The WRDI reflects an outcome avoided if the investment is made with a remaining residual risk of an impact that strikes a balance on the continuum of residual risk between an investment to avoid the average outcome with a higher residual risk and an investment to avoid the worst conceivable risk with no or negligible risk. This is consistent with the objective of risk assessment which is to avoid a reasonable level of risk, while permitting a reasonable and manageable level of residual risk to remain part of the operational focus of Hydro One. In doing this, Hydro One's risk assessment process takes into account total risk. The WRDI is determined by defining a scenario and a reasonable undesired outcome that could occur as a direct result of not making the investment (e.g., failure event that is the most reasonable, additional cost/risk of repair during emergency compared to regular operation). Determination of a "reasonable" outcome is based on an assessment of expectation based on: (i) historical events, (ii) unique characteristics of the proposed investment, and (iii) confidence in the outcome occurring. Determination of a "direct" outcome is based on an assessment of whether the event/damage is an immediate result of the failure itself, or whether it is a secondary/coincidental result.

[2] Reliability consequences can be classified in terms of unsupplied energy to current or forecast loads, load impacted and minutes of interruption duration. Environmental consequences can be classified in terms of overall impact to the environment, oil spill severity and greenhouse gas emissions. Safety consequences can be classified in terms of harm to employees or the public.

Hydro One assesses proposed candidate investments on the consequences and probability of the safety, reliability and environmental risks that they are designed to mitigate. These risk classifications were developed in an iterative and collaborative process based on: (i) historical data from Hydro One and other utilities, (ii) economic impact studies (e.g., insurance tables), (iii) management insights, and (iv) customer feedback (e.g., outage frequency was added to the probability framework to incorporate specific feedback from customers). Each risk classification has seven levels of consequence upon which each investment is assessed. The seven consequence levels are quantified to the same scale for each of the three risk classifications. The assessments are calibrated across all classifications. For example, a score of "6" in the reliability consequence scale is equivalent and comparable in severity to a score of "6" in safety and environmental classifications. Figure 4 to Figure 7 below illustrate the three risk taxonomies.

Taxonomy to evaluate consequences related to one failure event

Score	Impact on workforce : employee and contractor[1]	OR	Impact on public
7	▪ Multiple fatalities of employees		▪ Multiple public fatalities
6	▪ Fatality to 1 employee		▪ Fatality to a single member of public
5	▪ Permanent health consequence that precludes injured party from regular day-to-day activity (e.g., paralysis)		▪ Permanent health consequence that precludes or hinders injured party from regular day-to-day activity
4	▪ Permanent health consequence that hinders the injured party from regular day-to-day activity / doing their job (e.g., loss of hand)		▪ Permanent health consequence that does not prevent injured party from most regular day to day activity ▪ Injury to member of public requiring extended medical treatment with more than 8 weeks recovery time
3	▪ Permanent health consequence that does not prevent injured party from most regular day to day activity, e.g. doing their job (loss of finger) ▪ Injury requiring medical treatment resulting in 8+ weeks absence or temporary modified work for the employee		▪ Injury or illness to member of public requiring medical treatment with less than 8 weeks recovery time ▪ No permanent health consequences
2	▪ Injury requiring medical treatment resulting in less than 8 week absence and no modified work for the employee ▪ No permanent health consequences		▪ Minor injury to member of public requiring First Aid with quick and complete recovery in less than 1 week; No permanent health consequences
1	▪ Minor injury requiring First Aid resulting in less than a week absence and no modified work for the employee ▪ Quick and complete recovery without permanent health consequences		▪ No impact on public

Figure 4: Safety Consequence Framework

Taxonomy to evaluate consequences related to one failure event

Score	Impact on customers	OR	Load impacted	OR	Unsupplied energy	OR	Outage Duration
7	Impacts an entire metropolitan area, including multiple customers **and** 2+ priority customers		>500 MW		>1 200 MWh		> 7 days
6	(Impacts on at least 3 customers **and** one priority customer) **or** Impact on 2+ priority customers		200-500 MW		500 -1 200 MWh		1-7 days
5	Impacts on at least 3 customers **or** including multiple critical locations **or** one priority customer		75-200 MW		200 – 500 MWh		10-24 hours
4	Impacts on at least 2 customers **or** including a single critical location		25-75 MW		25 – 200 MWh		1-10 hours
3	Impacts one customer resulting in a small area outage with no disruption of service to critical locations (e.g., water plant)		<25MW		<25 MWh		<1 hour
2	No power interruption		None		None		None
1	No power interruption and no supply through redundancy		None		None		None

Figure 5: Transmission Reliability Consequence Framework

Scored per event

Score	Impact on customers	OR	Average load impacted	OR	Unsupplied energy	OR	Customer Minutes Interruption
7	>50,000 customers[1] Or >30 LDAs[2]		>60 MW		> 180 MWh		> 7M CMI
6	20,000 – 50,000 customers Or 10 – 30 LDAs		25 – 60 MW		70 – 180 MWh		3M – 7M CMI
5	7,000 – 20,000 customers Or 4 – 10 LDAs		10 – 25 MW		30 – 70 MWh		1M – 3M CMI
4	2,500 – 7,000 customers Or 2 - 4 LDAs		3 –10MW		10 – 30 MWh		350K – 1M CMI
3	500 – 2,500 customers Or 1 LDA		1 – 3 MW		2 – 10 MWh		70K – 350k CMI
2	100 – 500 customers		200kW – 1 MW		500 kWh – 2 MWh		20K – 70k CMI
1	< 100 customers		< 200 kW		<500 kWh		< 20K CMI

Figure 6: Distribution Reliability Consequence Framework

Taxonomy to evaluate consequences related to one failure event

Score	Description[1]	Examples[2]
7	▪ **Catastrophic / irreversible changes to the environment** such as entire loss of habitat, plant, and/or animal populations/ species at risk in the impacted area; will never completely recover ▪ Chronic threat to human health; National media coverage, viral social media coverage/criminal charges/ major fines/charges	Catastrophic/negligent release of PCB oil to sensitive environmental area requiring significant remediation, engineering, and/or long-term monitoring
6	▪ **Significant change to the environment** – substantial loss of habit, plant and/or animal populations / species at risk in the impacted area; requires multiple years to recover completely; Chronic risk to human health; ▪ Widespread provincial media coverage; significant fines/charges/order to comply	Very large off-site soil and/or groundwater contamination due to historical practices; significant release of PCB oil to a sensitive environmental area requiring significant remediation, engineering and/or long-term planning; catastrophic SF6 release
5	▪ **Notable change to environment** – visible loss of habitat, plant and/or animal populations / species at risk in impacted area; requires 1-2 years to recover completely ▪ Definite acute risk to human health ▪ Provincial media coverage; fines/order to comply	Large off-site soil and/or groundwater contamination due historical practices; notable PCB oil to sensitive environmental area requiring significant remediation, engineering and/or long term planning; some SF6 release
4	▪ **Measurable change to environment** – moderate loss of plant and/or animal populations/species at risk in impacted area; damage to environmentally sensitive sites/special interest sites; requires months/year to recover completely ▪ Potential for acute risk to human health ▪ Widespread local media coverage; limited fines/order to comply	Moderate on/off-site soil and/or groundwater contamination due to historical practices; measurable PCB oil, mineral oil, hydraulic oil or other hazardous liquid spill to an environmentally sensitive area requiring moderate remediation, engineering, and/or long-term planning
3	▪ **Limited change to environment** – limited loss of habitat, plant and/or animal populations/species at risk; requires weeks/months to completely recover ▪ Potential for limited risk to human health ▪ Local media coverage; inspection/ comment from regulator/order to comply but no charges/fines	PCB regulatory infraction/fine; minor on/off-site contamination from historical practices; large spill/fire of PCB oil, mineral oil, hydraulic oil or other hazardous liquid requiring remediation, engineering, and/or long-term monitoring
2	▪ **Limited change to environment/ requires day(s) to recover completely** ▪ No plant and/or animal species impacted ▪ No acute risk to human health ▪ No media coverage; minor regulatory fine or order	Large spill/fire of PCB oil or mineral oil requiring cleanup; other large volume liquid spills requiring cleanup (i.e., hydraulic oil, coolant); SAR infraction/fine; invasive species infraction/fine
1	▪ **Limited change to environment/ recovers immediately after remedial action** ▪ No media coverage; no regulatory fine or order	Typical pole-top/ padmount transformer spill of PCB oil or mineral oil requiring cleanup; other liquid spills requiring clean up (i.e., hydraulic oil, coolant) Minor liquid spills (mineral oil, hydraulic coil, coolant); minor environmental incidents (e.g., wood pole treatment seepage)

Figure 7: Environmental Consequence Framework

The probability scoring (set out below in Figure 8 below) assesses the likelihood of an event happening each year or during a specified period and the worst reasonable direct impact defined for the associated consequence.

Taxonomy to evaluate the probability of a failure event

Score	Frequency	OR	Expected time to event	OR	Prob. of event occurring in the next yr.	OR	Prob. of event occurring in the next 5 yr.	Example phrases you might hear during scoring
7	4+ per year		<3 months		100%		100%	This has happened 10 times every year for the last 5 years
6	1-4 times per year		3-12 months		100%		100%	Based on run time, the equipment life is over for 2 years, it will fail in the next year
5	1 every 1-3 years		1-3 years		33-100%		85-100%	We have to trench every 2 years, disturbing the habitat
4	1 every 3-10 years		3-10 years		10-33%		40-85%	We see this event about once a year on the whole system, which has 8 of these assets
3	1 every 10-25 years		10-25 years		4-10%		20-40%	This event happens on the system sometimes, and it's much more likely to happen here
2	1 every 25-100 years		25-100 years		1-4%		5-20%	This would happen on an APD (abnormal peak day), a 1/90 year event
1	Less than 1 every 100 years		>100 years		0-1%		0-5%	This has never happened, would be unexpected and an outlier

Figure 8: Probability Framework

The risk assessment process emphasizes fact-based and quantitative decision-making to the extent possible relying on historical data and experience for the purpose of making

and justifying a particular assessment decision. The risk assessment is a key component to the Prioritization process, with further reviews occurring through the Challenge process, including consideration of the total risk exposure.

1.7.3.1.1 FLAGGING

Hydro One utilizes a "flagging" process to account for special considerations and to ensure stakeholder perspectives are included in the evaluation of investments. Except for mandatory considerations, flags are not used to determine investment priority.

Investment considerations that cannot be quantified using the risk framework described above are captured by using qualitative flags to allow consideration of potential benefits of an investment beyond risk mitigation. In most cases, flags are used to identify mandatory investment requirements according to specific categories, described below. Non-mandatory flags are used to identify other considerations.

1.7.3.1.2 MANDATORY INVESTMENTS

Mandatory flags are applied to investments that are non-discretionary, as risk-based scoring cannot capture all relevant considerations. These mandatory investments address requirements and obligations that must be met, and a "do nothing" alternative would not satisfy the underlying requirement. The process is intended to reduce the number of proposed investments that are considered mandatory and foster a more effective discussion of what should be completed.

The following outlines what constitutes a mandatory/non-discretionary investment for the purpose of investment planning:

- Immediate risk to reliability, environment or safety
- Immediate / Short-term Compliance – Mandated obligation to a regulatory agency or regulatory requirement, including mandatory reliability standards or requirements established by standards authorities such as NERC, NPCC, the IESO, or the OEB
- Third party requests/direction – Transmission or distribution work, where explicitly requested, recommended or directed, by a governmental authority, to be

performed by Hydro One and/or in relation to Hydro One's transmission or distribution system, as applicable, and/or with a risk of non-compliance with transmission and distribution licences and other regulatory obligations.

  - This includes work required to connect new load, connect generation, address equipment loading or voltage/short circuit stresses when rated capacities are exceeded, or complete transmission work that Hydro One is required by its licence to develop and seek approvals for as well as investments recommended in IESO bulk system or regional planning reports and studies or a provincial government-approved plan, required to achieve provincial government objectives prescribed in directives or regulations, including but not limited to where such investment is the subject of an IESO hand-off letter or similar, Ministerial Directive or Order in Council declaring such investment to be a priority transmission project.

- Contractual – Contractual commitments with third parties for services such as IT support, or facility leases.
- In-Flight – Project already under construction.

Based on the foregoing, these investments are considered mandatory and are prioritized ahead of discretionary investments:

- All Transmission and Distribution System Access investments;
- All Transmission System Service investments; and
- Some Distribution System Service, Transmission and Distribution System Renewal, and General Plant investments that meet one or more of the mandatory criteria described above.

Other investments are considered discretionary/non-mandatory or not time-critical and are prioritized relative to one another through the process steps that follow.

1.7.3.2 CALIBRATION

Hydro One has implemented enterprise-wide calibration sessions to ensure that scoring is comparable across different types of investments. Once candidate investments have been scored and flagged, the scores are reviewed in calibration sessions. The calibration sessions bring planners and management from across the organization together to

compare approaches, assumptions and quality of data used in scoring investments. The sessions ensure that the scoring process is done consistently. After the session, investment owners have an opportunity to revise their scores based on feedback received.

1.7.3.3 PRIORITIZATION AND OPTIMIZATION

The results of the risk assessment are translated into risk scores, which are used to generate an initial prioritization and optimization of investments, which provides consistency across the organization. The conversion is completed using a risk matrix, as presented in Figure 9 below, and total risk mitigated is calculated by summing the risk score for each taxonomy (i.e., safety, reliability, environmental). To more effectively differentiate between the risk levels of investments with similar consequences and probability scores, Hydro One uses a logarithmic scale to assign risk scoring points.

Risk score (risk unit)

Consequence								
	7	900	4,200	12,000	36,000	100,000	400,000	1,000,000
	6	430	1,900	5,000	17,000	50,000	200,000	500,000
	5	170	800	2,100	7,000	20,000	80,000	200,000
	4	60	280	800	2,400	7,000	28,000	70,000
	3	20	80	230	700	2,200	8,000	20,000
	2	4	20	50	150	460	1,700	4,200
	1	1	3	10	30	90	350	800
		1	2	3	4	5	6	7
		Probability						

Figure 9: Risk Matrix

Based on the risk scores and cost estimates associated with each investment, candidate investments are ranked according to risk mitigation achieved per dollar or the risk-spend efficiency.

1.7.3.4 CHALLENGE SESSIONS

Challenge sessions are facilitated discussions to (i) review an integrated portfolio, (ii) evaluate and confirm non-risk parameters (e.g., strategic or productivity investments), (iii) assess and debate investments on the margin of the funding decision, and (iv) make trade-off decisions based on facts.

Challenge sessions are designed to provide a fact-based and structured approach to define the funded investments portfolio, with the focus on ensuring that the most valuable work is included in the plan. The discussions allow for the merits of an investment to be considered from both risk and non-risk perspectives. Challenge sessions are attended by various levels and types of stakeholders, which provide for execution feasibility and strategic alignment considerations.

Initial challenge sessions are held to identify investments that should be funded considering factors related to risk mitigation, productivity and non-risk parameters. The output is a funded investment portfolio, which is subsequently reviewed by portfolio owners and members of the executing lines of business. Additional and final challenge sessions are then held to confirm final trade-offs.

1.7.3.4.1 TRADE-OFF DECISIONS

As part of the challenge sessions, trade-off decisions assess which investments should be promoted or demoted based on the following levers:

- Risk: Is Hydro One comfortable with the remaining risk? Are there unfunded investments which mitigate large risks? The focus on total and absolute risk exposure provides a cross check that all critical and major risks are being addressed as part of the plan to augment prioritization based on risk-spend efficiency.
- Flags (non-risk parameters): Are there non-risk factors which need to be considered?
- The consideration of both ‘risk spend efficiency’ (i.e. risk mitigated per dollar) and mitigated risk supports the making of prudent and data-driven trade-off decisions.

1.7.3.5 ENGAGEMENT

Following the development of the draft portfolio of investments, the draft plan is subject to two types of engagement. Internally, an enterprise engagement process is undertaken to incorporate further execution considerations. In the case of investments to be included in regulatory applications, the Draft Plan is included in the second phase of customer engagement to solicit customer feedback on specific investment decisions. The results of both engagement activities are considered in the development of the final plan.

1.7.3.5.1 ENTERPRISE ENGAGEMENT

The enterprise engagement process is held to ensure that the investment plan is properly reviewed by the executing lines of business. The goal is to create an executable and up-to-date investment plan. This process incorporates operational and execution considerations such as resourcing, material availability and outage feasibility. Candidate investments are updated with the latest cost forecasts, schedule, and scope. Enterprise review also identifies investment definition milestone stages to monitor the investment and identify challenges early in the process.

Adjustments may be made to reflect emerging execution or asset management risks based on discussions during enterprise engagement sessions.

1.7.3.5.2 CUSTOMER ENGAGEMENT

To identify customer needs and preferences in preparation for its 2028 – 2032 investment planning process and this Application, Hydro One engaged Innovative Research Group (IRG) to develop and conduct a customer engagement study – see SPF Section 1.6. IRG employed a two-phased approach which allowed Hydro One to develop and finalize investment plans that are informed by customer input and have been refined based on specific investment trade-offs to achieve outcomes valued by customers

Phase I of the IRG Study focused on customers' general needs and outcome preferences for the electricity system. Customers expressed high levels of satisfaction with the electricity service they receive and identified reasonable rates and reliable electricity as

the top priorities across all customer segments. C&I, LDA, and other LDC Residential customers also indicated meeting growing electricity demand as a top priority.

While reasonable and affordable rates are generally of importance to customers, customers indicated that they generally value and are willing to pay for investments that maintain or improve performance on reliability, resiliency, enabling economic growth and system visibility where costs for these benefits are within the directional bill impacts provided.

In Phase II of the IRG Study, three investment scenarios were presented to customers, representing trade-offs that Hydro One has within its investment plan. These scenarios considered the customer feedback collected in Phase I:

- **Scenario 1: Spend Less / Slower Pace –** prioritizes lower cost/managing rate impacts, by deferring investments to a future rate period, and thus resulting in higher system risk
- **Scenario 2: Draft Plan –** balances needs of system, assets, customer preferences and rates, allowing Hydro One to keep pace with and/or improve assets condition and performance while managing costs
- **Scenario 3: Spend More / Accelerated Pace –** responds to the needs of the system and assets, and delivers the outcomes prioritized by customers, allowing Hydro One to invest more; costs under this plan are higher but long-term risk is lower because of accelerated investment

Phase II gave customers an opportunity to provide feedback on Hydro One's investment scenarios, including specific investment trade-offs. In respect of distribution, transmission and shared services, customers were presented with investment trade-offs relating to the following areas and objectives:

- Distribution: (i) overall system reliability; (ii) managing the impacts of severe weather; and (iii) targeted reliability;
- Transmission: (i) keeping pace with transmission renewal; and (ii) stewardship of transmission system; and

- Shared Services: (i) maintaining buildings and facilities; and (ii) information technology.

In respect of the above areas, customers were generally given options to choose between spending at the level of the draft plan, higher than the plan, or lower than the plan, with associated impacts on outcomes.

As stated in the IRG Overview Report (see SPF Section 1.6): "Overall, feedback collected from more than 100,000 customers shows that there is strong support across all customer types for a level of investment at or above Hydro One's 2028-2032 draft plans."[3] Depending on customer type, between 68% to 88% of customers support spending at or above the level of investment included in the plans.[4] Similar levels of support were observed for categories of investments in the transmission and distribution systems, as well as shared services.[5]

Phase II demonstrated that customers are willing to accept rate increases in exchange for prudent investments in the distribution and transmission systems. Some differences exist between customer segments regarding the specific level of investment, and corresponding bill impact, they prefer.

Hydro One's planners used the Phase I and II customer feedback, summarized in the tables below to revise and finalize the proposed investment plans. For further details on Phase I customer feedback, Phase II trade-offs and customer feedback, see SPF Section 1.6.

[5] IRG Overview Report p. 14-17.

Table 2 - Distribution Outcomes Supported by Customer Feedback

Segment	Outcome	Customer Input
Distribution 	**Phase I**	
	Connections and Growth Requirements for timely access and grid service Proactive investment to enable anticipated growth and accommodate new connections and service upgrades in a timely manner	A near majority of customers support proactive investments to enable anticipated growth and accommodate new connections.
	Phase I and II	
	Overall System Reliability Investments in overall system reliability included repairing or replacing overhead line defects, maintaining, repairing, or replacing major stations' equipment, and replacing or repairing underground cables.	A majority of customers want Hydro One to make investments to: • Improve or maintain current levels of reliability related to the distribution grid. • Make the system more resilient to severe weather, with a plurality wanting proactive investment. • Target reliability improvements for customers with significantly poorer reliability. Across all customer types, a majority or near majority of customers selected Hydro One's draft plan level of spending as it relates to distribution investments in overall system reliability, managing severe weather, and targeted reliability improvements
	Manage the Impacts of Severe Weather Investments in managing the impacts of severe weather included relocating or reinforcing vulnerable power lines, clearing of overhead trees and brush, and installing automated "intelligent" switches.	
	Targeted Reliability Investments in targeted reliability improvements included community-scale batteries and smaller individual customer batteries.	

Table 3 - Transmission Outcomes Supported by Customer Feedback

Segment	Outcome	Customer Input
Transmission 	**Phase I**	
	Connections and Growth Provide timely access and grid service	Meet mandated requirements for system access and system service.
	Phase I and II	
	Keeping Pace with Transmission Renewal Investments in keeping pace with transmission renewal included replacing major transmission station equipment and replacing high-impact underground transmission cables.	A majority of customers want Hydro One to make investments to either increase or maintain current levels of reliability related to the transmission grid. Across all customer types, a majority or near majority of customers selected Hydro One's draft plan level of spending as it relates to transmission investments in keeping pace with transmission renewal, and stewardship of the transmission system.
	Transmission System Stewardship Investments to replace overhead conductors and wood poles and extending the life of steel towers and clearing overgrowth trees and brush.	

Table 4 - Shared Services Outcomes Supported by Customer Feedback

Segment	Outcome	Customer Input
Shared	**Phase I and II**	
	Maintaining Buildings and Facilities Investments in maintaining buildings and facilities included addressing at-risk building components, making at-risk sites more resilient to severe weather, and repairing or retrofitting field offices.	A majority of customers want Hydro One to make investments to • Maintain buildings and facilities and increase resiliency to severe weather. • Proactively utilize technology to accommodate customer requests and improve system visibility. Across all customer types, a majority or near majority of customers selected the draft plan level of spending as it relates to shared investments in maintaining buildings and facilities, and information technology.
	Information Technology Investments in information technology included maintaining the current state of technology systems, enhancing customer service, improving operational efficiency, and protecting the grid from both cyber and physical security threats.	

This two-phased approach allowed Hydro One to ensure the final plans for 2028-2032 are responsive to customer needs and preferences. Phase II customer feedback confirmed support for Hydro One's Draft Plan, which formed the basis of the System Plans in this Application, with adjustments in select areas described in section 1.7.5.6 below. The tables below present a summary of customer feedback and how it shows up in the System Plans.

Table 5 - Reflection of Customer Feedback into the DSP

Segment	Option	Customer Feedback	How it shows up in the plan
Distribution 	**Connections and Growth**	Requirements for timely access and grid service Proactive investment to enable anticipated growth and accommodate new connections and service upgrades in a timely manner	• Provide customers with timely access to the network through customer connection (D-SA-01) • Build out the network to enable growth (D-SS-01)
	Overall System Reliability	Improve day-to-day reliability by 2032 through a balanced program addressing overhead line defects, station transformers, underground cables, and targeted pole refurbishments.	• Replace poor condition station transformers (D-SR-04) • Replace and rejuvenate underground cable (D-SR-15). • Address priority line defects (E-03-02)
	Manage the Impacts of Severe Weather	Reduce outage risk and shorten restoration times through targeted line hardening, increased vegetation clearing, and expanded deployment of automated switches.	• Selectively strengthen vulnerable pole clusters with higher-class poles (D-SR-07) • Selectively underground vulnerable, high-consequence overhead line sections (D-SR-14) • Rebuild distribution line sections and relocate off-road assets to roadside (D-SR-10) • Modernize feeders with remote operable switches and communicating fault circuit indicators (CFCIs) (D-SS-05) • Increased vegetation management (E-03-02)
	Targeted Reliability	Improve reliability for over 10,000 customers through a balanced deployment of community-scale and individual customer batteries.	• Selectively strengthen vulnerable pole clusters with higher-class poles (D-SR-07) • Selectively underground vulnerable, high-consequence overhead line sections (D-SR-14) • Rebuild distribution line sections and relocate off-road assets to roadside (D-SR-10) • Modernize feeders with remote operable switches and communicating fault circuit indicators (CFCIs) (D-SS-05) • Increased vegetation management (E-03-02)

Table 6 - Reflection of Customer Feedback in the TSP

Segment	Option	Customer Feedback	How it shows up in the plan
Transmission 	**Connections and Growth**	Requirements for timely access and grid service	• Provide customers timely access to the network through customer connections and paced regional expansions (T-SA, T-SS)
	Transmission Renewal	Maintain the current level of transmission station and cable health by replacing the highest-risk assets and managing failure risk over time.	• Address transformers and breakers at network stations and connection stations (T-SR-01, 02, 03). • Invest in replacement of underground cables (T-SR-16)
	Transmission Stewardship	Lowers the risk of equipment failure and severe weather through balanced investment in line renewal, structural asset stewardship, vegetation management, and system monitoring.	• Renew poor condition overhead lines (T-SR-13). • Replace and refurbish wood poles (T-SR-04) and steel towers (T-SR-05). • Carry out proactive vegetation management (E-02-02).

Table 7 - Reflection of Customer Feedback in the GSP

Segment	Option	Customer Feedback	How it shows up in the plan
Shared	**Maintaining Buildings and Facilities**	Maintains buildings and facilities by addressing some at-risk building components, increasing resiliency, and repairing or retrofitting facilities.	• Address at-risk building components (G-GP-03). • Increase resiliency for at-risk sites (G-GP-03). • Repairing or retrofitting facilities (G-GP-04).
	Information Technology	Improves systems focused on enhancing customer service and delivering operational efficiency.	• Improve systems focused on enhancing customer service (G-GP-07). • Improve systems focused on improving operational efficiency (G-GP-05, 06, 08, 16, 26).

1.7.3.6 INVESTMENT PLAN DEVELOPMENT

The final investments are developed, incorporating internal consultation and customer feedback. Those investments incorporate the following:

- **Feedback from Phase II of Customer Engagement** – when available, incorporate customer feedback and reprioritize investments based on cost-outcome considerations.
- **Input from third party and external studies** – incorporate select recommendations from benchmarking and other studies.
- **Updated costs, schedule, and scope** – reprioritizing based on updated cost, schedule maturity, and execution feasibility.

  Updated planning assumptions – incorporate updated planning assumptions associated with latest IESO bulk studies, and re-pacing of the distribution plan.

Additional considerations in the refinement to the investment plan include updated allocation of common assets between Transmission and Distribution, and updated load forecast based on latest IESO information.

1.7.3.7 INVESTMENT PLAN APPROVAL AND DELIVERY

The draft final Investment Plan is reviewed by all levels of the organization before leadership review and approval, firstly, at the executive level and then the Board of Directors level.

Once the plan is approved, the execution team takes ownership for delivery. The plan is reviewed throughout the execution phase as new information on asset condition and risks become available. If needed, resources may be redeployed based on changing operational and business conditions.

1.7.3.7.1 INDIVIDUAL INVESTMENT APPROVAL

Individual investments are reviewed and approved, consistent with the provisions of the corporate expenditure authority register. Once approval is granted, the individual investments move to the implementation and work execution phase, delivered through the strategies discussed in TSP Sections 2.11, DSP Section 3.10, and GSP Section 4.10 for capital and E-02-05 and E-03-05 for OM&A.

1.7.3.7.2 MONITORING, CONTROL AND PERFORMANCE REPORTING

Hydro One continues to monitor the performance of the approved Investment Plan by tracking year-to-date expenditures, accomplishments, and projected year-end expenditures as well as monitoring internal and regulatory scorecard performance as outlined in SPF Section 1.5, TSP Section 2.5, and DSP Section 3.5.

1.7.3.7.3 REPRIORITIZATION

While the System Plans are developed through extensive planning, analysis, and engagement, Hydro One must retain flexibility during implementation to respond to new information and changing circumstances. Plan adjustments may be required where customer-driven projects change, new customer requests emerge, cost estimates or execution assumptions are updated, approved projects or programs vary in pace or scope, policy and regulatory considerations evolve, or because of a regulator decision. In these circumstances, Hydro One may need to add previously unplanned investments,

accelerate or defer planned work, or reallocate resources within the portfolio to continue meeting its obligations efficiently and effectively.

Reprioritization applies the same planning, review, and approval principles described in this Exhibit to ensure that any adjustments to the System Plans are made consistent with Hydro One's risk-based investment planning framework, and in a manner that supports effective pacing of work across the plan period.

Reprioritization is assessed separately within the transmission and distribution portfolios, consistent with the separate planning, prioritization, and approval processes for each segment. General Plant investments are assessed on an integrated basis and resulting changes may affect both transmission and distribution segments. Where plan adjustments are required, Hydro One communicates the proposed changes to the relevant internal stakeholders for review and coordination.

SECTION 1.8 – SPF – MANAGING MARKET COST PRESSURES

1.8.1 INTRODUCTION

This section describes the persistent and materially higher inflation and cost pressures that have affected the utility sector since 2020.

Substantial inflation began to materialize during Hydro One's prior rate application (EB-2021-0110) causing Hydro One to update its Capital and OM&A envelopes for actual and forecasted inflation, which were reflected in the OEB-approved Capital and OM&A envelopes. However, higher and sustained industry inflation continued above Hydro One's inflation forecasts for the 2023-2027 period as substantiated by Handy-Whitman indices, which measure construction cost trends for utility functions, Statistics Canada's product price indices which reflect broad electrical equipment market pricing, and Hydro One's procurement experience purchasing electrical equipment and materials.

This section is organized as follows:

- **Industry-Wide Inflation Impacts:** Over the historical and bridge period, utility industry inflation trends have materially exceeded the levels reflected in both Hydro One's forecasts and in the OEB inflation factor used to adjust the company's rates over the historical and bridge period. This overall inflationary trend is described in Section 1.8.2.
- **Inflation Impacts on Critical Hydro One Equipment and Materials:** The cost of key equipment and materials necessary for Hydro One's investment plans has significantly exceeded even the generally heightened price inflation in the historical period. The prices of certain categories of critical equipment, like high-voltage circuit breakers, have increased by an average of 140% since 2020. These costs are described specifically in Section 1.8.3.
- **Hydro One's Management of Inflation:** Hydro One has actively managed these cost pressures in various ways, including i) leveraging its supply chain process, ii) challenging internal lines of business to deliver significant productivity and cost savings, and iii) prioritizing investments while deferring work as necessary to manage capital and OM&A expenditures within OEB-approved envelopes. These

cost management strategies and the results achieved are summarized in Section 1.8.4.

- **Impacts of Inflation on Hydro One's 2028-2032 Investment Plans:** As described in Section 1.8.5, the investment plans in this application reflect the material and sustained cost escalation that Hydro One and the broader utility sector has experienced over the historical period (until year-end 2025) and work that was deferred to manage towards OEB-approved capital and OM&A funding envelopes.

1.8.2 INDUSTRY-WIDE INFLATION IMPACTS

Since 2020, inflation in the utility sector has risen at a higher rate than the general economy.

Substantial inflation increases began to materialize during Hydro One's prior rate application (EB-2021-0110), causing Hydro One to update its Capital and OM&A envelopes to reflect actual inflation in 2021 (3.5%), forecast inflation in 2022 (4.5%), and forecast inflation in 2023 (3.3%).[1] An inflation assumption of 2.0% was used for the 2024 through 2027 capital forecast. These inflation assumptions were then reflected in the OEB-approved Capital and OM&A envelopes and are shown in Figure 1 below (Prior Application Assumption).

Higher and sustained inflation continued above the Prior Application Assumption in the current rate period, with significant increases in the cost of key electrical equipment and materials. Neither the Prior Application Assumption, nor the OEB inflation factors[2] have kept pace with the actual costs that Hydro One and other utilities have experienced during this period.

[1] EB-2021-0110, Exhibit O-01-02, p. 8-9, filed 2022-03-31.
[2] The OEB Inflation Factor is a weighted sum of the GDP-IPI (FDD) and the Average Weekly Earnings (AWE) for workers in Ontario, as reported by Statistics Canada. These factors lag by two years.

These trends are consistent with expert observations on utility costs during the historical period. In the 2025 Total Cost Benchmarking Survey issued by Pacific Energy Group (PEG) on behalf of the OEB, PEG similarly observed:

> unusually rapid inflation in the construction costs of US-based distributors in the years since the pandemic. For example, the Handy Whitman Indexes of Power Distribution Construction costs in the North Atlantic region of the United States have risen drastically in recent years. The summary index for distribution plant in July 2023 was 52% higher than it was in July of 2019 and the line transformers were 86% higher.[3] [emphasis added]

Handy-Whitman indices are widely used throughout the U.S. utility industry as a measure of construction cost trends for utility functions in different regions of the United States.[4] For Capital expenditures, Hydro One has shown the North Central region indices for Distribution (HW-Dx) and Transmission (HW-Tx) in Figure 1 below.[5] These indices follow the same pattern as Handy-Whitman's other indices across the United States as they are mostly based on similar prices for Distribution and Transmission inputs and are representative of Hydro One's market and costs. The North Central region is shown as it includes two out of three interconnections between Ontario and the United States (Michigan and Minnesota), while the North Atlantic region (referenced by PEG above) includes the other interconnection (New York).

Figure 1 shows the impact of inflation on a hypothetical $100 of capital expenditures starting in 2020 (the base year of cost estimates in Hydro One's prior rate application). Applying the Prior Application Assumption for inflation results in a modest increase to $116 (or 16% increase) by year-end 2025.

[3] Preamble to question B4 in the Construction Cost section of the PEG TCB Survey, issued May 6, 2025.
[4] Handy-Whitman data provided by S&P Global (formerly IHS Global Insight).
[5] Not adjusted to Canada: US exchange rates or tariffs.

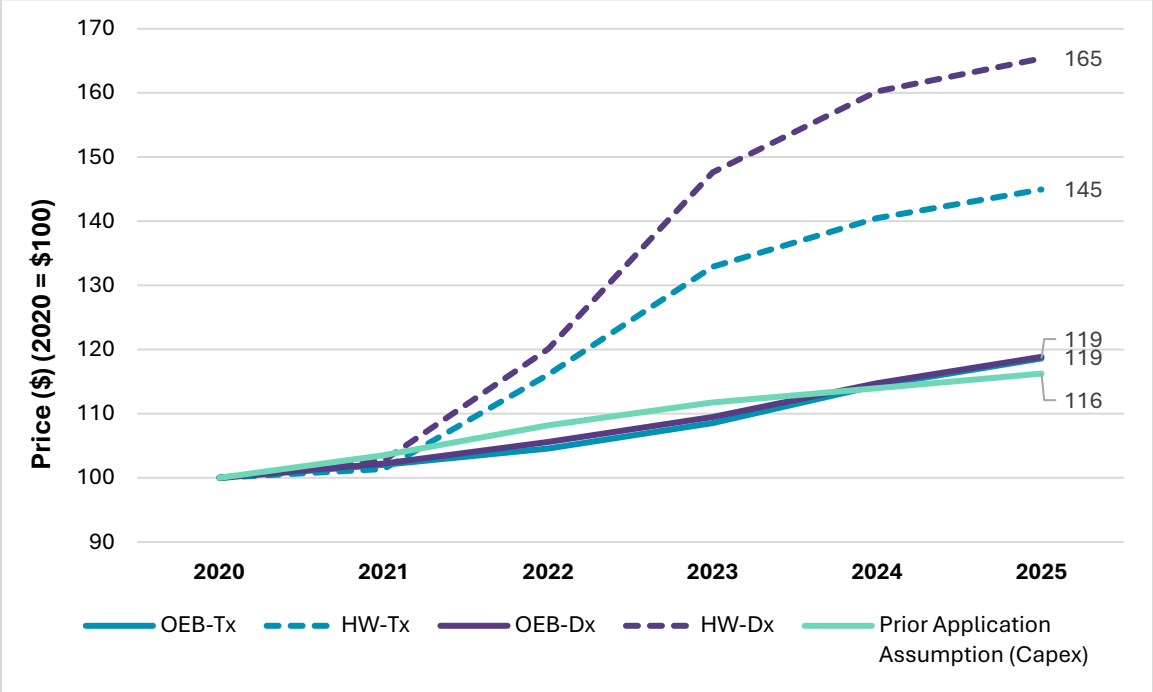

Figure 1: Capital-Related Inflation vs Hydro One's Prior Application Assumption

However, the inflation assumed in the prior application was lower than the published OEB inflation factor, and substantially lower than the Handy-Whitman indices (HW-Dx, HW-Tx). These latter indices most closely reflect the inflationary challenges that Hydro One has faced since 2020, and the degree to which utility-related inflation has exceeded the level reflected in rates over the historical period. While this difference is significant for Transmission, it is even greater in the Distribution context, in which $100 in 2020 has escalated as high as $165 by 2025 year-end, an increase of 65% in five years.

Similarly, Clearspring Energy Advisors, an independent energy consulting firm, observed that Handy-Whitman indices have grown significantly faster than the OEB's inflation factor over both the long term (by an average difference of 3.9% [Distribution] and 2.3% [Transmission] per year over the past two decades) and, even more sharply, since 2020 (by an average difference of 7% [Distribution] and 4.1% [Transmission] per year).[6] This widening capital inflation differential means that even if future annual asset-price inflation

[6] Exhibit A-04-01 Attachment 1, Clearspring Energy Advisors, Benchmarking, Productivity, and Incentive Regulation Parameter Study, p. 15 -16.

moderates, the elevated replacement cost of long-lived utility assets will continue to be higher than what the OEB's inflation (I) minus productivity (X) formula provides, is beyond the control of utilities, and will affect Hydro One's future capital forecasts.[6]

The significant and sustained inflation reflected in the Handy-Whitman indices is also evident in Statistics Canada's product price indices (PPIs) for broad categories of electrical equipment, including transformers, circuit breakers, and wire and cable equipment. From 2020 to 2025, these PPIs showed materially higher inflation increases ranging from 67% to 80%, compared to 19% for the OEB's Inflation factors and 16% for Hydro One's Prior Application Assumption, as shown in Figure 2.

While these PPIs confirm the elevated inflation in broader electrical equipment market indices, they do not reflect what the consumer pays. The PPIs exclude indirect taxes, such as sales taxes and tariffs, and all costs that occur between the time a good leaves the plant and the time the final user takes possession of the good. For these reasons, while the PPIs also show material increases, they are not directly comparable to Hydro One's specific equipment price increases summarized in Table 1, which shows the more acute final cost pressures affecting electrical equipment being procured.

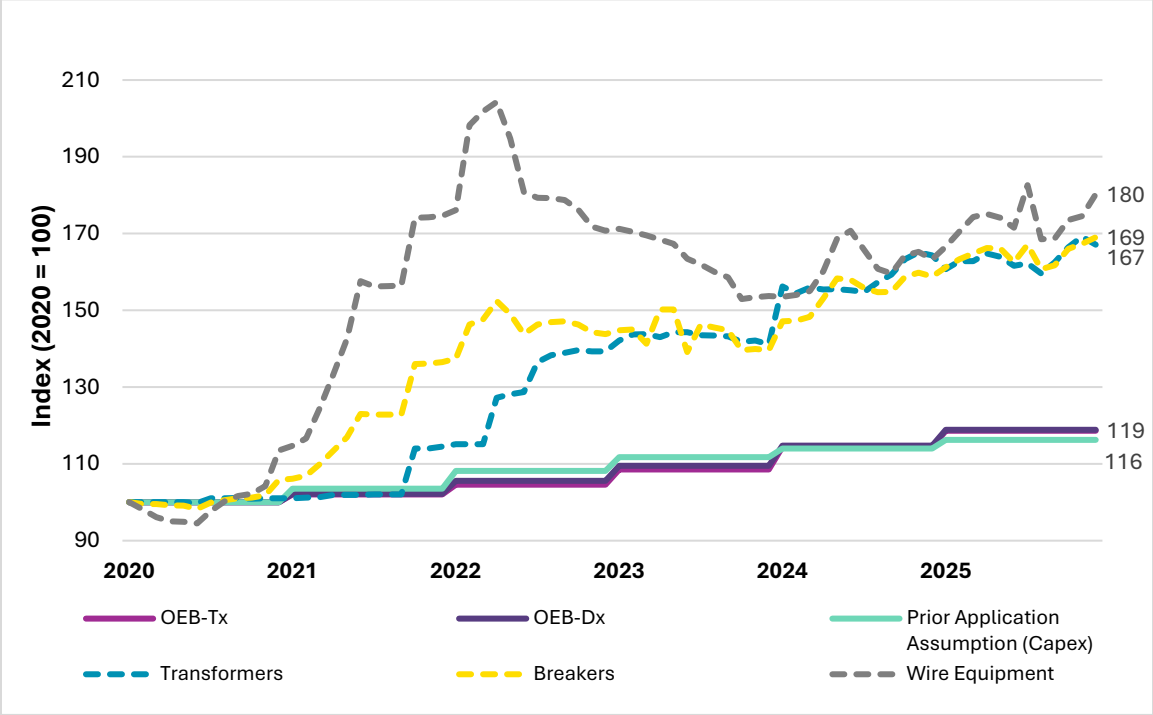

Figure 2 - Product Price Indices vs Hydro One's Prior Application Assumption

1.8.3 INFLATION IMPACTS ON CRITICAL HYDRO ONE EQUIPMENT AND MATERIALS

Since 2020, Hydro One has experienced material and sustained cost escalation across key equipment and materials required to deliver its transmission, distribution, and general plant work programs. These cost increases reflect broader utility-sector market conditions and are not isolated to a single procurement category. Rather, they are the result of various factors including supply-chain disruptions, constrained manufacturing capacity, rising commodity prices, tariffs, and increased demand for grid equipment.

The most significant pressure has been in equipment and materials such as power transformers, breakers and conductors that are highly exposed to global supply chains, and commodity inputs like steel, copper, and aluminum. Global supply chains have been strained by the rapid growth in demand for power equipment, as governments and utilities pursue system expansion to support load growth (including electrification and renewable generation), system renewal to replace aging power equipment, and grid modernization, as well as demand driven by customers seeking larger and more complex connections.

This demand has created a supply-demand imbalance for the equipment Hydro One regularly procures and has resulted in higher prices, longer lead times and shorter quote validity periods. These imbalances and pressures have been exacerbated by constrained manufacturer capacity, global conflicts that have altered supply chains and/or impacted freight costs, and the volatility of domestic and foreign tariffs being imposed on the commodities used to manufacture equipment and the finished equipment that Hydro One procures.

Since 2025, the trade environment between Canada and the United States has become increasingly volatile, with both countries implementing multiple rounds of tariffs and counter-tariffs targeting goods, commodities like steel, aluminum, copper and lumber, and products made from these commodities. These measures, ranging from 15% to 50%, depending on product classification, directly and indirectly affect utility supply chains because electrical equipment like transformers, conductors, circuit breakers, and transmission structures rely heavily on these commodity inputs sourced through complex global manufacturing networks. Direct exposure occurs on goods purchased from U.S. suppliers that are subject to Canadian import tariffs and indirect exposure is introduced through tariffs charged to suppliers. As tariff costs make their way through the supply chain, suppliers face higher material costs and increasingly seek to recover those costs through price increases, surcharges, escalation provisions and higher bid prices. Although Hydro One is actively managing this emerging issue, the evolving tariff environment creates new cost uncertainty that cannot be reliably predicted.

Wood Mackenzie, a leading research and consultancy business, has observed these supply chain and tariff impacts. Wood Mackenzie found: i) key transmission and distribution equipment types falling from a slight market surplus in 2020 to a significant shortage in 2025 (and expects this market shortage to continue throughout 2030), ii) increased demand for transformer and switchgear from electrification and load growth projects including data centers and commercial facilities that are intensifying pressure on

supply chains that are already operating at capacity, and iii) new tariffs are increasing market pricing.[7]

Similarly, Concentric Energy Advisors, a management consulting and economic advisory firm, referenced observations from the Canada Electricity Advisory Council that transmission transformers have seen a drastic increase in both procurement lead times and prices, that SaskPower faced a tripling of timelines for expected delivery of Neutral Grounding Transformers, a price increase of more than 50 percent and even higher costs for more complex units.[8]

Commodity inflation has been another driver of utility equipment cost increases. Key inputs for utility equipment, including steel, copper, aluminum, plastics, fuel, and chemicals, have experienced significant price increases since 2020. These commodity inputs represent a substantial portion of the manufacturing cost for transformers, circuit breakers, conductors, cables, vehicles, and other critical equipment. As these input costs increased, suppliers incorporated them into the cost of the equipment Hydro One purchases, either through update mechanisms in contracts or as legacy contracts expire and new contracts reflect current (higher) market pricing. Commodity inflation has also impacted fuel costs, increasing the cost to transport and deliver equipment and services.

While Hydro One sources some equipment such as distribution transformers from Canadian manufacturers to support the domestic industry and to help ensure supply reliability, domestic procurement does not insulate prices from global commodity markets and other market forces. Canadian manufacturers sell into global markets and depend on global commodity markets and international supply chains, meaning that global cost pressures inevitably flow into domestic pricing.

Beyond power equipment, Hydro One has also experienced material and sustained cost escalation in technology-related goods and services. These pressures include higher costs for enterprise software licensing, vendor support, managed services, cybersecurity

[7] Exhibit E-05-01 Attachment 2, Wood Mackenzie Supply Chain Practices Report, p. 23-25.
[8] Exhibit F-01-01 Attachment 1, Concentric Cost of Capital Study, p. 24.

capabilities, cloud services, advanced analytics, and other grid-enabling technologies. As reflected in Table 1, observed increases for information and operational technology ranged from approximately 9% to 90%.

These increases reflect broader market conditions affecting the technology sector, including increased cybersecurity requirements, higher baseline support costs, and a competitive labour market for specialized technology skills. Demand for expertise in cybersecurity, cloud services, advanced analytics, operational technology, and other grid-enabling capabilities has intensified across the utility sector and other infrastructure-critical industries, contributing to upward pressure on both external service costs and internal costs.

Within the broader portfolio of equipment, materials and services procured by Hydro One, Table 1 summarizes the observed cost increases for key equipment and materials, and services that are sourced to support Hydro One's work programs. The increase for each category is based on the average price increase of materials in the category weighted by actual annual expenditure. In some categories, increases since 2020 have reached as high as 140% on average.

Table 1 - Hydro One Equipment/Service Price Increases Since 2020

Material and Services Category	Average Increase	Application
Power Transformers	115%	These transformers are used across the Transmission and Distribution system
Distribution Transformers (<2.5 MVA)	40%	These transformers perform the final step-down to utilization voltages for end-use customers.
High Voltage Circuit Breakers	140%	These breakers are located in transmission stations and operate to isolate/deenergize transmission lines.
Conductor, Cables, and Wires	65%	Conductors, and submarine and underground cables transport electricity across the province.
Transmission and Distribution Poles	45%	Poles hold the conductors that transport electricity across the province. Generally, Hydro One uses wood poles however steel and composite poles may be used.
Vehicles	35%	Pickup trucks, and specialized line and service trucks are the backbone of the fleet and are essential for daily operations to move staff and equipment to job sites. These vehicles often require custom bodies, upfitting, and specialized components.
Information and Operational Technology	9% to 90%	This includes hardware and software such enterprise software licensing, vendor support, and managed services and are essential for daily operations

Since 2020, a portfolio of key materials routinely purchased by Hydro One representing $400M in annual spend has increased by approximately 75% to $700M a year by the end of 2025.[9] These sustained cost escalations, consistent with inflationary impacts observed across the utility industry, have been driven by a convergence of the factors described above, including supply chain disruptions, elevated energy costs, and the increase in commodity costs for critical inputs such as steel, copper, and aluminum.

[9] Hydro One annually procures over $1B in materials that flow through its procurement processes of which $700M or 70% of annual material procurement relate to routinely purchased materials. The balance of material procurement ($300M) is related to un-catalogued, engineered-to-order materials or low volume catalogued materials.

1.8.4 HYDRO ONE'S MANAGEMENT OF INFLATION

Overall, Hydro One's 2023-2027 experience demonstrates that cost pressures have been broad-based, material, and sustained. However, Hydro One has not been a passive recipient of these conditions.

As described below, Hydro One has taken proactive steps to manage cost pressures including i) leveraged its supply chain process, ii) challenged internal lines of business to deliver significant productivity savings and iii) prioritized investments important to our customers while managing Capital and OM&A expenditures towards the OEB-approved envelopes.

1.8.4.1 LEVERAGE SUPPLY CHAIN

Hydro One procures materials and services through a structured framework of policies and procedures designed to deliver productivity, maximize buying power, improve service levels and foster innovation while building supplier relationships necessary to control costs and maintain a secure supply chain.

Hydro One's large and growing work program – and the specialized, engineered-to-order, equipment needed to deliver it – requires sourcing strategies that deliver value, as well as capacity and continuity of supply. To that end, Hydro One utilizes multi-year contracts, indexed pricing, and multi-supplier strategies to provide sourcing resilience and flexibility, and to minimize pricing volatility and supply disruptions.

Hydro One's procurement management practices are described in further detail in Exhibit E-05-01 (Procurement Management). Hydro One's sourcing practices were evaluated by Wood Mackenzie, a leading research and consultancy business (see Exhibit E-05-01 Attachment 2, Wood Mackenzie Supply Chain Practices Report). Wood Mackenzie found:

- Hydro One demonstrates strong governance and disciplined sourcing practices under volatile market conditions;
- Indexed pricing mechanisms and a diversified supply base have aligned with best practices to effectively manage price increase requests;
- Procurement and engineering collaboration supports proactive planning and operational stability; and
- Sourcing plans are tightly aligned with capital investments and capacity needs.

In respect of recent trade tariffs discussed in section 1.8.3, Hydro One continues to proactively seek alternative sources for materials and equipment subject to direct tariffs, and to work with suppliers to mitigate their upstream tariff exposure: particularly where U.S. inputs can be replaced with viable Canadian alternatives, and requiring suppliers to demonstrate mitigation efforts before tariff-related increases are considered. Hydro One is also working with peer utilities across Canada to aggregate demand and encourage manufacturers to establish new domestic capacity, thereby reducing Canadian utilities to some tariff exposure.

Hydro One has also taken proactive steps to manage vendor-driven cost pressures while maintaining the service levels, operational reliability, and regulatory compliance required to support safe and reliable utility operations. For example, the Digital & Technology Services (DTS) function worked with vendors to optimize contract scopes by removing non-essential features or usage tiers, and renegotiated service levels, and consolidated overlapping services, thereby reducing technology-related costs. Applying this approach in respect of services provided by IT vendors resulted in forecasted savings as discussed in Exhibit E-04-04.

1.8.4.2 ACHIEVED PRODUCTIVITY SAVINGS

Hydro One's productivity program is a key corporate initiative which finds efficiencies within the annual OM&A and capital work programs. Hydro One targets annual productivity achievements with the goal of reducing costs while achieving the same output or accomplishing more work for a similar cost.

Notwithstanding the material and sustained cost pressures Hydro One has experienced, internal lines of business continue to challenge the status quo and explore improved ways of working by modernizing work practices to deliver efficiency and savings to partially offset external cost pressures. For example, Hydro One Transmission optimized crew sizing while maintaining productivity and safety, and Distribution increased wood pole refurbishments where possible instead of completing more costly full pole replacements. For more information, see SPF Section 1.4 (Productivity Framework).

1.8.4.3 INVESTMENT REPRIORITIZATION

Hydro One plans and prioritizes investments through the robust framework described in SPF Section 1.7, which supports risk-informed decisions across its transmission, distribution, and general plant work programs.

Over the 2023-2027 period, Hydro One experienced a material increase in non-discretionary work while also being impacted by significant and sustained cost escalation across key equipment and materials required to deliver its work programs. These pressures included higher System Access requirements to connect both distribution and transmission customers, growing System Renewal needs driven in part by severe storm events affecting the distribution network, and increased transmission System Service work associated with IESO Bulk System and Regional planning activities.

The combination of growing demand for non-discretionary work and escalating equipment and materials costs impacted the type and amount of work Hydro One could complete within the OEB-approved capital and OM&A funding envelopes.

In response, Hydro One optimized its work programs and allocated available funding to mandatory, customer-driven, and other high-priority investments while continuing to operate towards approved funding levels. This required the deferral of work where Hydro One had flexibility over timing/scheduling. Consistent with the prioritization processes described in SPF Section 1.7, Hydro One focused resources on the most critical assets and highest-value investments to mitigate potential impacts and maintain customer and system outcomes. For further information about the reprioritization of work in the 2023-

2027 period see TSP Section 2.9, DSP Section 3.9 and GSP Section 4.9 for capital and Exhibit E-02-01 (Transmission), E-03-01 (Distribution) and E-04-01 (Common) for OM&A.

1.8.5 IMPACTS OF INFLATION ON HYDRO ONE'S 2028-2032 INVESTMENT PLANS

The significant cost inflation that Hydro One and the broader utility sector experienced since 2020 has proven to be sustained, rather than temporary. Hydro One has continued to update project cost estimates to reflect market prices for materials and equipment, including power transformers, breakers, conductors, vehicles, and other critical inputs. These updated costs, which reflect the inflation of recent years until year-end 2025, now form the basis of the assumptions underlying Hydro One's 2028-2032 investment plans.

To manage towards OEB-approved capital and OM&A funding envelopes, Hydro One deferred certain investments during the 2023-2027 period where timing flexibility existed. While these deferrals were necessary, the underlying deferred work remains prudent and required. Accordingly, this work has been incorporated into the 2028-2032 plan and prioritized through the asset management process described in SPF Section 1.7.
